	Operational accuracy and error measures	Bernon *et al.* (2016:596) Hall *et al.* (2013:775, 776)	• *"Performance measures […] Accuracy of forecasting techniques […]."* (Lambert *et al.* 2011:567) • *"[…] key performance indicators […] the managers cited use of […] inventory accuracy […]."* (Li & Olorunniwo, 2008:385) • *"Performance Metrics • Sortation accuracy (total unit errors inventories that are inaccurately sorted as compared to total locations checked) • Over/short accuracy (total items inventoried as compared to total items shipped) […] Accuracy level for each employee in terms of number of items handled, number of errors, and percentage correct decisions, Damage amounts (in units, percent of the total) by type of damage […]."* (Stock & Mulki, 2009:45) • *"Error rates for items scanned […] Error rates for incorrect […]."* (Stock & Mulki, 2009:44) • *"Performance measures […] Delivery performance […] Defect-free deliveries […]."* (Lambert *et al.* 2011:567) • *"[…] key performance indicators used to assess the effectiveness and efficiency of RL activities […] errors and customer complaints […]."* (Li & Olorunniwo, 2008:385)
	Product return and flexibility measures	Chan *et al.* (2010:6297) Petersen and Kumar (2009:49) Stock and Mulki (2009:44)	• *"[…] use information about product returns as a metric for managing customer value […]."* (Petersen & Kumar, 2009:49) • *"The following metrics were identified by the participants of the research as most important: volume of returns, type of returned product […]."* (Genchev *et al.* 2011:256) • *"Another important factor that impacts on the cost of managing returns was the concept of "no fault founds". This expression describes a returned product that, after being tested, is found to have no fault associated with it. […] Measuring the level of "no fault founds" was therefore considered important […]."* (Bernon *et al.* 2011:500) • *"Qualitative metrics can be observed, […] they are listed as follows: (1) Reduction in uncertainty, leading to better inventory management […]."* (Lee & Lam, 2012:593) • *"[…] flexibility than can take care of the variation in the type of return and hence is an important performance indicator."* (Bokade & Raut, 2013:42)
	RL cycle time and productivity measures	Genchev (2009:147) Genchev *et al.* (2011:256) Li and Olorunniwo (2008:385) Shaik and Abdul-Kader (2014:95) Sharif *et al.* (2012:2517)	• *"Performance measure […] RL cycle time […] Average cycle time a product is being returned from the customer to the time the product is put back into the market or disposed."* (Shaik & Abdul-Kader, 2012:30) • *"Total order cycle time (TOCT) is the time that elapses from the beginning to the end of the reverse process."* (Efendigil *et al.* 2008:280) • *"[…] performance can be measured […] namely: […] reverse logistics cycle such as returns lead time."* (Lee & Lam, 2012:593) • *"Performance Metrics […] Hours required to complete each stage of the returns process and hours overall (broken down by employee, product category/class, time period) […]."* (Stock & Mulki, 2009:45) • *"Performance measures […] Delivery lead time […] Time to collect a return […]."* (Lambert *et al.* 2011:567) • *"Time from receipt to crediting of customer account […] Total returns processing time […] Time from receipt to initial returns processing […]."* (Stock & Mulki, 2009:44) • *"Disposition cycle time: Cycle times can be an important measure of reverse logistics."* (Rogers *et al.* 2013:47) • *"[…] metrics as a measure of their disposition goals, but cycle time […] The most frequently cited metric, scrap rate […]."* (Hall *et al.* 2013:775) • *"Productivity Metrics […] Units processed per hour, day, month and/or week (overall, receipt, initial sort, refurbishing, return to vendor, charity/donation, destroy) […] • Units/pieces received divided by units/pieces salvaged on a daily, weekly, or year-to-date (YTD) basis • Number of pallets received versus number of pallets processed • Total number of product scans at initial processing per hour, day, week or YTD • Number of returned pieces/items still not processed after 48 hours (time will vary by company and individual standards) • Total units/pieces received versus RA units/pieces authorized [sic] • Percentage of items authorized [sic] for return but not received • Percentage of items received and authorized [sic] […]."* (Stock & Mulki, 2009:45) • *"Number of pieces/items returned to stock per day […]."* (Stock & Mulki, 2009:44) • *"To reduce the product recovery time and to decrease the no of items entering the RSC […] Measures […] Idle time of returned products […]."* (Agrawal & Choudhary, 2014:17-18)
	Disposition/recovery efficiency measures	Shaik and Abdul-Kader (2014:95)	• *"Performance measure […] Recovery efficiency […] measures the ability of an enterprise to simultaneously meet cost, quality, and environmental impacts, and conserve valuable resource."* (Shaik & Abdul-Kader, 2012:30)
	Network and facility capacity and utilisation measures	Agrawal and Choudhary (2014:18) Lambert *et al.* (2011:567) Shaik and Abdul-Kader (2014:95)	• *"Performance measure […] Network capacity […] Appropriate infrastructure […] for a cost effective and efficient RL network."* (Shaik & Abdul-Kader, 2012:30) • *"Capacity usage ratio (CUR) is the percentage of used capacity in the overall facility."* (Efendigil *et al.* 2008:280) • *"Utilization [sic] Metrics • Amount of temporary storage space utilized at end of day, week or month […] • Number of totes/containers used versus number of*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			totes/containers available • Receiving and/or shipping doors used versus doors available […] Units/pieces received for each inbound transportation carrier (overall, daily, weekly, monthly, YTD) […].” (Stock & Mulki, 2009:45)
	Inventory measures	None	• *“Performance measures […] Total inventory […] Number of days of inventory […].”* (Lambert *et al.* 2011:567) • *“[…] metrics […] inventory control processes, particularly to separate new, refurbished, or previously used products, are suggested.”* (Hall *et al.* 2013:775)
	Transport measures	Shaik and Abdul-Kader (2014:95)	• *“Performance measure […] Transport capacity […] Transport planning and load management of vehicles […].”* (Shaik & Abdul-Kader, 2012:30)
Organisational and resource-related PM elements	***Organisational perspectives and objectives***	Shaik and Abdul-Kader (2014:92)	• *“Strategic performance perspective […] for performance measurement […].”* (Agrawal & Choudhary, 2014:17) • *“The innovation and learning perspective asks how the reverse logistics operations can continuously perform and improve to create more value for the customers […] Objective […] To develop new RL operations and be competitive in the market.”* (Agrawal & Choudhary, 2014:18) • *“Innovation and growth perspective concentrates on bringing efficiency in the operating domain of the business of the enterprise. It is obtained through continuous improvement of the infrastructure via innovation and learning for the achievement of the objectives.”* (Shaik & Abdul-Kader, 2012:26) • *“The BSC focuses on four strategic perspectives: […] (4) learning and growth […] for a wide variety of goals, including […] return rate minimization [sic] […].”* (Hall *et al.* 2013:776)
	Organisational capability	None	• *“Enterprise capability is a measurement of the enterprise’s current and future ability to satisfy stakeholder demand […] The capabilities can include human resources, systems construction […].”* (Shaik & Abdul-Kader, 2012:28)
	IT and information flow measures	Shaik and Abdul-Kader (2014:95)	• *“Performance measure […] Information Technology capability […] The information and communication technology to meet the needs of the RL […] technology innovation capability […].”* (Shaik & Abdul-Kader, 2012:30) • *“To develop new RL operations and be competitive in the market […] Measures […] Implementation of leading technologies […].”* (Agrawal & Choudhary, 2014:17) • *“To develop new RL operations and be competitive in the market […] Measures […] Information flow […].”* (Agrawal & Choudhary, 2014:18)
	Human resources and staff-related measures	Lambert *et al.* (2011:567) Presley *et al.* (2007:4609) Shaik and Abdul-Kader (2014:95)	• *“The following metrics were identified by the participants of the research as most important: […] resource utilization [sic], including human resources, dedicated to returns.”* (Genchev *et al.* 2011:256) • *“Utilization [sic] Metrics […] Employees (regular full time, regular part time, flexible) used in returns […] versus employees available […].”* (Stock & Mulki, 2009:45) • *“[…] labour indicators regarding reverse logistics including: breakdown of workforce, […] net employment creation […]-average hours of training, […] […] composition of senior management, […] employee benefits […] programs for skills management or for lifelong learning.”* (Nikolaou *et al.* 2013:178-179) • *“Performance measure […] Management initiatives and Employee competency […] The management support and employee training and skills provided […].”* (Shaik & Abdul-Kader, 2012:30) • *“Performance measure […] Employee satisfaction […] The satisfaction level of employees.”* (Shaik & Abdul-Kader, 2012:30) • *“BSC is […] combining nonfinancial indicators such as […] employee morale […].”* (Dhib *et al.* 2016:373)
	Product life cycle and return minimisation measures	Bernon *et al.* (2016:596) Janse *et al.* (2010:508)	• *“To develop new RL operations and for continuous improvement competitive in the market […] Performance measure […] Product life cycle reviews […].”* (Shaik & Abdul-Kader, 2014:95) • *“Performance measure […] Product life cycle reviews […] To perform product life cycle review of products, assessing impacts and seeking potential savings to the RL enterprise and society.”* (Shaik & Abdul-Kader, 2012:30) • *“Minimizing [sic] returns is also a concern. The return rate is the metric by which the goal is measured. The most common goal in this theme is that of cost reduction/control.”* (Hall *et al.* 2013:777)
	Risk and safety measures	None	• *“[…] performance monitoring of these operations […] can be achieved in terms of measures that relate to […] risk management, […].”* (Sharif *et al.* 2012:2517) • *“Performance measure […] Safety […] related to operating safety of the employees, products and equipment.”* (Shaik & Abdul-Kader, 2012:30)
Environmental elements	***Environmental perspective and objectives***	Shaik and Abdul-Kader (2014:95)	• *“[…] the goals and objectives of the enterprise can be clustered as […] Environmental perspective is based upon a heightened environmental consciousness, public policy and the law. It concentrates on achieving an environmentally benign RL meeting the regulations while maintaining the efficiency […].”* (Shaik & Abdul-Kader, 2012:26) • *“[…] the environmental performance of the reverse logistics network is the main goal […].”* (Daaboul *et al.* 2014:5) • *“Performance objectives […] were environmental regulatory compliance […].”* (Prahinski & Kocabasoglu, 2006:424)
	Compliance of environmental regulation measures	Lambert *et al.* (2011:567) Shaik and Abdul-Kader (2014:95)	• *“Performance measure […] Overall environmental compliance […] The level of continuous monitoring and regulatory compliance of environment-related issues.”* (Shaik & Abdul-Kader, 2012:30) • *“[…] the most appropriate environmental core indicators for reverse logistics may be*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			[…] incidents of […] non-compliance […].” (Nikolaou *et al.* 2013:178)
	Environmental impact and energy consumption measures	Shaik and Abdul-Kader (2014:95)	• *“[…] the most appropriate environmental core indicators for reverse logistics may be […] direct energy use, […] indirect energy use, […] total water use, […] use of renewable energy sources, […] energy consumption footprint, […] other indirect energy use […] and reuse of water […] […] major impacts on biodiversity, [...] significant environmental impacts of products and services, […] water sources and related ecosystems impacts […] impacts of activities and operations on protected and sensitive areas, […] the significant environmental impacts of transportation used for logistical purposes.* (Nikolaou *et al.* 2013:178) • *“Some environmental performance indicators that are used in reverse logistics […] energy use per item, annual fuel consumption, tonne km by mode, overall vehicle effectiveness, amount of payload used, tonne km per sales, and road vehicle km per sales.”* (Nikolaou *et al.* 2013:178) • *“To improve customer view of RL operations […] Measures […] No of eco friendly products […].”* (Agrawal & Choudhary, 2014:17) • *“Performance measure […] Energy utilization [sic] […] The control of energy consumption for the product recovery […].”* (Shaik & Abdul-Kader, 2012:30) • *“Energy used in handling returns: This metric is used in sustainability programs. It measure how much energy (diesel fuel, electricity, etc.) is used in the reverse logistics process.”* (Rogers *et al.* 2013:47) • *“Considering the environmental performance of the reverse logistics network is the main goal […] The most used life cycle assessment (LCA) indicators are […] carbon footprint of product), energy-related indicators, chemicals used, PFC/GHG emissions, fresh water consumption, and use of renewable/nonrenewable energy.”* (Daaboul *et al.* 2014:5)
	Pollution and waste measures	None	• *“Some environmental performance indicators that are used in reverse logistics mainly focus on reducing CO2 […].”* (Nikolaou *et al.* 2013:178) • *“[…] the most appropriate environmental core indicators for reverse logistics may be […] greenhouse gas emissions, […] emissions of ozone-depleting substances, […] air emissions, […] significant discharges to water, […] significant spills of chemicals, […] indirect greenhouse gas emissions […] percentage of waste materials, […] total amount of waste, […] production and transport of any hazardous wastes […].”* (Nikolaou *et al.* 2013:178).” • *“[…] tracking these metrics: […] Waste: How much product and other materials are moved to landfills, incinerated, or disposed of as waste?”* (Rogers *et al.* 2013:47) • *“Performance measure […] Disposing capability […] ensuring safety and protecting environment to the non-reuse part of recovered product.”* (Shaik & Abdul-Kader, 2012:30) • *“Performance perspective […] Environmental […] Performance measure […] […] Disposing capacity (DPCP).”* (Shaik & Abdul-Kader, 2014:95)
	Environmental certificates and awards measures	None	• *“To develop new RL operations and be competitive in the market […] Measures […] Number of ISO 9000 and EPA certification […].”* (Agrawal & Choudhary, 2014:18) • *“[…] indicators are […] awards received relevant to […] environmental performance […].”* (Nikolaou *et al.* 2013:179)
Social PM elements	***Social perspectives and objectives***	Shaik and Abdul-Kader (2014:95)	• *“[…] the goals and objectives of the enterprise can be clustered as […] Social perspective is based on the ability to lead as a corporate citizen and to promote ethical conduct. It focuses on building good image by meeting the obligations and expectations of communities and society […].”* (Shaik & Abdul-Kader, 2012:26)
	Social performance and corporate image measures	None	• *“[…] to measure the social responsibility performance of a reverse logistics system […] social responsibility indicators will be developed […].”* (Nikolaou *et al.* 2013:177) • *“[…] reverse logistics […] can be measured with the […] donations to community, civil society, and other groups associated with reverse logistics.”* (Nikolaou *et al.* 2013:177-178) • *“Performance measure […] Corporate image […] Market reputation of the enterprise and general image among society.”* (Shaik & Abdul-Kader, 2012:30) • *“[…] indicators are […] policies to manage impacts on communities in areas affected by activities, […] awards received relevant to social, ethical, […] performance and […].”* (Nikolaou *et al.* 2013:179)
	Social policies measures	None	• *“[…] indicators are […] policies to manage impacts on communities in areas affected by activities […].”* (Nikolaou *et al.* 2013:179) • *“[…] indicators […] adjusted to reverse logistics systems are […] policies to deal with all aspects of human rights, […] policies to evaluate human rights performance within the supply chain, […] policy preventing all forms of discrimination in operations […] freedom of association policy, […] policy excluding child labor [sic], […] policy to prevent forced and compulsory labor [sic] […] employee training on practices concerning human rights, […] practical human rights issues, […] policies to address the needs of indigenous people […].”* (Nikolaou *et al.* 2013:179)
Market-related PM elements	***Market-related perspectives objectives***	Shaik and Abdul-Kader, (2014:92)	• *“The customer perspective asks what customers must believe about the company’s reverse logistics operations in order for it to be successful. […] Objective […] To improve customer view of RL operations and services and to increase customer satisfaction.”* (Agrawal & Choudhary, 2014:17) • *“Performance objectives […] were […] improved customer relations […].”* (Prahinski & Kocabasoglu, 2006:424)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			• *"[…] the customer theme, and customer service was the most frequently cited goal […] For instance, "making the process clear for the customer" and "reducing customer wait time" were cited as being key RL goals."* (Hall *et al.* 2013:775)
	Competitiveness and market share measures	None	• *"[…] measures of effectiveness of product returns management are […] the company's competitive advantage […]."* (Shaharudin *et al.* 2015:10) • *"Increment in market share (MSI) is the percent increment in the market share […]."* (Efendigil *et al.* 2008:280)
	Consumer satisfaction measures	Dhib *et al.* (2016:373) Hall *et al.* (2013:774, 775) Olorunniwo and Li (2010:459) Shaik and Abdul-Kader (2012:30) Shaik and Abdul-Kader (2014:95)	• *"Customer satisfaction index (CSI) is the ratio between the number of satisfied customers and total number of customers."* (Efendigil *et al.* 2008:281) • *"[…] indicators of this category may be […] policies related to customer satisfaction […]."* (Nikolaou *et al.* 2013:179) • *"[…] performance monitoring of these operations […] can be achieved in terms of measures that relate to […] customer responsiveness […]."* (Sharif *et al.* 2012:2517) • *"Another important measure directly related to customer satisfaction is how fast WCC handles exceptions to the generally accepted returns policy."* (Genchev, 2009:147) • *"[…] to increase customer satisfaction Measures […] Response time for reimbursement […]."* (Agrawal & Choudhary, 2014:17) • *"Customer loyalty, […] measures the customer's repeat purchases as a result of customer satisfaction with the original purchase and product returns management."* (Shaharudin *et al.* 2015:10)
	Consumer service-related measures	Dhib *et al.* (2016:373) Genchev (2009:147) Genchev *et al.* (2011:256) Lee and Lam (2012:593)	• *"Service quality level (SQL) is the quality level of service requested by the customer."* (Efendigil *et al.* 2008:280) • *"[…] dependability […], which are also the well-known performance measures of any operations."* (Chan *et al.* 2010:6297) • *"Performance measures […] Customer perceived level of service […] Delivery reliability […] Total time to serve a customer […]."* (Lambert *et al.* 2011:567) • *"[…] several metrics for customer service management including […] speed of resolution […] Other suggested metrics may also be beneficial, such as tracking loyalty, churn, or perception of quality and service levels."* (Hall *et al.* 2013:775)
	Consumer protection measures	None	• *"[…] indicators of this category may be […] policies for preserving customer health and safety during use of products, […] management systems related to product information and labeling [sic] […] procedures for consumer privacy, […] type of instances of non-compliance with regulations concerning customer health and safety, […] the number of complaints upheld by regulatory or similar official bodies, […] voluntary code compliance, […] the type of instances of noncompliance with regulations concerning product information, […] procedures for adherence to standards related to advertising […] types of breaches of advertising and marketing regulations."* (Nikolaou *et al.* 2013:179)
	CI (consumer integration) and transparency measures	None	• *"Integration level index (ILI) is the index level related to B2C, […], E-commerce integration technologies among customer and company."* (Efendigil *et al.* 2008:280) • *"SCOR suggests metrics in its returns process that would lead to customer satisfaction […] return authorization/policy clearly communicated […]."* (Hall *et al.* 2013:775)
SC PM elements	***SC perspectives and objectives***	None	• *"Themes […] Service from supplier […] Goals […] Quality customer service* (Hall *et al.* 2013:777) • *"Service from supplier […] firms are concerned with the level of service that they from their supplier […] Also included in service from supplier is the goal of ensuring product and/or supplier quality […] a goal of "supplier performance management" […]."* (Hall *et al.* 2013:777)
	Supplier performance measures	None	• *"[…] performance monitoring of these operations […] can be achieved in terms of measures that relate […] supplier performance […]."* (Sharif *et al.* 2012:2517) • *"[…] a goal of "supplier performance management", and used a unique metric called, "quality performance index, which takes into account product and process quality measures."* (Hall *et al.* 2013:777) • *"Service from supplier […] Metrics […] Wait time – replacement product […] Wait time – credit […] Wait time – unspecified […] Service/satisfaction […] Unserviceable products […]."* (Hall *et al.* 2013:777)
	SC relationships	Shaik and Abdul-Kader (2014:95)	• *"Performance measure […] Relationships […] Maintain long term relations and alliances among RL partners."* (Shaik & Abdul-Kader, 2012:30)

Source: Compiled by the researcher

Table 6.24 shows the PM metrics for RL, including economic elements, operational and product return elements, organisational and resource-related elements, environmental elements, social, elements, market-related elements, and SC elements, which will be discussed in subsequent sections.

6.7.2.1 Economic PM elements for RL

Since RL can involve both economic drivers and barriers (see sections 2.3.1 and 2.4.1) that influence organisations' financial performance, economic PM elements can be important for the management of consumer returns. The economic PM elements for RL involve (1) financial perspectives and objectives, (2) economic performance measures, (3) various cost measures, (4) capital, investment, budget and loan measures, (5) value recovery measures, and (6) profit, income and cost saving measures.

The *financial perspective* that organisations can use for PM in RL associate with financial success, involving several *financial objectives* that can include maximising economic performance, reducing RL costs, asset recovery, profitability and reducing investments. Reaching the financial objectives demonstrate the potential economic outcomes associated with effective PM practices in RL.

In terms of the *economic performance measures* (KPIs and metrics), organisations can use the *economic performance* of RL as an indicator to measure the success of the overall RL function. Additionally, a variety of *cost measures* can be added to the PM framework for RL, including RL, network and infrastructure, operational, labour and miscellaneous costs and expenses. *RL cost measures* involve total RL costs consisting of (1) cost of the returned product (e.g. Rand value and inventory value of returned products), (2) RL process and activity costs, including return request and gatekeeping, collection, receiving, processing, inspection, sorting, disposition costs (e.g. repair cost and warranty cost), storage and repackaging costs, and (3) RLM costs.

Closely related to RL cost measures, *network* and *infrastructure cost measures* involve total network cost, including transport, facilities and inventory costs, costs of using the organisational infrastructure for RL, including IT and equipment costs. The *operational cost measures* associate with product return handling within a warehouse and can include unit operating costs or handling costs per returned product, fulfilment costs, overhead cost and cash-to-cash handling costs. *Labour cost* and *expense* measures involve any cost related to RL staff, including total payroll, benefits, labour cost per returned product, processing staff cost, administrative staff cost, operational staff cost and contracted worker costs.

Finally, other *miscellaneous cost and expense measures* related to RL can include total cost of ownership, which measures the cost of purchasing the product from the supplier, selling the product, receiving a consumer product returns, and reselling the recovered/returned product to a second consumer. Additionally, R&D costs, percentage of contracts paid per contractual agreements (e.g. outsourcing contracts or any contract related to RL), taxes paid for RL processes, and environmental

expenditures and/or penalties related to compliance or non-compliance with environmental laws, can be additional cost and expenses used for measuring financial performance in RL.

Capital, investment, budget and loans-related measures can include (1) total capital input, (2) financial investment in RL, (3) depreciation of investments in RL, (4) return on investment (ROI) rate, including return on working capital and fixed assets, (5) net present value for capital budgeting decisions, (6) variations in RL budget, and (7) capital break-down for interest on debts and loans.

Value recovery measures relate to revenue and monitory value recovered from returned products through disposition and product recovery activities in RL. Specifically, value recovery measures can include (1) percentage of costs recovered, (2) annual sales of returned products versus annual amount of sold products returned, (3) percentage of product returns sold or recovered, (4) net sales for reused or recovered products (after disposition), and (5) recovery percentage for each product category. Lastly, *profit, income* and *cost savings measures* in RL can include net profit versus productivity ratio (operational measure) in RL, increase/decrease of retained earnings and cost savings in the RL process, which can be important to demonstrate overall RL financial performance.

6.7.2.2 Operational and product return PM elements for RL

Since RL involves various operational and product return barriers that can hamper the effective RLM of consumer returns (see section 2.3.2), measuring operational and product return performance can be important. The operational and product return PM elements for RL involve (1) operational perspective and objectives, (2) operational efficiency, (3) operational accuracy and error measures, (4) product return and flexibility measures, (5) RL cycle-time and productivity measures, (6) disposition/recovery efficiency, (7) network and facility capacity and utilisation measures, (8) inventory measures, and (9) transport measures.

The *operational perspective* that organisations can use for PM in RL associate with operational success in RL to meet/exceed consumer needs, involving several *RL operational objectives* that can include obtaining operational efficiency, reduce RL cycle time, achieving productivity in RL, effective disposition and product recovery and efficient product returns. The RL operational objectives relate to the operational performance measures (KPIs and metrics) that organisations can use to measure and improve the overall efficiency of RL processes.

Operational efficiency measures in RL involve operational responsiveness, speed and quality in the RL process. Particularly, *operational responsiveness* as a measure focus on the efficiency and effectiveness of the RL process (e.g. ease of product returns and refunds for consumers), relating to the operational

perspective of meeting consumer needs. Likewise, *speed* can be used as an operational efficiency measure, which can include metrics like on-time-ship (or one-time-collection), tracking the velocity of returned products, inventory turns and dock-to-stock speed (e.g. speed from return receipt to return to stock).

Operational quality measures involve service quality (e.g. condition and timeliness of product repairs), quality of delivered products (which can affect return rates), quality of returned products and outbound shipping quality (e.g. quality of recovered product returned to consumer or market). The operational efficiency measures associate with customer satisfaction and service-related measures, which will be explored in section 6.7.2.5

Operational accuracy and *error measures* in RL involve the accuracy of and errors in the RL processes, which include (1) forecast technique accuracy, (2) inventory accuracy, (3) sorting accuracy (e.g. accurateness versus errors in sorting returned products for disposition), (4) accuracy level of staff handling returns (e.g. number of errors or percentage of correct decisions), (5) delivery performance (e.g. defect-free delivery), (6) returned product damages (e.g. damages during transportation and handling of returned products), and (7) consumer complaints in the RL process.

Product return and *flexibility measures* associate with consumer product returns and product return uncertainty. Specifically, *product return measures* can include usage of product return information (provided by consumer during a return request), type of product returns (or reasons for product returns), measuring number of false failure returns (see section 4.3), number of product returns received (product return volume), and reducing product return uncertainty. Similarly, RL *flexibility* measures the organisation's capability to deal with the uncertainty of product returns, which can include uncertainties in return time, condition, quality and volume (operational barriers).

Relating to operational efficiency and accuracy measures, *RL cycle time* and *productivity measures* associate with the average and total lead time from a customer return request to redistribution and reselling on secondary/primary markets, time spent in individual RL processes and time spent in handling returned products by RL staff. Various metrics can be used for measuring RL cycle time and productivity, including (1) total hours spent to complete each RL processes, (such as gatekeeping, collection, receiving, return processing, inspection/sorting and disposition/recovery cycle time), (2) number of returned products authorised but not received, (3) number of products/pallets received versus number of products/pallets processed, (4) total products received versus products authorised, (5) returned products handled by staff per hour, (6) returned product processed per hour, day, week or month (total RL cycle time per individual product), (7) number of returned products left unprocessed

after the set processing cycle time (e.g. after 48 hours), (8) idle time of returned products, (9) number of products returned to stock per day (for direct reuse disposition), and (10) recovery rate per product.

Like RL cycle time, *disposition/recovery efficiency measures* can associate with operational efficiency in RL but specifically focus on the effectiveness and efficiency of the disposition process, relating to the value recovery measures (economic measure) (see section 6.7.2.1). *Network and facility capacity utilisation measures* in RL relates to the facility and location practices in RL (see section 6.8), involving network capacity (usage of infrastructure for RL), facility capacity usage ratio (percentage used capacity for RL in the entire facility) and facility utilisation metrics, including the amount of storage space utilised (per day, week and month), number of containers used versus the number available (e.g. returned product sorting bins) and receiving or shipping doors/docks used versus the number available.

Inventory measures associate with managing returned inventory in the facility, which can include total returned product inventory, the number of days of returned products in inventory and inventory control. *Transport measures* associate with returned product transportation or recovered product redistribution and can include transport capacity (e.g. number of returned/recovered products in the vehicle and unused space in the vehicle), transport planning and load management of vehicles.

6.7.2.3 Organisational and resource-related PM elements for RL

Like the economic and operational elements, the PM of organisational and resource-related elements can be important in RL due to the organisational barriers (such as lack of attention, strategic planning and training) in RL (see section 2.3.3). Organisational and resource-related PM elements for RL involve (1) organisational perspectives and objectives, (2) organisational capability measure, (3) IT and information flow measures, (4) human resources and staff-related measures, (5) product life cycle and return minimisation measures, and (6) risk and safety measures.

The *organisational perspectives* of PM in RL can include a strategic perspective and an innovation and learning perspective, which associate with several *organisational objectives*, including developing new (or improved) RL processes, continuous improvement initiatives, creating more value through innovation and learning, and reducing returns (through return avoidance initiatives). *Organisational capability* can be an important strategic measure for RL, involving the capability of the organisation to meet the needs of RL parties (internal and external) through effective use of resources in RL. Similarly, *IT and information flow measures* involve IT capability (using IT effectively for RL), technology

innovation capability, implementation of state-of-the-art technologies, and information flow, associating with the organisational objectives of innovation and developing/improving RL processes.

Various *human resource* and *staff-related measures* can be used for PM in RL, including (1) human resource utilisation and employment level (e.g. employees used in RL versus employees available), (2) breakdown of employees (e.g. composition of senior managers and other staff involved in RL), (3) management initiatives, (4) staff competence, (5) staff training and skills, (6) staff benefits, (7) employee satisfaction and (8) employee morale.

Product life cycle and *return minimisation measures* involve reviewing a product throughout its life cycle and measuring the return rate of a product (frequency of return), which can help organisations with identifying the recoverability of the product and reduce the overall return rate of the product. For example, reviewing a retail branded product with a high return rate and a lower recovery rate, may motivate a retailer to improve the product (through innovation) to reduce the return rate and/or improve the recovery rate. Essentially, product life cycle and return minimisation measures relate to the objectives of developing new RL processes, innovation and minimisation of returns. Finally, *risk* and *safety measures* for RL can include measures related to risk management (e.g. number of risks identified in RL and number of risks that occurred) and safety (e.g. employee, product and equipment safety).

6.7.2.4 Environmental PM elements for RL

Since society and consumers pay more attention to environmental practices (see section 2.3.1), measuring environmental performance can be important for retailers. The environmental PM elements for RL involve (1) environmental perspectives and objectives, (2) compliance with environmental regulation measures, (3) environmental impact and energy consumption measures, (4) pollution and waste measures, and (5) environmental certificates and award measures.

The *environmental perspective* that organisations can use for PM in RL involves environmental consciousness and laws, associating with *environmental objectives,* which can include environmentally friendly practices, increase in environmental performance and compliance with environmental regulations. Consequently, environmental measures involve *compliance of environmental regulation,* which include the level of environmental compliance and incidence of non-compliance.

Additionally, *environmental impact* and *energy consumption measures* involve (1) the impact of RL processes, products (e.g. eco-friendliness of the product through life cycle assessments), services and transportation on the environment, and (2) energy utilisation and consumption, including direct energy

(e.g. annual fuel consumption and electricity used in the RL process), indirect energy (e.g. total water consumption and water reuse) and control of energy consumption in the RL process.

Although closely related to environmental impact and energy consumption, *pollution* and *waste* measures in RL focus on measuring pollution and the amount of waste that may harm the environment and the capability of the organisation to reduce waste. Specific measures associated with pollution and waste includes greenhouse emissions, ozone-depleting emissions, air emissions, chemical spills and water pollution, indirect greenhouse gases, transport of hazardous waste, percentage of waste materials, amount of waste disposal (landfill and incineration), and disposing capability and capacity.

Finally, *environmental certificates* and *award* measures in RL associate with the environmental performance of the organisation, which include number of environmental certifications (e.g. ISO 14001 in South Africa) and any awards received for environmental excellence.

6.7.2.5 Social PM elements for RL

Like the environmental PM elements, social elements (e.g. corporate citizenship) form part of the RL drivers, which motivate the need to measure social performance (see section 2.3.1). The social PM elements for RL include social perspective, objectives and measures, including social performance, corporate image and social policies.

The *social perspective* and *objectives* that organisations can use for PM in RL associate with the ability to lead as a corporate citizen, promote ethical practices, building a good corporate image and meeting the expectations of the society. Associating with the social perspective and objectives, *social performance* and *corporate image* measures for RL include social responsibility performance, awards received for social and ethical practice, donations to the community and other groups (RL disposition option), market reputation and corporate image in the society.

Finally, *social policy* measures for RL involves policies that manage the impact of RL on the society and policies related to human rights, including human right performance, prevention of discrimination, affirmative action (e.g. Black Economic Empowerment (BEE) in South Africa), prevention of forced and child labour, and staff training on human rights.

6.7.2.6 Market-related PM elements for RL

The market-related PM elements, including perspective, objectives and consumer satisfaction, consumer service-related, consumer protection, CI (consumer integration) and transparency measures,

cannot only be important due to consumer pressures and competitive factors that drive effective RLM (see section 2.3.1) but also due to the importance of consumer satisfaction and service in dealing with consumer returns.

The *market-related perspective* for PM in RL involves a consumer perspective, focussing on the market-related *objectives* of improving consumers' view of RL processes, consumer satisfaction, customer service, improving consumer relationship and transparency. However, based on *competitiveness* and *market share measures,* including competitive advantage and market share increment (percentage of market share), organisations may increase their competitive advantage and market share as market-related objectives.

Nevertheless, several market-related measures directly associate with the consumer perspective and consumer-focussed objectives. For instance, *consumer satisfaction measures,* which can include consumer satisfaction index, consumer satisfaction policies, consumer responsiveness (e.g. responsiveness to exceptions outside the return policy and consumer response time), and consumer loyalty (determined through repeat purchases), associate with the consumer satisfaction objectives.

Although closely related to operational efficiency measures (section 6.7.2.2), *consumer service-related measures* focus mainly on consumer perception and can include service quality level (e.g. service expected by consumers), dependability, delivery reliability, and time to serve, which can be determined through consumer surveys (PM strategy of feedback mechanisms) (see section 6.7.1.1).

Associating with the well-being of consumers, *consumer protection measures* for RL can include product health and safety policies, consumer privacy practices, consumer complaints to regulatory bodies, (non-)compliance of consumer protection legislation, (non-)compliance of product information requirements, and (non-)compliance of advertising and marketing regulations.

Finally, related to the objectives of maintaining relationships with consumers and communication, *CI* and *transparency measures* can include (1) integration level index (such as the level of ecommerce IT used to integrate with consumers) and (2) clear communication of return policies and procedures to consumers. These measures emphasise the importance of CI as a RL practice to manage consumer returns (see section 6.4.2).

6.7.2.7 SC PM elements for RL

Although PM for RL mostly focusses on the internal performance of organisations, the SC barriers can be problematic for effective RLM (see section 2.3.4), making SC PM elements important. The SC PM

elements for RL involves SC perspective, objectives and supplier performance and relationship measures. Specifically, the *SC perspective* involves supplier service and performance, focussing on the *SC objectives* of receiving quality service and products from suppliers and supplier performance management.

Relating to perspective and objectives, *supplier performance measures*, like quality performance index and supplier services in terms of consumer returns (e.g. wait times for warranty replacements, repairs and refunds/credits), can be important since it can influence RL performance of the organisation. Likewise, measuring *SC relationships* (e.g. partnerships and alliances) can be important due to the significance of SCI as a RL practice for effective RLM (see section 6.4.1).

Essentially, the variety of PM elements, including PM perspectives, objectives and measures for RL, demonstrate the importance of careful strategic planning and development of a PM framework for RL to manage RL performance of consumer returns. This importance will be further emphasised in the next section, which focusses on the outcomes of PM in RL.

6.7.3 Outcomes of PM practices in RL

The outcomes of PM practices involve the benefits and performance outcomes associated with the effective implementation of PM strategies, requirements and elements, which can be important to effectively manage consumer returns. The outcomes of PM practices in RL included (1) economic, (2) operational, (3) organisational (4) environmental, (5) social, (6) market-related, and (7) SC outcomes. Table 6.25 provides an overview of the findings related to the *outcomes of PM practices* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.25 Findings related to outcomes of PM practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Measure, control and manage costs***	None	• *"Direct cost […] and ROI […] are appropriate for measuring cost […] inbound organizations [sic] focused on the inventory value of the returned product or cost of the return."* (Hall *et al.* 2013:776) • *"Results analysis is an important process in a reverse logistics reform, as it is essentially a continuous feedback mechanism for the ever-changing reverse logistics situation. Proper results analysis at adequate time intervals enables: […] Control the costs […]."* (Lee & Lam, 2012:594) • *"In the financial perspective, RL costs are found to be the most preferred […] For any successful RL enterprise, the control of total RL costs incurred is important […]."* (Shaik & Abdul-Kader, 2012:31) • *"Another important factor that impacts on the cost of managing returns […] Measuring the level of "no fault founds" was therefore considered important […]."* (Bernon *et al.* 2011:500)
	Measure financial performance	Genchev (2009:147) Shaik and Abdul-Kader (2012:30)	• *"[…] reverse logistics financial performance can be measured with the following direct economic indicators […] net sales of reuse, resalable, and recyclable […] costs of used and returned materials, […] percentage of contracts that were paid in accordance with agreed terms, […] total payroll and benefits for staff in reverse logistics procedures […] distributions to providers of capital broken down by interest on debt and borrowings, […] increase/decrease in retained earnings at end of period […] taxes paid […] with reverse*

Table 6.25 shows that the PM strategies, requirements and elements (sections 6.7.1 and 6.7.2) in RL involves (1) economic, (2) operational, (3) organisational (4) environmental, (5) social, (6) market-related, and (7) SC outcomes, which will be discussed in subsequent sections.

6.7.3.1 Economic outcomes of PM practices in RL

The economic outcomes of PM practices in RL include (1) measuring, controlling and managing costs, (2) measuring financial performance, (3) increasing economic performance and financial success, (4) maximising value recovery, (5) cost efficiency and effectiveness, (4) cost savings/reductions, and (5) revenue and profitability.

In terms of *measuring*, *controlling* and *managing costs*, organisations can (1) measure RL costs through the economic measures (KPIs and metrics) of RL cost, ROI (investment measure) and value recovery (e.g. value of returned product), (2) control RL costs through PM strategies, including creating feedback mechanisms and analysing performance, and economic PM elements, including a financial perspective and RL cost measures, and (3) manage RL costs through product return measures related to the type of consumer returns. Additionally, organisations can measure their *financial performance* in RL through various economic measures, including total RL cost, labour cost, contract cost, tax, capital and loans, and the social performance measure of donations to communities, to obtain a better understanding on the overall economic efficiency of RL.

Several PM practices in RL can *increase economic performance* and *lead to financial success*, including the (1) PM strategies of a cost-benefit analysis, the implementation of a PM framework and the evaluation of performance results, (2) organisational requirement of management involvement and, (3) economic measures of economic performance, RL cost, capital, value recovery and profit. Similarly, the economic measures of RL cost (such as transport cost), capital, value recovery and profit can help with *maximising value recovery.*

PM practices in RL can lead to several cost advantages that associate with cost efficiency and effectiveness and cost savings/reduction. Particularly, *cost efficiency* and *effectiveness* can be obtained through outcomes related to identifying appropriate metrics (PM strategy) and network capacity and utilisation metrics (operational measures).

Additionally, *cost savings/reduction* in RL can be realised through several PM elements, including the economic elements related to a financial perspective and economic measures (such as economic performance, RL cost, capital, value recovery and profit measures), the operational measure of RL cycle time and the organisational measure of a product life cycle review. Finally, focussing on PM practices in RL can help to *increase revenue/profits* of organisations, especially through the economic PM element of a financial perspective that focus on obtaining financial success in RL.

6.7.3.2 Operational outcomes of PM practices in RL

The operational outcomes of PM practices in RL include (1) measuring and monitoring operational performance, (2) addressing operational barriers and risk determining, (3) RL process efficiency and effectiveness, (4) increasing operational efficiency and effectiveness, (5) improving RL processes, (6) reducing RL cycle time, (7) improving return transport management, and (8) improving inventory management.

Measuring and *monitoring operational performance* can be achieved through various measures (KPIs and metrics), including operational responsiveness, operational service quality and flexibility (operational measures), costs (economic measures), information flow measures and risk management (organisational measures), consumer satisfaction (market-related measure) and supplier performance (SC measure). Furthermore, organisations can *address operational barriers* (e.g. uncertainties in the quantity and timing of returns) and *risks* in RL (see section 2.3.2), through the strategic development of a reward system (PM strategy) and measuring operational responsiveness, flexibility (operational measures) and return rate (organisational measure).

Additionally, *RL process efficiency* and *effectiveness* can be determined through the establishment of appropriate KPIs (PM strategy), management involvement (organisational requirement) and several measures, including cost measures, operational measures (such as speed, quality, accuracy, RL cycle time and productivity), and consumer satisfaction measures. More importantly, organisations can *increase* their *operational efficiency* and *effectiveness* through establishing operational measures, including operational responsiveness, RL cycle time, network capacity and transport capacity.

RL processes can be *improved* through the PM strategies of developing appropriate KPIs for RL, creating feedback mechanisms and analysing RL performance, which shows the importance of PM practices for managing consumer returns. Additionally, *RL cycle time* can be *reduced* through identifying appropriate objectives (part of developing a PM framework for RL) (see section 6.7.1.1), and through establishing the operational measures of operational speed, disposition cycle time and idle

time (part of RL cycle time and productivity measures) (see section 6.7.2.2), and facility capacity utilisation.

Organisations can *improve return transportation management* (e.g. better vehicle utilisation and less in-transit damages), which can be achieved by establishing measures of transport capacity and utilisation (operational measures). Finally, *inventory management* can be *improved* through the product return measure, reduction in uncertainty (see section 6.7.2.2), emphasising the important role of PM practices in RL to reduce operational risks and barriers in RL.

6.7.3.3 Organisational outcomes of PM practices in RL

PM practices in RL involves numerous organisational outcomes, which include (1) determining organisational performance, competence and success, (2) facilitating planning, decision-making and control, (3) facilitating RL implementation and innovation, (5) facilitating performance management, (6) enabling a comprehensive approach to RL performance, (7) measuring and determining RLM performance and capabilities, (8) monitoring RL progress and performance, (9) enabling modifications and adjustments, (10) enabling growth and goal attainment, (11) improving RL performance, efficiency and effectiveness, (12) improving and facilitating RLM, (13) facilitating CFI, (14) facilitating facility/location practices, (15) facilitating RL formalisation (strategic planning and procedure (SPP) practices), and (16) facilitating RPA practices.

PM in RL can help organisations to determine overall *organisational performance, competence* and *success*, which can be obtained through the PM strategies of using existing PM frameworks (e.g. BSC or SCOR) (see section 6.7.1.1) for RL and strategic linking of PM elements (such as aligning objectives with metrics), and through several PM measures, including product return measures (part of operational measures), human resource measures related to staff morale (organisational measure), and customer satisfaction and service measures (market-related measures).

PM in RL can be important for RL *planning, decision-making* and *control*, which can be important to address the organisational barrier of a lack of strategic planning in RL (see section 2.3.3). Specifically, developing a PM framework for RL, identifying appropriate PM objectives and considering factors that can impact PM in RL (such as business environment) can help organisations to (1) add RL to their strategic plans, (2) determine future course of action, (3) guide decision-makers to focus on objectives, (4) facilitate decision-making and (5) increase control. Essentially, the strategic development of a PM framework and system for RL can help organisations with the entire *performance management* process in RL.

Subsequently, PM in RL can *facilitate RL implementation* and *innovation*, especially, through the PM strategies related to a holistic approach to PM in RL (strategic approach), RL benchmarking and identifying appropriate KPIs and metrics. Additionally, RL innovation can be facilitated through PM elements, including the organisational perspective and objective related to innovation and development of new RL processes, the organisational measures related to IT (e.g. state-of-the-art IT and IT innovation) and information flow, human resources (e.g. management initiatives and staff competence) and product life cycle reviews, and the environmental measure related to environmental certificates.

While a holistic approach to PM in RL can be an important part of a PM strategy, organisations can obtain a *comprehensive overview* of their *RL performance* through developing a PM framework for RL that includes numerous performance metrics (PM strategies). Furthermore, organisations can *measure* and *determine RLM performance* and *capabilities* through (1) PM strategies, including a cost-benefit analysis, identification of appropriate measures and performance evaluation, (2) management involvement (organisational requirement), and (3) PM elements in RL, including economic measures (cost, value recovery and economic performance), an operational measure (RL cycle time), a strategic (organisational) perspective, an environmental measure (waste measure), and market-related measures (competitiveness and consumer satisfaction).

PM strategies in RL can contribute to several performance-related outcomes, including *monitoring RL progress* and *performance* by using existing FL metrics, developing and identifying appropriate RL metrics, creating feedback mechanism and analysing performance data. Moreover, the PM strategies of regular performance reviews, creating feedback mechanisms and analysing performance data *enables modifications* and *adjustments* to RL processes and practices to fit business environment changes. Additionally, the PM practices related to strategic understanding of PM, strategic RL benchmarking, developing appropriate metrics for RL (PM strategies) and focussing on continuous improvement in RL (organisational requirement) *enables growth* and *goal attainment*, emphasising the organisational perspective of innovation (organisational PM element) (see section 6.7.2.3).

Subsequently, the PM strategies, including a holistic approach, the development of large quantities of KPIs and metrics for RL, the strategic linking of KPIs to organisational objectives, the creation of performance feedback mechanisms and a performance evaluation in RL, can *improve* and *facilitate RLM*. Furthermore, *improvement in RL performance, efficiency* and *effectiveness* can be realised through strategic considerations in PM (e.g. considering the impact of PM on RL parties), utilising RFID for PM (IT requirement) and developing a PM framework that consists of identifying perspectives and measures for RL, including (1) economic measures related to capital and investment,

(2) organisational perspective of growth/innovation, and (3) organisational measures related to IT, human resources and product life cycles.

The final few outcomes of PM in RL associate with other RL practices discussed in this chapter, including CFI (section 6.4.3), facility/location practices (section 6.8), RPA practices (section 6.9.3) and RL formalisation (see section 6.9.4). Specifically, identifying and developing appropriate metrics for RL can *facilitate CFI* by encouraging communication between different departments. Furthermore, PM practices, including strategic evaluation and analysis of performance, economic measures (related to costs) and network capacity measures (operational), can *facilitate facility/location practices,* like RL network design, network capacity and infrastructure, and facility management.

Similarly, PM in RL can *facilitate RPA* practices by preventing unnecessary product returns to enter the SC. Particularly, organisations can use operational measures related to RL cycle time and productivity (e.g. idle time and disposition time) and facility capacity, and the organisational measure of return rate to prevent unnecessary product returns. Finally, establishing appropriate RL metrics can *facilitate formalisation* in RL, which forms part of the strategic planning and procedure (SPP) practices in RL. Essentially, PM practices in RL can be important for various other RL practices, which can be critical for the effective management of consumer returns.

6.7.3.4 Environmental outcomes of PM practices in RL

The environmental outcomes of PM practices in RL include (1) determining environmental performance, (2) monitoring environmental compliance, (3) meeting environmental targets, and (4) environmental protection.

Certain environmental measures, including energy use per product, annual fuel consumption, waste percentage and incidences of non-compliance with environmental laws, can help organisations to *determine* their *environmental performance*. Similarly, environmental measures related to environmental compliance of RL, enables continuous *monitoring of environmental compliance,* preventing possible non-compliance fines.

Additionally, the PM practices related to strategic understanding of RL performance (PM strategy) and focussing on continuous improvement in RL (organisational requirement) can help organisations to *meet environmental targets.* Finally, environmental measures related to pollution and waste, including disposing capability and amount of waste sent to landfills or incineration plants, can help with *environmental protection,* emphasising the significance of environmental drivers in RL (see section 2.3.1.3).

6.7.3.5 Social outcomes of PM practices in RL

The social outcomes of PM in RL include (1) measuring social performance, (2) meeting society needs and (3) improving corporate image. To *measure social performance* organisations can identify several social measures, which may include corporate image, social policies, donations and social or ethical awards (see section 6.7.2.5). Additionally, developing a social perspective as part of PM elements in a PM framework for RL, can facilitate in *meeting* the *needs* of *society*, emphasising the importance of considering stakeholder needs before implementing a PM framework for RL (see section 6.7.1.1).

Similarly, *corporate image* can be *improved* not only through a social perspective (social PM element) but also through a consumer perspective and objective (market-related PM elements), operational measures (e.g. operational responsiveness and accuracy) and an environmental measure (e.g. environmental impact of RL). Evidently, various PM elements can apply to various outcome categories, showing the importance of developing a comprehensive RL framework and system for PM in RL (see section 6.7.1.1).

6.7.3.6 Market-related outcomes of PM practices in RL

The market-related outcomes of PM practices in RL include (1) increasing market value and competitiveness, (2) understanding consumer behaviour, (3) meeting consumer demands/needs, and (4) increasing consumer satisfaction. Specifically, *market value* and *competitiveness* can be increased through a social perspective and corporate image measures (social PM elements), organisational measures related to IT (e.g. state-of-the-art IT) and information flow, and an environmental measure related to the number of environmental certificates.

Understanding consumer behaviour can be possible through the operational responsiveness measure (operational PM element), emphasising the importance of creating feedback mechanisms, like consumer surveys, to accurately analyse RL performance (PM strategies) (section 6.7.1.1). Additionally, *meeting consumer demands/needs* can be possible through the PM strategies of identifying metrics and evaluating performance, and market-related PM elements of setting market-related objectives (e.g. customer service objectives) and customer satisfaction measures.

Consequently, PM in RL can help to *increase consumer satisfaction* by using standard (traditional) performance frameworks (such as SCOR) and identifying appropriate metrics for RL (PM strategies), measuring responsiveness and RL cycle time (operational measures), measuring environmental impact (e.g. number of eco-friendly products offered), and measuring consumer satisfaction and CI (e.g. transparency about return policies) (market-related measures). Therefore, PM strategies and various

PM elements can help organisations to increase consumer satisfaction through understanding consumers and meeting consumer needs, which can be essential to manage consumer returns.

6.7.3.7 SC outcomes of PM practices in RL

The SC outcomes of PM practices in RL include (1) monitoring and managing SC performance, (2) facilitating SCM, (3) increasing SC efficiency, and (4) facilitating SCI. *Monitoring and managing SC performance* can be possible through the PM strategies of using standard FL metrics and developing appropriate metrics for RL, and the SC PM elements related to supplier performance management (objective and measure) (see section 6.7.2.7). Furthermore, utilising standard PM frameworks (such as SCOR and BSC) for RL can *facilitate SCM*, which can help address SC barriers in RL (such as a lack of collaboration and SC support) (see section 2.3.4).

To *increase SC efficiency* in RL, organisations can focus on organisational PM elements of an innovation perspective and IT-related measures (such as technology innovation). Similarly, an innovation perspective and IT-related measures (such as IT capability), a social perspective and measures (such as corporate image) and a SC relationship measure can play important roles in *facilitating SCI,* which emphasise the importance of implementing various RL practices to manage consumer returns.

Essentially, PM practices in RL can facilitate measuring, monitoring, adjusting and improving RL performance and bring several benefits, which can be important for the effective management of consumer returns. In the next section, PM practices in RL will be concluded with a description, conceptual framework and summary of findings for PM practices to manage consumer returns.

6.7.4 Description, conceptual framework and summary of findings for PM practices to manage consumer returns

Like RL in/outsourcing and disposition practices, PM practices in RL contain a single description, conceptual framework and summary of findings. Based on the findings presented in section 6.7, PM practices in RL can be important for the management of consumer returns, and will be described as follows:

> PM practices for the management of consumer returns involve (1) PM strategies, including strategic approaches to PM, understanding PM, strategic considerations for PM, a cost-benefit analysis, establish teams for PM, strategic use of existing and standard PM frameworks/models and measures, strategic benchmarking, developing a strategic PM framework and system for RL through strategic identification, development and establishment of performance perspectives, objectives, and appropriate KPIs and metrics, establish standardised measures, strategic linking in PM, implementation of PM, performance monitoring and reviews, creating feedback mechanisms and using performance data, developing a reward system, and evaluating and analysing performance results, (2) PM requirements, including an economic requirement (measuring the financial impact of RL), IT requirement (utilise

RFID) and organisational requirements (focus on continuous improvement in RL, RL objectives in strategic plans, RL commitment and management involvement).

As part of the strategic development of a PM framework for RL, PM practices in RL consist of various PM elements, including (1) economic elements (financial perspectives, objectives, and economic performance, cost, capital, investment, budget and loan, value recovery profit, income and cost saving measures), (2) operational and product return elements (operational perspective, objectives, and operational efficiency, accuracy and error, product return and flexibility, RL cycle-time, productivity, disposition/recovery efficiency, network and facility capacity and utilisation, inventory, and transport measures), (3) organisational and resource elements (organisational perspectives, objectives, and organisational capability, IT and information flow, human resources and staff, product life cycle, return minimisation, risk and safety measures), (4) environmental elements (environmental perspectives, objectives, and environmental regulation compliance, environmental impact, energy consumption, pollution, waste, environmental certificates and award measures), (5) social elements (social perspective, objectives and social performance, corporate image and social policy measures), (6) market-related elements (market-related perspective, objectives and consumer satisfaction, service-related, protection, and CI and transparency measures), and (7) SC elements (SC perspective, objectives and supplier performance and relationship measures).

The PM strategies, requirements and elements in RL can result in several outcomes, including (1) economic outcomes (measure, control and manage costs, measure financial performance, increase economic performance and financial success, maximise value recovery, cost efficiency, effectiveness, and savings/reductions, and revenue/profitability), (2) operational outcomes (measure and monitor operational performance, address operational barriers and risks, determine RL process efficiency and effectiveness, increase operational efficiency and effectiveness, improve RL processes, reduce RL cycle time, and improve return transport and inventory management), (3) organisational outcomes (determine organisational performance, competence and success, facilitate with planning, decision-making, control, RL implementation, innovation and performance management, enable a comprehensive approach to RL performance, measure and determine RLM performance and capabilities, monitor RL progress and performance, enable modifications, adjustments, growth and goal attainment, improve RL performance, efficiency and effectiveness, improve and facilitate RLM, and facilitate CFI, facility/location, RPA and formalisation practices), (4) environmental outcomes (determine environmental performance, monitor environmental compliance, meet environmental targets, and environmental protection), (5) social outcomes (measure social performance, meet society needs and improve corporate image), (6) market-related outcomes (increase market value and competitiveness, understand consumer behaviour, meet consumer demands/needs and increase consumer satisfaction), and (7) SC outcomes (monitor and manage SC performance, facilitate SCM and SCI, and increase SC efficiency).

Figure 6.19 provides a conceptual framework of PM practices to manage consumer returns, which includes the PM strategies and requirements, outcomes and elements. Specifically, the framework illustrates the links between PM strategies and requirements, outcomes and elements, which can result in effective PM to manage consumer returns. The most significant PM practices (strategies and requirements), elements and outcomes are emphasised through italics, which will be elaborated upon in Table 6.26. The links between the PM strategies and requirements can be demonstrated by the PM strategy of developing a PM framework for RL, which can link with economic requirements (e.g. measuring financial impact on RL), IT requirements (e.g. utilise RFID for PM) and organisational requirements (e.g. continuous improvement and management involvement). Nevertheless, the PM strategies and requirements can be important for developing an appropriate PM framework for RL, linking with the PM elements that constitutes the PM framework for RL. However, the PM elements also link back to the PM strategies, which involves PM implementation, monitoring, reviews and analysis.

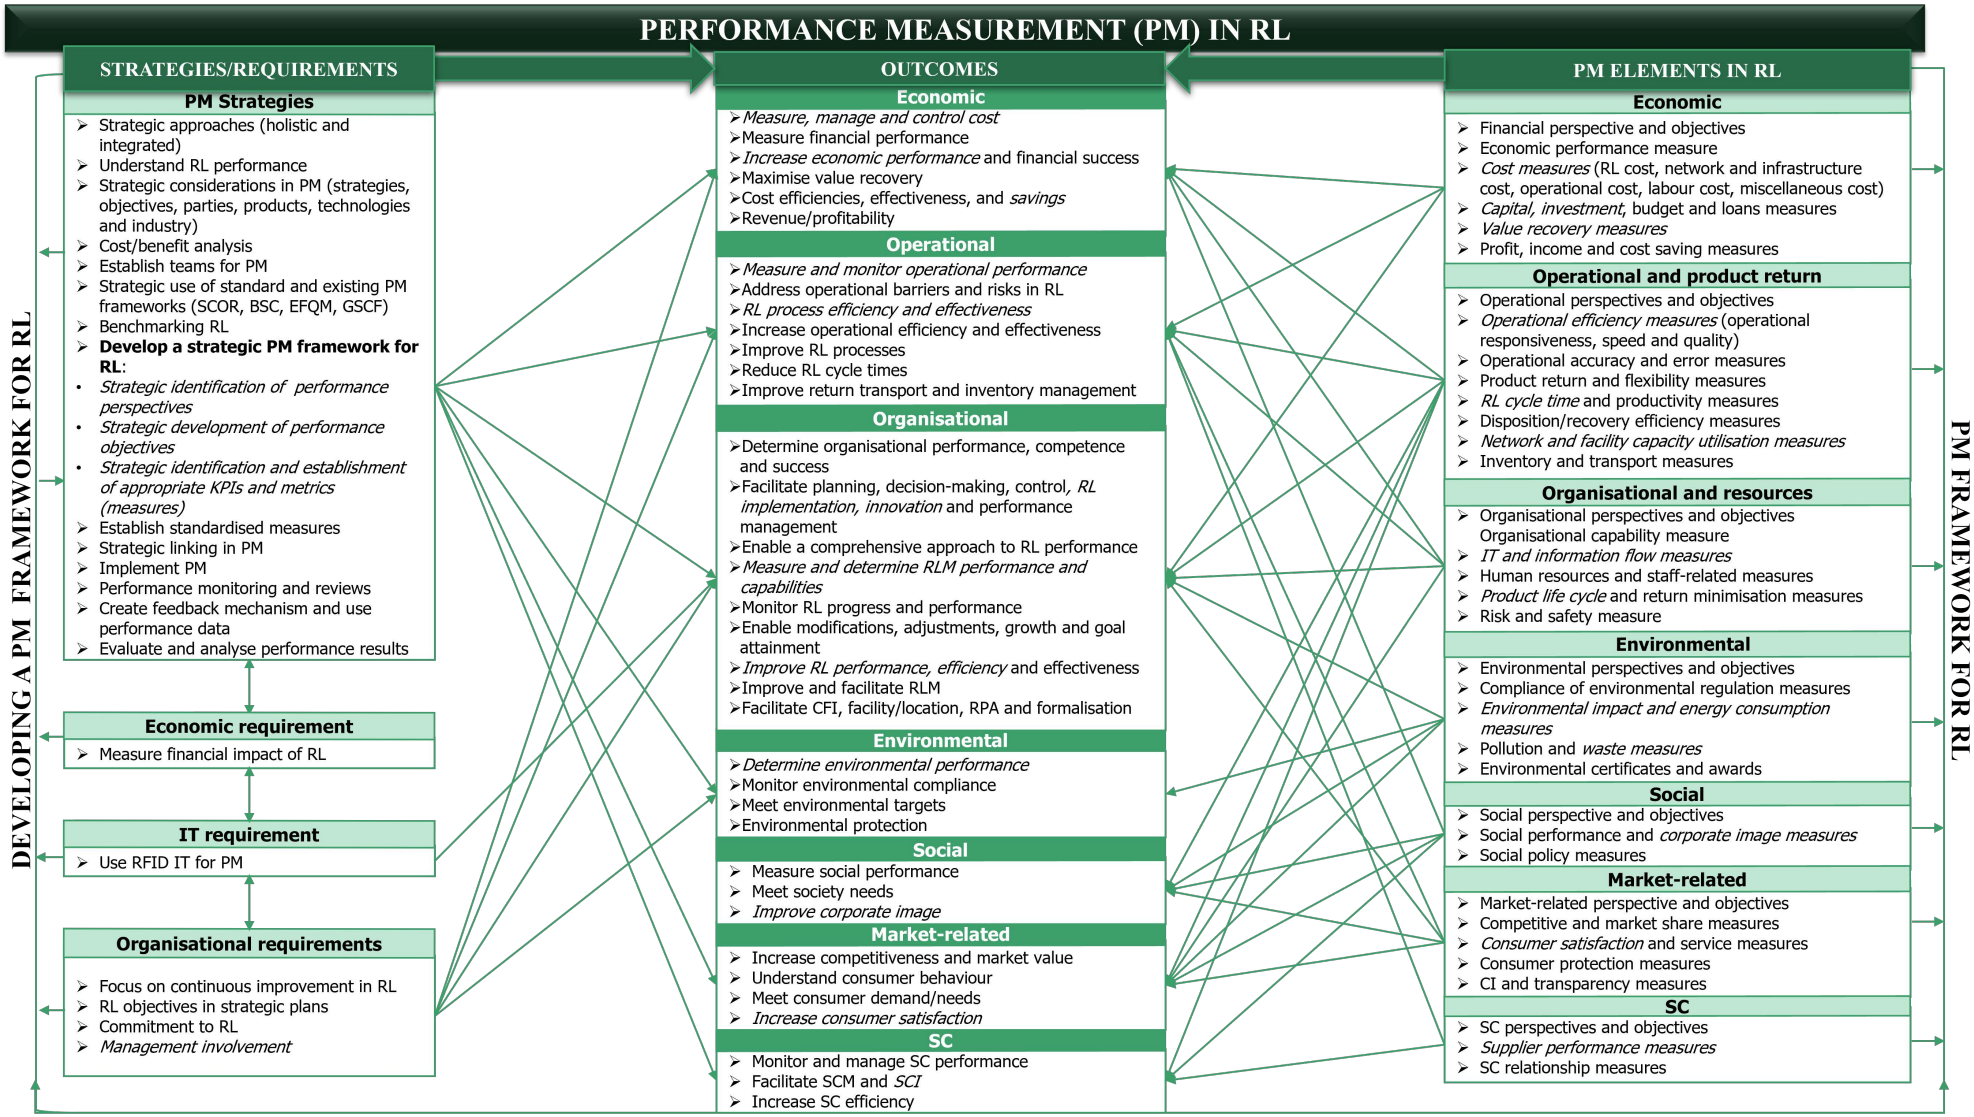

Figure 6.19 Conceptual framework of PM practices to manage consumer returns
Source: Compiled by researcher

Nonetheless, the main aim of the framework involves the links between the PM strategies, requirements and elements with the outcomes, demonstrating a cost and benefit relationship. Evidently, the PM strategies, requirements and elements can bring several benefits and help organisations to measure several performance areas related to RL, which can be essential for the effective management of consumer returns.

Based on Figure 6.19 and the discussions given in section 6.7, Table 6.26 provides a summary of the findings and managerial implications for PM practices to manage consumer returns.

Table 6.26 Summary of findings and managerial implications for PM practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	• PM in RL involves several strategies, including strategic approaches to PM, understanding of RL performance, strategic considerations for PM, a cost-benefit analysis, establish teams for PM, the strategic use of existing and standard PM frameworks/models and measures, benchmarking RL, the development of a strategic PM framework for RL, including the strategic identification, development and establishment of performance perspectives, objectives, and appropriate KPIs and metrics, establish standardise PM, strategic linking in PM, PM implementation, performance monitoring and reviews, the creation of feedback mechanisms and usage of performance data, develop a reward system, and performance results evaluation and analysis • The PM strategies associate with most of the PM outcomes, including economic, operational, organisational, environmental, market-related and SC outcomes. • From the PM strategies, developing of a strategic PM framework for RL, identifying appropriate KPIs and metrics, creating feedback mechanisms, and evaluating and analysing performance results associate with the most PM outcomes • The least significant PM strategies, with limited impact on the outcomes, include cost-benefit analysis, establish teams for PM, standardised PM, PM implementation, and conducting performance reviews • PM practices in RL involves a few requirements, including economic, IT and organisational requirements • From the PM requirements, the organisational requirements, especially management involvement, associate with the most PM outcomes, including economic, operational, organisational and environmental outcomes • The least significant requirements, with no impact on PM outcomes, include the economic requirement of measuring financial impact of RL and the organisational requirement of commitment to RL	• Organisations must develop a PM strategy that involves a holistic approach, an understanding of RL, strategic considerations, cost-benefit analysis, establishment of teams, standard PM frameworks and metrics, RL benchmarking, strategic development of PM framework consisting of perspectives, objectives and metrics, establishment of standardised PM, strategic linking of PM elements, performance monitoring, creating feedback mechanism, development of a reward system and evaluation and analyses of performance data and results • Organisations that seek various economic, operational, organisational, environmental, market-related and SC benefits in RL must implement PM strategies • Organisations must especially focus on developing a PM framework for RL that involves identifying and developing appropriate KPIs and metrics for RL, creating feedback mechanisms and analysing and evaluating performance results and data for effective PM in RL • For effective PM in RL organisations must focus on organisational requirements and management involvement
PM elements	• PM elements in RL consist of economic, operational and product return, organisational and resources, environmental, social, market-related, and SC elements that constitute of the PM framework for RL • All PM elements lead to PM outcomes • The most significant PM element (associating with the most outcomes) involves operational elements, followed by organisational, environmental, social and market-related elements • The least significant PM elements involve SC elements, leading to the least number of outcomes • From the economic elements, RL costs, capital, investment and value recovery measures contribute to most of the outcomes • From the operational elements, operational efficiency, RL cycle time and network and facility measures contribute to most of the outcomes • From the organisational elements, IT, information flow and product lifecycle measures contribute to most of the outcomes • From the environmental elements, energy impact and consumption, and waste measures contribute to most of the outcomes • From the social elements, corporate image measures contribute to	• To develop a PM framework for RL, organisations must incorporate economic, operational and product return, organisational and resources, environmental, social, market-related, and SC elements • Organisations must focus mostly on operational PM elements for effective and beneficial PM in RL • For effective economic PM in RL, organisations must focus on RL cost, capital, investment and value recovery measures • For effective operational PM in RL, organisations must focus on operational efficiency, RL cycle time, network and facility measures • For effective organisational and resource-related PM in RL, organisations must focus on IT, information flow and product lifecycle measures • For effective environmental PM in RL, organisations must focus on energy impact and consumption and waste measures • For effective social PM in RL, organisations must focus on corporate image measures • For effective market-related PM in RL, organisations must focus on customer satisfaction measures • For effective SC PM in RL, organisations must focus on supplier performance measures

	most of the outcomes • From the market-related elements, customer satisfaction measures contribute to most of the outcomes • From the SC elements, supplier performance measure contributes to most of the outcomes	
Outcomes	• PM practices in RL involve economic, operational, organisational, environmental, social, market-related and SC outcomes • The most significant outcomes of PM practices in RL involves organisational outcomes, followed by operational and economic outcomes • The least significant outcomes of PM practices in RL involves environmental outcomes • The most significant economic outcomes of PM practices in RL include measuring, controlling and managing cost, increase economic performance and cost savings/reductions • The most significant operational outcomes of PM practices in RL include measuring and monitoring operational performance and RL process efficiency and effectiveness • The most significant organisational outcomes of PM practices in RL include RL implementation and innovation, measure and determine RLM performance and capabilities and improve RL performance and efficiency • The most significant environmental outcome of PM practices in RL includes determine environmental performance • The most significant social outcome of PM practices in RL includes corporate image • The most significant market-related outcome of PM practices in RL includes consumer satisfaction • The most significant SC outcome of PM practices in RL includes facilitating SCI	• Organisations that seek economic, operational, organisational, environmental, social, market-related and SC benefits in RL can implement PM practices in RL • Organisations that seek to measure, manage and control costs must consider PM practices in RL • Organisations that seek to increase economic performance and realise cost savings in RL can consider PM practices in RL • Organisations that seek to measure and monitor operational performance must consider PM practices in RL • Organisations that experience inefficiencies in the RL process, must consider PM practices in RL • Organisations that seek to measure and determine RLM performance and increase RL performance must consider PM practices in RL • Organisations that experience difficulties in RL implementation and innovation must consider PM practices in RL • Organisations that seek to determine environmental performance must consider PM practices in RL • Organisations that seek to improve corporate image must consider PM practices in RL • Organisations that seek to increase consumer satisfaction must consider PM practices in RL • Organisations that experience challenges in SCI can consider PM practices in RL • For the effective management of consumer returns, organisations must identify/implement/consider PM strategies, requirements, elements and outcomes to develop the most appropriate PM framework for RL.

Source: Compiled by the researcher

Table 6.26 provides an in-depth understanding into the value of PM practices as part of the RL practices for consumer returns. Organisations can identify specific PM strategies, requirements, elements and outcomes to develop an appropriate PM framework for RL. Consequently, the suggested framework can help organisations to address the organisational barrier of a lack of PM in RL, which can contribute to the effective management of consumer returns. PM as a RL practice will further be explored in the interviews with industry experts (chapter 8).

In the next section, facility and location practices to manage consumer returns will be presented, discussed and analysed.

6.8 FACILITY AND LOCATION PRACTICES TO MANAGE CONSUMER RETURNS

Facility and location (hereafter facility/location) practices in RL represented one code category from the coding framework (see Appendix A) of the QCA. In reviewing the findings several categories of facility and location strategies were inductively identified from the QCA of RL literature, which included general facility/location, separate facility/location, integrated facility/location, centralisation, decentralisation and centralised return centre (CRC) practices. Based on the findings and the inductive classification of these categories, the subsequent paragraphs will briefly describe general, separate, integrated, centralised, decentralised facility/location and centralised return centre (CRC) practices.

General facility/location practices can be described as the general strategies and decision-making factors that enable organisations to design an optimum network for RL. Therefore, general facility/location practices can serve as a basis for the implementation of specific facility/locations (separate, integrated, (de)centralised and CRC) practices. *Separate facilities/locations* involve general separation of RL and FL in the form of facilities, locations, networks, infrastructure and operations. In contrast, *integrated facilities/locations* involve the integration of RL and FL in the form of facilities, locations, networks, infrastructure, resources and operations.

Centralisation involves a network of single or few facilities and locations that serve a wide region of markets. Therefore, centralisation means that a few facilities/locations further away from the markets perform various RL processes. In contrast, *decentralisation* involves a flat network of various facilities and locations for RL that serve specific regions/markets. Therefore, decentralisation means that various facilities closely located to markets perform the same RL processes.

CRCs involve specialised facilities that perform RL processes, mostly combining separate and centralisation facility/location strategies. Nevertheless, CRCs can form part of integrated and decentralisation strategies. For example, Hsu *et al.* (2009:516) explained that some DCs allocate space for CRCs to handle consumer returns. In the case study example of Hsu *et al.* (2009:520) a single retailer (in the USA) owns sixteen DCs across several regions serving various retail stores and thirteen of these DCs contain CRCs, handling consumer returns for various retail stores. Since fewer CRCs are assigned to DCs, CRCs serve more retail stores, hence, the term centralised return centres. Regardless of the combination of facility/location strategies associated with CRCs, several findings related to facility/location practices focus on the utilisation of CRCs for RL, and was, therefore, included as a category in facility/location practices.

In the subsequent sections, general facility/location practices, separate facilities/locations, integrated facilities/locations, centralisation, decentralisation and CRC practices will be analysed and discussed. The section will be concluded with a conceptual framework and summary of the findings for facility/location practices to manage consumer returns.

6.8.1 General facility/location practices to manage consumer returns

General facility/location practices involve general facility/location strategies, facility/location decision factors, requirements, and related outcomes, which can be important for the effective management of consumer returns. Table 6.27 provides an overview of the findings related to the *general facility/location practices to manage consumer returns*, including the categories, subcategories,

supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Source: Compiled by the researcher

Table 6.27 indicates the general facility/location practices in RL, including strategies, facility/location decision factors, requirements and outcomes, which will be discussed in subsequent sections and concluded with a description and conceptual framework of general facility/location practices to manage consumer returns.

6.8.1.1 General facility/location strategies

General facility/location strategies involve (1) RL network design, (2) strategic decisions, relating to facilities, locations, transportation and flows and parties, (3) cost-benefit or trade-off analysis, (4) benefit-driven facility/location strategies, and (5) strategic establishment of an appropriate infrastructure.

RL network design involves strategies and decisions that enable organisations to establish the correct infrastructure and strategically select the most appropriate facilities/locations for RL. However, due to the uncertainties of RL (such as timing, quality and quantity of product returns) organisations need to strategically design a flexible network and appropriately organise resources, which can be important for managing consumer product returns.

As a part of RL network design, organisations must make several strategic decisions related to facilities, locations, transportation and product flows. The *strategic decisions related to facilities* involve (1) determining the number of facilities, (2) the capacity or size of facilities, (3) the type of facilities (e.g. warehouse, repair facility, collection facility or CRC), (4) deciding between separate or integrated facilities (discussed in sections 6.8.2, 6.8.3 and 6.8.6), and (5) using own facilities or third-party facilities. *Strategic decisions related to locations* involve determining the most suitable location

for facilities (such as collection points and CRCs) to perform RL processes and the choice between centralisation and decentralisation (discussed in sections 6.8.4, 6.8.5 and 6.8.6).

The *strategic decisions related to transportation* and *product flows* involve arranging transportation flows or determining transportation links between facilities/locations, estimating the quantities of products that must be shipped between facilities/locations, and determining the allocation of RL flows. Lastly, the *strategic decisions related to RL parties* involve deciding on the responsibilities of parties in the RL network. For example, the organisation can decide that the entire RL process will be handled in-house, except for using a delivery partner to transport product returns from consumers to and between facilities. Like other RL practices (e.g. IT, integration, RL in/outsourcing and disposition), general facility/location strategies involve a *cost-benefit* or *trade-off analysis.* This trade-off analysis can relate to the strategic decisions of general facility/location strategies by comparing the costs and benefits of centralisation and decentralisation. Furthermore, organisations can perform a cost-benefit analysis for the costs of establishing new facilities against the benefits of better customer service due to faster return lead times.

Similarly, organisations can perform a cost-benefit or trade-off analysis for the distance between consumer locations and facilities, for example, the longer the distance from consumer locations the fewer facilities need to be established, resulting in transport cost (economies of distance) and facility set-up costs savings. However, establishing a single facility in a centralised location can result in longer return lead time that may impact consumer satisfaction, demonstrating the strategic importance of performing effective cost-benefit analyses in facility/location practices to manage consumer returns. Consequently, organisations must focus on *benefit-driven facility/location strategies,* for instance, organisations must focus on developing a RL network that minimise RL costs, maximise facility capacity, maximise consumer convenience and service, and maximise recovery.

Finally, general facility/location strategies involve *strategic selection* and *establishment* of an *appropriate infrastructure,* which relates to RL network design and strategic decisions. For example, organisations can select the current infrastructure (used for FL) in the network design for combined facility decisions or establish a new infrastructure in the network design for separate facility decisions. Regardless, of the strategic decisions, organisations must select/establish an appropriate infrastructure for the effective management of consumer returns.

6.8.1.2 Facility/location decision factors

The facility/location decision factors, including economic, operational, organisational, market and SC factors, influence the strategic decisions related to facilities, locations, transportation and product flows, and parties (see section 6.8.1.1).

The *economic factors* that influence general facility/location decisions involves investment and costs. Particularly, organisations must consider *investment* of infrastructure and transport systems before making decisions about specific facility/location practices (e.g. integrated and centralisation practices). For example, an organisation that lacks the resources to invest in a new facility for RL may find using an integrated facility for both FL and RL processes more feasible. In terms of *costs*, facility (e.g. warehouse) costs can influence the decision to expand an existing facility instead of opening a new facility, favouring an integrated facility decision. Moreover, the transportation costs (e.g. fuel prices) can influence location, facility and capacity decisions. For example, organisations with high transportation costs may select a centralised location to achieve economies of distance. Alternatively, organisations can curb transportation costs by deciding to expand facilities instead of opening new facilities, emphasising the strategic importance of performing cost-benefit analyses for effective general facility/location practices (see section 6.8.1.1).

The *operational factors* can be the most significant factors for effective facility/location decisions, involving IT, infrastructure, RL/FL integration, product returns and product type/offering factors. Since *IT* can be critical to manage consumer returns (see section 6.3), the IT systems of the organisation must be considered in facility/location network design decisions. For example an organisation that uses an integrated IT solution (e.g. ERP) for both RL and FL, may be more inclined to choose integrated facilities for RL and FL (see section 6.8.3), while an organisation that invested in RLIT (section 6.3.3) may be more inclined to choose separate facilities. The *infrastructure* factors relate to *RL/FL integration*, which associate with integrated or separate facility strategic decisions (sections 6.8.2 and 6.8.3). For instance, for an organisation that can integrate RL with the existing FL infrastructure may be more inclined to choose integrated facilities, while organisations that lacks the capability to integrate RL/FL may choose separate facilities. Consequently, organisations must consider the integration and coordination of RL and FL flows for effective facility/location decisions.

For *product return* factors, organisations must consider quantity, quality, timing and type of return for optimal facility/location decision-making. For instance, high product return volume and frequency may be more suitable for separate facilities/locations and CRCs, while lower product return volume and frequency may be more suitable for integrated facility/location practices. Furthermore, organisations

that mostly receive new/unused product returns may benefit from using an integrated facility and decentralised locations since most products can be returned to inventory and quickly redistributed to the markets/consumers (see sections 6.8.4 and 6.8.5). Alternatively, organisations that mostly receive defective/used product returns may benefit from using a separate facility or CRCs since most products require product recovery (e.g. repair and refurbishment). Consequently, organisations may need to develop some forecasting methods and consider historical return rates, consumer return behaviour, return policies and disposition strategies for effective facility/location decisions.

Product offering/type factors may associate with product characteristics, like shelf life, product value, or product size. For example, perishable products or products with shorter lifecycles need faster return lead times, which means that decentralised locations may be more appropriate (see section 6.8.5). Additionally, high value products may require more security, which means that a separate facility strategy might be more feasible. In terms of product size, larger products require more storage, which means that organisations might need to expand or build a new facility to accommodate returns.

The *organisational factors* for effective facility/location decisions relate to organisational capabilities, competencies and RL in/outsourcing strategies. For example, organisations that lack capabilities and inhouse competency in product recovery, may choose third-party facilities for RL. Furthermore, organisations that follow partial or full RL outsourcing strategies must consider potential and current outsourcing partners, which can be important for effective strategic decisions related to facilities and parties (section 6.8.1.1). The importance of RL in/outsourcing strategies in facility/location decisions reemphasise the importance of the holistic implementation of RL practices to manage consumer returns.

Finally, the *market-related* and *SC factors* for effective facility/location decisions involve competition, future demand, product ownership and SC structure. Specifically, organisations must consider the RL network strategies of *competitors*, for instance, if competitors utilise CRCs, the organisation may choose to follow the same facility/location strategy. Alternatively, the lack of a decentralised approach by competitors may motivate organisations to follow a decentralised strategy for a potential competitive advantage. *Future demand* of products can influence facility capacity decisions since an increase in demand can result in an increase in product returns, which emphasise the importance of designing a flexible RL network (see section 6.8.1.1).

Similarly, *product ownership* can influence decisions related to locations and capacity of facilities. For example, an online retailer that sell own products and third-party seller products may keep own consumer product returns at the warehouse and send third-party consumer product returns to the third-

party sellers, influencing the size or capacity requirements of the facility. *SC structure* can involve considering the number and type of parties in the SC, which can link with the strategic decisions related to parties in facility/location strategies (section 6.8.1.1). Additionally, the network design of the SC can be an important consideration in facility/location decisions. For example, if the SC mostly consist of centralised facilities, an online retailer may decide to establish decentralised facilities for speedier return cycle times (see section 6.8.5)

Essentially, by considering economic, operational, organisational, market-related and SC facility/location decision factors, organisations can make effective strategic facility/location decisions and design an optimum RL network to manage consumer returns.

6.8.1.3 Requirements of general facility/location practices

The requirements of general facility/location practices, including economic, IT and organisational requirements, can be important for supporting the general facility/location strategies, which will be emphasised in the subsequent paragraphs.

The *economic requirements* of general facility/location practices involve investment and set-up costs, which relate to the general facility/location strategies. For instance, establishing an appropriate infrastructure (strategy) means that organisations must invest in the appropriate transportation system and facilities/locations in the network design. Moreover, opening new facilities for RL require set-up *costs* (e.g. capital, equipment and land), adding to the investment requirements. Consequently, financial management (FM) practices in RL can help organisations to identify the costs associated with various facility/location practices, which can be important for performing cost-benefit or trade-off analyses in facility/location strategies (see section 6.8.1.1).

The *IT requirements* of general facility/location practices involve *utilising IT* to support facility/location strategies in RL. For instance, the APS software (part of TLIT practices) and barcode IT can support RL network design and RFID can facilitate strategic decisions related to locations. Consequently, IT practices can be critical for effective facility/location strategies, demonstrating an important link between IT and facility/location practices.

The *organisational requirements* associate with PM and resource commitment (RC) practices in RL, which can be important for strategic decisions and RL network design in facility/location strategies. Particularly, through *PM practices* organisations can assess RL performance and use the throughput information to select appropriate facilities/locations in the RL network. For example, if organisations perform poorly in operational efficiency (slow return lead-times), a decentralised RL network can be

designed, or if organisations perform poorly in productivity (using staff for both RL/FL), a centralised RL network can be designed. Similarly, *RC* in RL can facilitate RL network design by allowing organisations to organise resources effectively and implement an appropriate infrastructure to support RL processes (see section 6.8.1.1), reemphasising the importance of RC practices to manage consumer returns.

Essentially, general facility/location strategies must be supported by other RL practices, including IT (section 6.3), PM (section 6.7), RC (section 6.9.1) and FM (section 6.9.2) practices, for the effective management of consumer returns. In the next section, the outcomes of general facility/location practices will be explored.

6.8.1.4 Outcomes of general facility/location practices

The outcomes of general facility/location practices include (1) facility/location, (2) economic, (3) operational, (4) organisational, (5) market-related and (6) SC outcomes, which can be described as the benefits related to general facility/location strategies, decision factors and requirements necessary for effective RL network design.

Unique to facility/location practices, the *facility/location outcomes* include the ability to expand facilities, optimal capacity utilisation, optimal network design and network control. Particularly, organisations can *expand facilities* through the general facility/location strategies of RL network design (e.g. designing a flexible network) and the establishment of an appropriate infrastructure for RL. Additionally, benefit-driven facility/location strategies can ensure *optimal capacity utilisation* of facilities, which may reduce the need to establish new facilities.

Several general facility/location practices can facilitate with *optimal network design* in RL, including (1) strategic establishment of an appropriate infrastructure for RL (general facility/location strategy), (2) identifying the cost of various facility/location practices (economic requirement), (3) utilise barcode IT for network design (IT requirement), (4) PM in RL, and (5) RC in RL (organisational requirements). Moreover, organisations can *control* the RL *network* by considering IT (operational facility/location decision factor) in network design decisions.

The *economic outcomes* of general facility/location practices include RL cost savings, cost effectiveness and maximum value recovery. Particularly, organisations can realise *RL cost savings* through the (1) general facility/location strategies of strategic decisions related to facilities and locations, performing cost-benefit or trade-off analyses and implementing benefit-driven facility/location strategies, and (2) economic facility/location decision factors related to transport costs.

Moreover, *cost effectiveness* can be realised through the economic facility/location decision factor of costs (e.g. expanding transport system instead of opening new facilities) and the organisational requirement of RC, emphasising the importance of cost-benefit analyses for effective facility/location strategies. Lastly, organisations can *maximise value recovery* through several general facility/location strategies, including (1) RL network design, (2) strategic decisions related to facilities, locations and transportation links, (3) benefit-driven facility/location strategies and (4) the establishment of appropriate infrastructure for the RL network.

The *operational outcome* of general facility/location practices involves *improvements in RL process efficiency*, which can be attained through the general facility/location strategy of RL network design. Evidently, organisations that optimally design networks for RL can optimise the flow of product returns, from the collection of returned products at consumer locations, transportation to facility locations, receiving the returned products at the facility, inspection, sorting and processing in the facility, disposition of the returned product (same or separate facility) to the redistribution of the recovered product back to the market (see chapters 4 and 5).

The *organisational outcomes* of general facility/location practices include (1) facilitating RL implementation, (2) enhancing RL performance, (3) effective RLM, and (4) facilitating decision-making. Particularly, the general facility/location strategies of RL network design and establishing an appropriate logistics infrastructure can *facilitate RL implementation.* Similarly, organisations can *enhance RL performance* through effective RL network design and RC for RL (organisational requirement). Moreover, the general facility/location strategy of effective network design in RL and the facility/location decision factor of organisational competency (e.g. considering the level of inhouse competency for effective network design) can result in *effective RLM*, demonstrating the importance of general facility/location practices in RL. Lastly, the IT requirement of utilising IT (such as APS software) for facility/location practices can *facilitate decision-making* in RL network design, contributing to several other outcomes associated with effective network design in RL.

The *market-related outcomes* of general facility/location practices involve consumer convenience and satisfaction. Particularly, organisations can *increase consumer convenience* through the implementation of benefit-driven facility/location strategies. For example, focussing on consumer convenience and establishing facilities close to consumers means that consumers can benefit from shorter return cycles or less transportation costs (for drop-off collection), which can improve consumer service. Similarly, organisations can *increase customer satisfaction* by performing a cost-benefit or trade-off analysis related to establishing new facilities (facility/location strategy) and incurring set-up costs for the establishment of new facilities (economic requirement), which can be important for a consumer-centric

RL process. Consequently, facility/location practices can indirectly play a role in the effective implementation of CI practices in RL (section 6.4.2).

Finally, the *SC outcome* of general facility/location practices involves *SCM*, which can be *facilitated* through the strategic decisions related to facilities and locations, demonstrating that general facility/location practices in RL can be important for RSCM.

Essentially, despite being limited to a few outcomes, general facility/location practices provide various facility/location, economic, operational, organisational, market-related and SC benefits, which can be important for the effective management of consumer returns. In the next section, the description and conceptual framework of general facility/location practices will be given.

6.8.1.5 Description and conceptual framework of general facility/location practices to manage consumer returns

Based on the findings presented in section 6.8.1, general facility/location practices in RL can be important for the management of consumer returns, and will be described as follows:

> General facility/location practices for the management of consumer returns involve (1) general facility/location strategies, including RL network design, strategic decisions related to facilities, locations, transportation and product flows, and RL parties, cost-benefit or trade-off analyses, benefit-driven facility/location strategies and selection or establishment of an appropriate infrastructure, (2) facility/location decision factors, including economic factors (cost and investment), operational factors (IT, infrastructure, RL/FL integration, product returns and product type/offering), organisational factors (capabilities, competencies and RL in/outsourcing strategies) and market-related and SC factors (competitors, future demand, product ownership and SC structure), and (3) general facility/location requirements, including economic requirements (investment and costs), IT requirements (utilise appropriate IT) and organisational requirements (PM and RC practices).
>
> The general facility/location strategies, decision factors and requirements can result in several outcomes, including (1) facility/location outcomes (ability to expand facilities, optimal capacity utilisation, optimal network design and network control), (2) economic outcomes (RL cost savings, cost effectiveness and maximum value recovery), (3) an operational outcome (improve RL process efficiency), (4) organisational outcomes (facilitate RL implementation, enhance RL performance, effective RLM and facilitate decision-making), (5) market-related outcomes (improve consumer convenience and satisfaction), and (6) a SC outcome (facilitate SCM).

Figure 6.20 provides a conceptual framework of general facility/location practices to manage consumer returns. Particularly, the framework illustrates the links between general facility/location strategies, decision factors, requirements and outcomes, which can be important for designing an optimum RL network for the effective management of consumer returns. The links between the general facility/location strategies and decision factors can be demonstrated by the economic facility/location decision factor of cost that links with the general facility/location strategies related to strategic decisions on facilities and locations in RL, performing cost-benefit analysis and focussing on benefit-driven strategies.

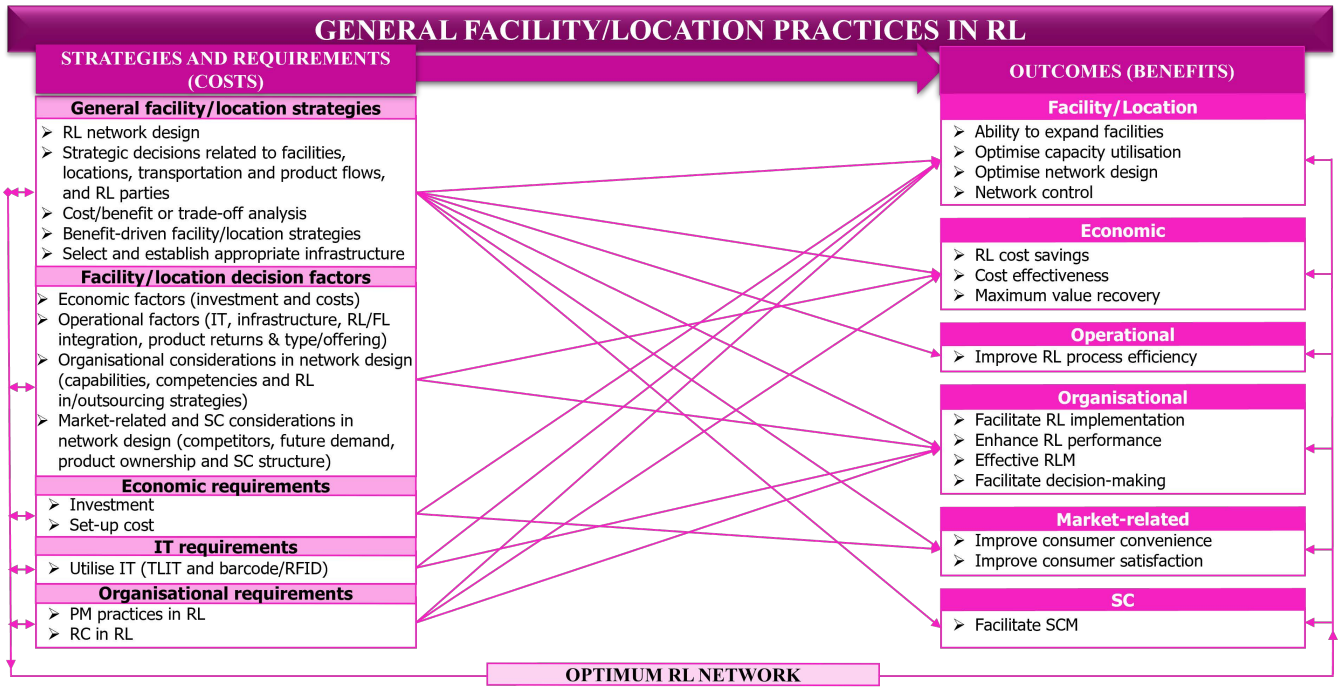

Figure 6.20 Conceptual framework of general facility/location practices to manage consumer returns
Source: Compiled by researcher

Moreover, the organisational facility/location decision factors of organisational capabilities can link with the economic requirements (costs and investment) and organisational requirement of RC, demonstrating a link between facility/location decision factors and requirements. The links between the general facility/location strategies and requirements can be demonstrated by the facility/location strategy of RL network design that links with the economic (cost and investment), IT (utilise IT) and organisational requirements (PM and RC practices). More importantly, the framework demonstrates that the general facility/location strategies, decision factors and requirements can result in an optimum RL network, contributing to the general facility/location outcomes.

Regarding the links between general facility/location strategies, requirements and outcomes, the framework demonstrates that general facility/location strategies can be the most significant practice category, linking with all the outcomes, including facility/location, economic, operational, organisational, market-related and SC outcomes. Nevertheless, the general facility/location decision factors and requirements can support effective implementation of general facility/location strategies, and indirectly link with various outcomes. Additionally, from the general facility/location requirements, the organisational requirements contribute to the most outcome categories, including facility/location, economic and organisational outcomes.

In terms of the outcomes of general facility/location practices, facility/location and organisational outcomes can be the most significant outcome categories (associated with most of the practice

categories), which means that general facility/location practices can be the most beneficial for organisations that seek facility/location and organisational benefits through RL practices. In contrast, the operational and SC outcomes can be the least significant categories (only associated with general facility/location practices strategies), meaning that general facility/location practices may be less important for organisations that seek operational and SC benefits in RL. Nonetheless, all the outcomes of general facility/location practices provide important benefits in key areas of RL in this study, including RL costs, RL processes, RLM, consumer convenience and satisfaction and RSCM.

Essentially, the links between the general facility/location strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of general facility/location practices for the effective management of consumer returns.

In the next section, separate facility/location practices in RL will be analysed and discussed.

6.8.2 Separate facility/location practices to manage consumer returns

Based on the strategic decisions in general facility/location practices, organisations that choose separate facilities/locations to manage consumer returns must implement strategies and requirements related to separating RL and FL operations in single or separate facilities at single or separate locations to manage consumer returns. Table 6.28 provides an overview of the findings related to the *separate facility/location practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Economic requirements	***Investment***	None	• *"[…] invest in the construction of reverse logistics facilities […]."* (Vlachos, 2016:16)
	Costs	None	• *"Separate reverse logistics facilities from forward facilities […] may also be cost-intensive to implement, and for this reason organisations should carefully consider the cost-benefit trade-off."* (Badenhorst, 2016:10) • *"[…] fixed costs associated with new facilities."* (Min & Ko, 2008:179)
Operational requirements	***High return volume***	None	• *"When return volumes are high, […] a dedicated facility makes more sense."* (Stock & Mulki, 2009:41)
	Extensive RL operations	Nine	• *"[…] significant processing of the returns is necessary, […] a dedicated facility makes more sense."* (Stock & Mulki, 2009:41)
Organisational requirement	***Partial RL outsourcing strategy***	None	• *"WCC has an airport-like security system run by a specialized [sic] separate firm. Employees have only one point to enter/exit the returns area […]."* (Genchev, 2009:142)
Economic outcomes	***Economies of scale***	None	• *"The benefits of processing at a secondary facility include economies of scale […] The drawbacks include the need to establish new, separate facilities."* (Barker & Zabinsky, 2008:255)
	Cost savings	None	• *"Some warehouses, however, may dedicate their space for repair or refurbishment in an effort to save fixed costs associated with new facilities."* (Min & Ko, 2008:179)
Operational outcomes	***Improve product return control and security***	None	• *"A major reason behind separating returns from outbound distribution related to security issues."* (Genchev, 2009:141) • *"[…] airport-like security system run by a specialized [sic] separate firm. Employees have only one point to enter/exit the returns area […] The number of unaccounted returns is drastically minimized [sic]."* (Genchev, 2009:142)
	Facilitate and improve RL processes	Piplani and Saraswat (2012:1424)	• *"[…] setting up additional appropriate logistics infrastructure for the arising flows of used and recovered products. Physical location, facilities and transportation links need to be chosen […] for the purpose of recovery […]."* (Lee & Dong, 2009:61) • *"[…] to build a separate infrastructure in order to facilitate the operation of the reverse logistics process."* (Bernon & Cullen, 2007:43) • *"[…] since all returns processes are done in one location, they can more quickly identify problems in the returns process and make improvements."* (De Leeuw *et al.* 2016:723) • *"Some warehouses, however, may dedicate their space for repair or refurbishment […]."* (Min & Ko, 2008:179) • *"[…] returned products were often mixed with new products waiting to be shipped. In addition, the shipping gate was frequently blocked by returns and much time was wasted sorting through the mix. […] Assigning a separate mailing address to the returns dock avoids these situations.* (Genchev, 2009:140) • *"Reverse logistics activities must be allowed to function separately as a separate entity. If the reverse and forward distribution activities are combined, it may lead to several confusions and problems."* (Subhashini, 2016:11)

Source: Compiled by the researcher

Table 6.28 indicates separate facility/location practices in RL, including strategies, requirements and outcomes, which will be discussed in subsequent sections. The section will be concluded with a description and conceptual framework for separate facility/location practices to manage consumer returns.

6.8.2.1 Separate facility/location strategies in RL

The separate facility/location strategies in RL include (1) an open-loop RL network design, (2) strategic decisions related to separate facility/location practices, (3) cost-benefit analysis, (4) strategic establishment of a separate network and infrastructure, (5) strategic establishment, implementation and utilisation of separate facilities, (6) strategic utilisation of separate facilities at a single location, (7) strategic separation of a single facility, and (8) strategic separation of RL and FL.

Separate facility/location strategies involve an *open-loop RL network design*, which means that RL flows are separated from FL flows. For example, an organisation that mostly sell product returns to third parties, may design an open-loop network for RL since the returned products enter a separate SC. *Strategic decisions* in *separate facility/location practices* associate with general facility/location strategic decisions, which can include decisions related to facilities, locations and transportation links (section 6.8.1). For example, the organisation must determine the number of separate facilities/locations, choose the type of separate facilities (e.g. return centre, repair facility or DC) and decide between centralisation and decentralisation strategies.

Like other RL practices, organisations must perform *cost-benefit analyses* for separate facility/location practices. Particularly, organisations must consider the cost implications of establishing a separate network, infrastructure and facilities for RL and identify the potential benefits of implementing separate/facility location practices (see section 6.8.2.3). Consequently, if the costs of establishing separate infrastructure/facilities for RL out-weigh the benefits organisations may need to consider other alternatives (such as separating RL and FL in an established facility).

Accordingly, separate facility/location strategies can involve the *strategic establishment* of a *separate network* and *infrastructure* to manage consumer returns, emphasising an open-loop RL network design. Similarly, organisations may *strategically establish, implement* and *use separate facilities* for RL, which emphasises the importance of performing a cost-benefit analysis for separate facilities. Additionally, separate facility/location strategies in RL can entail the *strategic utilisation* of *separate facilities* at a *single location.* For example, a traditional warehouse and a repair facility at the same location in different buildings, running as separate entities.

Alternatively, separate facility/location strategies can involve the *strategic separation* of a *single facility,* which can be a warehouse or DC with separate areas for RL processes. Strategic separation of a single facility (performing both FL and RL operations) involves allocating a dedicated space for RL and creating a separate entry/exit for RL, a separate security for RL and a physical address for product

returns. For example, product returns arrive at a separate receiving dock and RL employees enter and exit the warehouse in separate area and work in separated areas in the warehouse (e.g. separate offices, storage area, and kitchen).

Regardless of the form of facility or location separation, a separate facility/location strategy signifies the *strategic separation* of *RL* and *FL*, which means that RL processes/operations function independently from FL operations. The strategic separation of RL and FL in separate facility/location strategies can involve a separate RL department, utilisation of RLIT (e.g. return software), dedicated RL staff, dedicated resources and separate operations.

6.8.2.2 Requirements of separate facility/location practices in RL

Separate facility/location practices involve few requirements, including economic, operational, and organisational requirements. The *economic requirements* of separate facility/location practices involve investment and costs, which relate to the separate facility/location strategies of establishing separate infrastructure and facilitates for RL. Additionally, the investment and cost requirements may associate with the strategic separation of a single facility for RL (e.g. dedicated security, staff and equipment), reemphasising the importance of performing a cost-benefit analysis for separate facility/location practices.

The *operational requirements* of separate facility/location practices involve high return volume and extensive RL operations. Particularly, a *high return volume* can be important for justifying the costs of establishing a separate infrastructure/new facility for RL, which emphasises the importance of the general facility/location operational decision factor of return volume for effective facility/location decisions (see section 6.8.1.2). Similarly, separate facility/location practices must involve *extensive RL operations* to justify the establishment and use of separate facilities.

Finally, the *organisational requirement* of separate facility/location practices involves a *partial RL outsourcing strategy* appropriate for strategically separating RL and FL in a standard facility. Since returned products can arrive in less secure packaging from consumers, outsourcing to a specialised security organisation can be important in preventing the potential theft of returned products.

In the next section, the outcomes of separate facility/location practices will be discussed.

6.8.2.3 Outcomes of separate facility/location practices in RL

The outcomes of separate facility/location practices are limited to economic and operational outcomes, which point to the importance of performing a cost-benefit analysis as part of the separate facility/location strategies (see section 6.8.2.1).

Nevertheless, the *economic outcomes* of separate facility/location practices include economies of scale and cost savings/reduction. Particularly, strategically establishing a new and separate facility for RL can help organisations achieve *economies of scale*, emphasising the high return volume (operational) requirement of separate facility/location practices (section 6.8.2.2). Alternatively, organisations can realise *cost savings* (such as fixed costs) through the strategic separation of a single facility (such as a warehouse) to perform RL processes.

The *operational outcomes* of separate facility/location practices involve improving product return control and security and facilitating and improving RL processes. Particularly, separate facility/location practices related to separating RL and FL in a single facility (strategy) and a partial RL outsourcing to a security organisation (organisational requirement) can *improve product return control* and *security*. Additionally, organisations can *facilitate* and *improve RL processes* through the several separate facility/location strategies, including (1) strategic decisions related to the number of separate facilities and locations, (2) strategic establishment of a separate network and infrastructure for RL, (3) strategic establishment and utilisation of a separate facility for RL, (4) strategic utilisation of separate facilities at a single location for RL, (5) strategic separation of a single facility, and (6) strategic separation of RL and FL processes.

Particularly, establishing a separate infrastructure can facilitate RL disposition processes and strategically separating a single facility (e.g. separate mailing address and dedicated space) can facilitate and improve receiving, sorting and disposition processes. For example, a separate return dock can prevent the mixing of returned products and new products streamlining the receiving and sorting processes. Consequently, separating RL and FL processes can help organisations identify inefficiencies in RL processes and reduce overall operational problems.

Despite the limited outcomes, separate facility/location practices may involve other benefits related to the utilisation of CRCs for RL since CRCs form part of separate facility/location practices (see section 6.8). Consequently, organisations that require a separate facility/location strategy (e.g. high return volume) must explore the utilisation of CRCs for additional facility/location, economic, operational,

organisational and market-related benefits (see section 6.8.6.2). In the next section, separate facility/location practices will be concluded with a description and conceptual framework.

6.8.2.4 Description and conceptual framework of separate facility/location practices to manage consumer returns

Based on the findings presented in section 6.8.2, separate facility/location practices in RL can be important for the management of consumer returns, and will be described as follows:

> Separate facility/location practices for the management of consumer returns involve (1) separate facility/location strategies, including open loop RL network design, strategic decisions related to separate facilities and locations, cost-benefit analyses, strategic establishment of a separate network and infrastructure, strategic establishment, implementation and use of a separate facility, strategic use of separate facilities at a single location, strategic separation of a single facility, and strategic separation of RL and FL, and (2) separate facility/location requirements, including economic requirements (investment and costs), operational requirements (high return volume and extensive RL operations) and an organisational requirement (partial RL outsourcing strategy). The separate facility/location strategies and requirements can result in a few outcomes, including (1) economic outcomes (economies of scale and cost savings) and (2) operational outcomes (product return control and security and facilitate and improve RL processes).

Figure 6.21 provides a conceptual framework of separate facility/location practices to manage consumer returns.

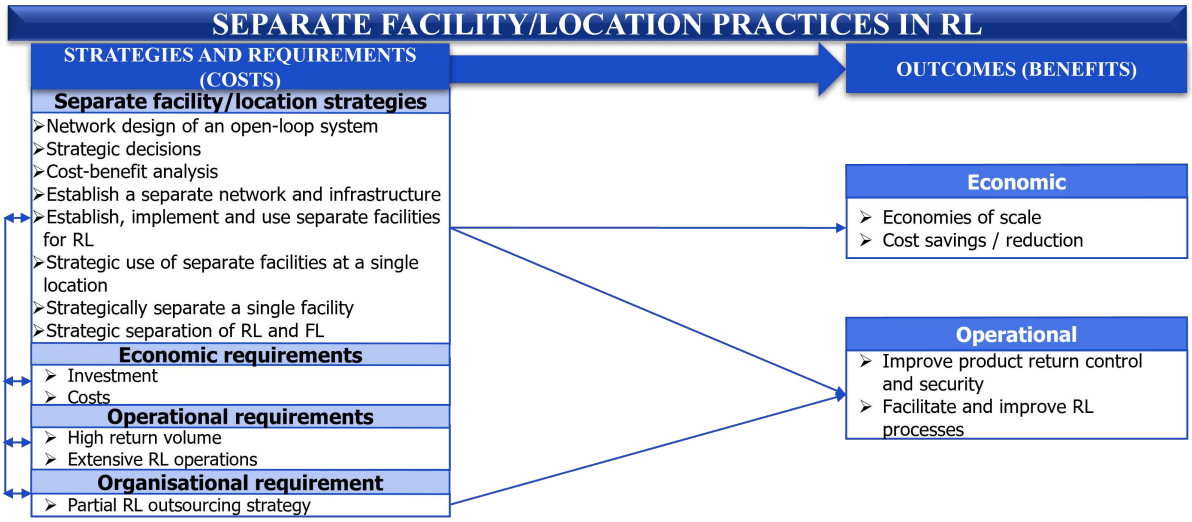

Figure 6.21 Conceptual framework of separate facility/location practices to manage consumer returns
Source: Compiled by researcher

Figure 6.21 illustrates the links between the strategies, requirements and outcomes of separate facility/location practices, demonstrating a cost and benefit relationship. For example, the links between separate facility/location strategies and requirements can be demonstrated by the separate facility/location strategy of establishing, implementing and using a separate facility for RL, which links with the economic requirements of investments and costs and the operational requirement of high return volume. Additionally, the separate facility/location strategy of separating a single facility for RL

and FL process separation can link with the organisational requirement of a partial RL outsourcing strategy.

Regarding the links between separate facility/location strategies, requirements and outcomes, the framework demonstrates that separate facility/location strategies, can be the most significant practices, linking with both economic and operational outcomes. In terms of the separate facility/location requirements, only the organisational requirement of partial outsourcing contribute to the operational outcome category. Nevertheless, like emphasised above, the economic and operational requirements can be important for the implementation of separate facility/location strategies and, therefore, indirectly contribute to the outcomes of separate facility/location practices.

From the outcomes of separate facility/location practices, the operational outcome category can be the most significant (associated with separate facility/location strategies and the organisational requirement), demonstrating that organisations that experience operational barriers and inefficiencies in RL processes can benefit from implementing separate facility/location practices.

Essentially, the links between the separate facility/location strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of separate facility/location for the effective management of consumer returns.

In the next section, integrated facility/location practices will be analysed and discussed.

6.8.3 Integrated facility/location practices to manage consumer returns

Integrated facility/location practices can be viewed as the opposite of separate facility/location practices, focussing on RL and FL (RL/FL) integration and strategic combination of facilities, infrastructure and resources. Additionally, the findings of integrated facility/location practices are more extensive than separate facility/location practices, implying that integrated facilities/locations may be preferred in practice to manage consumer returns. Nonetheless, like separate facility/location practices in RL, integrated facility/location practices must be chosen based on the general facility/location strategic decisions and factors (section 6.8.1), and involve strategies, requirements and related outcomes for the effective management of consumer returns.

Table 6.29 provides an overview of the findings related to the *integrated facility/location practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

This separation does not necessarily imply that the warehouse is totally divided into two separate entities."* (Dowlatshahi, 2012:1271)
	Strategic establishment of hybrid facilities	None	• *"[…] building such hybrid processing facilities might include cost savings and pollution reduction as a result of sharing material handling equipment and infrastructure."* (Lee & Dong, 2009:62)
Economic requirement	***Costs***	None	• *"[…] the facility operating costs may only have slightly change in different scenarios due to the relatively small variations in fixed facility costs and variable unit processing costs […] through the optimal combination of facilities […]."* (Yu & Solvang, 2016:12) • *"Installing inspection equipment in few warehouses will costs less than installing it in each collection points."* (Luitel *et al.* 2014:94)
IT requirement	***Utilise TLIT***	None	• *"Integration of forward and reverse logistics […] through the use of integrated logistics information management system to reduce waste and to improve profitability."* (Lau & Wang, 2009:459) • *"[…] enterprise systems also enable information sharing of forward logistics and reverse logistics […]."* (Shi *et al.* 2012:228)
Operational requirement	***Equipment***	None	• *"Installing inspection equipment in few warehouses will costs less than installing it in each collection points."* (Luitel *et al.* 2014:94)
	Compatible operations	None	• *"[…] separation does not necessarily imply that the warehouse is totally divided into two separate entities. In fact, the compatibility of warehousing operations is more important than the physical separation."* (Dowlatshahi, 2012:1271)
	Low return volume	None	• *"When return rates and/or volumes are low, a combined facility is usually optimal."* (Stock & Mulki, 2009:41) • *"[…] return volumes are low, they can typically be handled in a portion of the warehouse or DC where forward logistics takes place."* (Stock & Mulki, 2009:41)
Organisational requirements	***RL implementation***	None	• *"[…] reverse logistics recovering the economic value from the used products should be efficiently implemented and well coordinated with the forward logistics."* (Kim *et al.* 2013:510)
	RL insourcing strategy	None	• *"To run a selfsupport system, the demand for management skills is high as the company will be responsible […] for integrating both forward and reverse logistics […]."* (Lau & Wang, 2009:461)
	RL formalisation practices	None	• *"RL process managers formalize [sic] their processes; […] aligning 'new' reverse process with established pipelines and transportation channels […]."* (Hall *et al.* 2013:777)
	Management involvement	Jayaraman *et al.* (2008:419)	• *"Managers need to consider integration of collection, inspection and consolidation of used products with forward logistics in reverse logistics programs."* (Ravi & Shankar, 2015:889) • *"RL process managers […] aligning 'new' reverse process with established pipelines and transportation channels […]."* (Hall *et al.* 2013:777)
	Staff buy-in	None	• *"[…] integration may disturb the whole of the forward supply chain. Employee's awareness and motivation for the change is essential for successful integration."* (Agrawal *et al.* 2016d:20)
	Staff with dual functions	Agrawal *et al.* (2016d:20)	• *"[…] some employees handle FL and RL through consolidation of returns in DCs, which may also serve the forward supply flow […]."* (Olorunniwo & Li, 2011:7)
	Combined department	None	• *"[…] responsibility of RL is assigned to the supply chain department rather than having separate department. Therefore integration of forward and reverse supply chain plays an important role."* (Agrawal *et al.* 2016d:20)
SC requirement	***Combine and integrate SC and RSC***	Keh *et al.* (2012:33) Prakash and Barua (2015:603)	• *"[…] combine the forward supply chain (FSC) with RSC to form a whole supply chain that creates improved value."* (Hong *et al.* 2008:173) • *"Efficiently integrating forward and reverse SCs for managing product, finance and information flow in both directions […]."* (Agarwal *et al.* 2016:3)
Facility/ location outcomes	***Optimum network design***	None	• *"Separating the design may lead to sub-optimality and therefore integration of design of forward and reverse logistics network is needed."* (Choudhary *et al.* 2015:434)
	Optimise network utilisation	None	• *"[…] companies want to optimise the utility of their physical network by combining the reverse operation with the forward operation."* (Bernon & Cullen, 2007:43)
Economic outcomes	***Address economic barriers***	None	• *"[…] a reverse logistics channel is widely integrated into forward logistics in terms of processes, resources, skills, information management, and infrastructure […] to overcome […] economic barriers […] during reverse logistics implementation."* (Keh *et al.* 2012:33)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Facilitate FM	None	• *"[…] to integrate the existing forward logistics network with the backward logistics network for product returns and therefore help the firm […] estimate the true cost of managing product returns from the holistic perspective."* (Min & Ko, 2008:191) • *"[…] by integrating forward and reverse SC to manage […] finance […] in both directions easily and efficiently."* (Prakash & Barua, 2015:603)
	Economic benefits	None	• *"Gathering and integrating the reverse logistic information […]and analyzing [sic] them with the information of the forward logistics […] […] are critical activities to increase the economic benefits of the entire logistic system."* (Shi *et al.* 2012:226) • *"[…] combine the forward supply chain (FSC) with RSC to form a whole supply chain that creates improved value."* (Hong *et al.* 2008:173)
	Reduce investment requirements	None	• *"Co-locating facilities is preferred as this leads to some savings in capital and manpower investment as well as transportation costs."* (Srivastava & Srivastava, 2006:530)
	Cost savings	Srivastava and Srivastava (2006:530) Sasikumar and Kannan (2008b:238)	• *"[…] integrating forward and reverse logistics should be the first priority in order to reduce cost […]."* (Vlachos, 2016:15) • *"[…] distribution-cum-collection centre which is advantageous when compared to separate distribution or collection centre with regard to cost savings […] The main motivation behind this activity is sharing of material-handling equipment and infrastructure, prompting to use the above-mentioned integrated forward–reverse logistics network."* (Choudhary *et al.* 2015:434) • *"[…] the facility operating costs may only have slightly change […] in fixed facility costs and variable unit processing costs, however, the transportation costs can be significantly reduced through the optimal combination of facilities and allocation of materials."* (Yu & Solvang, 2016:12) • *"Integrate reverse logistics to forward logistics: Reduce implementation cost […] by pooling infrastructures and resources."* (Keh *et al.* 2012:32) • *"[…] building such hybrid processing facilities might include cost savings […] as a result of sharing material handling equipment and infrastructure*." (Lee & Dong, 2009:62) • *"Installing inspection equipment in few warehouses will costs less than installing it in each collection points."* (Luitel *et al.* 2014:94)
	Profitability	None	• *"[…] to economically integrate both the forward logistics and backward logistics, […] to guarantee the profitability of the forward-reverse logistics."* (Kim & Goyal, 2011:2536) • *"Integration of forward and reverse logistics […] to form a close loop through the use of integrated logistics information management system […] to improve profitability."* (Lau & Wang, 2009:459)
Operational outcomes	***Address operational barriers and challenges***	None	• *"Integrate reverse logistics to forward logistics: Reduce […] operational difficulties by pooling infrastructures and resources."* (Keh *et al.* 2012:32) • *"This integration also enables minimizing [sic] operational difficulties related to the implementation of such a process by reusing knowledge and experience already acquired during forward logistics operations."* (Keh *et al.* 2012:32) • *"[…] a reverse logistics channel is widely integrated into forward logistics in terms of processes, resources, skills, information management, and infrastructure […] to overcome operational […] barriers often experienced by firms during reverse logistics implementation."* (Keh *et al.* 2012:33)
	Address infrastructure barriers in RL	None	• *"The integration of reverse logistics within a traditional logistics chain enables reusing the infrastructure […] already available […]."* (Keh *et al.* 2012:32)
	Improve RL and FL process efficiency	None	• *"Returns information captured should be integrated with forward supply chain information […] The whole support network can then be designed in such a way that it can service both the forward and RL processes efficiently."* (Sasikumar & Kannan, 2008b:238)
	Enhance operational effectiveness	None	• *"[…] the distinction between inbound and outbound flow of parts and products is essential for the proper functioning of the overall warehousing operations. This separation does not necessarily imply that the warehouse is totally divided into two separate entities."* (Dowlatshahi, 2012:1271)
	Successful RL/FL integration	None	• *"[…] integration may disturb the whole of the forward supply chain. Employee's awareness and motivation for the change is essential for successful integration."* (Agrawal *et al.* 2016d:20)
Organisational outcomes	***Facilitate successful RL design and implementation***	None	• *"The use of an existing warehouse for returned items appears to be a prerequisite for the successful design and implementation of RL. This is consistent with the strategic utilisation of a firm's existing resources."* (Dowlatshahi, 2012:1269) • *"[…] reverse logistics […] is widely integrated into forward logistics in terms of processes, resources, skills, information management, and infrastructure […] to overcome […] barriers often experienced by firms during reverse logistics implementation."* (Keh *et al.* 2012:33)
	Facilitate planning and innovation	None	• *"Returns information captured should be integrated with forward supply chain information to achieve optimum planning […]."* (Sasikumar & Kannan, 2008b:238) • *"Feeding forward logistics with insights from reverse logistics […] drives*

	Improve consumer satisfaction	None	• *"[…] integrating forward and reverse logistics should be the first priority in order to […] improve customer satisfaction."* (Vlachos, 2016:15)
SC outcome	***Enhance SCM***	None	• *"[…] to guarantee and maintain the sustainable supply chain management, the reverse logistics […] should be efficiently implemented and well coordinated with the forward logistics."* (Kim *et al.* 2013:510)

Source: Compiled by the researcher

Table 6.29 indicates integrated facility/location practices in RL, including strategies, requirements and outcomes, which will be discussed in subsequent sections. The section will be concluded with a description and conceptual framework for integrated facility/location practices.

6.8.3.1 Integrated facility/location strategies in RL

Integrated facility/location strategies in RL include (1) prioritising integrated facility/location practices, (2) integrated and closed-loop network design, (3) strategic considerations and decisions for integrated facility/location practices, (4) strategic analyses for integrated facility/location practices, (5) strategic utilisation of a standard facility, (6) strategic utilisation of combined facilities and locations, (7) strategic utilisation of an established network and infrastructure, (8) strategic utilisation of existing

expertise, resources, capabilities and operations, (9) strategic integration of RL and FL, (10) strategic separation of operational flows, and (11) strategic establishment of hybrid facilities.

Like IT, integration, and RL outsourcing practices, integrated facility/location practices must be *prioritised* for the successful strategic integration of RL/FL. Contrasting separate facility/location practices, integrated facility/location strategies involve an *integrated* and *closed-loop network design,* which involves integrating RL/FL network design and establishing a closed-loop network for product returns to re-enter the original SC. Consequently, organisations that mostly deal with new/unused product returns can benefit from a closed-loop network design (also see section 6.8.1.2).

Like other facility/location practices, integrated facility/location strategies can include *strategic considerations* and *decisions.* Particularly, organisations must consider the distribution interaction of FL and RL, storage space, transportation capacity and modes of transportation as well as decide on the method of RL/FL integration. Moreover, organisations must perform *strategic analyses,* including cost-benefit, trade-off and information analyses, for integrated facility/location practices. The cost-benefit analysis may help organisations identify the economic benefits of utilising an established facility for RL operations, for example, performing a cost-benefit analysis by comparing increased operational costs (additional warehouse processes) with transportation cost savings.

Additionally, performing a trade-off analysis for RL/FL integration can be important for the efficiency of RL and FL operations. Organisations can consider trade-offs related to integrated infrastructure, warehouse space, equipment and resources, locations and transportation in the analysis. For example, warehouse space may be required for new products (from suppliers) but to recover costs from returned products, the space may be better for new/unused product returns that can be resold. In terms of the information analysis, organisations can analyse RL information to identify inefficiencies in FL operations, which can be important for return avoidance (RA). For example, high product returns related to wrong products can be used to identify problems in FL operations, such as picking errors or administration/systems errors (see section 6.8.3.3).

In terms of strategies related to facilities and locations, integrated facility/location practices mostly involve the *strategic utilisation* of a *standard facility,* which closely relates to the strategic use of a single facility in separate facility/location strategies (e.g. DC for both FL and RL) (see section 6.8.2.1). However, unlike the separate facility strategy, an integrated facility strategy uses a standard facility, like a warehouse or DC, to run integrated operations for both RL and FL processes. Nevertheless, an integrated facility/location strategy can involve the *strategic utilisation* of a *combined facility* and

location, meaning that RL and FL take place at the same location in a combined facility (e.g. combining a collection or a repair facility and a DC) for integrated operations.

Additionally, an integrated facility/location strategy involves the *strategic utilisation* of an *established network* and *infrastructure* for RL and FL operations, emphasising an integrated network design. Consequently, integrated facility/location practices in RL entail the *strategic utilisation* of *existing expertise, resources, capabilities* and *operations*, meaning that all FL expertise/knowledge, IT, equipment, storage, labour, capabilities and operational methods can be used for RL. Nevertheless, the integrated facility or standard facility for RL and FL (like a warehouse) must be capable of managing both RL and FL operations for effective utilisation of existing infrastructure and resources.

Essentially, integrated facility/location strategies entail the *strategic integration* of *RL* and *FL*, which associates with other integrated facility/location strategies, including prioritisation, integrated network design, strategic decisions (e.g. methods of integration), strategic analyses, strategic use of integrated facilities/locations and strategic use of existing network, infrastructure, expertise, resources and capabilities. Particularly, the strategic integration of RL/FL in integrated facility/location practices involves efficient coordination of FL and RL operations (e.g. integrated collection, transportation and sorting) and effective integration of resources (e.g. IT, equipment, costs and staff), skills, capabilities, information management (for information analysis), infrastructure and network. Nevertheless, *strategic separation* of *operational flows* (such as separating inbound and outbound flows) can be critical for the efficiency of an integrated facility. This separation excludes complete separation of RL and FL in separate facility/location practices (such as separate entry/exits, receiving docks, security, space and staff for RL) (section 6.8.2).

Finally, integrated facility/location strategies may involve the *strategic establishment* of *hybrid facilities* for integrated RL/FL operations. Organisations may as part of general facility/location decision factors (see section 6.8.1.2) identify that integrated facility/location practices may be the best facility/location strategy but may lack the capacity to run integrated operations in an established facility. Alternatively, organisation may run two separate facilities at the same location and decide to combine the separate facilities and build a hybrid facility to integrate RL and FL operations.

In essence, integrated facility/location strategies can be viewed as the opposite of separate facility/location strategies, in terms of network design, strategic decisions, strategic use of facilities and locations, sharing of infrastructure and resources and RL/FL integration.

6.8.3.2 Requirements of integrated facility/location practices in RL

The requirements of integrated facility/location practices include (1) economic (2) IT, (3) operational, (4) organisational, and (5) SC requirements. The *economic requirement* of costs relates to the strategic utilisation of combined facilities with additional processing costs and the need to install equipment for RL processes. Additionally, costs may be incurred for the establishment of hybrid facilities for RL/FL integration (see section 6.8.3.1). Nevertheless, the cost requirement for integrated facility/location practices may be less than the establishment of separate facilities and infrastructure in separate facility/location practices, demonstrating the importance of performing cost-benefit analysis in facility/location practices (see sections 6.8.1.1 and 6.8.3.1).

The *IT requirement* of integrated facility/location practices relate to the strategic integration of RL/FL in terms of sharing of IT. Particularly, organisations can *utilise TLIT* (traditional logistics) systems, like LIMS (logistics information management system) and ERP (enterprise system) for RL/FL integration (see section 6.3.3). Consequently, for successful integration of RL and FL, organisations can use IT systems capable of managing both RL and FL information, emphasising the importance of IT practices for the effective management of consumer returns.

The *operational requirements* of integrated facility/location practices involve equipment, compatible operations and low return volumes. Relating to the economic requirement of costs, integrated facility/location practices require the installation of *equipment* to perform RL processes in the standard warehouse facility. The equipment requirements can involve the installation of inspection equipment (such as testing equipment) or other equipment for disassembly and repair operations (see section 5.6.3.1).

Additionally, integrated facility/location practices require *compatible operations,* which associates with the strategic separation of operational flows in a standard facility (section 6.8.3.1). For example, RL flows running parallel to FL flows in the warehouse without delays or bottlenecks caused by either operation. Contrasting the high return volume requirement of separate facility/location practices (section 6.8.2.2), integrated facility/location practices require *low return volumes.* Consequently, high return volume can cause operational challenges in a combined facility, for example, employees that perform RL and FL activities may neglect FL activities due to the amount of product return handling requirements. The impact of return volume on facility/location decisions, emphasise the significance of considering return volume as an operational decision factor in general facility/location practices (see section 6.8.1.2).

Several *organisational requirements* associate with integrated facility/location practices, including (1) RL implementation, (2) RL insourcing strategies, (3) RL formalisation practices, (4) management involvement, (5) staff buy-in, (4) staff with dual functions, and (5) a combined department. Since integrated facility/location practices involve the strategic integration of RL and FL, organisations must *implement RL* for effective coordination between RL and FL. Consequently, organisations must pay attention to RL and focus on implementing various RL practices for successful integrated facility/location practices. *RL insourcing strategies* can be one example of such a RL practice for effective integrated facility/location practices. Evidently, organisations must focus on developing a self-support insourcing strategy for RL, requiring the development of RL capabilities and skills to successfully perform RL processes alongside FL processes in a combined facility (also see section 6.5).

Similarly, *RL formalisation practices* (part of SPP practices) can be important for effective RL/FL integration in integrated facility/location practices. For example, establishing formal operating procedures, rules and defined responsibilities (see section 6.9.4) for staff with dual RL and FL responsibilities. *Management involvement* can be critical for integrated facility/location practices like making strategic decisions related to the methods of RL/FL integration (see section 6.8.3.1) and strategically integrating RL and FL processes. Additionally, management involvement may be important for *staff buy-in*, which involves employee awareness and acceptance of RL/FL integration. Staff buy-in in integrated facility/location practices may relate to the organisational barriers in RL that involve a lack of awareness on the importance of RL and a resistance to change since RL involves a change in mindset (see section 2.3.3).

Furthermore, staff buy-in can be important for the requirement of *staff* with *dual functions*, which associates with the strategic sharing of resources and strategic integration of RL/FL (integrated facility/location strategies). Therefore, some staff must be tasked with RL and FL activities (such as receiving and sorting of new and returned products), emphasising the importance of the lower return volume (operational) and RL formalisation requirements. Evidently, integrated facility/location practices require a *combined department* (e.g. logistics or SC department) responsible for managing and performing integrated RL/FL operations in standard or combined facilities.

Finally, the *SC requirement* of *combining* and *integrating the SC* and *RSC*, which relates to the integrated facility/location strategies of an integrated closed-loop network design and RL/FL integration (section 6.8.3.1). Therefore, integrated facility/location practices require integrated SCM for the effective management of integrated RL and FL flows.

In the next section, the outcomes of integrated facility/location practices will be explored.

6.8.3.3 Outcomes of integrated facility/location practices in RL

Integrated facility/location practices involve numerous outcomes, including (1) facility/location (2) economic, (3) operational, (4) organisational, (5) environmental, (6) market-related and (7) SC outcomes, which will be discussed in subsequent sections.

6.8.3.3.1 Facility/location and economic outcomes of integrated facility/location practices in RL

The *facility/location outcomes* of integrated facility/location practices include optimum network design and optimising network utilisation. *Optimum network design* can be achieved through the integrated facility/location strategy of an integrated network design, which implies that organisations may find it challenging to design an optimum separate network for RL as part of separate facility/location strategies. Additionally, organisations can *optimise network utilisation* through the strategic integration of RL and FL operations (integrated facility/location strategy), reemphasising the importance of an integrated network design.

Integrated facility/location practices involve numerous *economic outcomes*, including (1) addressing economic barriers, (2) facilitating FM, (3) economic benefits, (4) reducing investment requirements, (5) cost savings, and (6) profitability. Since RL involves high costs and economic barriers (see section 2.3.1), the strategic integration of RL and FL in terms of infrastructure, resources, skills, information management and processes (integrated facility/location strategies) can be important to *address economic barriers* in RL. Additionally, the integrated facility/location practices related to strategic integration of the RL/FL network (strategy) and integration of SC and RSC (SC requirement) *facilitate FM* (financial management), which can be an important RL practice. For example, strategic integration of RL and FL can help organisations to identify true RL costs, which can be important for the managing of RL costs of consumer returns (also see section 6.9.2).

Similarly, organisations can achieve *economic benefits* through the integrated facility/location practices related to strategic information analysis, strategic integration of RL/FL information (strategies) and integration of the SC and RSC (SC requirement), adding value to the overall RL/FL system. Moreover, the strategic combination of a facility for RL/FL *reduces investment requirements* related to capital and manpower, emphasising the significance of integrated facility/location practices in addressing economic barriers in RL (e.g. financial investment barriers) (see section 2.3.1).

Several integrated facility/location practices can provide *cost savings*, including (1) prioritising integrated facility/location practices, (2) integrated network design, (3) strategic analysis for integrate facility/location practices, (4) strategic use of a combined facility, (5) strategic use of an established

infrastructure, (6) strategic use of existing resource (e.g. equipment), (7) strategic integration of RL and FL, (8) strategic establishment of a hybrid facility (strategies), (9) costs (economic) requirement (e.g. costs of installing equipment in fewer facilities can realise cost savings), and (10) equipment installation (operational) requirement.

Finally, *profitability* can be obtained through the integrated facility/location practices of a closed-loop network design, integrating RL/FL (e.g. economic integration) (combined strategies) and utilising TLIT (such as LIMS) (IT requirement). Consequently, organisations that experience various economic challenges and barriers in RL can benefit from implementing integrated facility/location practices to manage consumer returns.

6.8.3.3.2 Operational outcomes of integrated facility/location practices in RL

The operational outcomes of integrated facility/location practices include (1) addressing operational barriers and challenges, (2) addressing infrastructure barriers, (3) improving RL and FL process efficiency, (4) enhancing operational effectiveness, and (5) successful RL/FL integration. Like separate facility/location practices (section 6.8.2.3), integrated facility/location practices can *address operational barriers* and *challenges* in RL, especially through the strategic use of an established infrastructure and existing knowledge and expertise, and strategic integration of RL and FL in terms of resources, skills, information management, infrastructure and processes. Similarly, organisations can *address infrastructure barriers* (developmental barriers) in RL through the integrated facility/location strategy of integrating RL and FL. Consequently, organisations that lack the necessary infrastructure to effectively manage consumer returns (see section 2.3.2) can consider implementing integrated facility/location practices in RL.

Organisations can *enhance* the *efficiency* of *RL* and *FL processes* through the integrated facility/location strategies of an integrated network design and RL/FL integration (in terms of information), which can be important for the overall logistics and operational efficiency of organisations. Moreover, organisations can *enhance operational effectiveness* through the integrated facility/location strategy of separating operational flows of RL and FL in a standard (warehouse) facility. Finally, organisations can *successfully integrate RL/FL* through the integrated facility/location operational requirement of staff buy-in, demonstrating the importance of staff commitment and awareness in RL for the effective management of consumer returns.

6.8.3.3.3 Organisational outcomes of integrated facility/location practices in RL

Integrated facility/location practices associate with several organisational outcomes, including (1) facilitating successful RL design and implementation, (2) facilitating planning and innovation, (3) facilitating the development of integrated RL/FL strategies, (4) enhancing RL system effectiveness, (5) enhancing overall logistics system, (6) facilitating information sharing and management, (7) facilitating RC practices, and (8) facilitating RPA practices.

The integrated facility/location strategies of utilising a standard facility (e.g. a warehouse), utilising existing resources and integrating RL/FL (in terms of resources, skills, information management, infrastructure and processes) can *facilitate successful RL design* and *implementation*. Furthermore, the integrated facility/location strategies related to strategic information analysis (e.g. analysing return information) and strategic integration of RL/FL information can *facilitate planning* and *innovation*, bringing new insights and improvements through research and development initiatives.

Additionally, the integrated facility/location strategies of using and integrating an existing network for RL and FL can *facilitate* the *development* of *integrated RL/FL strategies*, which can be important for the effective management of consumer returns. Moreover, organisations can *enhance* the *effectiveness* of the *RL system* through the integrated facility/location strategies of utilising a standard (warehouse) facility and existing resources and capabilities (e.g. space, labour, equipment and operational method) for RL. Consequently, by performing a strategic trade-off analysis for RL and FL (combined strategy), organisations can *enhance* the overall *logistics system*, demonstrating the importance of implementing RL practices for overall business success.

Additionally, the integrated facility/location practices of utilising TLIT (e.g. ERP) (IT requirement) and integrating the SC and RSC (SC requirement) can *facilitate information sharing* and *management*. Similarly, the integrated facility/location practices related to the strategic integration of RL/FL (strategy) and integration of the SC and RSC can *facilitate RC practices*, which can be critical for the effective management of consumer returns (see section 6.9.1). Evidently, integrated facility/location practices can indirectly facilitate other RL practices that require RC, including CI and RL disposition practices (see sections 6.4.2 and 6.6).

Finally, the integrated facility/location strategy of integrating RL/FL can *facilitate RPA practices* since organisations can use return information to identify inefficiencies in the FL processes that result in unnecessary product returns (e.g. poor packaging and delivery inefficiencies), emphasising the

importance of performing an information analysis for effective combined/facility practices (see section 6.8.3.1).

6.8.3.3.4 Environmental, market-related and SC outcomes of integrated facility/location practices

The *environmental outcomes* of integrated facility/location practices include reduction in pollution and waste. Particularly, organisations can *reduce pollution* through the integrated facility/location strategies of an integrated network design, using or establishing a combined/hybrid facility for RL and FL, using an established infrastructure and using existing resources for RL. Similarly, organisations can *reduce waste* through the combined/facility location practices of an integrated closed-loop network design, strategic integration of RL/FL (strategies) and the utilisation of TLIT (e.g. LIMS) (IT requirement). Consequently, integrated facility/location practices can be more environmentally friendly than separate facility/location practices (without environmental outcomes) and can be important for organisations aiming to improve environmental performance.

The *market-related outcomes* of integrated facility/location practices involve consumer responsiveness and satisfaction. Particularly, organisations can *increase responsiveness* through a strategic information analysis for integrated facility/location practices, demonstrating the importance of using RL information for the efficiency of both RL and FL processes (operational outcomes) (section 6.8.3.3.2). Subsequently, organisations can *improve consumer satisfaction* through the integrated facility/location strategies of prioritising RL/FL integration and strategically integrating RL/FL, which demonstrate that integrated facility/location practices can be important for the effective management of consumer returns.

Finally, the *SC outcome* of integrated facility/location practices involves SCM. Specifically, organisations can *enhance SCM* through the integrated facility/location practices related to strategic integration of RL/FL (e.g. well-coordinated integration) (strategy) and RL implementation (organisational requirement). Consequently, organisations that seek sustainable SCM can benefit from implementing integrated facility/location practices in RL.

Essentially, organisations can realise various economic, operational, organisational, environmental, market-related and SC benefits through integrated facility/location practices, which can be essential for the effective management of consumer returns. In the next section, integrated facility/location practices will be concluded with a description and conceptual framework.

6.8.3.4 Description and conceptual framework of integrated facility/location practices to manage consumer returns

Based on the findings presented in section 6.8.3, integrated facility/location practices can be important for the management of consumer returns, and will be described as follows:

> Integrated facility/location practices for the management of consumer returns involve (1) integrated facility/location strategies, including prioritising integrated facility/location practices, integrated and closed-loop network design, strategic considerations and decisions, strategic analyses (cost-benefit, trade-off and information analyses), strategic utilisation of a standard facility, combined facilities and locations, an established network and infrastructure and existing expertise, resources, capabilities and operations, strategic integration of RL and FL, separating operational flows, and establishing hybrid facilities, and (2) integrated facility/location requirements, including an economic requirement (costs), an IT requirement (utilise TLIT), operational requirements (equipment, compatible operations and low return volume), organisational requirements (RL implementation, RL insourcing and formalisation practices, management involvement, staff buy-in, staff with dual functions and a combined department), and a SC requirement (combine and integrate the SC and RSC).
>
> The integrated facility/location strategies and requirements can result in several outcomes, including (1) facility/location outcomes (optimum network design and optimise network utilisation), (2) economic outcomes (address economic barriers, facilitate FM, economic benefits, reduce investment requirements, cost savings and profitability), (3) operational outcomes (address operational barriers and challenges, address infrastructure barriers, improve RL and FL process efficiency, enhance operational effectives and successful RL/FL integration), (4) organisational outcomes (facilitate successful RL design and implementation, facilitate planning and innovation, facilitate the development of integrated RL/FL strategies, enhance RL system effectiveness, enhance overall logistics system, facilitate information sharing and management, facilitate RC and facilitate RPA practices), (5) environmental outcomes (reduce pollution and waste), (6) market-related outcomes (improve responsiveness and consumer satisfaction), and (7) SC outcome (enhance SCM).

Figure 6.22 provides a conceptual framework of integrated facility/location practices to manage consumer returns.

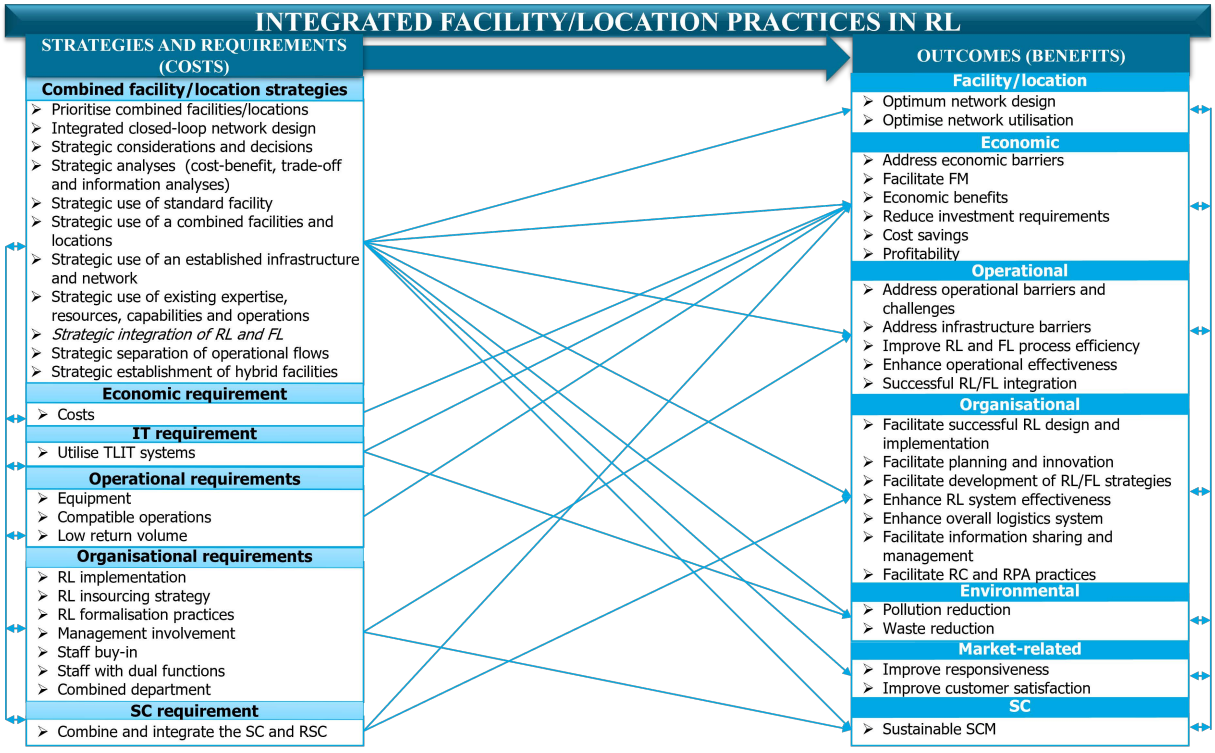

Figure 6.22 Conceptual framework of integrated facility/location practices to manage consumer returns

Source: Compiled by researcher

Figure 6.22 illustrates the links between the strategies, requirements and outcomes of integrated facility/location practices, demonstrating a cost and benefit relationship. The links between integrated facility/location strategies and requirements can be demonstrated by the integrated facility/location strategy of using a combined or standard facility for RL and FL, which links with the economic requirement of costs (installation), IT requirement of TLIT, operational requirement of equipment and organisational requirement of staff buy-in. Additionally, the integrated facility/location strategy of an integrated closed-loop network can link with the SC requirement of combining and integrating the SC and RSC.

Regarding the links between integrated facility/location strategies, requirements and outcomes, the framework demonstrates that integrated facility/location strategies, especially, the strategic integration of RL and FL, can be the most significant practice, linking with all the integrated facility/location outcomes, including facility/location, economic, operational, organisational, environmental, market-related and SC outcomes. Therefore, organisations must pay attention to the strategic integration of RL/FL and integrated facility/location strategies to achieve optimum results to manage consumer returns. From the integrated facility/location requirements, IT, organisational and SC requirements equally lead to the most outcome categories (two each), while economic and operational requirements lead to the least outcome categories (one each). Nevertheless, all integrated facility/location practices can lead to various outcomes, which can be important to manage consumer returns. From the outcomes of integrated facility/location practices, the economic outcome category can be the most significant (associated with most of the integrated facility/location practices), demonstrating that organisations experiencing economic barriers and cost-related problems in RL can benefit from implementing integrated facility/location practices. In contrast, the facility/location and market-related outcomes can be the least significant outcome categories (only associated with one practice category), meaning that integrated facility/location practices may be less important for organisations that experience facility/location and market-related challenges in RL.

Finally, the framework shows that the integrated facility/location outcome categories can be linked, for example, the operational outcome of successful RL/FL integration can link with all the outcome categories that associate with strategic integration of RL/FL, including facility/location, economic, organisational, economic, market-related and SC outcomes.

Essentially, the links between the integrated facility/location strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of integrated facility/location for the effective management of consumer returns.

In the next section, centralised facility/location practices will be analysed and discussed.

6.8.4 Centralised facility/location practices to manage consumer returns

Based on the strategic decisions in general facility/location practices, organisations that choose centralised facilities/locations for RL must implement strategies and requirements related to a centralised network, facilities and locations to achieve outcomes to manage consumer returns. Like separate facility/location practices, centralisation can be associated with centralised return centre (CRC) practices, if the return facilities are centrally located in the RL network (see the introduction of section 6.8). While centralised facilities will be included in centralisation, CRCs are excluded and discussed as a distinct practice in section 6.8.6. Table 6.30 provides an overview of the findings related to the *centralised facility/location practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.30 Findings related to centralised facility/locations practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Centralised facility/location strategies	***Strategic decisions and considerations related centralisation***	Gobbi (2011:779)	• *"The objective of this reverse logistics network design is to choose the […] degree of centralization [sic] of the network […]."* (Pishvaee *et al.* 2010:271) • *"[…] centralised returns are a related possibility when companies are considering the construction of their physical network."* (Bernon & Cullen, 2007:43) • *"Low recovery value and high investments require higher processing volume to make it economically viable. That's the reason that a centralized [sic], open loop network structure involving a small number of levels is preferred."* (Agrawal *et al.* 2015:83) • *"[…] using a centralised return strategy has problems such as an increase in shipping and transportation time […]."* (Jayaraman *et al.* 2008:419)
	Cost-benefit / trade-off analysis	None	• *"[…] it is important to clarify that for these warehousing managers, the benefits clearly outweighed the costs and hence the choice to use a centralised returns strategy to process returns."* (Jayaraman *et al.* 2008:419) • *"[…] returns are […] processed at a centralized location. The returns decay in value over time […] there is an intrinsic tradeoff in the decision – a longer interval between collections reduces transportation cost, but also reduces the value of asset recovery."* (Ruiz-Benítez *et al.* 2014:56)
	Benefit-driven strategies	None	• *"When centralization [sic] is pursued, the focus is on efficiency, cost reduction, and economies of scale."* (Gobbi, 2011:772) • *"The centralized [sic] structure is aimed at minimizing [sic] processing and transportation costs at the expense of a long lead time."* (Gobbi, 2011:779)
	Develop a centralised return strategy	Ramírez (2012:1139)	• *"A more centralized [sic] strategy can achieve greater benefit of economies of scale."* (Du & Evans, 2008:2618) • *"[…] the choice to use a centralised returns strategy to process returns."* (Jayaraman *et al.* 2008:419)
	Strategic establishment of a centralised open-loop network structure	Gobbi (2011:772)	• *"[…] a centralized [sic], open loop network structure involving a small number of levels is preferred."* (Agrawal *et al.* 2015:83) • *"[…] a centralized [sic] structure, all returned products are delivered first to a central facility […]."* (De Leeuw *et al.* 2016:717)
	Strategic establishment of a centralised return system	Hahler and Fleischmann (2013:4) Zikopoulos and Tagaras (2015:438)	• *"[…] a centralized [sic] returns system, in which all returns are processed in a centralized [sic] facility […]."* (De Leeuw *et al.* 2016:722)
	Strategic utilisation of a central facility and/or location for RL	Luitel *et al.* (2014:94) Ramírez (2012:1139)	• *"[…] all returned products are delivered first to a central facility […]."* (De Leeuw *et al.* 2016:717) • *"[…] all returns are processed in a centralized [sic] facility […]."* (De Leeuw *et al.* 2016:722) • *"[…] processing returns in a central point […]."* (Bernon *et al.* 2016:597) • *"[…] products are taken to a centralized [sic] location […]."* (Barker & Zabinsky, 2011:560) • *"[…] returns are picked up from a collection point and then processed at a centralized [sic] location."* (Ruiz-Benítez *et al.* 2014:56)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Strategic utilisation of a few central facilities and locations for RL	None	• *"Installing inspection equipment in few warehouses will costs less than installing it in each collection points."* (Luitel *et al.* 2014:94) • *"In a centralized [sic] structure, each activity is installed at a few locations […].* (Gobbi, 2011:772)
Economic requirements	***Investment***	Agrawal *et al.* (2015:83)	• *"[…] centralized structure […] high investments required in terms of specialized [sic] recovery equipment and personnel."* (Gobbi, 2011:788)
	Costs	None	• *"[…] processing returns in a central point […] the downside is the potential for additional logistics costs especially where product is returned to store at a later date."* (Bernon *et al.* 2016:597) • *"[…] using a centralised return strategy has problems such as an increase in shipping and transportation time and the corresponding increase in transportation costs […]."* (Jayaraman *et al.* 2008:419) • *"[…] centralized [sic] warehouses […] only large numbers of returns would be sufficient to cover central storage costs."* (Ramírez, 2012:1139) • *"Installing inspection equipment in few warehouses will costs […]."* (Luitel *et al.* 2014:94)
Operational requirements	***Equipment***	Agrawal *et al.* (2015:83) Zikopoulos and Tagaras (2015:438)	• *"Installing inspection equipment in few warehouses […]."* (Luitel *et al.* 2014:94) • *"[…] centralized structure […] required […] specialized [sic] recovery equipment […]."* (Gobbi, 2011:788)
	High return volume	Agrawal *et al.* (2015:83)	• *"[…] if the firm's strategy is to use centralized warehouses, […] only large numbers of returns would be sufficient to cover central storage costs."* (Ramírez, 2012:1139)
	Consolidation	None	• *"[…] using a centralised return strategy has […] the difficulty in consolidating all return shipment to the centralised facility."* (Jayaraman *et al.* 2008:419)
Organisational requirement	***Management involvement***	None	• *"[…] for these warehousing managers, the benefits clearly outweighed the costs and hence the choice to use a centralised returns strategy to process returns."* (Jayaraman *et al.* 2008:419)
	Skilled staff	None	• *"[…] centralized structure […] required […] specialized [sic] […] personnel."* (Gobbi, 2011:788) • *"[…] availability of experienced work-force and sophisticated equipment […] to a centralized [sic] system."* (Zikopoulos & Tagaras, 2015:438)
Economic outcomes	***Reduce investment requirements***	None	• *"Centralization [sic] avoids multiple investments in specialized [sic] resources."* (Gobbi, 2011:785) • *"[…] high investments require higher processing volume to make it economically viable. That's the reason that a centralized [sic], open loop network structure involving a small number of levels is preferred."* (Agrawal *et al.* 2015:83)
	Economies of scale	None	• *"When centralization [sic] is pursued, the focus is on […] economies of scale."* (Gobbi, 2011:772) • *"A more centralized [sic] strategy can achieve greater benefit of economies of scale."* (Du & Evans, 2008:2618)
	Cost savings	Hsu *et al.* (2009:527)	• *"The centralized [sic] structure is aimed at minimizing [sic] processing and transportation costs at the expense of a long lead time."* (Gobbi, 2011:779) • *"[…] returns are […] processed at a centralized [sic] location. The returns decay in value over time […] there is an intrinsic tradeoff in the decision – a longer interval between collections reduces transportation cost, […]."* (Ruiz-Benítez *et al.* 2014:56) • *"[…] a centralized [sic] returns system, in which all returns are processed in a centralized [sic] facility, is potentially more capable of minimizing [sic] the costs of returns processes."* (De Leeuw *et al.* 2016:722) • *"Installing inspection equipment in few warehouses will costs less than installing it in each collection points."* (Luitel *et al.* 2014:94)
Operational outcomes	***Improve RL processes***	None	• *"[…] since all returns processes are done in one location, they can more quickly identify problems in the returns process and make improvements."* (De Leeuw *et al.* 2016:723)
	Improve RL process efficiency	None	• *"When centralization [sic] is pursued, the focus is on efficiency […]."* (Gobbi, 2011:772) • *"[…] processing returns in a central point is more efficient."* (Bernon *et al.* 2016:597)
Organisational outcomes	***Facilitate RC***	None	• *"Centralization [sic] avoids multiple investments in specialized [sic] resources."* (Gobbi, 2011:785)

Source: Compiled by the researcher

Table 6.30 indicates centralised facility/location practices in RL, including strategies, requirements and outcomes, which will be discussed in subsequent sections and concluded with a description and conceptual framework.

6.8.4.1 Centralised facility/location strategies in RL

Centralised facility/location strategies in RL include (1) strategic decisions and considerations related to centralisation, (2) a cost-benefit/trade-off analysis, (3) benefit-driven strategies, (4) developing a centralised return strategy, (5) strategic establishment of a centralised open-loop network structure, (6) strategic establishment of a centralised return system, (7) strategic utilisation of a central facility and/or location for RL, and (8) strategic utilisation of a few facilities and locations for RL.

Like other facility/location practices, centralised facility/location strategies entail *strategic decisions* and *considerations* to facilitate organisations with determining the appropriateness of a centralisation strategy while establishing a network structure for RL. Particularly the strategic decisions in centralised facility/location decisions relate to the degree of centralisation, for example, one central facility at a central location or a few central facilities at a few central locations, for the effective management of consumer returns. In terms of the strategic considerations, centralisation involve product recovery value, investment, volume and return lead time considerations, which means that organisations must consider economic and operational factors for a centralisation strategy.

Consequently, organisations with limited capital for investment, high return volumes and product returns of low recovery value, may benefit from implementing an open-loop centralisation strategy. For example, online grocery retailers that deal with perishable products that can only be destroyed or recycled (due to shelf-life limitations) may select centralisation to deal with product returns. Nevertheless, organisations must consider the longer return lead time associated with centralisation and the potential impact on customer service and satisfaction.

Subsequently, performing a *cost-benefit* or *trade-off analysis* can be important for centralised facility/location strategies, ensuring that the benefits (outcomes) of centralisation outweigh the costs (requirements). For example, for a centralisation strategy, organisations can perform an analysis by considering the costs of longer return lead-time against the benefits of transportation and processing cost savings. Essentially, like general facility/location strategies (section 6.8.1.1), organisations must focus on establishing *benefit-driven* centralisation strategies, including cost minimisation, economies of scale and efficiency for the effective management of consumer returns.

Based on the strategic decisions and considerations, a cost-benefit analysis and benefit-driven strategies, organisations can *develop a centralised return strategy* to guide the implementation of centralised facility/location practices to manage consumer returns. Additionally, organisations must *strategically establish a centralised open-loop network structure*, meaning that all product returns

arrive at a central facility/location for processing, inspection, sorting and disposition to eventually enter a different SC (see section 6.8.2.1) or get disposed of. Moreover, organisations must *strategically establish a centralised return system* to facilitate centralised collection, receiving, processing, inspection, sorting, disposition and redistribution of product returns through an open-loop network structure.

Regarding the degree of centralisation (strategic decision), organisations can *strategically utilise* of a *central facility* and/or *location* to perform RL processes. Alternatively, organisations can *strategically utilise a few central facilities and locations* for various RL processes. For example, organisations can centralise a collection facility to collect and consolidate product returns, dispatch the returned products to a central warehouse to perform inspection, sorting and testing, and then dispatch the returned products (that requires product recovery) to a central repair facility to perform disposition operations.

6.8.4.2 Requirements of centralised facility/location practices in RL

Like separate facility/location practices (see section 6.8.2.2), centralised facility/location practices include economic, operational, and organisational requirements. The *economic requirements* of centralised facility/location practices involve investment and costs. Particularly, the *investment* requirement of centralised facility/location practices associates with other requirements related to equipment (operational) and skilled staff (organisational), which can be important for the effective management of consumer returns. The *cost* requirements associate with the longer shipping and return lead times, which means that organisations may incur additional transport, logistics and storage/inventory costs by using a central facility/location for RL processes.

This contrasts the transport cost savings associated with fewer transportation return trips and economies of distance (see section 6.8.1.2) to a centralised location, emphasising the importance of a cost-benefit analysis and benefit-driven strategies for effective centralised facility/location practices (section 6.8.4.1). Moreover, organisations can incur equipment installation costs for using a few facilities at central locations to perform specific RL processes, which emphasise the investment requirements of a centralised network structure.

The *operational requirements* of centralised facility/location practices involve equipment, return volume and consolidation. Relating to the investment and cost requirements, centralised facility/location practices require specialised *equipment* (such as inspection and repair equipment) to perform RL processes at centralised facilities/locations (e.g. few central warehouses). The *high return volume* requirement can be important for a benefit-driven centralisation strategy that focus on cost

minimisation, emphasising the importance of volume considerations in the strategic considerations related to centralisation (section 6.8.4.1). Additionally, organisations must perform *consolidation* that involves combining product returns at a location for larger shipments, which reemphasise the importance of considering longer return lead times in centralisation strategies.

Finally, the *organisational requirements* of centralised facility/location practices include management involvement and skilled staff. *Management involvement* can be important for the strategic decisions and considerations related centralisation, development of a centralised return strategy, performing cost-benefit analyses and implementing benefit-driven centralisation strategies (see section 6.8.4.1). Relating to the economic (investment) and operational (equipment) requirements of centralisation, *skilled staff* can be important for operating specialised RL process equipment and performing challenging RL processes (like inspection and disposition). Consequently, the skilled staff requirement of centralisation demonstrates that organisations may choose centralisation for more specialised RL processes since it may be too costly to duplicate resources in various locations and facilities (associated with decentralisation) (see section 6.8.5).

6.8.4.3 Outcomes of centralised facility/location practices in RL

Centralised facility/location practices involve economic, operational and organisational outcomes, which can be important for the management of consumer returns.

The *economic outcomes* of centralised facility/location practices, include (1) reducing investment requirements, (2) economies of scale and (3) cost savings. Organisations can *reduce investment requirements* through the centralised facility/location practices related to (1) strategic considerations (such as considering investment and return volume), (2) strategic establishment of an open-loop network structure, (3) investment (economic requirement), and (4) high return volume (operational requirement). Consequently, utilising a single or fewer facilities/locations means less investment in resources for RL (such as installing inspection equipment and employing skilled staff at each facility) (see section 6.8.4.2), emphasising the importance of a cost-benefit analysis for centralisation (section 6.8.4.1).

Economies of scale can be obtained through the implementation of a benefit-driven centralisation strategy (focussing on economies of scale) and the development of a centralised return strategy, emphasising the high return volume (operational) requirement of centralisation (section 6.8.4.2). Accordingly, *cost savings* can be realised through several centralised facility/location practices, including (1) strategic considerations for centralisation, (2) cost-benefit analyses, (3) benefit-driven

centralisation strategies, (4) strategic establishment of a centralised network, (5) strategic establishment of a centralised return system, (6) strategic utilisation of a central facility and location for RL, (7) cost (economic) requirement, and (8) equipment (operational) requirement.

Centralised facility/location practices involve *operational outcomes* related to the improvement of RL processes and efficiency. Particularly, organisations can *improve RL processes* through the strategic utilisation of a central location since inefficiencies in RL processes can quickly be identified. Subsequently, centralised facility/location practices, including implementing benefit-driven centralisation strategies and utilising a central location for RL, can *improve RL process efficiency*, which can be important for the effective management of consumer returns.

Finally, the *organisational outcome* of centralised facility/location practices involves *RC* in RL, which relates to the reduced investment (economic) outcome of centralisation. Consequently, despite the investment requirement (economic) of centralisation utilising fewer facilities/locations reduce the need for duplication of resources (e.g. specialised equipment and skilled staff), reemphasising the importance of the centralisation strategies related to considering investment, performing a cost-benefit analysis and focussing on benefit-driven strategies (see section 6.8.4.1).

In the next section, centralised facility/location practices will be concluded with a description and conceptual framework.

6.8.4.4 Description and conceptual framework of centralised facility/location practices to manage consumer returns

Based on the findings presented in section 6.8.4, centralisation in RL can be important for the management of consumer returns, and will be described as follows:

> Centralised facility/location practices for the management of consumer returns involve (1) centralised facility/location strategies, including strategic decisions and considerations related to centralisation, a cost-benefit / trade-off analysis, benefit-driven strategies, developing a centralised return strategy, strategic establishment of a centralised open-loop network structure and a centralised return system, strategic utilisation of a central facility and/or location for RL, and strategic utilisation of a few facilities and locations for RL, and (2) centralised facility/location requirements, including economic requirements (investment and costs), operational requirements (equipment, high return volume and consolidation) and organisational requirements (management involvement and skilled staff). The centralised facility/location strategies and requirements can result in a few outcomes, including (1) economic outcomes (reduce investment requirements, economies of scale and cost savings), (2) operational outcomes (improve RL processes and RL process efficiency) and (3) an organisational outcome (facilitate RC).

Figure 6.23 provides a conceptual framework of centralised facility/location practices to manage consumer returns.

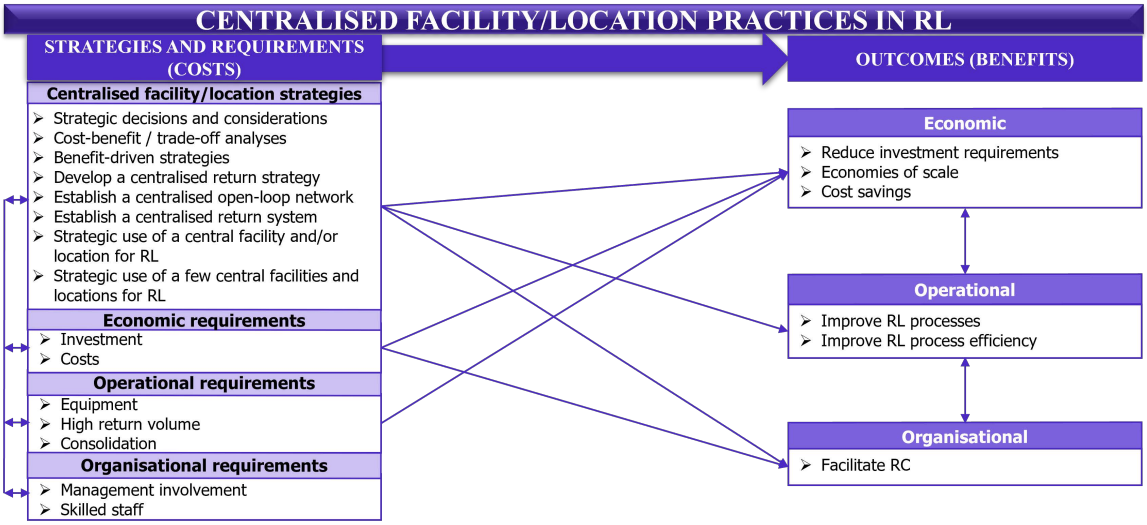

Figure 6.23 Conceptual framework of centralised facility/location practices to manage consumer returns

Source: Compiled by researcher

Figure 6.23 illustrates the links between the strategies, requirements and outcomes of centralised facility/location practices, demonstrating a cost and benefit relationship. The links between centralised facility/location strategies and requirements can be demonstrated by the economic requirements of investment, which links with the strategic considerations of centralisation (strategy), operational requirement of equipment and organisational requirement of skilled staff.

Regarding the links between centralised facility/location strategies, requirements and outcomes, the framework shows that centralised facility/location strategies, can be the most significant practice category, linking with all the outcome categories, including economic, operational, and organisational outcomes. Therefore, organisations must pay attention to the centralised facility/location strategies to achieve optimum results to manage consumer returns. From the centralised facility/location requirements, the economic requirement category leads to the most outcome categories (two out of three), while the organisational requirements exclude any outcomes.

From the outcomes of centralised facility/location practices, the economic outcome category can be the most significant (associated with most of the centralised facility/location practices), demonstrating that organisations experiencing economic barriers and cost-related problems in RL can benefit from implementing centralised facility/location practices. In contrast, the operational outcome category can be the least significant outcome categories (only associated with one practice category), meaning that centralised facility/location practices may be less important for organisations that experience operational challenges in RL.

Finally, the framework shows that the centralised facility/location outcome categories can be linked, for example, the economic outcome of reduce investment requirement can link with the organisational outcome of facilitating RC, and the operational outcome of improving RL process efficiency can link with the economic outcome of cost savings.

Essentially, the links between the centralised facility/location strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of centralised facility/location for the effective management of consumer returns.

In the next section, decentralised facility/location practices will be analysed and discussed.

6.8.5 Decentralised facility/location practices to manage consumer returns

Decentralisation as a facility/location practice to manage consumer returns can be described as the opposite of centralisation, which means that several facilities and locations can be utilised for RL processes. Like other RL practices, decentralised facility/location practices entail strategies and requirements, which can contribute to the outcomes for the management of consumer returns. Table 6.31 provides an overview of the findings related to the *decentralised facility/location practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.31 Findings related to decentralised facility/location practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Decentralised facility/location strategies	***Strategic decisions and considerations related to decentralisation***	None	• *"The appropriate level of decentralization [sic] of a returns network is influenced by the type of product. Time-sensitive products require fast turnaround processing, for which decentralized [sic] networks may be more beneficial."* (De Leeuw *et al.* 2016:723) • *"[…] decision on location about products collection should be made from JIT perspective. If the returned products require fast processing (e.g. they are perishable in nature […]), the collection points should be set close to the customer, and the frequency for collection should be increased."* (Chan *et al.* 2010:6301) • *"[…] the availability of the decentralized [sic] […] system is influenced by the investment in the number of collection points."* (Hahler & Fleischmann, 2013:4) • *"[…] Direct reusable products require only minor inspection, cleaning and minor maintenance. Table 6.31 indicates decentralised facility/location practices in RL, including strategies, requirements and outcomes, which will be discussed in subsequent sections and concluded with a description and conceptual framework.

6.8.5.1 Decentralised facility/location strategies in RL

Decentralised facility/location strategies in RL include (1) strategic decisions and considerations related to decentralisation, (2) a benefit-driven strategy, (3) strategic establishment of a decentralised flat network structure, (4) strategic establishment of a decentralised returns system, (5) strategic establishment of facilities/locations close to markets/consumers, (6) strategic utilisation of retail stores for RL, (7) strategic utilisation of decentralised facilities for RL, (8) strategic utilisation of multiple / flexible locations for RL and, (9) strategic decentralisation of specific RL processes.

Like centralisation (section 6.8.4.1), the *strategic decisions* and *considerations* related to *decentralisation* associate with the degree of decentralisation and decisions related to optimum decentralised locations. However, organisations must consider several factors for selecting decentralised facility/locations for RL, including time requirements, investment, product characteristics, disposition options and product return quality. Specifically, organisations that require faster RL processes due to perishable products or products with shorter life cycles (e.g. portable electronics like smart watches, cellular devices and cellular accessories) may choose a decentralisation strategy.

Furthermore, decentralisation can be appropriate for organisations that invested (or allocated funds for investment) in several facilities (e.g. collection centres) closer to the markets. Relating to the operational (general facility/location) decision factor of product returns (see section 6.8.1.2), organisations that receive mostly new/unused products with limited RL operational requirements (e.g. minor inspection and repackaging) for direct reuse (disposition option) can benefit from utilising a decentralised network for quick redistribution to the markets. Alternatively, organisations receiving (less bulky) used product returns with high uncertainty in return qualities can benefit from

decentralisation since better situation-based (non-standardised) decision making can be performed in different facilities.

Subsequently, organisations must implement a *benefit-driven strategy* for decentralisation, focussing on geographical coverage, fast lead times and consumer service. Contrasting a centralised network structure (section 6.8.4.1), decentralisation involves the *strategic establishment* of a *decentralised flat network structure*, meaning that product returns arrive at multiple facilities/locations that perform the same RL processes (see section 6.8.5.2). Additionally, organisations must *strategically establish a decentralised returns system* for effective decentralised RL processes and information sharing across several facilities.

Regarding the decentralised facilities and locations for RL, organisations can *strategically establish facilities/locations closer to markets/consumers* for RL processes. Particularly, organisations can *strategically utilise retail stores* or *strategically utilise decentralised facilities* for RL processes. Consequently, decentralisation involves the *strategic utilisation of multiple / flexible locations* for RL, for example, using several drop-off collection centres (or points) convenient for consumers. Finally, organisations can *strategically decentralise specific RL processes*, for example, utilising collection points for decentralised product return collection and utilising decentralised repair centres for inspection and repair activities.

6.8.5.2 Requirements of decentralised facility/location practices in RL

Decentralised facility/location practices in RL involve a few requirements, including economic, IT and operational requirements. The *economic requirements* of decentralisation involve investment and costs, which relate to the decentralisation strategies. For instance, the *investment* requirement associates with the strategic consideration related to investment in several collection points (see section 6.8.5.1). Furthermore, *costs* associate with the strategic utilisation of multiple facilities/locations for RL processes, which can consist of fixed costs and installation costs of equipment in multiple facilities at multiple locations.

The *IT requirements* of decentralisation involve *utilising an IT infrastructure* and *integrated IT*, which can be important for the quick resale of returned products to consumers and effective information sharing across several facilities. Consequently, organisations that choose a decentralised return strategy can benefit from implementing general IT practices that associate with the development and utilisation of a new/current IT infrastructure and integrative IT for RL (see section 6.3.1).

Finally, the *operational requirements* of decentralisation involve equipment, duplicate RL operations and simpler RL operations. Associating with the economic requirement of installation costs, decentralised facilities require *equipment* to perform RL processes (e.g. inspection). Consequently, multiple facilities/locations in decentralisation require *duplicate RL operations*, meaning that several facilities must perform the same RL processes. For example, four RL facilities must all receive, process, inspect, sort, recover and redistribute product returns. Contrasting separate facility/location practices (see section 6.8.2.2), decentralisation requires *simpler RL operations* (such as minor inspection), associating with the strategic decisions and considerations of choosing decentralisation based on the reuse disposition option (see section 6.8.5.1).

6.8.5.3 Outcomes of decentralised facility/location practices in RL

The outcomes of decentralised facility/location practices involve (1) facility/location (2) economic, (3) operational, (4) organisational and (5) market-related outcomes, which will be discussed in subsequent paragraphs.

The *facility/location outcome* of decentralisation involves *greater geographical coverage*, which can be realised through the implementation of a benefit-driven decentralisation strategy. Moreover, through the decentralisation strategies related to establishing facilities/locations close to consumers and decentralisation of specific RL processes (such as inspection), organisations can realise the *economic outcome* of *cost avoidance*. Evidently, decentralisation can be a viable RL practice for organisations that seek to avoid unnecessary RL transportation costs to central facilities, emphasising the high transport cost requirement of centralisation (section 6.8.4.2).

The *operational outcomes* of decentralisation involve facilitating product return quality uncertainties and improving RL process speed. Particularly, organisations can *facilitate uncertainties* in *product return quality* by selecting a decentralisation strategy based on the strategic consideration of heterogenous return quality, demonstrating that decentralisation can address the operational barriers in RL related to product return uncertainties (see section 2.3.2). Additionally, organisations can *improve RL process speed* through strategic decisions and considerations related to time requirements, a benefit-driven decentralisation strategy, the strategic establishment of a decentralised network structure and strategic utilisation of retail stores for RL. For example, a multi/omnichannel retailer can encourage online consumers to return products to retail stores for fast processing (immediate refunds).

The *organisational outcome* of decentralisation involves *internal information sharing* between facilities, which can be realised through the strategic establishment of a decentralised returns system

(strategy) and utilisation of integrated IT (requirement). Consequently, decentralised facility/location practices may facilitate CFI (internal integration) practices, which can be important for the management of consumer returns (see section 6.4.3).

Finally, decentralised facility/location practices involve *market-related outcomes* that include consumer convenience and service. Particularly, organisations can enhance *consumer convenience* through the strategic establishment of facilities/locations close to consumers and utilisation of multiple/flexible locations for RL. For example, decentralised facilities/locations close to consumers can decrease the time and of costs for consumers to return products, emphasising the economic outcome of cost avoidance (e.g. transport costs) through decentralisation practices. Essentially, decentralised facility/location practices, including benefit-driven strategies (focussing on consumer service) and establishing facilities close to consumers, can *increase customer service*, which emphasise the decentralisation operational outcome of speedy RL processes.

In the next section, decentralised facility/location practices will be concluded with a description and conceptual framework.

6.8.5.4 Description and conceptual framework of decentralised facility/location practices to manage consumer returns

Based on the findings presented in section 6.8.5, decentralised facility/location practices in RL can be important for the management of consumer returns, and will be described as follows:

> Decentralised facility/location practices for the management of consumer returns involve (1) decentralised facility/location strategies, including strategic decisions and considerations related to decentralisation, a benefit-driven strategy, strategic establishment of a decentralised flat network structure, a decentralised returns system and of facilities/locations close to markets/consumers, strategic utilisation of retail stores, decentralised and multiple/flexible locations for RL, and strategic decentralisation of specific RL processes, and (2) decentralised facility/location requirements, including economic requirements (investment and costs), IT requirements (IT infrastructure and integrated IT), and operational requirements (equipment, duplicate RL processes and simpler RL operations). The decentralised facility/location strategies and requirements can result in a few outcomes, including (1) facility/location outcome (greater geographical coverage), (2) an economic outcome (cost avoidance), (3) operational outcomes (facilitate product return quality uncertainties and improve RL process speed), (4) an organisational outcome (internal information sharing), and (5) market-related outcomes (consumer convenience and improve customer service).

Figure 6.24 provides a conceptual framework of decentralised facility/location practices to manage consumer returns.

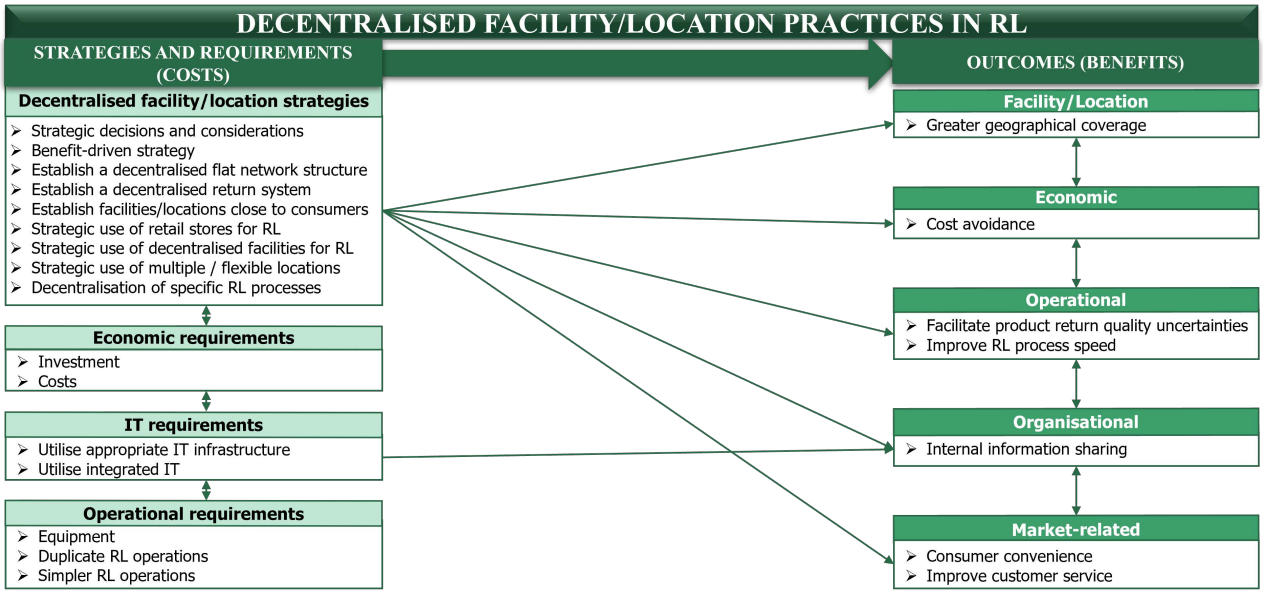

Figure 6.24 Conceptual framework of decentralised facility/location practices to manage consumer returns

Source: Compiled by researcher

Figure 6.24 illustrates the links between the strategies, requirements and outcomes of decentralised facility/location practices, demonstrating a cost and benefit relationship. The links between decentralised facility/location strategies and requirements can be demonstrated by the economic requirements of investment, which links with the strategic considerations of decentralisation (strategy) and the operational requirement of equipment. Additionally, the decentralisation strategy of establishing a decentralised returns system links with the IT requirement of integrated IT.

Regarding the links between decentralised facility/location strategies, requirements and outcomes, the framework demonstrates that decentralised facility/location strategies, can be the most significant practice category, linking with all the outcome categories, including facility/location, economic, operational, organisational and market-related outcomes. Therefore, organisations must pay attention to the decentralised facility/location strategies to achieve optimum results to manage consumer returns. From the decentralised facility/location requirements, only the IT requirement of integrated IT contribute to one outcome category, while the economic and operational requirements exclude any outcomes. Nevertheless, like emphasised above, the economic and operational requirements can be important for the implementation of decentralised facility/location strategies and, therefore, indirectly contribute to the outcomes of decentralised facility/location practices.

From the outcomes of decentralised facility/location practices, the organisational outcome category can be the most significant (associated with most of the decentralised facility/location practices), while all other outcome categories only associate with decentralised facility/location strategies. Finally, the framework shows that the decentralised facility/location outcome categories can be linked, for

example, the market-related outcome of consumer convenience can link with the facility/location outcome of greater geographical coverage and the economic outcome of cost avoidance. Similarly, the operational outcome of speedy RL processes can link with the organisational outcome of internal information sharing and market-related outcome of improved customer service.

Essentially, the links between the decentralised facility/location strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of decentralised facility/location for the effective management of consumer returns.

In the next section, CRC practices to manage consumer returns will be analysed and discussed.

6.8.6 Centralised Return Centre (CRC) practices to manage consumer returns

Despite being termed as a centralised return centre, CRCs can be a combination of separate, integrated, centralisation and decentralisation facility/location practices (see section 6.8). Regardless of the combination of facility/location practices, CRC practices can be described as the strategies and requirements related to the utilisation of specialised RL facilities/locations, which can contribute to important outcomes for the effective management of consumer returns. Table 6.**32** provides an overview of the findings related to the *CRC practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Source: Compiled by the researcher

Table 6.**32** indicates CRC practices in RL, including strategies, requirements and outcomes, which will be discussed in subsequent sections and concluded with a description and conceptual framework.

6.8.6.1 The strategies and requirements of CRCs in RL

CRC strategies in RL include (1) establish a CRC strategy in RL, (2) strategic decisions related to CRCs, (3) a cost-benefit analysis, (4) benefit-driven strategies, (5) strategic design, establishment and utilisation of CRCs, and (6) strategic utilisation of standard facilities for CRCs.

Organisations must start by *establishing a CRC strategy in RL*, which guides the utilisation of a specialised facility to perform various RL processes. Furthermore, like other facility/location practices, CRC practices involve *strategic decisions*, including the number of CRCs and the choice of CRC location(s) (e.g. choosing an optimum central region) for the effective management of consumer returns. However, CRCs can involve strategic decision-making about product returns, for example, determining the most appropriate course for the returned product within the CRC (e.g. appropriate inspection areas) and determining the most suitable disposition options, demonstrating the importance of CRCs for the effective management of consumer returns.

Nevertheless, performing a *cost-benefit analysis* can be important for the establishment of CRCs, ensuring that the benefits (outcomes) of CRCs outweigh the costs (requirements). Essentially, like other facility/location practices, organisations must focus on *a benefit-driven CRC strategy* for the effective

management of consumer returns. Consequently, organisations must focus on cost minimisation, facility capacity maximisation and consumer convenience/service during the strategic decision-making on the number and location of CRCs.

Based on the CRC strategy, strategic decisions, cost-benefit analysis and benefit-driven strategies, organisations can *strategically design, establish* and *utilise CRCs* for RL. Therefore, the CRC must be designed to perform receiving, processing, inspection, sorting and disposition processes and related RL activities effectively and efficiently. Alternatively, organisations can *strategically utilise a standard facility for a CRC,* for example, allocating a portion of the DC to operate a CRC to manage consumer returns.

The *requirements* of CRC practices include economic, IT and organisational requirements. The *economic requirement* of CRC practices involves *costs*, which relates to the CRC strategies of establishing and utilising CRCs for RL. Particularly, organisations must incur set-up or establishment costs and other RL process costs, including inspection, sorting and disposition costs, emphasising the importance of performing a cost-benefit analysis for CRC practices. The *IT requirement* of CRC practices involve the *utilisation* of *IT,* which can be important for effective strategic decision-making in CRCs. Consequently, the IT utilisation requirement in CRCs, reemphasise the importance of IT practices for the effective management of consumer returns.

Finally, the *organisational requirements* of CRC practices involve sophisticated and efficient RL programs and staff involvement. Since the function of CRCs involves performing RL operations, organisations must establish *sophisticated* and *efficient RL programs.* Consequently, any barriers to the implementation of RL (such as economic, operational and organisational barriers) (see section 2.3) can impede the effectiveness of CRC practices, emphasising the importance of developing a CRC strategy for RL. Linking with the IT requirement, *staff involvement* can be important for strategic decision-making in CRCs, demonstrating an important link between the CRC strategies and requirements.

In the next section the outcomes of CRC practices will be explored.

6.8.6.2 Outcomes of CRC practices in RL

Several outcomes associate with CRC practices, including (1) facility/location (2) economic, (3) operational, (4) organisational and (5) market-related outcomes.

The *facility/location outcomes* of CRC practices include optimum capacity utilisation and RL network benefits. Like general facility/location practices (section 6.8.1.4), CRC practices can provide *optimum*

capacity utilisation, which can be achieved through strategic decisions related to the number of and locations of CRCs and implementing benefit-driven CRC strategies. Similarly, organisations can realise *RL network benefits* through strategic decisions on the optimum locations for CRCs and establishing and utilising CRCs in a RL network. Particularly, CRCs can play an important role in the RL network providing a link between collection points (closer to consumer) and recovery facilities (may be closer to suppliers), and thereby simplifying the network structure.

The *economic outcomes* of CRC practices include (1) economic benefits, (2) economies of scale, (3) cost savings/reduction and (4) profitability. Like the abovementioned facility/location outcomes, strategic decisions for the optimum locations for CRCs can provide economic benefits, which demonstrate the importance of effective strategic decision making for effective CRC practices. Moreover, through the strategic utilisation of CRCs, organisations can achieve *economies of scale* since larger scale RL operations can be performed in CRCs. Accordingly, *cost savings / reductions* can be realised through (1) strategic decisions related to the number and locations for CRCs, (2) benefit-driven CRC strategies, and (3) strategic utilisation of CRCs. Consequently, despite the economic requirement of costs, CRC practices can reduce RL costs, transportation costs and inventory carrying costs, emphasising the importance of performing a cost-benefit analysis for CRC practices (see section 6.8.6.1). Ultimately, organisations can realise greater *profitability* through the strategic utilisation of CRCs to manage consumer returns.

CRC practices involve numerous *operational outcomes*, including (1) addressing operational barriers, (2) improving product return visibility, (3) facilitating and improving RL processes, and (4) improving RL process speed, efficiency and effectiveness. Organisations can *address operational barriers in RL*, including problems with product returns, limited forecasting and visibility, IT and infrastructure barriers, through the strategic establishment of CRCs. Subsequently, organisations can *improve product return visibility* through the strategic utilisation of CRCs (strategy) and implementation of sophisticated RL programs (organisational requirement).

Furthermore, by establishing CRC strategies and strategically designing and utilising CRCs, organisations can *facilitate* and *improve RL processes*, including gatekeeping, processing and disposition processes. Likewise, organisations can *improve RL process speed*, *efficiency* and *effectiveness* through the CRC practices of (1) establishing CRC strategies, (2) strategic decisions for optimum locations for CRCs, (3) strategic utilisation of CRCs and (4) efficient RL programs (organisational requirement). Particularly, CRCs can improve the speed and efficiency of processing, sorting and disposition processes, expediting product return flows. Consequently, CRCs can improve

and enhance all post-receipt RL processes, demonstrating the importance of CRCs for the effective management of consumer returns.

Accordingly, the *organisational outcomes* of CRC practices involve RLM, RL disposition practices and RL standardisation practices. Particularly, organisations can *facilitate RLM* through the CRC strategies of designing and utilising CRCs for RL. Consequently, utilising a standard facility (e.g. DC) for RL can result in less attention being paid to RL, causing inefficiencies in the management of consumer returns. Several CRC practices can *facilitate RL disposition practices,* including (1) establishing a CRC strategy for RL, (2) strategic decisions related to CRCs, (3) strategic utilisation of CRCs (strategies), (4) IT utilisation (IT requirement), and (5) staff involvement (organisational requirement). Moreover, establishing a CRC strategy and utilising CRCs can *facilitate RL process standardisation* (SPP) *practices*, which can be equally important for the effective management of consumer returns (see section 6.9.4).

The *market-related outcomes* of CRC practices include consumer convenience, service, satisfaction and loyalty. Particularly, organisations can *increase consumer convenience* through the strategic decisions related to the number and locations of CRCs and benefit-driven CRC strategies. Additionally, establishing a CRC strategy and utilising CRCs can *increase consumer service* through the operational outcomes related to speedy and improved gatekeeping and processing processes. Likewise, organisations can improve *consumer satisfaction* by utilising IT in CRCs, which associates with speedy RL processes. Finally, organisations can use CRCs as a marketing strategy to *improve consumer loyalty*, demonstrating the strategic significance of CRCs for the effective management of consumer returns.

Essentially, CRCs can be a critical RL practices, bringing several facility and location, economic, operational, organisational and market-related benefits. In the next section, CRC practices will be concluded with a description and conceptual framework.

6.8.6.3 Description and conceptual framework of CRC practices to manage consumer returns

Based on the findings presented in section 6.8.6, CRC practices in RL can be important for the management of consumer returns, and will be described as follows:

> Centralised return centre (CRC) practices for the management of consumer returns involve (1) CRC strategies, including establishing a CRC strategy in RL, strategic decisions related to CRCs, cost-benefit analyses, benefit-driven strategies, strategic design, establishment and utilisation of CRCs, and strategic utilisation of standard facilities for CRCs, and (2) CRC requirements, including an economic requirement (costs), an IT requirement (utilise IT) and organisational requirements (sophisticated and efficient RL programs and staff involvement). The CRC strategies and requirements can result in several outcomes, including (1) facility/location outcomes (optimum capacity utilisation and RL network benefits), (2) economic outcomes (economic benefits, economies of

scale, cost savings/ reduction and profitability), (3) operational outcomes (address operational barriers, improve product return visibility, facilitate and improve RL processes and improve RL process speed, efficiency and effectiveness), (4) organisational outcomes (facilitate RLM, RL disposition practices and RL standardisation practices), and (5) market-related outcomes (increase consumer convenience and service and improve consumer satisfaction and loyalty).

Figure 6.**25** provides a conceptual framework of CRC practices to manage consumer returns.

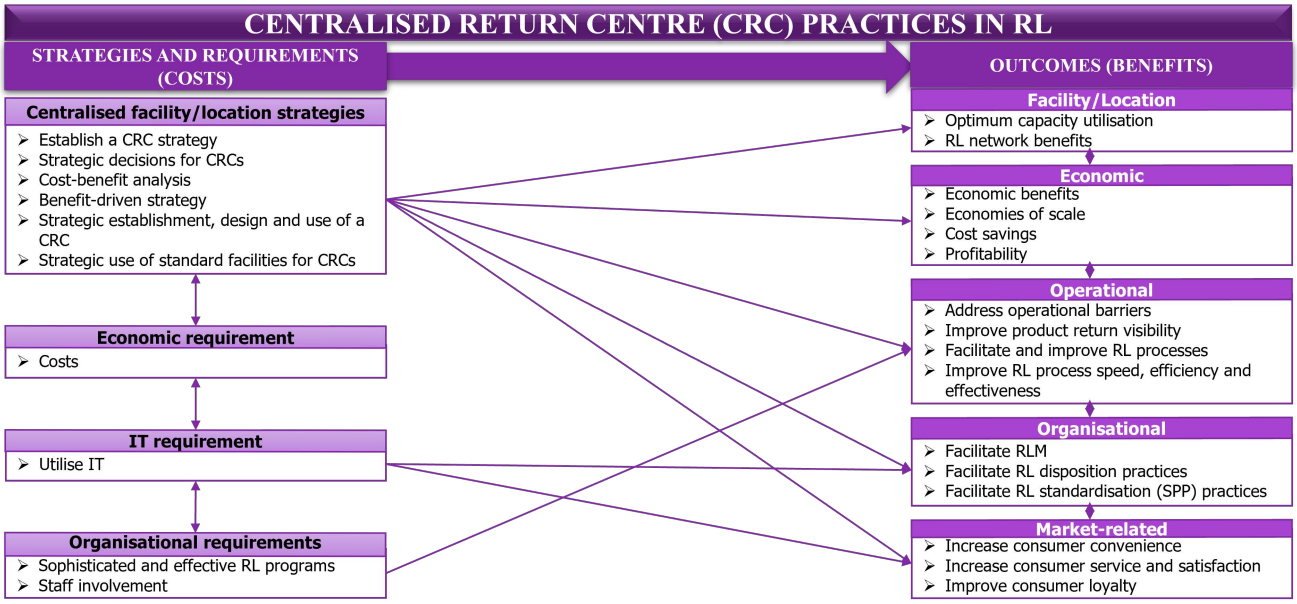

Figure 6.25 Conceptual framework of CRC practices to manage consumer returns
Source: Compiled by researcher

Figure 6.**25** shows the links between the strategies, requirements and outcomes of CRC practices, demonstrating a cost and benefit relationship. For example, the links between CRC strategies and requirements can be demonstrated by the strategic decisions related to CRCs, which links with the IT requirement and organisational requirement of staff involvement. Additionally, the CRC strategy of establishing CRCs for RL and link with the economic requirement of costs. Regarding the links between CRC strategies, requirements and outcomes, the framework demonstrates that CRC strategies can be the most significant practice category, linking with all the CRC outcomes, including facility/location, economic, operational, organisational and market-related outcomes. Therefore, organisations must pay attention to CRC strategies to achieve optimum results to manage consumer returns. From the CRC requirements, the IT requirement category leads to the most outcome categories, while the economic requirement category excludes any outcomes. Nevertheless, like emphasised above, the economic requirements can be important for the establishment of CRCs, and therefore, indirectly contribute to the outcomes of CRC practices.

From the outcomes of CRC practices, the operational, organisational and market-related outcome categories can be the most significant (associated with two practice categories), demonstrating that organisations that seek operational, organisational and market-related benefits in RL can consider

implementing CRC practices. Finally, the framework shows that the CRC outcome categories can be linked, for example, the CRC outcome of optimum capacity utilisation can link with the economic outcome of economies of scale, and the operational outcome of RL process speed, efficiency and effectiveness can link with the organisational outcome of facilitating RL disposition practices and the market-related outcome of improving consumer service.

Essentially, the links between the CRC strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of CRC practices for the effective management of consumer returns.

In the next section, a conceptual framework and summary of findings for facility/location practices (discussed in section 6.8) to manage consumer returns will be presented and described.

6.8.7 Conceptual framework and summary of findings for facility/location practices to manage consumer returns

This section provides a conceptual framework summary of findings for facility/location practices in RL to manage consumer returns. The findings presented in section 6.8 showed that all the facility/location practices, including general, separate, integrated, centralised, decentralised and CRC facility/location practices, can be important for the management of consumer returns.

Figure 6.26 provides a conceptual framework of facility/location RL practices to manage consumer returns. Specifically, the framework illustrates a summary of the findings related to the facility/location practices, general, separate, integrated, centralised, decentralised and CRCs, focussing on the combined strategies and requirements (costs) and outcomes (benefits). Furthermore, the framework shows the relationship between the costs (strategies and requirements), facility/location practice category and the benefits (outcomes) of implementing the facility/location practices. Additionally, the most significant (occurring the most often) strategies, requirements and outcomes associated with facility/location practice categories (at least four out of six) are emphasised through *italics*, while unique requirements and outcomes (only applicable to a single practice category) are emphasised through a coloured asterisk* (linked to the practice colour). The strategies, requirements and outcomes without italics and asterisks associate with two to three facility/location practice categories.

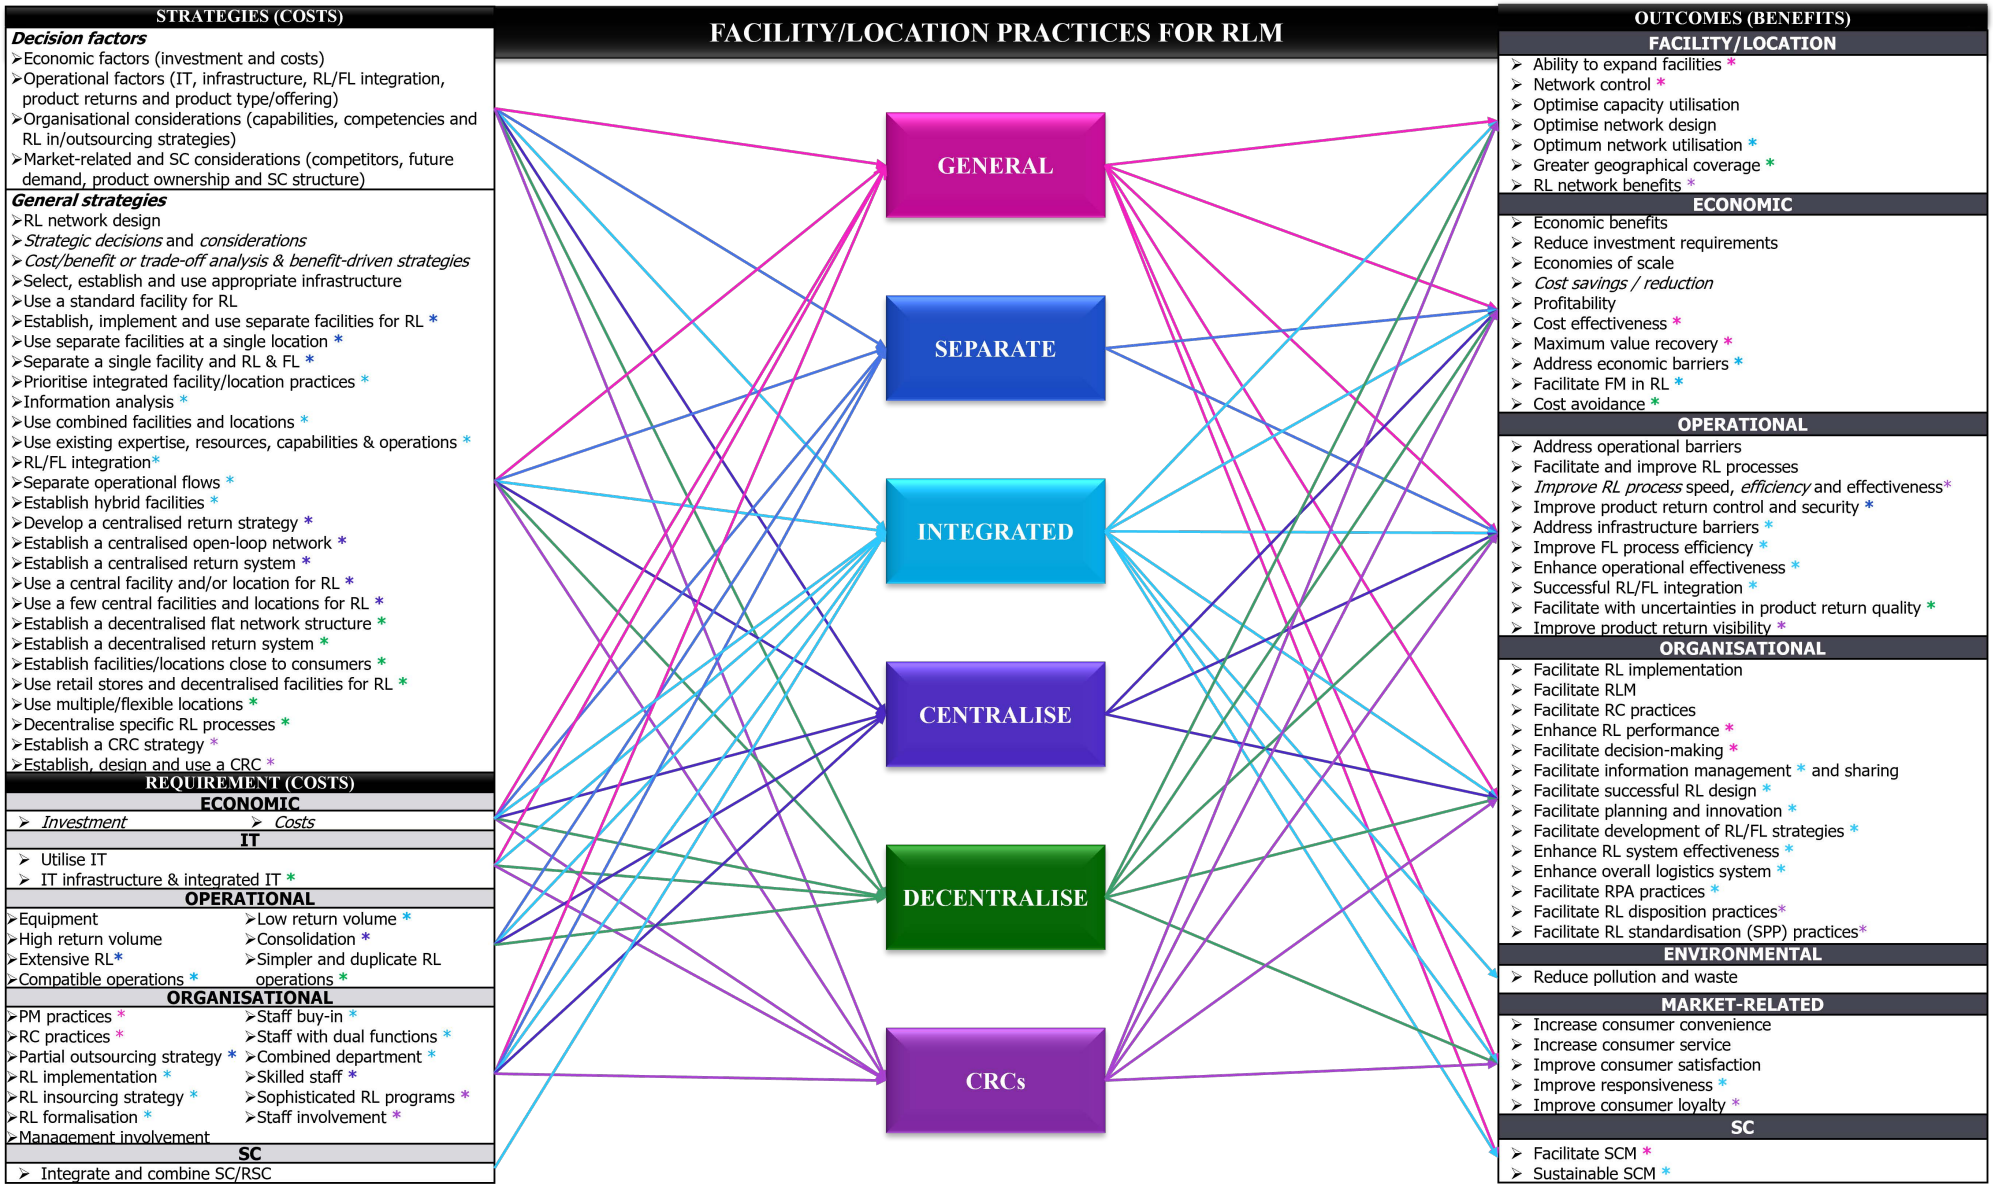

Figure 6.26 Conceptual framework of facility/location practices to manage consumer returns
Source: Compiled by the researcher

Based on Figure 6.26 and the discussions given in section 6.8, Table 6.33 provides a summary of the findings and managerial implications of facility/location practices to manage consumer returns.

Table 6.33 Summary of findings and managerial implications for facility/location practices

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies	•Facility/location practices involve economic, operational, organisation, market and SC decision factors that can influence strategic facility/location decisions •All facility/location practice categories involve strategies, especially, strategic decisions •All facility/location practice categories (except decentralisation) involve a form of cost-benefit or trade-off analysis •Most facility/location practice categories (except separate and CRCs) involve strategic considerations •Most facility/location practice categories (except separate and integrated) involve benefit-driven strategies •General, separate and integrated facility/location practices involve RL network design and use of an appropriate infrastructure •CRC and integrated facility/location practices involve utilisation of a standard facility •Only separate facility/location practices involve strategies related to establishing and using separate facilities for RL, using separate facilities and a single location, separating a single facility and separate RL and FL •Only integrated facility/location practices involve strategies related to prioritisation, information analyses, using combined facilities/locations, existing expertise, resources, capabilities and operations, RL/FL integration, separate operational flows and establishing a hybrid facility •Only centralised facility/location practices involve strategies related to developing a centralised return strategy, establishing a centralised open-loop network structure, establishing a centralised returns system, using a central facility and/or location for RL, and using few central facilities and locations for RL •Only decentralised facility/location practices involve strategies related to establishing a decentralised flat network structure, establishing a decentralised returns system, establishing facilities/locations close to consumers, using retail shops and decentralised facilities for RL and using multiple/flexible locations for RL •Only CRC practices involve strategies related to establishing a CRC strategy and establishing, designing and using CRCs	•For effective facility/location decision-making organisations must consider economic, operational, organisation, market and SC decision factors •For successful facility/location practices in RL, organisations must focus on facilities/locations strategies, particularly, strategic decisions and considerations, cost-benefit or trade-off analysis and benefit-driven strategies •For effective general, separate and integrated facility/location strategies, organisations must focus on RL network design and using an appropriate infrastructure •Organisations can use standard facilities for integrated and CRC facility/location practices •For effective separate facility/location strategies, organisations must establish and use separate facilities, use separate facilities at a single location or separate a standard facility and RL and FL •For effective integrated facility/location strategies, organisations must prioritise integration, perform an information analysis, use combined facilities/locations or establish hybrid facilities, use existing expertise, resources, capabilities and operations, integrate RL and FL and separate operational flows •For effective centralised facility/location strategies, organisations must develop a centralised return strategy, establish a centralised open-loop network structure, establish a centralised returns system, and use a central facility/location or a few central facilities/locations for RL •For effective decentralisation strategies, organisations must establish a decentralised flat network structure, establish a decentralised returns system, establish facilities/locations close to consumers, use retail shops or decentralised facilities for RL and use multiple/flexible locations for RL •For effective CRC strategies, organisations must establish a CRC strategy and establish, design and use CRCs
Requirements	•All facility/location practice categories involve requirements, especially, the economic requirement of costs •Most facility/location practice categories (except integrated and CRCs) involve the *economic requirement* of investment •Most facility/location practice categories (except separate and centralised) involve the IT requirements related to IT use, but uniquely decentralised facility/location practices require an IT infrastructure and integrated IT •Most facility/location practice categories (except general and CRCs) involve *operational requirements*, but uniquely, separate facility/location practices require extensive RL operations, integrated facility/location practices require compatible operations and low return volume, centralised facility/location practices require consolidation, and decentralised facility/location practices require simpler and duplicate RL operations •Integrated, centralised and decentralised facility/location practices involve the operational requirement of equipment for RL •Separate and centralised facility/location practices involve the operational requirement of high return volume •All facility/location practices (except decentralised) involve *organisational requirements*, but uniquely, general facility/location practices require PM and RC practices, separate facility/location practices require a partial outsourcing strategy, integrated facility/location practices require RL implementation, insourcing strategy, formalisation, staff buy-in, RL/FL staff and a combined department, centralised facility/location practices require skilled staff and CRC	•For effective facility/location practices in RL, organisations must be willing to invest and incur costs •Organisations must use IT for effective general, integrated and CRC facility/location practices •For effective decentralised facility/location practices, organisations must use an IT infrastructure and integrated IT •For effective facility/location practices (except general and CRCs) in RL, organisations must focus on operational requirements •Organisations require extensive RL operations for effective separate facility/location practices •For effective integrated facility/location practices, organisations must receive low return volumes and establish compatible (RL and FL) operations •Organisations must consolidate product returns for effective centralised facility/location practices •For effective decentralised facility/location practices, organisations require simpler RL operations and must be willing to duplicate RL operations •Organisations must install RL equipment for effective integrated, centralised and decentralised facility/location practices •For effective separate and centralised facility/location practices, organisations must receive high return volumes •For effective facility/location practices (except decentralised), organisations must focus on organisational requirements •Organisations must implement PM and RC practices in RL for effective general facility/location practices •For effective integrated facility/location practices, organisations must implement RL, develop a RL insourcing strategy, formalise RL, attain staff buy-in, use staff with dual RL/FL functions and establish a combined department

	practices require sophisticated RL programs and staff involvement •Integrated and centralised facility/location practices involve the organisational requirement of management involvement •Only integrated facility/location practices involve the *SC requirement* of combining or and integrating SC and RSC	•Organisations must implement sophisticated RL programs and involve staff for effective CRC practices •Organisation must involve management for effective integrated and centralised facility/location practices •For effective integrated facility/location practices, organisations must integrate the SC and RSC
Outcomes	•All facility/location practices involve benefits to manage consumer returns •Integrated facility/location practices include all outcome categories, including facility/location, economic, operational, organisational, environmental, market-related and SC outcomes •Most facility/location practices (except separate and centralised) involve *facility/location outcomes*, but uniquely, general facility/location practices can expand facilities and enable network control, integrated facility/location practices can optimise network utilisation, decentralised facility/location practices can cover greater geographical areas, and CRC practices can bring RL network benefits •General and integrated facility/location practices involve the facility/location outcome of optimising network design •General and CRC facility/location practices involve the facility/location outcome of optimising capacity utilisation •All facility/location practices involve economic outcomes, but uniquely, general facility/location practices can bring cost effectiveness and maximise value recovery, integrated facility/location practices can address economic barriers and facilitate FM in RL, and decentralised facility/location practices can avoid RL costs •All facility/location practices (except decentralised) involve the *economic outcomes* of saving and reducing costs •Integrated and centralised facility/location practices involve the economic outcomes of economic benefits and reducing investment requirements •Separate, centralised and CRC facility/location practices involve the economic outcome of economies of scales •Integrated and CRC facility/location practices involve the economic outcome of profitability •All facility/location practices involve *operational outcomes*, but uniquely, separate facility/location practices can improve product return control and security, integrated facility/locations can address infrastructural barriers, enhance FL efficiency and operational effectiveness and successfully integrate RL and FL, decentralised facility/location practices can facilitate uncertainties in product return quality, and CRC practices can improve product return visibility and RL process effectiveness •Integrated and CRC facility/location practices involve the operational outcome of addressing operational barriers in RL •All facility/location practices (except decentralised) can improve RL process efficiency •Separate, centralised and CRC facility/location practices involve the operational outcomes of facilitating and improving RL processes •Decentralised and CRC facility/location practices involve the operational outcome of improving RL process speed •All facility/location practices (except separate) involve *organisational outcomes*, but uniquely, general facility/location practices can enhance RL performance and facilitate decision-making, integrated facility/location practices can facilitate RL information management, design, planning, innovation and development of RL/FL strategies, enhance RL system effectiveness and overall logistics system, and facilitate RPA practices, and CRC practices can facilitate disposition and standardisation practices •General and integrated facility/location practices involve the organisational outcome of facilitating RL implementation •General and CRC facility/location practices involve the organisational outcome of facilitating RLM •Integrated and centralised facility/location practices involve the organisational outcome of facilitating RC •Integrated and decentralised facility/location practices involve the organisational outcome of facilitating internal information sharing •Only integrated facility/location practices can provide the *environmental outcomes* of pollution and waste reduction •Most facility/location practices (except separate and centralised) involve *market-related outcomes*, but uniquely, integrated facility/location practices can improve consumer responsiveness and CRC practices can improve consumer loyalty	•Organisations that experience various facility/location, economic, operational, organisational, environmental, market-related and SC challenges in RL can consider implementing integrated facility/location practices •Organisations that seek facility/location benefits in RL can implement any facility/location practices (except separate and centralised) •To expand facilities and improve network control, organisations can consider general facility/location practices •Organisations that seek to optimise network utilisation can consider integrated facility/location practices •Organisations that seek greater geographical coverage can implement decentralisation practices for RL •For RL network benefits, organisations can implement CRC practices •For optimum network design, organisations can implement general and integrated facility/location practices •To optimise facility capacity utilisation, organisations can consider general and CRC facility/location practices •Organisations that seek economic advantages in RL can implement facility/location practices •For cost effectiveness and maximum value recovery, organisations can implement general facility/location practices •Organisations that experience economic barriers in RL can consider integrated facility/location practices •Organisations can implement integrated facility/location practices to facilitate FM in RL •For cost avoidance, organisations can implement decentralised facility/location practices •Organisations that experience high RL costs, can consider any facility/location (except decentralised) practices •Organisations that seek economic benefits and a reduction in investment requirements can implement centralised and integrated facility/location practices •For greater economies of scale in RL, organisations can implement separate, centralised and CRC facility/location practices •Organisations that seek higher profitability through RL can implement integrated and CRC facility/location practices •Organisations that seek operational benefits in RL can implement facility/location practices •For product return control and security, organisations can implement separate facility/location practices •Organisations that experience infrastructure barriers in RL can implement integrated facility/location practices •To enhance FL efficiency and operational effectiveness, organisations can implement integrated facility/location practices •For successful RL/FL integration, organisations can implement integrated facility/location practices •Organisations that experience uncertainties in product return qualities can implement decentralised facility/location practices •Organisations can implement CRC practices to improve product return visibility and RL process effectiveness •Organisations that experience operational barriers in RL can consider integrated and CRC facility/location practices •Organisations that experience inefficiencies in the RL process can consider implementing any facility/location (except decentralised) practices •Organisation can implement separate, centralised and CRC facility/location practices to facilitate and improve RL processes •For speedy RL processes, organisations must consider decentralised and CRC facility/location practices •Organisations that seek organisational benefits in RL can implement any facility/location (except separate) practices •Organisations can implement general facility/location practices to enhance RL performance and facilitate decision-making •For greater organisational benefits, including information management, RL design, planning and innovation, development of RL/FL strategies, RL system effectiveness, overall logistics system effectiveness and RPA, organisations can implement integrated facility/location practices •Organisations can implement CRC practices to facilitate RL disposition and standardisation (SPP) practices in RL •Organisations that experience RL implementation challenges can implement general and integrated facility/location practices •Organisations can implement general and CRC facility/location practices

	•General, decentralised and CRC facility/location practices involve the market-related outcome of increasing consumer convenience •General, integrated and CRC facility/location practices involve the market-related outcome of improving consumer satisfaction •Decentralised and CRC facility/location practices involve the market-related outcome of increasing consumer service •Only general and integrated facility/location practices involve the *SC outcomes* of effective and sustainable SCM	to facilitate RLM •Organisations that experience RC challenges in RL can consider implementing integrated and centralised facility/location practices •Organisations that seek to increase internal information sharing can consider implementing integrated and decentralised practices for RL •Organisations that seek environmental benefits, including pollution and waste reduction, can implement integrated facility/location practices •Organisations that seek to improve consumer responsiveness can implement integrated facility/location practices •To improve consumer loyalty, organisations can consider implementing CRC practices •Organisations can implement general, decentralised and CRC facility/location practices to increase consumer convenience •Organisations that seek to improve customer satisfaction must consider general, integrated and CRC facility/location practices •For greater customer service in RL, organisations can consider implementing decentralised and CRC facility/location practices •For effective and sustainable SCM, organisations can implement general or integrated facility/location practices •Organisations with specific RL problems and inefficiencies in consumer returns can implement the relevant facility/location practices to address the specific RL problems and inefficiencies

Source: Compiled by the researcher

Table 6.33 provides an in-depth understanding into the value of facility/location practices to manage consumer returns. Essentially, the findings show that general, separate, integrated, centralised, decentralised and CRC facility/location practices can be important for the management of consumer returns, but before implementing a specific facility/location practice a cost-benefit analysis must be performed. Facility/location practices in RL, will further be explored in the interviews with industry experts (chapter 8).

In the next section, other RLM practices to manage consumer returns will be explored, analysed and discussed.

6.9 OTHER RLM PRACTICES TO MANAGE CONSUMER RETURNS

Other RLM practices consist of smaller RL practice categories, which include (1) resource commitment (RC) practices, (2) financial management (FM) practices, (3) return prevention and avoidance (RPA) practices, (4) strategic planning and procedural (SPP) practices, and (5) management and staff practices in RL. Despite being included in a single section (due to limited findings) (see Figure 6.3), RC (section 6.9.1), FM (section 6.9.2), RPA (section 6.9.3), SPP (section 6.9.4), management and staff practices (section 6.9.5) will be discussed as separate practices, with distinct strategies, requirements, outcomes, descriptions, conceptual frameworks and summary of findings.

6.9.1 Resource commitment (RC) practices to manage consumer returns

Despite the limited focus on RC in the QCA of RL literature (see Figure 6.3), RC as a RL practice can be critical for the effective management of consumer returns. Accordingly, Sharif *et al.* (2012:2528) and Skinner *et al.* (2008:532) suggested that the lack of RC in RL can weaken RL performance, causing inefficiencies in the RL processes of organisations. Additionally, a lack of investment in RL

can result in capacity risks associated with the unavailability of financial resources needed to manage consumer returns effectively (Panjehfouladgaran & Lim, 2020:1461).

As with all other RL practices, the categories associated with RC practices, included RC strategies, requirements and outcomes, which will be presented and discussed in subsequent sections, and concluded with a description, conceptual framework and summary of findings to manage consumer returns.

6.9.1.1 Strategies and requirements of RC practices in RL

The strategies and requirements of RC practices in RL involve the strategic practices of RC, and requirements of RC, including, economic, operational, organisational, market-related and SC requirements, which can contribute to effective RC for the management of consumer returns. Table 6.34 provides an overview of the findings related to the *strategies and requirements of RC practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Market-related and SC requirements	***Relationship management with external RL parties***	None	• *"Support is needed to commit the proper level of resources necessary for RL; this includes […] effectively managing relationships with partners and customers."* (Huscroft *et al.* 2013b:315)

Source: Compiled by the researcher

Table 6.34 indicates the strategies and requirements of RC practices needed to manage consumer returns, which will be discussed in subsequent sections.

6.9.1.1.1 Strategies of RC practices in RL

RC strategies in RL include (1) prioritising RC for RL, (2) strategic considerations for RC, (3) strategic mapping RL, (4) strategic classification and identification of resources for RL, (5) strategic allocation of sufficient and appropriate resources for RL, (6) financial, IT and infrastructure, RL process, human and external RC, (7) strategic combination of resources for RL, (8) strategic utilisation of committed resources and (9) strategic sharing RC.

Before organisations can practise RC in RL effectively, RC in RL must be *prioritised,* meaning that organisations must focus on developing a RC strategy for RL. Additionally, organisations need to *strategically consider* certain aspects of *RC* in RL, including the characteristics of RL, being different from FL, requiring additional RL-specific resources and the infrastructure requirements in RL, including transport, facilities and IT or any other resources needed for effective RLM. Similarly, *strategic mapping* of *RL* may involve identifying RL processes, parties and networks, which can guide organisations with effective allocation of resources for RL.

After the considerations and mapping of RL for RC, organisations can start with the *strategic classification* and *identification* of *resources* for RL. Classifying the resources may help organisations to identify the type of resources needed for RL, for example, property-based and tangible RC (such as assets, human resources and IT) and knowledge-based and intangible RC (such as expertise, capabilities, trust and reputation). Accordingly, organisations must *strategically allocate sufficient* and *appropriate resources for RL,* which can be critical for effective and efficient RL processes and practices (see section 6.9.1.2).

The specific types of RC in RL can relate to some of the RL processes (e.g. processing, inspection and disposition) and RL practices, including finance, IT, network and facilities, disposition, staff and management, in/outsourcing, CI and SCI, identified from the QCA of RL literature. Particularly, *financial RC* associate with the willingness of the organisation to provide financial support for RL processes and practices, which can link with financial practices in RL (see section 6.9.2). Additionally, *IT* and *infrastructure RC* involves technological (such as IT for RL) and infrastructure (such as

facilities and equipment) RC needed to manage RL processes, linking with the IT (section 6.3) and facility/location (section 6.8) practices in RL.

RL process RC can involve technical (specialised) RC that can be applied to specific RL processes, for example, RC for inspection (e.g. specialised testing equipment) and disposition options (e.g. repair tools/equipment and facilities), which can link with RL processes (chapter 5) and facility/location and disposition practices (section 6.6) in RL. *Human RC* for RL involves (1) managerial RC, like management skills and allocating managers and supervisors for RL, which can relate to RL insourcing (section 6.5) and management and staff practices (section 6.9.5), and (2) staff RC, like trained/qualified staff (e.g. inspectors and repair technicians) and allocating staff directly/indirectly involved in RL (e.g. receiving clerks, creditors and finance, customer service, IT and warehouse staff), which links with various RL processes (see chapters 4 and 5) and practices (e.g. IT, facility/location, insourcing, CFI, CI and staff practices).

Lastly, *external RC* can include intangible RC that organisations can use for CI and SCI practices (sections 6.4.2 and 6.4.1), which focusses on relationships with key stakeholders, including consumers and SC partners. However, external RC can also involve external human resources (such as couriers or 3PRL providers) forming part of the RL outsourcing practices (section 6.5). Essentially, organisations must match their RL processes and practices to their RC strategy, ensuring effective RLM of consumer returns. Subsequently, organisations must *strategically combine* various *resources for RL,* demonstrating that individual RC for RL can be insufficient for effective and efficient RL processes and practices. Likewise, organisations must *strategically utilise committed resources* for RL, avoiding wastage of valuable resources and ensuring optimal outcomes of RC practices in RL (see section 6.9.1.2).

Finally, associating with SCI practices, organisations can *strategically share committed resources*, for example, sharing knowledge, expertise and capabilities (see section 6.4.1) with SC partners, which in return may grant them access to the committed resources of SC partners.

6.9.1.1.2 Requirements of RC practices in RL

The requirements of RC practices in RL include (1) economic, (2) operational, (3) organisational, and (4) market-related and SC requirements, which can relate to the RC types identified in the RC strategies (section 6.9.1.1.1). For instance, relating to financial, IT, infrastructure and human RC, the *economic requirements* for RC in RL can include *investment* in capital, training and IT, and *financial support* for committed resources (such as staff and infrastructure resources). Accordingly, RC can increase *costs,* meaning that organisations must be willing to incur additional expenses for RL operations.

The *operational requirements* of RC practices involve focus on RL process efficiency and facility/location practices. *Focusing on RC on RL process efficiency* means that organisations must ensure that resources for RL must be directed towards improving RL processes, emphasising the need to match RC to RL processes (see section 6.9.1.1.1). For example, an organisation that commits human resources must ensure that training focusses on helping staff to perform RL tasks efficiently (such as training staff to become product specialist to conduct efficient inspection activities). Since investment requirements for RC can be high, organisations can utilise *facility/location* practices to support RC in RL. Specifically, organisations can integrate RL/FL through integrated facility/location practices or utilise centralised facilities/locations, which can reduce the RC requirements for RL. For example, organisations can use the same facilities and human resources for RL and FL operations or use fewer RL facilities (in centralisation) that reduce physical infrastructure RC requirements.

RC in RL involves several *organisational requirements,* including (1) RC focus on RL capabilities, (2) management involvement, commitment and support, (3) internal communication, and (4) efficient, trained and skilled human resources. Like the need to focus RC on RL process efficiency, organisations must ensure that *RC focusses on RL capabilities,* meaning that financial, IT, infrastructure, technical and human RC must be aimed at developing RL capabilities, emphasising the importance of matching RL practices with RC to ensure effective RLM of consumer returns.

Similarly, *management involvement, commitment and support* can be critical for effective RC in RL. Particularly, like other RL practices (e.g. CI, in/outsourcing, PM and facility/location practices), managers must be involved in RC and responsible for assigning appropriate resources for RL. Moreover, managers must be committed to RC in RL and support other requirements (e.g. investments in resources) for effective RC in RL, which can address the organisational barrier of the lack of management support in RL (see section 2.3.3).

Internal communication can be an important requirement for human RC since staff/departments must be aware of the importance of RC for effective RL processes, pointing to the need for CFI practices (see section 6.4.3) for RC in RL. Additionally, effective RC requires *efficient, trained* and *skilled human resources*, which can be demonstrated through human RC of management and staff skills (RC strategy) and the economic requirement of investment in staff training and education for RC.

Finally, the *market-related* and *SC requirements* involve relationship management with consumers and SC partners, which can be important to support effective RC. Accordingly, SCI and CI practices (see sections 6.4.1 and 6.4.2) can be important requirements of RC, emphasising the external intangible RC of trust and reputation with key RL parties and strategic sharing of resources as part of the RC strategies (see section 6.9.1.1.1).

In the next section, the outcomes of RC practices in RL will be analysed and discussed.

6.9.1.2 Outcomes of RC practices in RL

The outcomes of RC practices involve the benefits associated with the effective implementation of RC strategies and requirements, which can be important for the effective management of consumer returns. The outcomes of RC practices in RL included (1) economic, (2) operational, (3) organisational, (4) environmental and social, (5) market-related, and (6) SC outcomes.

Table 6.35 provides an overview of the findings related to the *outcomes of RC practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.35 Findings related to outcomes of RC practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Increase financial RC***	None	• *"[…] to provide adequate training […] to all members of its organisation to maximise […] financial-resource commitment."* (Sharif *et al.* 2012:2528)
	Increase RL funding	None	• *"Financial resources by definition are necessary to fund a strategic process such as reverse logistics."* (Jack *et al.* 2010:232)
	Financial management of RL	None	• *"Human resource […] Finance in charge […] economic counterpart, which is managed by that person […]."* (Hernández *et al.* 2011:84)
	Improve economic performance	None	• *"[…] resource commitment can improve a firm's economic […] performance."* (Skinner *et al.* 2008:533) • *"[…] firms should invest more resources […]; for instance, improving RL information systems and technology would lead to […] economic performance outcomes."* (Huang & Yang, 2014:635)
	Reduce costs	None	• *"While financial, technical and managerial resources are used to […] to reduce cost when these returns are handled in an efficient manner."* (Jack *et al.* 2010:242)
	Reduce investment requirements		• *"Centralization [sic] avoids multiple investments in specialized [sic] resources."* (Gobbi, 2011:785)
Operational outcomes	***Address operational barriers***	None	• *"[…] managerial resource commitments evidenced through communication and training needs are seen to be very important for the RL operation, since it helps the firm overcome the complexity of the reverse logistics processes […]."* (Sharif *et al.* 2012:2528)
	Facilitate IT implementation	None	• *"[…] human resource allocation because well-trained individuals are required to ensure that the technology is implemented appropriately."* (Morgan *et al.* 2016:307)
	Support RL infrastructure	None	• *"Finance is needed to support the infrastructure […] requirements of reverse logistics processes."* (Ravi *et al.* 2008:4857) • *"[…] allocations of capital and resources for the construction of reclamation and redistribution facilities […]."* (Sarkis *et al.* 2010:348)
	Facilitate and support RL processes	None	• *"With sufficient resources, processes can be put in place to provide immediate returns authorization [sic], credit processing, and charge-back handling."* (Skinner *et al.* 2008:534) • *"[…] manpower and tools are important in executing related operations of reverse logistics."* (Ho *et al.* 2012:33) • *"[…] match resources to technologies and infrastructures that can support the reverse-logistics operation (e.g. technological commitment)."* (Sharif *et al.* 2012:2519)
	Improve RL process efficiency and effectiveness	Sharma and Singh (2013:34)	• *"RC are indeed crucial factors that lead to the development of effective and efficient RL operations."* (Sharif *et al.* 2012:2527) *RC in general* • *"While financial, technical and managerial resources are used to […] to handle these returns, they also facilitate […]in an efficient manner."* (Jack *et al.* 2010:242) • *"[…] by investing in resources […] in RL processes can provide […] the capability of taking back returned items quickly and crediting them in a timely manner […]."* (Olorunniwo & Li, 2011:3)
	Improve RL operational performance	None	• *"[…] resource commitment can improve a firm's […] operational performance."* (Skinner *et al.* 2008:533) • *"RC can improve the performance of an RL process by eliminating parallel processes and work duplication […]."* (Sharif *et al.* 2012:2528)
Organisational outcomes	***Understand the value of RL***	Agrawal *et al.* (2016a:936)	• *"[…] managerial resources and technology are also critical for the success of RL. Availability and effective utilization [sic] of both types of resources is essential for exploring the true value potential of RL."* (Agrawal *et al.* 2016d:20)
	Increase and	None	• *"[…] to provide adequate training […] to all members of its organisation to maximise*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	support human RC		*its management and financial-resource commitment."* (Sharif *et al.* 2012:2528) • *"Finance is needed to support the […] manpower requirements of reverse logistics processes."* (Ravi *et al.* 2008:4857)
	Effective RC for RL	None	• *"Mapping of the reverse logistics process […] should guide the allocation of resources."* (Morgan *et al.* 2016:307) • *"Support is needed to commit the proper level of resources necessary for RL; this includes proper funding, personnel allocation, employee training, and effectively managing relationships with partners and customers."* (Huscroft *et al.* 2013b:315)
	Facilitate RL implementation	Bernon and Cullen (2007:44) Khor and Udin (2013:72)	• *"The implementation of internal RL programs often involves significant allocations of capital and resources […]."* (Sarkis *et al.* 2010:348) • *"[…] financial, technical and managerial resources are used to implement the reverse logistics […]."* (Jack *et al.* 2010:242) • *"Human resource is crucial for RL implementation."* (Agrawal *et al.* 2016d:20)
	RL innovation and development of RL capabilities	Bernon and Cullen (2007:44) Skinner *et al.* (2008:534)	• *"Resource commitments to reverse logistics thus should be a priority […] through new value creation […]."* (Hsu *et al.* 2016:95) • *"[…] developing a reverse logistics competency may require firms to commit specific resources to their efforts."* (Morgan *et al.* 2016:307) • *"Resource commitment consists of the financial, technical, and managerial resources that are committed […] Each of these resources are necessary for reverse logistics capabilities […]."* (Jack *et al.* 2010:232) • *"[…] capabilities that are built upon effective use of tangible and intangible resources […]."* (Lau & Wang, 2009:450) • *"[…] adequate training […] to maximise its management and financial-resource commitment […] this may lead to the increasing of operational costs in order to develop RL capability within the organisation […]."* (Sharif *et al.* 2012:2528)
	Improve RL performance and effectiveness	Sharma and Singh (2013:34)	• *"Resource commitments to reverse logistics thus should be a priority […] because of their potential for enhancing performance […]."* (Hsu *et al.* 2016:95) • *"Since the reverse logistics is different from conventional logistics and will require some additional resources to improve […] performance of the firm."* (Tiwari, 2013:241) • *"Committing significant resources to a reverse logistics program may very well be the key to realizing [sic] superior performance."* (Skinner *et al.* 2008:533) • *"[…] commitment in technological, managerial, and financial resources would help firms to enhance RL performance."* (Sharif *et al.* 2012:2523) • *"IT should be combined with additional, complimentary firm resources in order to reap maximum effectiveness […]."* (Huscroft *et al.* 2013a:238)
	Facilitate RLM and decision-making	None	• *"Human resource […] Reverse logistics supervisor […] manages the boxes/products to follow their movements, requests more and knows their current state […] Logistics staff […] relating to management of transport, boxes and the order requests […] Transport supplier […] in charge of the transport management process."* (Hernández *et al.* 2011:84) • *"Management skills refer to the knowledge and capabilities to manage the facilities, equipment, people, and information involved in the different reverse logistics systems."* (Lau & Wang, 2009:461) • *"[…] resource commitment would also help managers make appropriate decisions in procurement, inventory level […] and sales and marketing plans (e.g. recognising brand loyalty and customer satisfaction)."* (Sharif *et al.* 2012:2528)
	Facilitate internal information sharing	None	• *"Human resource […] Logistics and system department manager […] this manager transmits […] information to the personnel […]."* (Hernández *et al.* 2011:84)
	Successful RL function	None	• *"These reverse flows differ from standard, outbound operations and need special handling, likely requiring additional resource allocations […] Allocating sufficient resources […] constitutes one of the principle antecedents of strong reverse logistics programs."* (Hsu *et al.* 2016:95) • *"Knowledge-based resources including managerial resources and technology are also critical for the success of RL."* (Agrawal *et al.* 2016d:20) • *"[…] management commitment in terms of […] financial and personnel resources […] in RL are important to the success of the firm […]."* (Li & Olorunniwo, 2008:384) • *"[…] commitments evidenced through communication and training needs are seen to be very important […] upholding the fact that resource commitment is one of the crucial elements that contribute to the success and performance of RL programmes […]."* (Sharif *et al.* 2012:2528)
Environmental and social outcomes	***Environmental protection***	None	• *"[…] firms should invest more resources […]; for instance, improving RL information systems and technology would lead to more sustainable environmental protection […]."* (Huang & Yang, 2014:635)
	Improve corporate image	None	• *"Resource commitments to reverse logistics thus should be a priority […] offering strategic means to develop […] positive firm images."* (Hsu *et al.* 2016:95)
Market-related outcomes	***Competitive advantage***	None	• *"IT should be combined with additional, complimentary firm resources in order to reap maximum effectiveness and set the stage for achieving competitive advantage […]."* (Huscroft *et al.* 2013a:238)
	Improve customer service and responsiveness	None	• *"Since the reverse logistics is different from conventional logistics and will require some additional resources to improve the service quality and performance of the firm."* (Tiwari, 2013:241) • *"[…] managers focus their attention on prompt and accurate service to customers by assigning additional resources for processing."* (Genchev, 2009:145) • *"[…] adequate training […] to maximise its management and financial-resource*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			commitment. Although this may lead to the increasing of operational costs […] this indeed indirectly provides a better and longer running responsiveness back to customers […].” (Sharif *et al.* 2012:2528)
	Improve consumer satisfaction and loyalty	None	• *“[…] by investing in resources to build customer loyalty and satisfaction.”* (Olorunniwo & Li, 2011:3) • *“[…] training, and capital investments focused upon increased returns processing speed should be rewarded in the marketplace with more loyal customers who purchase more, and with greater frequency.”* (Griffis *et al.* 2012:291)
	Facilitate CI	None	• *“Resource commitments to reverse logistics thus should be a priority […] offering strategic means to develop lasting linkages with customers […].”* (Hsu *et al.* 2016:95)
SC outcomes	***SC sustainability***	None	• *“These reverse flows differ from standard, outbound operations and need special handling, likely requiring additional resource allocations […] Allocating sufficient resources to support sustainable supply chain initiatives […].”* (Hsu *et al.* 2016:95)
	Facilitate SCI	None	• *“Human resource […] Computer experts in charge […] support the interoperability between the main customer and […] supplier by attending the related ERP systems […].”* (Hernández *et al.* 2011:84)
	Enhance SC trust and transparency	None	• *“Resources committed to returns may also be combined with efforts to improve other supply chain concepts such transparency.”* (Morgan *et al.* 2016:307) • *“[…] engendering trust among supply-chain participants by allowing companies to share their committed resources and information in order to achieve supply chain goals and objectives.”* (Sharif *et al.* 2012:2523)
	Improve SC efficiency	None	• *“Investing in technology can improve reverse logistics capabilities allowing for more efficiency between the retailer and the supplier.”* (Jack *et al.* 2010:232)

Table 6.35 presents numerous outcomes of RC practices in RL, including economic, operational, organisational, environmental and social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.9.1.2.1 Economic outcomes of RC practices in RL

The *economic outcomes* of RC practices in RL can include (1) increasing financial RC in RL, (2) increasing RL funding, (3) financial management (FM) in RL, (4) enhancing economic performance, (5) reducing cost, and (6) reducing investment requirements. Specifically, through the organisational requirement of trained human resources, *financial RC in RL* (RC strategy) can be *increased*, which in turn can *increase RL funding.*

Human RC in terms of specific staff for RL, like financial staff, can be important for *FM in RL*, and subsequently can be important for FM practices in RL (section 6.9.2). Additionally, RC practices in RL can *enhance economic performance* in RL, especially if organisations invest in resources (such as IT) (economic requirement), implying that a cost-benefit analysis can be important in RC. Similarly, organisations can *reduce costs* through RC of financial, RL process (technical) and human (managerial) resources, which associates with improvements in RL efficiency. Lastly, organisations can *reduce investment requirements* in RC through the operational requirement of facility/location practices (centralisation), demonstrating an important link between RC and facility/location practices in RL.

6.9.1.2.2 Operational outcomes of RC practices in RL

The operational outcomes of RC in RL include (1) addressing operational barriers, (2) facilitating IT implementation, (3) supporting infrastructure, (4) facilitating and supporting RL processes, (5) improving RL process efficiency and effectiveness, and (6) improving operational performance. Through managerial (human) RC and the organisational requirements of internal communication and trained human resources, organisations can address the *operational barriers in RL*, which associates with the complexities of product returns (uncertainties in timing, quality and quantity) (see section 2.3.2).

Moreover, part of the operational barriers in RL can be a lack of IT and infrastructure barriers (section 2.3.2), which can be addressed through RC practices. Particularly, organisations can *facilitate IT implementation* through human RC (strategy) and trained staff (organisational requirement), showing the importance of combining resources for effective RLM (see section 6.9.1.1.1). Additionally, allocating sufficient and appropriate resources for RL, financial RC (RC strategies) and financial support (economic requirement) can *support RL infrastructure,* which can be essential for efficient and effective RL processes (also see section 6.8).

Furthermore, allocating sufficient and appropriate resources and committing IT, infrastructure and human resources for RL (RC strategies) can *facilitate* and *support RL processes.* Similarly, RC in RL can *improve RL process efficiency* and *effectiveness,* especially through financial RC and investment (economic requirement), RL process RC and managerial (human) RC (strategies). Essentially, RC in RL can *improve RL operational performance* by eliminating inefficient and duplicate RL activities.

6.9.1.2.3 Organisational outcomes of RC practices in RL

Several organisational outcomes associate with RC in RL, which include (1) understanding RL value, (2) increasing and supporting human RC, (3) effective RC in RL, (4) facilitating RL implementation, (5) RL innovation and developing RL capabilities, (6) improving RL performance and effectiveness, (7) facilitating RLM and decision-making, (8) facilitating internal information sharing (CFI), and (9) successful RL function.

Allocating appropriate and sufficient resources for RL, IT and managerial RC and strategic utilisation of committed resources can help organisations to *understand* the true *value of RL,* which can address the organisational barriers of a lack of awareness and understanding of RL (see section 2.3.3). Similarly, through financial RC and training and education efforts (organisational requirement) organisations can bring awareness to RL and *increase* and *support human RC,* meaning that sufficient staff and managerial resources will be available for RL.

Organisations can ensure *effective RC* for *RL* by mapping RL (RC strategy) and through the requirements of financial support (economic), efficient and trained human resources (organisational) and managing relationships with consumers and SC parties (market-related and SC requirements). Additionally, allocating appropriate and sufficient resources, and committing financial, technical and human resources (RC strategies) can *facilitate RL implementation,* which can be critical for effective RLM.

Moreover, organisations can achieve *RL innovation* and *develop RL capabilities* through prioritising RC, allocating appropriate and sufficient resources, financial, technical and human RC, strategic utilisation of committed resources (RC strategies), cost (economic requirement), and trained human resources (organisational requirement). Similarly, prioritising RC, considering the requirements of RL for RC, allocating appropriate and sufficient resources, committing financial, technical, IT and human resources, and strategic combination of committed resources (RC strategies), can *improve RL performance* and *effectiveness*, emphasising economic and operational performance improvements of RC in RL (see sections 6.9.1.2.1 and 6.9.1.2.2).

Additionally, human RC (management skills, managerial staff and operational staff), and external RC (utilising 3PLs) can enable organisations to manage facilities, staff, information and RL processes, which in turn, *facilitate RLM* and managerial *decision-making*. Likewise, human RC (allocating managers for RL) can *facilitate internal information sharing*, contributing to effective CFI (see section 6.4.3) needed to manage consumer returns.

Essentially, organisations can expect a *successful RL function* through the RC strategies, like considerations for RC, classifying, identifying and allocating sufficient resources for RL, and committing IT, infrastructure and human resources for RL, and through management commitment (organisational requirement).

6.9.1.2.4 Environmental and social outcomes of RC practices in RL

Although RC in RL mostly provide financial, operational and organisational benefits, organisations may realise environmental and social benefits through RC. Specifically, organisations facilitate *environmental protection* with investment and commitment of IT resources, which reemphasise the importance of IT for RL.

Additionally, the *social outcome* of RC involves improvements in *corporate image*, which organisations can realise through prioritising RC as a RL practice. Consequently, RC in RL may contribute to the environmental and corporate responsibility drivers of RLM (see section 2.3.1), which can be important for sustainable business practices.

6.9.1.2.5 Market-related outcomes of RC practices in RL

RC in RL involves several market-related outcomes, including (1) a competitive advantage, (2) customer service and responsiveness, (3) consumer satisfaction and loyalty, and (4) CI. Particularly, organisations can obtain a *competitive advantage* by combining committed resources in RL (RC strategy), showing the importance of identifying and allocating various and sufficient resources for RL (see section 6.9.1.1.1). Additionally, organisations can *improve consumer satisfaction* and *loyalty* through the RC requirements of investing in resources (economic) and focussing RC on RL process efficiency (operational).

Moreover, organisations can *improve customer service* and *responsiveness* by considering the difference between RL and FL (RC consideration), allocating appropriate and sufficient resources in RL, committing financial, RL process and human (managerial) resources (RC strategies), incurring cost (e.g. operational costs) (economic requirement), involving management, and training human resources (organisational requirements). Finally, despite the RC requirement of managing external relationships with consumers (see section 6.9.1.1.2), prioritising RC in RL (strategy) can *facilitate* with *CI* and consumer relationship development, emphasising the importance of RC for customer service, satisfaction and loyalty.

6.9.1.2.6 SC outcomes of RC practices in RL

The SC outcomes of RC practices in RL involve SC sustainability, SCI, SC trust and transparency and SC efficiency. Particularly, through the RC strategies of considerations for RC (e.g. recognising that RL needs other resources) and allocating appropriate and sufficient resources for RL, organisations can promote *SC sustainability*, which can be important for all the parties in the SC.

Additionally, organisations can *facilitate SCI* through human RC (such as allocating IT staff for RL), for example, IT staff can help manage the IT systems (e.g. ERP) needed for SC information sharing. Moreover, organisations can *enhance SC trust* by sharing committed resources, improve *SC transparency* by combining resources (such as IT and human RC) and *improve SC efficiency* by utilising and investing in IT resources (economic requirement). Consequently, RC in RL can be critical for effective SCI practices in RL, reemphasising the relationship between RC and integration practices in RL (also see sections 6.9.1.2.3 and 6.9.1.2.5).

Essentially, RC strategies and requirements in RL can be important for economic, operational, organisational, environmental and social, market-related and SC outcomes, contributing to the effective RLM of consumer returns. In the next section, RC practices in RL will be concluded with a description, conceptual framework and summary of findings for RC practices to manage consumer returns.

6.9.1.3 Description, conceptual framework and summary of findings for RC practices to manage consumer returns

This section concludes RC practices in RL with a description, conceptual framework and summary of the findings related to RC practices in RL. Based on the findings presented in section 6.9.1, RC practices in RL can be important for the management of consumer returns, and will be described as follows:

> RC practices for the management of consumer returns involve (1) RC strategies, including prioritise RC for RL, strategic considerations, mapping RL, classification and identification of resources for RL, allocation of sufficient and appropriate resources for RL, financial, IT, infrastructure, RL process, human and external RC, strategic combination of resources for RL, strategic utilisation of committed resources and strategic sharing RC, and (2) RC requirements, including economic requirements (investment, financial support and cost), operational requirements (RC focus on RL process efficiency and facility/location practices), organisational requirements (RC focus on RL capabilities, management involvement, commitment and support, internal communication, and efficient, trained and skilled human resources), and market-related and SC requirements (relationship management with external parties).
>
> The RC strategies and requirements can result in several outcomes, including (1) economic outcomes (increasing financial RC in RL, increasing RL funding, FM in RL, enhancing economic performance, and reducing cost and investment requirements), (2) operational outcomes (address operational barriers, facilitate IT implementation, infrastructure support, facilitate and support RL processes, improve RL process efficiency and effectiveness, and improve operational performance), (3) organisational outcomes (understand RL value, increase and support human RC, effective RC in RL, facilitate RL implementation, RL innovation, develop RL capabilities, improve RL performance and effectiveness, facilitate RLM and decision-making, facilitate internal information sharing (CFI), and successful RL function), (4) environmental and social outcomes (environmental protection and corporate image), (5) market-related outcomes (competitive advantage, increase consumer service, responsiveness, satisfaction and loyalty, and facilitate CI), and (6) SC outcomes (SC sustainability, SCI, SC transparency and trust and improve SC efficiency).

Figure 6.27 provides a conceptual framework of RC practices, including RC strategies, requirements and related outcomes to manage consumer returns. Particularly, the framework illustrates the links between RC strategies, requirements and outcomes, demonstrating a cost and benefit relationship. The links between the strategies and requirements can be demonstrated by the economic requirement of investment, which links with the RC strategy of allocating sufficient resources for RL, the types of RC (such as IT, infrastructure and human RC), operational requirement of facility/location practices and the organisational requirement of skilled/trained staff. Additionally, the RC strategy of strategic sharing of resources can link with the market-related and SC requirements of relationship management with external parties.

Nonetheless, the main aim of the framework involves the links between the RC strategies, requirements and outcomes, which can be important for the effective management of consumer returns. Subsequently, the most significant RC strategies and requirements (associated with the most outcomes) and RC outcomes (associated with the most RC practices) are emphasised by *italics*, which will be elaborated upon in Table 6.36. Like disposition and PM practices, RC practices represent one concept, which means that the summary of findings will be presented differently from the practice categories that consist of subcategories (e.g. IT, integration and facility/location). Consequently, the summary of

findings and managerial implications will focus on the most significant strategies, requirements and outcomes in RC.

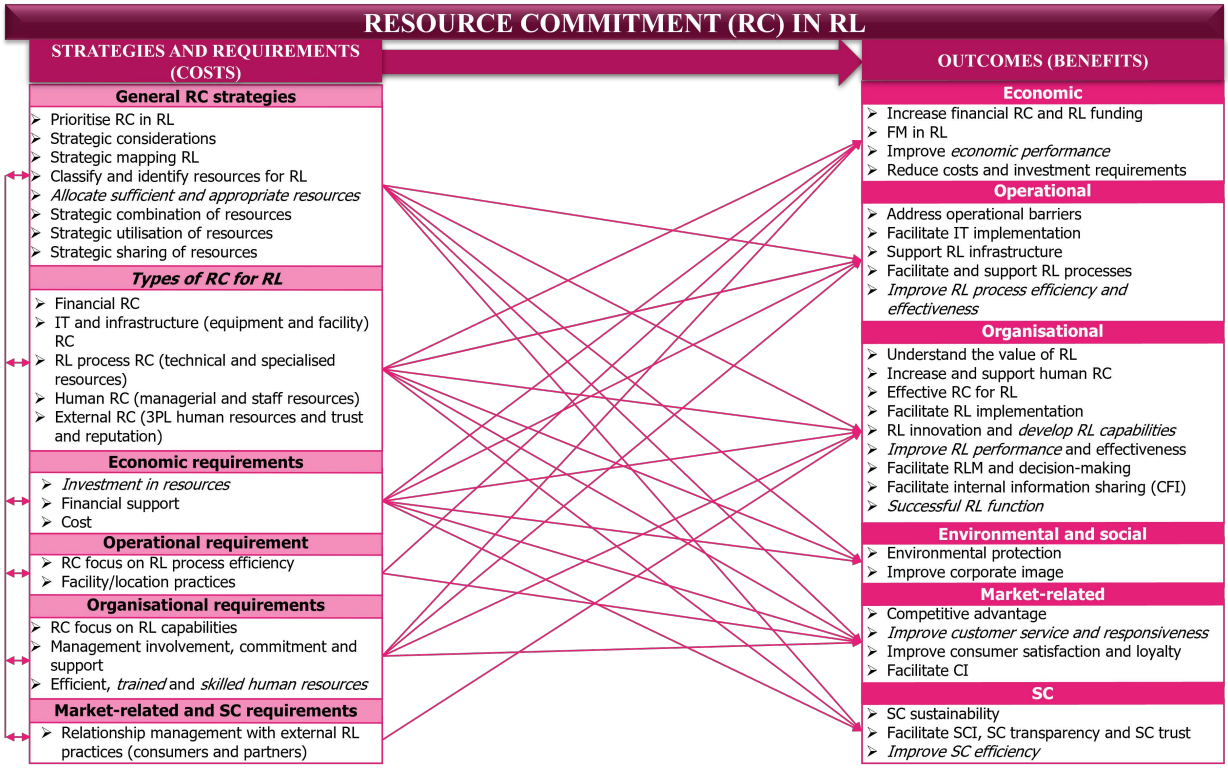

Figure 6.27 Conceptual framework of RC practices to manage consumer returns
Source: Compiled by the researcher

Based on Figure 6.27 and the discussions given in section 6.9.1, Table 6.36 provides a summary of the findings and managerial implications for RC practices to manage consumer returns.

Table 6.36 Summary of findings and managerial implications for RC practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	•RC in RL involves several strategies, including prioritising RC, strategic considerations, mapping RL, classification and identification of resources for RL, allocation of sufficient and appropriate resource for RL, financial RC, IT and infrastructure RC, RL process RC, human RC, external RC, and strategic utilisation, combination and sharing of committed resources •The RC strategies, especially types of committed resources, associate with all the RC outcomes, including economic, operational, organisational, environmental, social, market-related and SC outcomes. •The RC strategies of allocating sufficient and appropriate resources, financial RC and human RC can be the most beneficial for RL •The least significant RC strategies, with limited impact on the outcomes, include, mapping RL, classifying resources for RL, external RC and sharing committed resources •RC practices in RL involves several requirements, including economic, operational, organisational, market-related and SC requirements •The economic requirements of RC in RL associate with all the outcomes, including economic, operational, organisational, environmental and social, market-related and SC outcomes. •From the economic requirements of RC practices, investment in resources can lead to the most benefits •The organisational requirements of RC practices associate with most outcome categories, including economic, operational, organisational and market-related outcomes •From the organisational requirements of RC practices, trained and skilled human resources lead to the most benefits	•Organisations must prioritise RC for RL and develop a RC strategy that involves strategic considerations, RL mapping, classifying, identifying and allocating sufficient and appropriate resources for RL, including financial, IT, infrastructure, RL process, human and external RC, and utilising, combining and sharing committed resources •Organisations that seek various economic, operational, organisational, environmental, social, market-related and SC benefits in RL must focus on allocating sufficient and appropriate resources, financial RC and human RC for RL •Organisations must focus on investment in resources to achieve optimum RC benefits in RL •For effective RC in RL, organisations must focus on training and educating staff (human resources)

	•The least significant requirements, with limited impact on the RC outcomes, include the market-related and SC requirements of relationship management with external RL parties	
Outcomes	•RC practices in RL involve economic, operational, organisational, environmental, social, market-related and SC outcomes •The most significant outcomes of RC practices in RL involves organisational and market-related, followed by economic outcomes •The least significant outcomes of RC practices in RL involves environmental and social outcomes •The most significant economic outcome of RC practices includes improving economic performance •The most significant operational outcome of RC practices in RL includes improving RL process efficiency and effectiveness •The most significant organisational outcomes of RC practices in RL include, developing RL capabilities, improving RL performance and successful RL function •The most significant market-related outcome of RC practices in RL includes improving customer service and responsiveness •The most significant SC outcome of RC practices in RL includes SC efficiency	•Organisations that seek economic, operational, organisational, environmental, social, market-related and SC benefits in RL can implement RC practices in RL •Organisations that seek to improve economic performance can consider RC practices in RL •Organisations that experience inefficiencies in the RL process can consider RC practices in RL •Organisations that seek to develop RL capabilities and improve RL performance must consider RC practices in RL •For a successful RL function, organisations must consider RC practices in RL •Organisations that seek to increase consumer service and responsiveness can consider RC practices in RL •Organisations that experience inefficiencies in the SC can consider RC practices in RL •For the effective management of consumer returns, organisations must identify/implement/consider RC strategies, requirements, and outcomes.

Source: Compiled by the researcher

Table 6.36 provides an in-depth understanding into the value of RC practices as part of the RL practices for consumer returns. Organisations can use the RC strategies, requirements and related outcomes for effective RC in RL, which can contribute to the effective RLM of consumer returns. RC in RL will further be explored in the interviews with industry experts (chapter 8).

In the next section, final management (FM) practices in RL will be presented, discussed and analysed.

6.9.2 Financial management (FM) practices to manage consumer returns

FM practices in RL focusses on understanding and managing RL costs and profits, which can be critical to manage consumer returns. Accordingly, Huscroft *et al.* (2013b:317) asserted that RL cost can significantly impact organisational performance and return on investment (ROI), making FM in RL an integral part of RLM. Additionally, FM in RL can be important for managing consumer returns since retailers must absorb consumer return cost (Ahsan & Rahman, 2016:611). Despite this importance, Figure 6.3 showed that limited RL literature (in the QCA) focusses on FM practices in RL, demonstrating a gap in this area of RL research and implying that FM associate with RL might be less popular in practice.

Although RL cost can mirror forward logistics (FL) cost (e.g. operational cost, inventory cost, infrastructure cost and transportation cost) (Kumar *et al.* 2016:3), RL involves additional cost that associates with product returns and the loss of income (e.g. refund the consumer and pay for return cost), which not only explain the economic barriers in RL but also the lack of management commitment and attention to RL (see section 2.3).

The aim of the subsequent sections is to identify and discuss FM strategies, requirements and outcomes and to provide a description, conceptual framework and summary of the findings for FM practices in

RL, which can help organisations to understand and manage RL costs for the management consumer returns.

6.9.2.1 Strategies and requirements of FM practices in RL

The FM strategies in RL involve general FM strategies and FM strategies for RL cost. The FM requirements in RL involve economic, organisational and SC requirements, which, in combination with the FM strategies, can contribute to effective FM in RL needed to manage consumer returns. Table 6.37 provides an overview of the findings related to the *strategies and requirements of FM practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.37 Findings related to strategies and requirements of FM to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
General FM strategies	***Strategic considerations for FM***	Ahsan and Rahman (2016:611) Badenhorst and van Zyl, (2015:149) Dowlatshahi (2010a:1370) Janse *et al.* (2010:508) Lambert *et al.* (2011:565)	• *"Financial considerations comprise investment, profitability, and cost […]."* (Lau & Wang, 2009:460) • *"[…] the fundamental questions may be 'Will pure maximisation of pecuniary profit distort the RLM processes […]' or 'If the recovery revenue cannot cover the cost of RLM operations, what should RLM do?'."* (Tsai & Hung, 2009:5392) • *"[…] managers must consider […] possible measurements concerning reverse logistics […]."* (Hsueh & Lin, 2015:164)
	Develop and use of financial and accounting statements for RL	None	• *"The company also introduced a financial statement that recorded the cost of the returns process, the value of returned goods and the cash recovered through the recovery process."* (Bernon & Cullen, 2007:50) • *"[…] use of an accounting document […] to promote the recovery of cash through the refurbishment process."* (Bernon & Cullen, 2007:52)

Source: Compiled by the researcher

Table 6.37 indicates the FM strategies, including general FM strategies and FM strategies for RL costs, and requirements of FM practices to manage consumer returns, which will be discussed in subsequent sections.

6.9.2.1.1 General strategies of FM practices in RL

The general FM strategies in RL include (1) strategic considerations for FM, (2) developing and using financial and accounting statements for RL, (3) strategic application of accounting techniques (4) strategic utilisation of costing techniques and models, (5) strategic understanding of RL profits and earnings, (6) performing cost and value estimations, (7) performing a cost-benefit analysis, and (8) a benefit-driven strategy.

Certain *strategic considerations for FM* in RL can be important, including investment, profits, costs, the party responsible for paying RL costs and performance measures (PM elements). Particularly, organisations need to consider the investment and cost of RL versus the profits obtained through RL disposition (recovery). Additionally, organisations must consider situations where investment and RL cost exceeds RL profits and the impact this may have on RLM. Lastly, PM (performance measurement)

in RL can play a role in the FM of RL and, accordingly, must be considered in the FM strategy of an organisation.

Accounting can play an important role in the FM of RL (see section 6.9.2.2), which necessitates (1) the *development and use financial and accounting statements* and (2) the *strategic application of accounting techniques and systems for RL*. Furthermore, *strategic utilisation of cost techniques for RL*, including activity-based costing (ABC), quality costing and lifecycle costing or total cost of ownership (TCO), can facilitate FM in RL. The most common technique, ABC involves the costs for each RL process and activity. Quality costing can be less direct and entails comparing return gatekeeping/avoidance costs with return costs (such as return prevention cost, inspection costs and internal and external failure costs), which can be used for trade-offs in RL.

Lifecycle costing or TCO involves the cost related to the purchasing a product from the supplier, cost related to holding the product, cost related to selling the product, the cost related to receiving a product return and the cost related to product reuse, recovery and disposal. TCO also form an important part of PM in RL, emphasising the importance of considering PM for FM in RL. Complementing the costing techniques, organisations can utilise *cost models*, which involves RL cost simulations and estimations to manage and minimise RL costs.

For successful application of financial and accounting statements and techniques organisations need a *strategic understanding of RL profits and earnings*, emphasising the importance of considering RL profits for FM. Organisations can gain a better understanding of RL profits and earnings by defining RL profits (e.g. any profits from RL processes) and separating non-profit and for-profit RL processes and activities. Furthermore, by *performing* accurate and detailed *costs* and *value estimations*, organisations can identify RL costs, the economic benefits of RL activities (such as disposition and recovery activities) and potential profits and earnings.

Similarly, organisations can *perform a cost-benefit analysis* for FM in RL, using the quality costing technique or comparing the cost of established RL processes and practices with the costs of new/alternative RL processes and practices. Additionally, organisations can perform a long-term cost-benefit analysis, which includes the initial set-up cost of RL (e.g. investment and infrastructure) (short-term expenses) and the long-term outcomes/benefits of effective RL processes and practices.

Finally, like disposition, outsourcing and facility/location practices (see sections 6.5.1, 6.6.1 and 6.8) organisations can focus on cost minimisation as part of a *benefit-driven FM strategy*, which can be important for the effective management of consumer returns.

6.9.2.1.2 FM strategies for RL costs

The FM strategies for RL costs involve (1) developing a cost perspective, (2) strategically consider the factors that influence RL costs, (3) strategic understanding and identification of RL cost, including investment, assets, infrastructure, rental, administrative, staff, operational, inventory, RL process, RLM and hidden costs, and (4) implementing cost policies, controls and measurements. FM strategies for RL costs can start with *developing a cost perspective and approach for RL,* for example, viewing RL costs as a part of overall cost (such as a total cost approach), viewing RL costs as an opportunity for profits or viewing RL costs as an expense or loss. Regardless of the cost perspective and approach for RL, organisations need to consider PM in RL and other RL practices that can shape the cost perspective (such as disposition practices and RC).

Apart from the general strategic considerations for FM in RL (section 6.9.2.1.1), organisations must *strategically consider the factors that influence RL costs,* including product condition, quality, type and volume, transport mode, service levels, hidden costs, the party responsible for costs and owning versus renting. Specifically, products that arrive in poor *condition* can be costlier since additional expenses must be incurred (such as costs for new packaging, disposition activities and value depreciation). Similarly, poor *quality* products that may be defective can result in costlier disposition activities (e.g. repair and refurbishment) and additional holding and handling cost.

Furthermore, the *type* of the returned *product* can influence RL costs, for example, larger furniture or appliances requires larger vehicles and special handling equipment that can increase RL costs. Product return *volume* can influence economies of scale, which means that lower return volumes can be costlier than higher return volumes. Similarly, different costs associate with different *transportation modes*, for example, air transport can be costlier than road transport, influencing RL cost. Furthermore, the consumer *service level* can impact RL cost, for example, a consumer-focussed strategy can involve higher RL cost since the retailer may incur expenses related to consumer returns (e.g. free return shipping cost).

RL can involve many *hidden costs* that organisations must consider to accurately calculate RL costs for effective FM in RL. Additionally, the party responsible for RL cost must be considered, for example, a retailer may be responsible for the RL costs for consumer product returns (e.g. collection, transport, processing, inspection and redistribution) and the supplier may give credit for the returned product, which can be important for accurate calculation of RL cost. Finally, organisations must consider rental versus ownership cost, for example, owning a vehicle involves purchasing cost, depreciation cost and other variable cost, and renting a vehicle involves operational and variable costs.

Strategic understanding and identification of RL cost can be critical for the effective management of consumer returns, and like the strategic understanding of profits and earnings can be important for accurate financial statements and techniques (see section 6.9.2.1.1). Organisations can define RL cost, identify RL processes, activities and practices and use the cost perspective/approach and costing techniques as guidelines. RL cost can relate to financial, IT and infrastructure, and human resources, operations, inventory, RL processes, hidden cost and RLM, which will be described in subsequent paragraphs.

Organisations can start by *identifying investment, asset and infrastructure costs,* which can include initial investment in infrastructure (such as fixed and set-up costs for facilities), investment in and use of IT (such as initial capital and operating costs), and investment in fixed assets (such as vehicles that require purchasing costs, operating costs and overhead costs), demonstrating the importance of investment considerations in FM strategies (section 6.9.2.1.1). However, if organisations decide to rent infrastructure and assets (such as facilities, equipment and vehicles), *identifying rental costs* can be important. Rental costs can exclude capital and set-up costs but include rental fees and operating costs, showing the importance of considering ownership versus renting as factors that influence RL costs.

Furthermore, organisation can *identify* any *administrative costs* associated with RL, for example, administrative costs for managing return policies. Relating to human resources in RL, organisation can *identify staff-related costs,* which include the labour or staffing costs for handling consumer returns and the costs of qualified workers (such as inspectors). Organisations may need to *identify operational costs* for RL, which includes the operating costs of facilities and administrative, general and selling costs. Additionally, organisations can *identify inventory-related costs,* which range from inventory-holding costs, depreciation and shrinkage costs, storage costs to inventory loss costs.

In terms of the costs associated with RL processes, organisations can *identify* pre-receipt RL process costs, including *collection costs* (any costs associated with return pickup) and *transportation costs* (costs of moving the returned products from consumer to facility and between facilities). However, transportation costs can also be part of the post-receipt RL processes and include *redistribution costs* of transporting recovered/returned products to consumers or markets.

Other post-receipt RL process costs that organisations can *identify* includes *receiving costs* (cost of loading, unloading and handing at the receiving dock), *processing costs* (e.g. costs of issuing refunds and credits), *inspection and sorting costs* (e.g. costs of testing and classification of product returns), and *disposition/recovery costs,* which includes costs of disposition options and recovery activities (such as reuse costs, repackaging costs, disassembly costs, repair costs and refurbishment costs).

Furthermore, organisations can *identify* any *costs* related to *RLM,* which involves the costs of managing consumer returns and the total costs of investment, infrastructure, operations and RL processes, emphasising a total cost approach for FM in RL. Consequently, understanding the different RL processes (chapters 4 and 5) and RL practices can help organisations to identify total RL costs, which emphasise the importance of a holistic approach for the effective management of consumer returns.

Nevertheless, organisations must *identify* the *potential hidden costs* of *RL,* which can include maintenance costs, opportunity costs (e.g. poor investment decisions or inefficient practices in RL), social responsibility costs (e.g. loss of reputation and corporate image), promotion costs, environmental costs, and taxes (e.g. cost of tax compliance), emphasising the importance of strategically consider hidden RL cost. These mentioned hidden costs can form part of the financial PM elements (see section 6.7.2), which demonstrates the importance of considering PM for effective FM strategies (section 6.9.2.1.1).

Finally, organisations can *implement cost policies, controls* and *measurements* to manage RL costs, which reemphasises the link between PM and FM practices in RL. Essentially, FM strategies can be important for the management of consumer returns, enabling organisations to manage the RL costs of consumer returns and realise the benefits (profits) of effective RLM.

6.9.2.1.3 Requirements of FM practices in RL

Due to the strategic nature of FM practices in RL, fewer requirements, including economic, operational, organisational and SC, associate with FM practices.

The *economic requirements* of FM practices in RL include cost visibility, timely access to cost data and acceptance of initial losses. To support the FM strategies in RL, especially for identifying various costs in RL, *cost visibility* can be critical. Therefore, organisations must identify and implement mechanisms (such as the ABC technique) to achieve visibility of all the RL costs needed for effective FM in RL (see section 6.9.2.2).

Similarly, organisations need *timely access to cost data* of RL processes (such as transportation), which can be important to monitor, measure and control costs as part of FM strategies for RL costs (section 6.9.2.1.2). Furthermore, organisations must *accept initial losses* associated with RL processes and practices, emphasising the importance of considering investment, costs and profits for FM strategies and performing a cost-benefit analysis, which can assist organisations with realising the long-term benefits (e.g. effective RLM) of short-term investments and expenses (see section 6.9.2.1.1).

The *operational requirement* of FM practices involves facility/location practices, which includes integrated facility/location practices. Particularly, organisations can integrate RL and FL networks to identify true RL costs, demonstrating an important link between FM and facility/location practices.

The *organisational requirements* of FM practices in RL entails management involvement and CFI practices. Specifically, *managers* must be *involved* in the strategic considerations for FM, performing a cost-benefit analysis, developing a cost perspective/approach, identifying and understanding RL costs and implementing cost policies, controls and measures to manage RL cost (see sections 6.9.2.1.1 and 6.9.2.1.2). Furthermore, *CFI practices* (functional integration) that involve collaboration, cooperation and communication between functional departments (like logistics and finance) can be important for effective FM in RL.

Similarly, the SC requirement of FM in RL involves *collaboration with SC partners*, which demonstrates that SCI practices can be important for FM practices (e.g. the costing technique of TCO) (section 6.9.2.1.1). Consequently, organisations must focus on internal and external integration practices for effective FM in RL.

In the next section, the outcomes of FM practices in RL will be analysed and discussed.

6.9.2.2 Outcomes of FM practices in RL

Although limited outcome categories associate with the FM strategies and requirements, the outcomes of FM practices provide benefits that can be important for the effective management of consumer returns. The outcomes of FM practices in RL included (1) economic, (2) operational, (3) organisational and (4) market-related outcomes. Table 6.38 provides an overview of the findings related to the *outcomes of FM practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

	Facilitate facility/ location strategies	None	• *"Identifying where costs lie […] enables organizations [sic] to determine the best physical network for […] flow of returns."* (Partida, 2011:63)
	Facilitate RC in RL	None	• *"Activity-Based Costing (ABC) […] improves the resource allocation […]."* (Dhib *et al.* 2016:373)
Market-related outcomes	***Facilitate CRM***	None	• *"[…] organizations [sic] are recommended to conduct a cost and benefit analysis for a long time horizon. […] sunk costs at the beginning stage of implementation. […] benefits brought by the new solutions can only be realized at a later stage. This means that even the organizations [sic] can achieve […] customer acquisition in the long run, they may have to bear losses in the short run."* (Lee & Lam, 2012:596)

Source: Compiled by the researcher

Table 6.38 presents the outcomes of FM practices in RL, including economic, operational, organisational and market-related outcomes, which will be discussed in subsequent paragraphs.

6.9.2.2.1 Economic outcomes of FM practices in RL

Various economic outcomes associate with FM practices in RL, which include (1) improving FM and control in RL, (2) identifying true RL costs, (3) enhancing cost visibility, (4) accurate RL cost and profit calculations, (5) recording and managing RL costs, (6) understanding RL expenditure, (7) facilitating RL cost allocation, (8) recording and enhancing value/cost recovery, (9) cost effectiveness, (10) cost reduction and long-term cost savings, and (11) profitability. Particularly, CFI practices in RL, for example, integration between the logistics and finance department, can *improve FM* and *control in RL*, demonstrating the importance of implementing various RL practices for the efficient RLM of consumer returns.

Several FM strategies can be implemented to *identify true RL costs*, including the (1) general FM strategies of developing and using financial and accounting statements, strategic application of accounting techniques and systems, strategic application of cost techniques (e.g. ABC technique), performing cost estimations, (2) FM strategies for RL costs, which include, developing a cost perspective/approach (e.g. total cost approach), strategic considerations of factors that influence RL costs (such as parties responsible for costs) and implementing cost policies, and (3) operational requirement of integrated facility/location practices. Consequently, FM strategies, especially strategic

application of accounting techniques and cost techniques (such as ABC), can *enhance cost visibility* and thereby achieve the economic requirement of cost visibility needed for the effective FM of consumer returns (see section 6.9.2.1.3).

FM strategies, including understanding and identifying costs and profits (sections 6.9.2.1.1 and 6.9.2.1.2), enables *accurate RL cost and profit calculations*. Subsequently, formulas can be used to calculate RL costs and profits, for example, subtracting revenue earned from reselling recovered/reused products from total RL costs, which can be recorded on the financial statement. Furthermore, developing and using financial and accounting statements, strategic application of accounting techniques and systems and strategic application of cost techniques (e.g. ABC) enable *recording* and *managing of RL costs,* which provides and in-depth understanding into the financial requirements and outcomes of RLM.

Developing and using financial statements and considering and identifying hidden costs in RL enables an *understanding of RL expenditures*, which in combination with understanding and identifying RL costs (including all individual RL costs) (see section 6.9.2.1.2) can *facilitate RL cost allocation.* Furthermore, the FM strategies of developing and using financial statements and performing cost and value estimations can facilitate with the *recording* and *enhancing of cost/value recovery* in RL. Additionally, *cost effectiveness* in the RL process can be enhanced through the strategic understanding and identification of RL costs, which emphasises the importance of cost visibility (economic requirement) for effective FM in RL (see section 6.9.2.1.3).

Moreover, organisations can *reduce costs* through the strategic utilisation of costing techniques (e.g. ABC) and models, as well as realise *long-term cost savings* by performing a cost-benefit analysis (FM strategy) and accepting initial losses associated with RL implementation (economic requirement). Similarly, *profitability* can be realised by performing accurate and comprehensive cost and value estimations and implementing benefit-driven FM strategies that focus on cost minimisation, emphasising the importance of understanding RL profits (see section 6.9.2.1.1).

6.9.2.2.2 Operational outcomes of FM practices in RL

The operational outcomes of FM practices in RL involve (1) identifying operational benefits of RL, (2) determining operational effectiveness, (3) facilitating and supporting RL processes, and (4) improving RL process efficiency and effectiveness.

Organisations can *identify the operational benefits of RL* through the development and use of financial statements to manage consumer returns, which can facilitate with identifying the outcomes of the cost-benefit analysis for FM in RL (see section 6.9.2.1.1). Furthermore, through the strategic understanding

and identification of RL costs (including individual costs in RL) (section 6.9.2.1.2), organisations can *determine* the *operational effectiveness* of their RL processes. In terms of individual RL costs, understanding and identifying labour costs in RL can *facilitate* and *support RL processes*, emphasising the importance of human RC in RL (see section 6.9.1.1).

Finally, the FM strategies of (1) benefit-driven FM strategies, (2) understanding and identifying RL costs, and (3) implementing RL cost policies can improve the *efficiency* and *effectiveness* of *RL processes,* which emphasise the importance of FM practices to manage consumer returns.

6.9.2.2.3 Organisational and market-related outcomes of FM practices in RL

The *organisational outcomes* of FM practices in RL involve (1) addressing organisational barriers in RL, (2) facilitating RL implementation, (3) a sustainable RL function, (4) facilitating PM, facility/location and RC practices in RL, and (5) facilitating RLM and decision-making.

Organisations can *address organisational barriers in RL,* including a lack of top management support, lack of internal communication and a resistance to change (see section 2.3.3), through the economic requirement of cost visibility. Moreover, considering investments in FM (see section 6.9.2.1.1) and identifying investment and infrastructure costs for RL can *facilitate RL implementation,* emphasising the importance of accepting initial losses in RL (economic requirement) (section 6.9.2.1.3). Additionally, organisations can ensure a *sustainable RL function* by developing a benefit-driven FM strategy (focusing on cost minimisation) and identifying transport costs in RL as a part of the strategic identification of RL costs (section 6.9.2.1.2).

Several, FM practices in RL can *facilitate RLM* and *decision-making,* especially through the (1) strategic application of accounting techniques and systems, (2) strategic use of costing techniques (ABC, quality and TCO), (3) strategic understanding of RL profits, (4) performing a cost-benefit analysis for FM in RL, (5) developing a cost perspective, (6) strategic understanding and identification of RL costs, and (7) management involvement (organisational requirement), demonstrating the importance of FM practices in the RLM of consumer returns.

Moreover, FM practices in RL can *facilitate* other RL practices, including *PM in RL* through the strategic application of accounting systems for RL, which emphasises the importance of considering PM in the FM strategies of RL (section 6.9.2.1.1). Additionally, through the strategic understanding and identification of RL costs, organisations can improve *facility/location practices* in terms of network design decisions (see section 6.8), reemphasising the important link between FM and facility/location practices (see section 6.9.2.1.3). Lastly, through the strategic use of cost techniques (namely ABC) for

RL, organisations can improve *RC in RL*, which can be essential to manage consumer returns (see section 6.9.1).

The *market-related outcome* of FM practices in RL involves *customer relationship management (CRM)*, which can be facilitated by performing a cost-benefit analysis and accepting initial losses associated with RL investment and start-up costs. Therefore, FM practices may facilitate with the relationship management strategy of consumer integration (CI) (see section 6.4.2).

Essentially, FM practices clearly contribute to the effective and efficient RLM of consumer returns, and organisations can greatly benefit from implementing and following FM strategies and requirements in RL. In the next section, FM practices in RL will be concluded with a description, conceptual framework and summary of findings for FM practices to manage consumer returns.

6.9.2.3 Description, conceptual framework and summary of findings for FM practices to manage consumer returns

This section concludes FM practices in RL with a description, conceptual framework and summary of the findings. Based on the findings presented in section 6.9.2, FM practices in RL can be important for the management of consumer returns, and will be described as follows:

> FM practices for the management of consumer returns involve (1) general FM strategies, including strategic considerations for FM, developing and using financial and accounting statements for RL, strategic application of accounting techniques, strategic utilisation of costing techniques and models, strategic understanding of RL profits and earnings, performing cost and value estimations, performing a cost-benefit analysis, and a benefit-driven strategy for FM, (2) FM strategies for RL costs, including developing a cost perspective and approach, strategically consider the factors that influence RL costs, strategic understanding and identification of RL cost, including investment, assets, infrastructure, rental, administrative, staff, operational, inventory, RL process, RLM and hidden costs, and implementing cost policies, controls and measurements, and (3) FM requirements, including economic requirements (cost visibility, time and accurate cost data and acceptance of initial losses), an operational requirement (integrate facility/location practices), organisational requirements (management involvement and CFI), and (3) a SC requirement (collaboration with SC partners).
>
> The FM strategies and requirements can result in several outcomes, including (1) economic outcomes (improve FM and control, identify true RL costs, enhance cost visibility, accurate RL cost and profit calculations, record and managing RL costs, understand RL expenditure, facilitate RL cost allocation, record and enhance value/cost recovery, cost effectiveness, cost reduction and long-term cost savings, and profitability), (2) operational outcomes (identify operational benefits of RL, determine operational effectiveness, facilitate and support RL processes, and improve RL process effectiveness and efficiency), (3) organisational outcomes (address organisational barriers in RL, facilitate RL implementation, a sustainable RL function, facilitate RLM and decision-making, facilitate PM, facility/location and RC practices in RL,), and (4) a market-related outcome (facilitate CRM).

Figure 6.28 provides a conceptual framework of FM practices, including FM strategies, requirements and related outcomes to manage consumer returns.

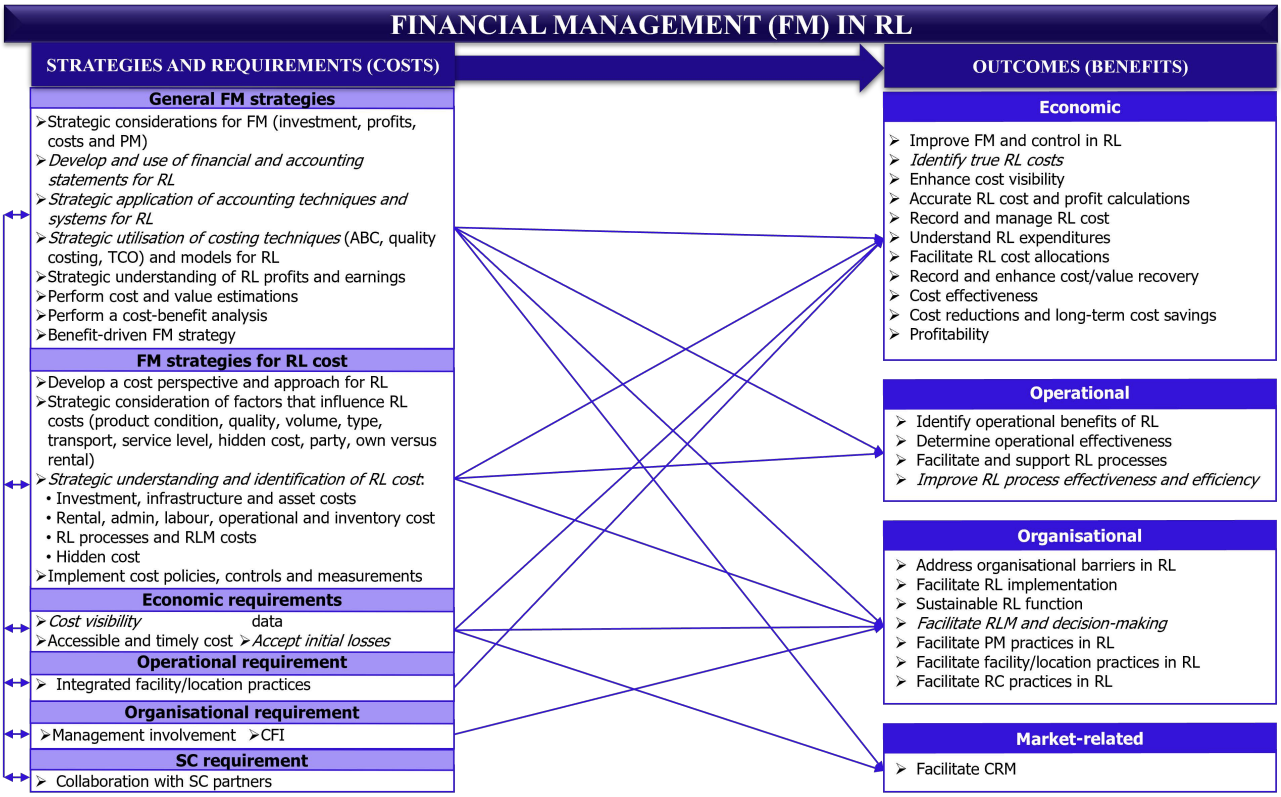

Figure 6.28 Conceptual framework of financial management (FM) practices to manage consumer returns
Source: Compiled by the researcher

Figure 6.28 illustrates the links between RC strategies, requirements and outcomes, demonstrating a cost and benefit relationship. The links between the general FM strategies, FM strategies for RL costs and the FM requirements can be demonstrated by the RL costs (FM) strategy of understanding and identifying RL costs, which links financial and accounting statements (general FM strategy), cost visibility (economic requirement), integrated facility/location practices (operational requirement) and management involvement (organisational requirement).

Additionally, TCO as a RL costing technique (general strategy) links with SC collaboration (SC requirement). Although the links between FM strategies and requirements can be important for FM in RL, the main aim of the framework involves the links between the FM strategies, requirements and outcomes, which can be important for the effective management of consumer returns. Subsequently, the most significant FM strategies and requirements (associated with the most outcomes) and FM outcomes (associated with the most RC practices) are emphasised through italics, which will be elaborated upon in Table 6.39.

Based on Figure 6.28 and the discussions given in section 6.9.2, Table 6.39 provides a summary of the findings and managerial implications, focussing on the most significant FM practices in RL.

Table 6.39 Summary of findings and managerial implications for FM practices in RL

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	•FM in RL involves (1) general strategies, including strategic considerations for FM, financial and accounting statements for RL, strategic application of accounting techniques, utilisation of costing techniques and models, understanding of RL profits and earnings, cost and value estimations, a cost-benefit analysis, and a benefit-driven strategy for FM, and (2) strategies for RL costs, including cost perspective/approach, strategic considerations of factors that influence RL cost, understanding and identification of RL cost (including investment, rental, operational, staff, inventory, RL process, RLM and hidden costs) and implementing cost policies, controls and measures. •The general FM strategies associates with all the FM outcome categories, including economic, operational, organisational and market-related outcomes •From the general FM strategies, financial and accounting statements, application of accounting techniques and utilisation of costing techniques can be the most beneficial for RL •The FM strategies for RL cost associates with most of the FM outcome categories, including economic, operational, and organisational outcomes •From the FM strategies for RL cost, understanding and identifying RL costs can be the most beneficial for RL •The least significant FM strategies, with limited impact on the outcomes include strategic considerations of FM, followed by understanding profits, cost perspective, considering factors that influence RL costs and implementing cost policies, controls and measures. •FM practices in RL involves economic, operational, organisational, and SC requirements •The economic requirements of FM in RL associate with most of the outcome categories, including economic, organisational, and market-related outcomes. •From the economic requirements of FM, cost visibility and acceptance of loss can lead to the most benefits •From the FM practices, operational, organisational and SC requirements can be the least significant practice categories •The least significant requirements, with no impact on FM outcomes, include the economic requirement of timely access of cost data, and the SC requirement of collaboration with SC partners	• Organisations must develop and implement general FM strategies and FM strategies for RL costs • Organisations that seek various economic, operational, organisational and market-related benefits in RL must focus on FM strategies • Organisations must focus on the development and use of financial accounting statements, strategic application of accounting techniques, utilisation of costing techniques and strategic understanding and identification of RL costs for optimum FM benefits in RL • Organisations must focus on the economic requirements relating to cost visibility and acceptance of initial losses (set-up and investment costs) to achieve optimum FM benefits in RL
Outcomes	•FM practices in RL involve economic, operational, organisational and market-related outcomes •The most significant outcomes of FM practices in RL involves economic and organisational outcomes •The least significant outcome of FM practices in RL involves the market-related outcome •The most significant economic outcome of FM practices includes identifying true RL costs •The most significant operational outcome of FM practices in RL includes improving RL process efficiency and effectiveness •The most significant organisational outcome of FM practices in RL includes facilitating RLM and decision-making	• Organisations that seek economic, operational, organisational, and market-related benefits in RL can implement FM practices in RL • Organisations that seek to identify overall and accurate RL costs must implement FM practices in RL • Organisations that experience inefficiencies in the RL process can consider FM practices in RL • To facilitate RLM and decision-making in RL, organisations must consider FM practices in RL • For the effective management of consumer returns, organisations must identify/implement/consider FM strategies, requirements and outcomes.

Source: Compiled by the researcher

Table 6.39 demonstrates the value of FM practices as part of the RL practices for consumer returns. Organisations can use the FM strategies, requirements and related outcomes for effective FM in RL, which can contribute to the effective RLM of consumer returns. FM in RL will further be explored in the interviews with industry experts (chapter 8). In the next section, return prevention and avoidance (RPA) practices in RL will be presented, discussed and analysed.

6.9.3 Return prevention and avoidance (RPA) practices to manage consumer returns

According to Rogers *et al.* (2012:114), RPA practices involve strategies, methods and techniques to minimise returns, which can be the most efficient way to effectively deal with consumer returns. Likewise, Badenhorst (2013:4) asserted that RPA can be one of the best solutions to overcome various

problems and barriers in RL. RPA practices include closely retailed concepts, namely gatekeeping practices[20] and return avoidance (RA) practices. Specifically, RPA entails the gatekeeping of product returns at the point of the consumer, enabling online retailers to effectively implement RA practices and eliminate unnecessary product returns (Hjort *et al.* 2019:774). Nevertheless, RPA practices can extend early gatekeeping prevention initiatives and encompass various strategies to prevent and avoid unnecessary consumer returns (see section 6.9.3.1.).

In the subsequent sections, the strategies, requirements and outcomes of RPA practices will be discussed and concluded with a description, conceptual framework and summary of findings to manage consumer returns.

6.9.3.1 Strategies and requirements of RPA practices in RL

The strategies of RPA practices involve general RPA strategies and strategic methods for RPA, and the requirements of RPA practices involve economic, IT, operational, organisational, market-related and SC requirements, which can contribute to the RLM of consumer returns. Table 6.40 provides an overview of the findings related to the *strategies and requirements of RPA practices in RL*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.40 Findings related to strategies and requirements of RPA to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
General RPA strategies	***Strategic approach and perspective***	Janse *et al.* (2010:502)	• *"[…] a balanced approach that integrates both sides of the same coin: that is, focusing on customer satisfaction without losing sight of cost-effectiveness. This requires an integrative stance […]."* (Asdecker 2015:11) • *"[…] an integrated supply chain approach […] lead to significant avoidance of product returns. This holistic approach would […] enhance the profitability of retailers […]."* (Bernon & Cullen, 2007:55) • *"Reduce is the first element and will lead companies to examine how they can reduce returns arising in the first place […]."* (Bernon & Cullen, 2007:52)
	Prioritise RPA practices	None	• *"To address issues […] in reverse logistics, organisations can implement a variety of first-priority practices, such as […] establishing a gatekeeper or implementing a robust gatekeeping function, establishing clear return policies […]."* (Badenhorst, 2016:9)
	Strategic considerations for gatekeeping practices	Ahsan and Rahman (2016:612) Griffis *et al.* (2012:291)	• *"Gatekeeping measures are less popular in business practice because sellers fear the negative influence these may have on customer satisfaction and the generated turnover."* (Asdecker, 2015:10) • *"[…] distance sellers with high return rates are very likely to benefit from avoidance and gatekeeping […] In contrast, vendors with low return rates should critically review preventive options."* (Asdecker 2015:10) • *"[…] rejection or acceptance of the returned items […] reflect the availability of resources, the commitment of the firm to RL and its customers, and its product mix strategy."* (Dowlatshahi, 2010a:1370) • *"[…] aspects of gatekeeping […] costs vary as a function of the volume of returned products and the service level desired."* (Lambert *et al.* 2011:568) • *"The advisable level of gatekeeping […] is related to the product type and available information infrastructure [...]."* (De Leeuw *et al.* 2016:725) • *"[…] consider three possibilities: (1) centralized screening, […] (2) decentralized*

[20] As indicated in section 4.5, gatekeeping can be a process and practice in RL, but the distinction can be made between gatekeeping activities as part of RL processes and strategic gatekeeping practices aiming to control and reduce product returns.

Source: Compiled by the researcher

Table 6.40 indicates the RPA strategies, including general RPA strategies and strategic methods for RPA, and the RPA requirements, which will be discussed in subsequent sections.

6.9.3.1.1 General strategies of RPA practices in RL

The general RPA strategies in RL include (1) strategic approach and perspective, (2) prioritising RPA practices, (3) strategic considerations for gatekeeping practices and return avoidance (RA) practices, (4) strategic decisions for RPA, (5) strategic identification of product return drivers, (6) establishing economic benchmarks, (7) performing a cost-benefit analysis for RPA, (8) a benefit-driven strategy for RPA, (9) developing a clear RL strategy, (10) developing and using return programmes, (11) developing a consumer database, (12) strategic utilisation of return analytics, (13) strategic classification of consumers, (14) creating measurements for RPA, and (15) rewarding RPA initiatives.

Organisations can adopt several *strategic approaches* and *perspectives* for RPA, including balanced, integrative (including an integrative SC) and holistic approaches, focussing on consumer satisfaction, cost-effectiveness and profitability, and a "reduce" perspective in which organisations examine and identify RPA methods. Additionally, like RC practices in RL (section 6.9.1), organisations must *prioritise* RPA practices and focus on developing and implementing effective strategic methods for RPA (see section 6.9.3.1.2) to manage consumer returns.

Several *strategic considerations* can be critical for effective RPA practices, including strategic considerations for gatekeeping practices and strategic considerations for RA practices. The *strategic considerations for gatekeeping practices* involve considering the (1) impact on consumer satisfaction and sales, (2) type of business (e.g. online retailer or traditional retailer), (3) product-mix offering and

type of product, (4) customer service strategy, (5) organisation's commitment to RL, (6) availability of resources, (7) IT infrastructure, (8) facility/location strategies, and (9) return volume.

Additionally, the *strategic considerations for RA practices* involve considering the (1) industry and product type (e.g. electronics or apparel), (2) type of consumer (including demographics), (3) product costs, (4) return costs, (5) return volume and (6) recovery potential of products. Evidently, organisations must consider the business-, industry-, product(s)- and consumer -type, organisational strategies, RC and return volume for effective RPA practices in RL.

Nevertheless, several *strategic decisions* can be important for RPA practices, including the type of RPA methods to adopt, the use of return authorisation and verification, gatekeeping processes and potential agreements with suppliers (e.g. B2B distribution returns). Organisations can use the strategic approach, perspective and considerations for RPA to facilitate RPA decision-making. Furthermore, in developing an RPA strategy, organisations must *strategically identify* the *key drivers of product returns,* for example, identifying the strategies and policies of suppliers and inefficiencies in FL processes that may increase consumer product returns (see section 6.9.3.1.3).

Organisations can *establish economic benchmarks* for product return approval and rejection, which can guide the cost-benefit analyses for RPA practices. Relating to the strategic approach and considerations for RPA, organisations must *perform a cost-benefit analysis* to identify the gatekeeping trade-offs between the costs of lower sales (due to more return restrictions) and the costs of lower returns. Additionally, organisations must perform a cost-benefit analysis that simulate the costs of implementing RA practices (such as additional product information) (see section 6.9.3.1.2) versus the RL cost savings associated with lower return volumes.

Consequently, organisations must implement a *benefit-driven* RPA *strategy* that focusses both on cost-effectiveness and consumer satisfaction, emphasising the importance of a balanced strategic approach in RPA. Nevertheless, organisations must *develop a clear RL strategy,* which can be the basis for developing an effective RPA strategy. Furthermore, *developing* and *using return programmes* (or plans) that focus on discouraging consumer returns can be part of effective RPA strategies.

Organisations can *develop a consumer database,* which can assist with the strategic consideration of the type of consumer and with the *strategic utilisation* of *product return analytics* to identify return abusers. Consequently, the consumer database and product return analytics can be used to *strategically classify consumers,* distinguishing profitable and loyal consumers from less profitable and frequent returning consumers.

The final two RPA strategies relate to PM practices in RL (see section 6.7), involving measuring and rewarding RPA practices. Evidently, organisations must *create measurements for RPA* and based on the set measurement outcomes (e.g. avoiding product returns) reward RPA initiatives, which may create a culture of effective RPA practices.

6.9.3.1.2 Strategic methods for RPA in RL

Several strategic methods can be used for effective RPA in RL, including (1) developing a clear and appropriate return policy, (2) strategic implementation of return restrictions, (3) developing and implementing appropriate gatekeeping strategies and practices, (4) developing and implementing return avoidance (RA) strategies and policies, and (5) the strategic implementation of product-related RA initiatives, consumer support initiatives, and account suspensions.

The strategic methods for RPA must start with *developing* a *clear* and *appropriate return policy,* which stipulates clear warranty and return conditions, and enables effective gatekeeping (easy to identify legitimate and illegitimate returns). Organisations may need to place more restrictions and tighten their lenient return policies, offering more restrictive return policies, or may decide to implement zero-return policies (which might be problematic for retailers, restricted by consumer protection laws). Consequently, organisations can *strategically implement appropriate return restrictions,* including (1) a clear "do not return" or "ineligible for return" list, (2) charging return fees (e.g. return shipping and processing fees), (3) shortening the return timeframe (e.g. from 30 days to seven days) and (4) requesting a proof of purchase, for a more restrictive return policy.

Additionally, organisations can *develop* and *implement appropriate gatekeeping strategies* and *practices,* which can include (1) creating gatekeeping programmes, (2) establishing a robust gatekeeping function, (3) appointing a gatekeeper at the source of the RL process and (4) installing systems to discourage product returns. Consequently, appropriate gatekeeping methods must be created to prevent invalid and unauthorised product returns to enter the reverse supply chain (RSC).

In terms of avoidance, organisations can *develop* and *implement RA strategies* and *policies* to reduce product returns. Specifically, organisations can *strategically implement product-related RA initiatives,* including quality products (to reduce defective returns), streamlining the product offering, providing accurate product information and user-friendly products. The product-related initiatives demonstrate the importance of considering the type of industry, type of products and product offering strategy for RPA practices (see section 6.9.3.1.1).

Similarly, organisations can *strategically implement consumer support initiatives,* including (1) support for sound purchasing decisions, (2) proper instructions to use products correctly, (3) quick start sheets

and technical helplines for more complex products, and (4) consumer education and training programmes. Evidently, the type of support offered to consumers depends on the type of product, reemphasising the importance of considering the product type for RPA practices.

Finally, in extreme cases organisations may *strategically implement account suspensions,* which essentially means, closing the accounts of return abusers to prevent future transactions that result in product returns. Account suspensions rely on the RPA strategies of developing a consumer database, using return analytics and classifying consumers, and demonstrate the importance of performing a cost-benefit analysis comparing the cost of lost sales with the cost savings associated with lower returns (see section 6.9.3.1.1).

Essentially, organisations can develop and implement various RPA strategies, methods and initiatives to reduce product returns and effectively manage consumer returns. Nevertheless, certain requirements can be important to facilitate RPA strategies, which will be discussed next.

6.9.3.1.3 Requirements of RPA practices in RL

The requirements of RPA practices in RL include economic, IT, operational, organisational, market-related and SC requirements. The *economic requirements* of RPA practices involve investments and costs, for example, investing in an after-sale consumer support centre to run technical helplines (see section 6.9.3.1.2) and incurring costs for additional instructions, staff and office space. The investment and cost requirements demonstrate the importance of performing a cost-benefit analysis for RPA practices. The *IT requirement* for RPA practices involve *implementing* and *utilising IT.* Particularly, organisations can use TLIT (traditional IT) (such as EDI, WMS and ordering systems), RFID IT and RLIT (such as RMA systems) for RPA practices, reemphasising the importance of IT practices to manage consumer returns.

The *operational requirements* of RPA practices include high return volumes, effective return authorisation, facility/office space and RL/FL integration. The *high return volume* requirement demonstrates the importance of considering return volume and performing a cost-benefit analysis for RPA practices since organisations with low return volumes might find RPA too costly to implement, emphasising the economic, IT and infrastructure requirements. Similarly, *effective return authorisation,* an activity in CRR (consumer return request) and gatekeeping processes (see sections 4.4.1 and 4.4.2), demonstrates the importance of using implementing RMA (return merchandise authorisation) systems (IT requirement) to support gatekeeping practices.

Relating to the economic cost requirements, organisations must use physical *facility/office space* for effective RPA methods, demonstrating the importance of considering resources, IT and

facility/locations strategies for gatekeeping practices (see section 6.9.3.1.1). Moreover, organisations must implement integrated facility/location practices that involve *RL/FL integration* (see section 6.8.3), which can be important for the RPA strategy of identifying key product return drivers. For example, integrating RL/FL means that organisations can utilise product return information to identify problems in FL that may lead to higher returns (such as poor packaging and handling practices).

The *organisational requirements* of RPA practices mostly involve staff, management and CFI (cross-functional integration) practices in RL, which include management involvement, staff involvement, staff training and internal information sharing. Like other RL practices (e.g. PM, RC and FM practices), *management involvement* can be important for strategic decision-making and developing and implementing RPA strategies. Additionally, *staff involvement* can be important for successful implementation of strategic RPA methods, like acting as gatekeepers and supporting consumers before, during and after purchases (see section 6.9.3.1.2). Nevertheless, organisations must provide *training* to equip staff with the appropriate product knowledge and expertise needed for effective consumer support RA initiatives. Additionally, *internal information sharing* can be important for communicating the return policy and restrictions (strategic RPA methods) to staff, preventing unnecessary and illegitimate product returns.

Similarly, the *market-related requirements* of RPA practices associate with communication, involving consumer information sharing, requesting product return information, contacting consumers and CI (consumer integration) practices. Like internal information sharing, organisations must *share information* on the return policy and return restrictions (e.g. unreturnable products, return time limit and other return conditions) with *consumers.* However, *requesting product return information* (such as return reasons) from consumers can, equally be important to prevent ineligible product returns.

Relating to the RPA strategies of developing a consumer database, using return analytics and classifying consumers (section 6.9.3.1.1), *contacting consumers* flagged as return abusers can be an important requirement, especially for account suspension initiatives (see sections 6.9.3.1.2). Nevertheless, organisations must implement *CI practices* focussing on consumer service and relationship development (also see section 6.4.2), emphasising the importance of (1) following a balanced and holistic approach for RPA, (2) considering the customer service strategy and impact of RPA on consumers, (3) performing a cost-benefit analysis and (4) a benefit-driven RPA strategy (see section 6.9.3.1.1).

Finally, the *SC requirements* of RPA practices involve *SCM* and *SC collaboration*, which not only emphasises an integrated SC approach of RPA but also the significance of strategically identifying SC partners as key product return drivers (section 6.9.3.1.1). Consequently, SC collaboration as part of SCI

(supply chain integration) practices (see section 6.4.1) can be important for curbing product returns associated with inefficiencies in the SC, reemphasising the importance of RL/FL integration (operational requirement) for effective RPA practices.

Essentially, the RPA requirements associate with various RL practices, including IT practices (section 6.3), integration practices (SCI and CI) (section 6.4), facility/location practices (section 6.8) and management and staff practices (section 6.9.5), demonstrating the importance of a holistic approach to RPA practices (RPA strategy). Consequently, RPA practices represent a strong association between the RPA strategies and RPA requirements, which can contribute to the outcomes discussed in the next section.

6.9.3.2 Outcomes of RPA practices in RL

The outcomes of RPA practices involve the benefits associated with the effective implementation of RPA strategies and requirements, which can be important for the management of consumer returns. The outcomes of RPA practices in RL include (1) economic, (2) operational (3) organisational (4) environmental, (5) and market-related outcomes. Table 6.41 provides an overview of the findings related to the *outcomes of RPA practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.41 Findings related to outcomes of RPA practices to manage consumer returns

Source: Compiled by the researcher

Table 6.41 presents numerous outcomes of RC practices in RL, including economic, operational and product return, organisational, environmental and market-related outcomes, which will be discussed in subsequent sections.

6.9.3.2.1 Economic outcomes of RPA practices in RL

The economic outcomes of RPA practices in RL can include (1) addressing economic barriers in RL, (2) RL cost reductions, (3) enabling cost avoidance, (4) cost effectiveness, (5) profitability, and (6) maximising asset recovery. RL associate with several *economic barriers* including high RL costs and investment requirements (see sections 2.4.1 and 6.9.2), which can be *addressed* with gatekeeping strategies and practices (strategic RPA method).

Moreover, *RL costs* can be *reduced* through several RPA practices, including (1) performing a cost-benefit analysis (general RPA strategy), (2) developing appropriate return policies (restrictive policies), (3) gatekeeping and RA strategies and practices, (4) strategic implementation of product-related RA initiatives (e.g. adjusting product design), consumer support initiatives (e.g. additional instructions, education and training) and account suspension (strategic RPA methods), and (4) cost (economic) requirements. Consequently, despite the costs of implementing RPA practices, organisations can achieve greater cost savings and even *avoid* unnecessary RL *costs* through effective RPA practices (such as gatekeeping strategies).

Furthermore, organisations can achieve *cost effectiveness* through a balanced and integrative (strategic) approach, strategic decisions (e.g. type of RPA methods to adopt), a benefit-driven RPA strategy and the development and implementation of gatekeeping strategies. Similarly, an integrative SC and a holistic approach to RPA practices can enhance the *profitability* of organisations, demonstrating the important role of RPA as a sustainable business practice.

Finally, organisations can *maximise asset recovery* through the development and implementation of gatekeeping practices. Evidently, gatekeeping strategies allow organisations to separate wanted from unwanted product returns, focussing all recovery efforts on wanted product returns, which emphasise the importance of considering the recoverability of products in RPA practices (see section 6.9.3.1).

6.9.3.2.2 Operational and product return outcomes of RPA practices in RL

The operational and product return-related outcomes of RPA in RL include (1) addressing operational barriers, (2) improving forecasting and visibility, (3) addressing product return quality problems, (4) facilitating and supporting RL processes, (5) improving RL process efficiency and effectiveness, (6) improving FL processes, (7) identifying product return reasons, (8) reducing unnecessary, invalid and fraudulent returns, and (9) reducing and controlling product return volume.

Like the economic outcomes of addressing economic barriers, RPA practices, including clear return policies, gatekeeping and RA strategies (strategic RPA methods), can *address* the *operational barriers*

(e.g. uncertainties in product return quality, quantity and timing) in RL (see section 2.3.2). Subsequently, organisations can *improve product return forecasting* and *visibility* (operational barriers) through several RPA practices, including the (1) general RPA strategies of prioritising RPA practices, creating measures for RPA and rewarding RPA initiatives, (2) strategic RPA methods of establishing clear return policies and implementing gatekeeping practices (e.g. gatekeeper and robust gatekeeping function), and (3) RPA requirements of utilising IT systems (IT requirement) and requesting return information from consumers (market-related requirement).

Additionally, the operational barrier of *problems* with *product return quality* can be *addressed* through the strategic RPA method of developing and implementing appropriate gatekeeping strategies and practices, including a gatekeeper and a gatekeeping function. Similarly, strategic RPA methods, including developing and implementing gatekeeping and RA strategies, can *facilitate* and *support RL processes.* For example, gatekeeping and RA strategies can help the CRC process by reducing the number of return requests received (see section 4.4) and the return processing process by reducing the number of returns that requires processing (see section 5.4).

Subsequently, RPA practices, including gatekeeping and RA strategies (RPA methods), IT systems (such as an RMA system) (IT requirement) and requesting return information from consumers (market-related requirement), can *improve* the *efficiency* and *effectiveness of RL processes.* For instance, utilising appropriate IT systems to request return information from consumers (RPA requirements) can reduce staff errors (less return handling errors) and increase processing speed (e.g. fast refunds or exchanges) (see section 5.4). Moreover, organisations can *improve FL processes* by strategically identifying key product return drivers that originate from upstream SC partners (general RPA strategy) and RL/FL integration (operational requirement), which emphasises the importance of an integrated SC approach (RPA strategy) (see section 6.9.3.1).

In terms of *product return-related outcomes*, organisations can effectively *identify product return reasons* by developing a consumer database (general RPA strategy). Furthermore, organisations can *reduce unnecessary, invalid* and *fraudulent product returns* by (1) developing and using return programmes, (2) creating a consumer database (general RPA strategies), (3) developing appropriate return policies (restrictive policies), (4) developing and implementing gatekeeping strategies, (5) implementing product-related RA initiatives (e.g. accurate product information) (RPA methods), (6) utilising IT systems (IT requirement), (7) implementing effective return authorisation procedures (operational requirement), (8) sharing information with consumers (market-related requirement) and (9) collaboration (SC requirement).

Finally, organisations can *reduce* and *control product return* through the (1) RPA methods of restrictive measures (e.g. ineligible product return list), gatekeeping strategies, RA strategies, product-related RA initiatives (e.g. changing product design) and consumer support initiatives (e.g. technical help lines), and (2) RPA requirements of costs (economic), staff involvement and training (organisational), consumer information sharing and CI (market-related), and SCM (SC), which can be important for the effective management of consumer returns.

6.9.3.2.3 Organisational and environmental outcomes of RPA practices in RL

The *organisational outcomes* of RPA practices in RL include (1) successful RA, (2) successful RL programmes, (3) facilitating RLM, and (4) facilitating information management. Particularly, organisations can realise *successful RA* through an integrated SC approach (general RPA strategy), product-related and consumer support RA initiatives (RPA methods), internal information sharing (organisational requirement), and consumer information sharing (market-related requirements) (e.g. clearly communicating product return restrictions).

Additionally, implementing product-related RA initiatives (such as offering high quality products) can contribute to a *successful RL programme*. Furthermore, the RPA strategies of developing RPA measures, rewarding RPA initiatives and implementing product-related RA initiatives can *facilitate RLM,* demonstrating the importance of RPA practices to effectively manage consumer returns. Lastly, organisations can *improve information management* in RL by developing a consumer database, classifying consumers (e.g. profitable versus return abusers) (general RPA strategies) and contacting consumers (market-related requirements).

In terms of the *environmental outcomes,* RPA practices can provide environmental sustainability and improve environmental performance. *Environmental sustainability* can be achieved through an integrated and holistic approach to RPA (general RPA strategy), which associates with effective RA (organisational outcome). Furthermore, management involvement (organisational requirement) in RPA practices can *improve environmental performance,* reemphasising the importance of managerial involvement in all RL practices.

6.9.3.2.4 Market-related outcomes of RPA practices in RL

The market-related outcomes of RPA practices in RL include (1) understanding consumer return behaviour, (2) improving consumer service and experience, (3) consumer satisfaction and loyalty, and (4) improving CRM. Specifically, through the development and implementation of RA strategies (RPA method) organisations can obtain a better *understanding of consumer return behaviour,* which may facilitate in developing more effective RPA methods.

Furthermore, organisations can *improve consumer service* and *experience* through several RPA strategies, including (1) an integrative strategic approach and a "reduce" perspective, (2) a benefit-driven RPA strategy, (3) utilising product return analytics, (4) classifying consumers (e.g. profitable consumers and return abusers) (general strategies), (5) developing and implementing gatekeeping strategies and practices, and (6) implementing consumer support initiatives (RPA methods). Similarly, organisations can obtain *consumer satisfaction and loyalty* through the general RPA strategies, including a balanced strategic approach, strategic decisions in RPA (e.g. type of RPA methods to implement), a benefit-driven RPA strategy, utilising product return analytics, and classifying consumers (focussing efforts on profitable consumers).

Finally, organisations can improve *CRM* by implementing consumer support initiatives (RPA method), utilising appropriate IT systems (IT requirement), involving and training staff (organisational requirements), requesting information from consumers and CI (market-related requirements), showing the significance of RPA practices for the effective management of consumer returns.

Essentially, RPA strategies and requirements in RL can be important for economic, operational, product return, organisational, environmental and market-related outcomes, contributing to the effective RLM of consumer returns. In the next section, RPA practices in RL will be concluded with a description, conceptual framework and summary of findings for RPA practices to manage consumer returns.

6.9.3.3 Description, conceptual framework and summary of findings for RPA practices to manage consumer returns

Based on the findings presented in section 6.9.3, RPA (return prevention and avoidance) practices in RL can be important for the management of consumer returns, and will be described as follows:

> RPA practices for the management of consumer returns involve (1) general RPA strategies, including a strategic approach and perspective, prioritising RPA practices, strategic considerations for gatekeeping practices and RA practices, strategic decisions for RPA, strategic identification of product return drivers, establishing economic benchmarks, performing a cost-benefit analysis for RPA, a benefit-driven strategy for RPA, developing a clear RL strategy, developing and using return programmes, developing a consumer database, strategic utilisation of return analytics, strategic classification of consumers, creating measurements for RPA, and rewarding RPA, (2) strategic RPA methods, including developing a clear and appropriate return policy, strategic implementation of return restrictions, developing and implementing appropriate gatekeeping strategies and practices, developing and implementing RA strategies and policies, strategic implementation of product-related RA initiatives, consumer support initiatives, and account suspensions, and (3) RPA requirements, including economic requirements (investment and costs), an IT requirement (implement and utilise IT), operational requirements (high return volume, effective return authorisation, facility/office space and RL/FL integration), organisational requirements (management involvement and staff involvement and training), market-related requirements(consumer information sharing, requesting product return information, contacting consumers and CI), and SC requirements (SCM and SC collaboration).
>
> The RPA strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, RL cost reductions, cost avoidance, cost effectiveness, profitability, and maximise asset recovery), (2) operational and product-related outcomes (address operational barriers, improve forecasting and visibility, address product return quality problems, facilitate and support RL processes, improve RL process

efficiency and effectiveness, improve FL processes, identify product return reasons, reduce unnecessary, invalid and fraudulent returns, and reduce and control product return volume), (3) organisational outcomes (successful RA, successful RL programmes, facilitate RLM, and facilitate information management), (4) environmental outcomes (environmental sustainability and improve environmental performance), and (5) market-related outcomes (understand consumer return behaviour, improve consumer service and experience, consumer satisfaction and loyalty, and improve CRM).

Figure 6.29 provides a conceptual framework of RPA practices to manage consumer returns, which includes the strategies, requirements and outcomes of RPA practices in RL.

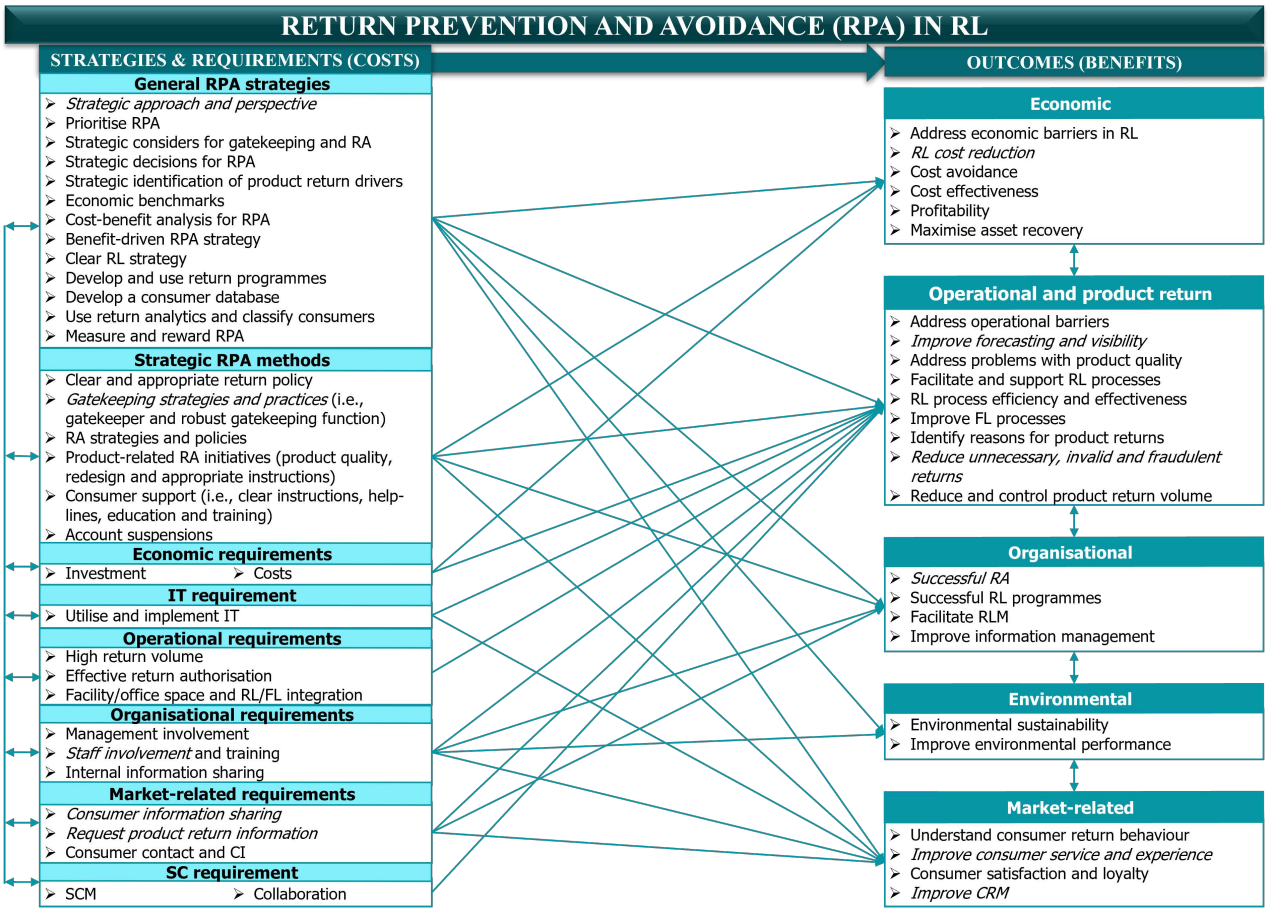

Figure 6.29 Conceptual framework of RPA practices to manage consumer returns
Source: Compiled by researcher

Figure 6.29 illustrates the links between general RPA strategies, strategic RPA methods, RPA requirements and RPA outcomes, demonstrating a cost and benefit relationship. The links between the general strategies, strategic RPA methods and requirements can be demonstrated by the economic requirements of investment and costs, which link with performing a cost-benefit analysis (general strategy), implementing gatekeeping, product-related RA and consumer support initiatives (strategic RPA methods), implementation and utilisation of IT systems (IT requirement), facility/office space (operational requirement) and staff involvement and training (organisational requirements), linking general RPA strategies, strategic RPA methods and RPA requirements. Additionally, the RPA strategy of identifying product return drivers can link with RL/FL integration (operational requirement) and SC collaboration (SC requirement).

Nonetheless, the main aim of the framework involves the links between the RPA strategies, requirements and outcomes, which can be important for the effective management of consumer returns. Subsequently, the most significant RPA strategies and requirements (associated with the most outcomes) and RPA outcomes (associated with the most RPA practices) are emphasised by italics, which will be elaborated upon in Table 6.42.

Finally, the framework shows that the RPA outcome categories can be linked, for example, reducing and controlling product return volume (operational and product-related outcome) can link with RL cost savings (economic outcome), facilitating RLM (organisational outcome), environmental sustainability (environmental outcome) and understanding consumer return behaviour (market-related outcome). Essentially, the links between the RPA strategies, practices and outcomes demonstrate the importance of a holistic approach, considering both the costs (strategies and requirements) and benefits (outcomes) of RPA for the effective management of consumer returns.

Based on Figure 6.29 and the discussions given in section 6.9.3, Table 6.42 provides a summary of the findings and managerial implications of RPA practices to manage consumer returns.

Table 6.42 Summary of findings and managerial implications for RPA practices in RL

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	• RPA in RL involves (1) general strategies, including a strategic approach and perspective, prioritising RPA, strategic considerations, strategic decisions, identification of product return drivers, establishing economic benchmarks, performing a cost-benefit analysis, a benefit-driven strategy, developing a clear RL strategy, developing and using return programmes, developing a consumer database, utilising return analytics, classification of consumers, creating measurements, and rewarding RPA, and (2) strategic RPA methods, including clear and appropriate return policy, implementing return restrictions, developing and implementing appropriate gatekeeping and RA strategies, practices and policies, implementing product-related RA initiatives, consumer support initiatives, and account suspensions. • The general RPA strategies associates with all the RPA outcome categories, including economic, operational, product return-related, organisational, environmental and market-related outcomes • From the general RPA strategies, a strategic approach and perspective can be the most beneficial for RL • Strategic RPA methods associate with most of the RPA outcome categories, including economic, operational, product return-related, organisational, environmental and market-related outcomes • From the strategic RPA methods, developing and implementing gatekeeping strategies and practices can be the most beneficial for RL • The least significant RPA strategies and methods, with no to limited impact on the outcomes include strategic considerations, economic benchmarks and a clear RL strategy, followed by implementation of return restrictions and account suspensions • RPA practices in RL involves economic, IT, operational, organisational, market-related and SC requirements • The organisational requirements of RPA practices in RL associate with most of the outcome categories, including operational/ product return, organisational, environmental and market-related outcomes, followed by market-related requirements • From the organisational requirements of RPA practices, staff involvement can lead to the most benefits • From the market-related requirements of RPA practices, consumer information sharing and requesting product return information can lead to the most benefits • From the RPA practices, operational and SC requirements can be the least significant practice categories	• Organisations must prioritise the implementation of general RPA strategies and strategic RPA methods • Organisations that seek various economic, operational, product return, organisational, environmental and market-related benefits in RL must focus on general RPA strategies • Organisations must focus on developing a strategic approach for RPA to realise optimum benefits in RL • Organisations must focus on developing and implementing gatekeeping strategies and practices for optimum RPA benefits in RL • Organisations must focus on the organisational requirement relating to staff involvement for optimum RPA benefits in RL • Organisations must focus on the market-related requirements of consumer information sharing and requesting product return information to achieve optimum RPA benefits in RL

	• The least significant requirements, with no impact on RPA outcomes, include the economic requirement of investment and the operational requirement of facility/office space	
Outcomes	• RPA practices in RL involve economic, operational, product return, organisational, environmental and market-related outcomes • The most significant outcomes of RPA practices in RL involves operational outcomes (associated with all RPA practice categories), followed by market-related and organisational outcomes • The least significant outcome of RPA practices in RL involves the environmental outcomes • The most significant economic outcome of RPA practices in RL includes RL cost reductions • The most significant operational and product-related outcomes of RPA practices in RL includes improving product return forecasting and visibility and reducing unnecessary/fraudulent product returns • The most significant organisational outcome of RPA practices in RL includes successful RA (return avoidance) • The most significant market-related outcomes of RPA practices include improving consumer service and experience and improving CRM	• Organisations that seek economic, operational, product return, organisational, environmental and market-related benefits in RL can implement RPA practices • Organisations that seek to reduce RL costs can consider implementing RPA practices in RL • Organisations that experience product return forecasting and visibility problems can consider implementing RPA practices in RL • To reduce unnecessary and fraudulent product returns, organisations can implement RPA practices in RL • Organisations that seek to effectively avoid product returns can implement RPA practices in RL • Organisations that experience consumer service and experience problems in RL can consider RPA practices • To improve CRM, organisations can consider RPA practices in RL • For the effective management of consumer returns, organisations must identify/implement/consider RPA strategies, requirements and outcomes

Source: Compiled by the researcher

Table 6.42 demonstrates the value of RPA practices as part of the RL practices for consumer returns. Organisations can use the RPA strategies, requirements and related outcomes for effective RPA in RL, which can contribute to the effective RLM of consumer returns. RPA practices in RL will further be explored in the interviews with industry experts (chapter 8).

In the next section, SPP practices in RL will be explored, analysed and discussed.

6.9.4 Strategic planning and procedural (SPP) practices to manage consumer returns

SPP practices to manage consumer returns relate to strategic planning, formalisation and standardisation. Since a lack of strategic planning and procedural practices in RL represent organisational barriers to effective RLM (see section 2.3.3), SPP practices can be important for the management of consumer returns. Most of the findings related to SPP practices focus on formalisation and standardisation (strategic procedures), which indicates that RL literature (of the QCA) lacks insight into the strategic planning of RL. Consequently, the lack of literature on the strategic planning of RL mirrors the organisational barrier related to a lack of strategic planning in RL, demonstrating a significant gap in RL research.

Like other RL practice categories, SPP practices involve strategies, requirements and related outcomes. In the subsequent sections, the strategies, requirements and outcomes of SPP practices in RL will be discussed and concluded with a description, conceptual framework and summary of findings for SPP practices to manage consumer returns.

6.9.4.1 Strategies and requirements of SPP practices in RL

The strategies of SPP practices involve the strategies for strategic planning in RL and the strategies for strategic procedures in RL, and the SPP requirements include operational, organisational and SC

requirements, which can contribute to the effective RLM of consumer returns. Table 6.43 provides an overview of the findings related to the *strategies and requirements of SPP practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.43 Findings related to strategies and requirements of SPP practices to manage consumer returns

SC requirements	***Establish SC partnerships***	None	• *"[…] RL integrated strategic planning model […] can be effectively implemented by creating contractual arrangements […]."* (Das, 2012:1439)

Source: Compiled by the researcher

Table 6.43 indicates the SPP strategies, including strategies for strategic planning in RL and strategies for strategic procedures in RL, and the SPP requirements, which will be discussed in subsequent sections.

6.9.4.1.1 Strategies for strategic planning practices in RL

The strategies for strategic planning practices in RL include (1) strategic approaches and perspectives for strategic planning, (2) strategic considerations for strategic planning, (3) understanding and analysing strategic factors in RL, (4) developing a strategic plan for RL, (5) integrating the strategic plan for RL with the strategic plans of the organisation, (6) implementing an integrative strategic planning model for RL, (7) utilising incentives for strategic planning, (8) developing RL strategies, and (9) integrating RL strategies with organisational strategies.

The *strategic approaches* and *perspectives* for strategic planning in RL involves an integrated strategic planning approach, a systematic decision-making approach and a strategic planning perspective in RL, which set the foundation for developing and implementing strategic plans and strategies for RL. Moreover, certain *strategic considerations* can be important for strategic planning in RL, which includes considering (1) the RL function, (2) facility/location and disposition (recovery) strategies, (3) RL processes, (4) product return volume, (5) SCM, and (6) the financial, environmental and social impact of RL strategies. Therefore, organisations must consider both internal and external factors related to RL processes and practices for developing effective strategic plans in RL.

Similarly, organisations must *understand* and *analyse strategic factors* in RL practices, which may include in/outsourcing decisions (section 6.5), disposition decision factors (section 6.6), factors for PM in RL (section 6.7), factors that influence facility/location strategies (section 6.8), factors for FM in RL (section 6.9.2), and factors for RPA in RL (section 6.9.3). Based on the strategic approaches, perspective, considerations, and understanding of strategic factors in RL, organisations can *develop a strategic plan for RL*, which must include the vision and goals for adopting and implementing RL practices and RL processes (such as collection, transport, receiving, processing, inspection, sorting, disposition and redistribution).

Once completed, organisations can *integrate* the *strategic plan* for *RL* with the *strategic plans* of the *organisation* and *implement an integrated strategic planning model for RL*, linking with an integrated strategic planning approach in RL. Additionally, organisations can *utilise incentives*, ensuring effective development and implementation of integrated strategic plans in RL.

Following the development and implementation of the strategic plans for RL, organisations can *develop RL strategies*, which can include developing strategies for individual RL practices (such as integration, outsourcing, disposition, PM, facility/location, RC, FM and RPA strategies). Finally, organisations must *integrate RL strategies* with *organisational strategies*, complementing the integrative strategic plans of RL and the organisation. Consequently, RL strategies must be in line with organisational vision, goals and strategies for the effective management of consumer returns.

6.9.4.1.2 Strategies for strategic procedures in RL

As indicated in the introduction of section 6.9.4, SPP practices in RL mostly focus on strategic procedures, which include formalisation and standardisation of RL. Subsequently, strategic procedures in RL involve several strategies, including (1) a strategic approach for strategic procedures in RL, (2) prioritising strategic procedures, (3) strategic considerations for procedural practices, (4) articulating and defining RL processes and practices, (5) defining roles and responsibilities in RL, (6) the formal development and implementation of RL programs, (7) developing a formalisation strategy for RL, (8) defining and developing formal rules and controls for RL, (9) the formal development of standard operating procedures (SOPs) and manuals for RL, (10) formalising RL processes, activities and skills, (12) standardising RL processes and the RSC (reverse SC), (13) publishing accessible strategic procedures for RL, (14) the formal implementation of strategic procedures in RL, and (15) developing incentives for strategic procedures.

Despite the formal nature of procedural practices, organisations can benefit from implementing strategic procedures with an innovative *strategic approach*, which means that formalisation and

standardisation of RL enables RL innovation and knowledge creation. Furthermore, like RC and RPA practices in RL (sections 6.9.1 and 6.9.3), organisations must *prioritise strategic procedures in RL*, demonstrating the importance and potential benefits of strategic procedural practices for effective RLM. Nevertheless, organisations must *strategically consider* their level of control over RL processes, since this can directly influence the level of formalisation and strategic procedures appropriate for the RL function. Evidently, organisations that outsource some or all RL processes requires less strategic procedures than those that keep the entire RL function inhouse.

In developing strategic procedures for RL, organisations need to *articulate* and *define RL processes* and *practices.* For example, defining collection, transportation, receiving, processing, inspection, sorting, disposition and redistribution processes, and SCI, in/outsourcing, facility/location, disposition and strategic planning practices in RL. Additionally, organisations must *define roles* and *responsibilities in RL*, for example, describing the role and responsibilities for the RL manager, receiving clerks, processing staff and inspectors that handle product returns.

With clear descriptions of the RL function, organisations can start to *formally develop RL programs*, which links with the strategic plans for RL (section 6.9.4.1.1). Consequently, organisations must develop plans or agendas for RL that include information and procedures for the *formal implementation* of the *RL program.* In procedural practices, implementing the RL program can be important since it directly influences the level of formalisation (or procedural practices) needed for RL. Subsequently, organisations can *develop a formalisation strategy for RL*, which forms the foundation of developing and implementing strategic procedures in RL.

As part of the formalisation strategy, organisations must *define* and *develop formal rules* and *controls* for *RL*, followed by the *formal development* of *SOPs* and *manuals* for *RL* to capture the norms and rules for RL. As part of the development of rules and SOPs, organisations can *formalise RL processes* and *activities* that involve written rules and procedures for individual RL processes and activities (e.g. inspection, testing and repackaging), emphasising the importance of defining RL processes during the initial stages of strategic procedures in RL. Likewise, linking to the definitions of roles and responsibilities in RL, organisations must *formalise* the *RL skills* needed to perform RL processes effectively and efficiently.

Additionally, organisations can *standardise the RL process*, ensuring an even and consistent application of strategic procedures across RL functions and operations. However, organisations may choose to extend the standardisation of RL processes to the *standardisation* of the *RSC*, which means that all the organisations in the SC applies the same standards and procedures for managing product returns.

Consequently, SCI and collaborative relationships between SC partners can be important for a SC-wide implementation of strategic procedures for RL.

Following the formalisation and standardisation of RL, organisations must *publish accessible strategic procedures* for RL, meaning that all stakeholders (especially staff) in the RL process can easily obtain the documented rules and SOPs to understand the formalised and standardised RL processes, skills and practices of the organisation. Furthermore, organisations can create *incentives for strategic procedures* in RL, which may link to measuring and tracking the performance and outcomes of formalisation and standardisation in RL (see section 6.9.4.1.3).

Finally, organisations can *formally implement strategic procedures* in RL to gain control over the RL function and realise the benefits associated with the formalisation and standardisation of RL (see section 6.9.4.2). The implementation of the strategic procedures in RL can be organisation-wide to encourage CFI as another important RL practice to manage consumer returns (see section 6.4.3).

6.9.4.1.3 Requirements of SPP practices in RL

Due to the strategic nature of SPP practices, the requirements of SPP are limited to operational, organisational and SC requirements. The *operational requirement* of SPP in RL involve utilising a CRC (centralised return centre) as part of the facility/location practices in RL. Particularly, organisations can use CRCs to support standardisation of RL processes, demonstrating an important link between SPP and facility/location practices.

The *organisational requirements,* including (1) awareness of the importance of RLM, (2) implementing PM for RL, and (3) management involvement, mostly support the effective development and implementation of the SPP strategies in RL. For instance, *awareness* of the *importance* of *RLM* can motivate organisations to pay more attention to RL, and subsequently, develop and implement strategic plans, strategies and procedures for RL. Likewise, *implementing PM* practices in RL, including a PM framework (that include performance perspectives, objective and measures), performance reviews and feedback mechanisms (see section 6.7), can be important to measure the effectiveness of SPP strategies in RL. Measuring the performance of SPP strategies can be important to effectively utilise incentives developed for SPP, including incentives for strategic planning (section 6.9.4.1.1) and strategic procedures in RL (section 6.9.4.1.2). Like other RL practices, *management involvement* can be important for SPP practices in RL. For instance, a SC manager can be important for adopting an integrative strategic planning approach in RL, developing strategic plans for RL and integrating strategic plans for RL with the strategic plans of the organisation (see section 6.9.4.1.1). Additionally,

managers can play important roles in developing and implementing formalisation strategies, rules and SOPs for RL processes and practices.

Finally, *establishing SC partnerships* as a *SC requirement* in SPP practices can be important for the effective implementation of an integrative strategic planning model for RL (strategic planning strategy), which demonstrates the importance of SCI practices for the effective management of consumer returns (see section 6.4.1).

Essentially, SSP requirements strongly associate with the SPP strategies, which can lead to important outcomes of SPP practices in RL, discussed in the next section.

6.9.4.2 Outcomes of SPP practices in RL

The outcomes of SPP practices involve the benefits associated with the effective implementation of the SPP strategies and requirements, which can be important for the management of consumer returns. The outcomes of SPP practices in RL include (1) economic, (2) operational (3) organisational (4) environmental, (5) market-related and (6) SC outcomes. Table 6.44 provides an overview of the findings related to the *outcomes of SPP practices in RL*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.44 Findings related to outcomes of SPP practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Address economic barriers in RL***	None	• *"[…] the high cost of reverse logistics also compels firms to look at the issue seriously from a long-term strategic perspective."* (Lau & Wang, 2009:448)
	Cost reductions	None	• *"[…] formalization [sic] […] can be an effective method of reducing costs effectively […]."* (Huang & Yang, 2014:635) • *"[…] process formalization [sic] is a top priority […] the need to establish formal operating procedures regarding RL operations […] to […] minimize [sic] associated costs."* (Genchev *et al.* 2011:257)
	Cost effectiveness	None	• *"[…] the need to rethink the significance of Reverse Logistics management. This has also given rise to the development and incorporation of Reverse Logistics strategies in their business model […] to gain cost effectiveness […]."* (Rajagopal *et al.* 2015:47) • *"[…] formalized [sic] reverse logistics processes may represent a rare, valuable, and not easily imitable knowledge resource […] enabling more cost effective processes."* (Hazen *et al.* 2015:163)
	Increase RL budget / funding	None	• *"Detailed description of the reverse logistics program […] increases the probability of […] securing favorable [sic] budgeting for the reverse logistics program."* (Genchev, 2009:147)
	Profitability	None	• *"[…] strategic-level SC planning that integrates RL […] as a way of improving […] performance in terms of profit […]."* (Das, 2012:1439) • *"Formalized [sic] efforts would help firms to profitably manage the returned product."* (Genchev *et al.* 2011:255)
	Minimise financial losses	None	• *"The potential for losses from mishandling unwanted product make it imperative for firms to […] effectively formalizing [sic] their programs."* (Genchev *et al.* 2011:245)
Operational outcomes	***Address operational barriers in RL***	None	• *"[…] the operational barriers in reverse logistics included problems with product quality, limited forecasting and visibility, inadequate information and technology systems and developmental barriers. The practices that were identified for overcoming these barriers included […] standardising the reverse logistics process […]."* (Badenhorst, 2016:10)
	Increase forecasting and visibility in RL	Tiwari (2013:241)	• *"To address issues with limited forecasting and visibility in reverse logistics, organisations can implement a variety of first-priority practices, such as standardising the reverse logistics process […]."* (Badenhorst, 2016:9) • *"Formalization [sic] will help to increase visibility of RL […]."* (Genchev *et al.* 2011:258)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Reduce uncertainties in the RL process	Genchev *et al.* (2011:253)	• *"Formalization [sic] of the processes […] reducing the ambiguity that can exist in the process through the application of rules and procedures."* (Aitken & Harrison, 2013:753)
	Address IT and infrastructure barriers in RL	None	• *"[…] strategic plans and visions associated with adoption and implementation of RL practices […] Understanding and analyzing [sic] Strategic factors is important […] to improve certain weaknesses related to technology, infrastructure […]."* (Mangla *et al.* 2016:617)
	Improve operational flexibility and efficiency	None	• *"[…] strategic plans and visions associated with adoption and implementation of RL practices […] Understanding and analyzing [sic] Strategic factors is important […] to improve […] flexibility […]."* (Mangla *et al.* 2016:617) • *"[…] formalization [sic] improved operating flexibility and the achievement of operating efficiency."* (Tiwari, 2013:242)
	Simplify RL processes	None	• *"Simplified […] reverse logistic operations […] formulating, tailoring, RL operation specification […]."* (Prakash & Barua, 2015:603) • *"[…] streamline their RL operations by effectively formalizing [sic] their programs."* (Genchev *et al.* 2011:245)
	Monitor and measure accuracy in RL processes and activities	None	• *"Formal rules can be applied to assess whether returns inspectors made the right decision according to firms' manuals […]."* (Genchev *et al.* 2011:254) • *"Formalization [sic] of processes and skills into assessable and auditable formats […] to monitor variances in execution […]."* (Aitken & Harrison, 2013:759) • *"[…] monitoring […] the reverse logistics operation […] can be moderated by formalizing [sic] the processes and activities involved."* (Genchev, 2009:147)
	Enables control of RL processes	None	• *"[…] level of formalization [sic] becomes indicative of how much control a given firm has over its RL operations. The issue of control is associated with the formal development and implementation of a RL program."* (Genchev *et al.* 2011:243) • *"[…] controlling the reverse logistics operation […] can be moderated by formalizing [sic] the processes and activities involved."* (Genchev, 2009:147)
	Facilitate and support RL processes	Huang and Yang (2014:635)	• *"[…] return initiation […], to receiving and processing the returns, to their final disposition, written rules and procedures must be readily available to guide execution."* (Genchev, 2009:147) • *"The formalization [sic] […] of these activities […] help streamline returns processing."* (Genchev *et al.* 2011:253)
	Improve RL process efficiency and effectiveness	None	• *"RL process formalization [sic] […] facilitate a more efficient flow of goods from the point of consumption to the point of origin."* (Hall *et al.* 2013:782) • *"[…] formalization [sic] […] employees understand how the RL process is supposed to work and are informed on how to make it operate more efficiently, […] to ensure the RL process is executed appropriately."* (Huscroft *et al.* 2013b:318) • *"Efficiency is improved because formal rules and procedures eliminate the need to treat every event as a new decision […]."* (Tiwari, 2013:242)
	Facilitate RL/FL integration	None	• *"RL process managers formalize [sic] their processes; especially when coupled with an effective metrics program […] aligning 'new' reverse process with established pipelines and transportation channels […]."* (Hall *et al.* 2013:777)
Organisational outcomes	***Address organisational barriers***	None	• *"[…] successful strategic SC planning that integrates the collection, recovery, […] and redistribution of recovered products [...] to be pursued by SC managers for addressing RL in their business."* (Das, 2012:1439) • *"Detailed description of the reverse logistics program […] increases the probability of getting senior management's attention […]."* (Genchev, 2009:147)
	Facilitate RL system development	None	• *"Formalization [sic] of the processes can assist in the establishment of a RL system through […] the application of rules and procedures."* (Aitken & Harrison, 2013:753)
	Enables and support RL innovation and initiatives	Tiwari (2013:242)	• *"RL innovation […] for example, […] formalization [sic] […]."* (Huang & Yang, 2014:635) • *"The organizations [sic] report having standardized [sic] processes in place organization-wide [sic] to support reverse logistics initiatives […]."* (Partida, 2011:64)
	Enables control over the RL function	None	• *"[…] process formalization [sic] is a top priority […] if you want to gain control of your reverse logistics program, you must clearly define the rules […] and strictly enforce them […]."* (Genchev *et al.* 2011:257)
	Facilitate and enhance PM in RL	None	• *"[…] formalize [sic] each individual process in order to more accurately measure program performance."* (Genchev *et al.* 2011:246) • *"RL process formalization [sic] will help firms to better align goals with metrics […]."* (Hall *et al.* 2013:782) • *"[…] providing a platform to help measure the effectiveness of RL process formalization [sic] achieved […]."* (Genchev *et al.* 2011:247)
	Improve RL performance	None	• *"Written procedures and guidelines for execution […] to achieve predetermined performance outcomes."* (Genchev, 2009:147) • *"[…] process formalization [sic] as key determinants of enhanced program performance."* (Genchev, 2009:140)
	Facilitate RLM	None	• *[...] strategic planning would improve the achievement of and contribution toward servicing RL management."* (Yuan *et al.* 2016:189) • *"[…] Formalization [sic] is a strategy of control that provides a structure for directing logistics operations […]."* (Tiwari, 2013:242) • *"[…] norms […] develop and guide the behaviour of the actors."* (Flygansvær *et al.* 2008:14) • *"[…] increased process formalization [sic] can help companies to better manage their RL operations."* (Genchev *et al.* 2011:246) • *"Formalization [sic] of processes and skills into assessable and auditable formats*

Table 6.44 presents numerous outcomes of SPP practices in RL, including economic, operational, organisational, environmental, market-related and SC outcomes, which will be discussed in subsequent sections.

6.9.4.2.1 Economic outcomes of SPP practices in RL

The economic outcomes of SPP practices in RL include (1) addressing economic barriers in RL, (2) RL cost reductions, (3) cost effectiveness, (4) increasing RL budget, (5) profitability and (6) minimising financial loss. RL associate with several *economic barriers* including high RL costs (see sections 2.4.1), which can hamper effective planning and implementation of RL. Consequently, adopting the strategic perspective of strategic planning in RL can address high-cost barriers in RL.

Moreover, *RL costs* can be *reduced* through several strategic procedural strategies, including, prioritising strategic procedures, developing a formalisation strategy (can be viewed as general formalisation in RL), developing SOP's and formalisation of RL processes. Furthermore, organisations can achieve *cost effectiveness* through various SPP practices, including (1) strategic planning strategies that involve developing RL strategies and integrating RL strategies with organisational strategies, (2) the strategic procedural strategy of formalising RL processes, and (3) the organisational requirement of becoming aware of the importance of RLM.

Like RC practices in RL (see section 6.9.1), the strategic procedure strategy of articulating and defining RL processes and practices, including a detailed description of RL programs (plans), can secure funding for RL and *increase* the *RL budget*. Additionally, integrating RL strategic planning with the strategic plans of the organisation (strategic planning strategy) and developing a formalisation strategy (strategic procedure strategy) can increase *profitability*, which demonstrates the strategic significance of RL.

Finally, organisations can *minimise financial losses*, which associate with inefficient handling of unwanted product returns, through the formal development of RL programs (strategic procedure strategy). Consequently, developing appropriate RL programs can link with the RPA practices in RL, which reduce or avoid unwanted returns (see section 6.9.3).

6.9.4.2.2 Operational outcomes of SPP practices in RL

SPP practices in RL involve several operational outcomes, which include (1) addressing operational barriers in RL, (2) increasing forecasting and visibility, (3) reducing uncertainties in the RL process, (4) addressing IT and infrastructure barriers in RL, (5) improving operational flexibility and efficiency, (6) simplifying RL processes, (7) monitoring and measuring accuracy in RL processes and activities, (8) enabling control over RL processes, (9) facilitating and supporting RL processes, (10) improving RL process efficiency and effectiveness, and (11) facilitating RL/FL integration.

Like other RL practices (such as PM, facility/location, RC and RPA practices), the strategic procedure strategy of standardising RL processes can *address operational barriers* in RL, which includes limited forecasting and visibility, problems with product return quality, inadequate IT for RL and developmental (lack of infrastructure) barriers (see section 2.3.2). Particularly, prioritising strategic procedures, formalising RL and standardising RL processes (strategic procedure strategies) can *increase forecasting* and *visibility* in RL.

Similarly, strategic procedure strategies in RL, including developing and defining rules, developing SOPs, formalising RL processes and implementing strategic procedures in RL, can *reduce uncertainties* in the *RL process* (e.g. uncertainties in timing, quality and quantity of product returns) (see section 2.3.2). Furthermore, understanding and analysing strategic factors in RL and developing a strategic plan for RL (strategic planning strategies) can *address IT* and *infrastructure barriers* in RL, implying that SPP practices can support IT practices (see section 6.3) and facility/location practices (see section 6.8) in RL.

Accordingly, SPP practices, including understanding and analysing strategic factors in RL, developing a strategic plan for RL (strategic planning strategies) and formalising RL (strategic procedure strategy), can *improve operational flexibility* and *operational efficiency* in RL. Moreover, *RL processes* can be *simplified* by articulating and defining RL processes and practices and developing a formalised RL program (strategic procedure strategies).

Several strategic procedural strategies, including (1) defining and developing rules in RL, (2) developing a manual for RL (part of SOPs), (3) formalising RL processes and RL skills, and (4) publishing accessible strategic procedures, enable *monitoring* and *measuring* the *accuracy* of *RL processes* and *activities.* Evidently, strategic procedure strategies, especially, strategic considerations (e.g. level of formalisation appropriate for RL) in strategic procedures, the formal development and implementation of RL programs, and formalisation of RL processes, can help organisations to *control RL processes*.

Furthermore, the strategic procedural strategies of defining and developing rules for RL, developing SOPs, formalising RL processes and publishing accessible strategic procedures can *facilitate* and *support RL processes* as well as *improve* the *efficiency and effectiveness of RL processes,* which can be important for the effective management of consumer returns.

Finally, SPP practices in RL, including formalising RL processes (strategic procedure), implementing PM practices and involving managers (organisational requirements), can *facilitate RL* and *FL integration,* confirming the importance of SPP practices for facility/location practices in RL, especially, integrated facility/location practices (see section 6.8.3).

6.9.4.2.3 Organisational outcomes of SPP practices in RL

Like the operational outcomes, SPP practices in RL involve several *organisational outcomes,* including (1) addressing organisational barriers, (2) facilitating RL system development, (3) enabling and supporting RL innovation and initiatives, (4) enabling control over the RL function, (5) facilitating and enhancing PM in RL, (6) improving RL performance, (7) facilitating RLM, (8) facilitating standardisation in RL, (9) supporting RL staff, (10) facilitating decision-making, (11) effective management of staff, (12) enhancing knowledge management and information sharing, (13) facilitating CFI practices, and (14) facilitating RPA practices.

Like the operational barriers in RL, *organisational barriers* can hamper effective implementation and management of RL (see section 2.3.3), which can be *addressed* through SPP practices in RL. Specifically, organisations can address the lack of senior management support for RL and management inattention by integrating RL strategies and organisational strategies (strategic planning strategy), defining RL processes and practices (strategic procedure strategy) and involving management in SPP (organisational requirement). Furthermore, strategic procedure strategies relating to formalising RL processes and publishing accessible strategic procedures (such as rules and SOPs) can *facilitate* the *development* of an *RL system.*

Relating to the strategic procedure approach of innovation (see section 6.9.4.1), formalising RL, standardising RL processes and implementing strategic procedures in RL (strategic procedure strategies) can *enable* and *support RL innovation* and *initiatives.* Furthermore, organisations can obtain *control over the RL function* by prioritising strategic procedures, defining rules, formalising RL processes and implementing the strategic procedures in RL (strategic procedure strategies), which emphasise the operational outcome of enabling control over RL processes (section 6.9.4.2.2).

Organisations can *facilitate* and *enhance PM practices,* including aligning objectives with metrics, measuring RL process effectiveness and measuring RL performance (also see section 6.7), by

formalising RL processes (strategic procedure strategy) and implementing PM practices (organisational requirement of SPP). Similarly, *RL performance* can be *improved* by developing SOPs and manuals for RL, formalising RL processes and implementing PM practices for SPP. Moreover, developing a strategic plan for RL (strategic planning strategy), developing a formalisation strategy, developing SOPs (that include norms) for RL, formalising RL processes and skills, and publishing accessible strategic procedures (strategic procedure strategies) can *facilitate RLM*, confirming the importance of SPP practices for managing consumer returns.

Certain SPP practices can *facilitate standardisation* in *RL,* including articulating and defining RL processes and practices (strategic procedure strategy), utilisation of CRCs (operational requirement) and awareness of the importance of RLM (organisational requirement), which indirectly contributes to several benefits (e.g. operational, organisational and market-related benefits) (see section 6.9.4.2). Furthermore, strategic procedure strategies, like formal development of SOPs, standardisation in RL and formalisation in RL (including RL processes), can *support RL staff.* For example, SOPs and standardisation in RL can reduce confusion and potential conflict in RL operations, formalisation can reduce complex decision-making (e.g. easier for RL manager to identify disposition decisions), and formalisation of RL processes provide clear expectations for internal stakeholders (e.g. RL staff, departments and managers).

Subsequently, strategic procedure strategies, including defining rules, developing SOPs and implementing strategic procedures for RL, *facilitate RL decision-making,* reducing the need to make unique or incorrect decisions in the RL process. Moreover, formalisation and publication of strategic procedures in RL (procedural strategies) enables *effective management of staff,* for example, formalisation of RL processes enables personal accountability and application of corrective action, and formalisation and publication of strategic procedures enables the development of appropriate staff incentives. Additionally, formalisation in RL can *enhance knowledge management* and *information sharing*, demonstrating the importance of publishing accessible strategic procedures (see section 6.9.4.1).

Similarly, strategic procedure strategies, like formalisation in RL, standardisation in RL processes, and implementation of strategic procedures, *facilitate CFI practices*, which involve internal coordination and integration and elimination of silo activities. Furthermore, developing a strategic plan for RL (strategic planning strategy) *facilitate RPA practices,* emphasising that SPP practices can minimise financial losses associated with unwanted returns (economic outcome) (section 6.9.4.2.1). Consequently, SPP practices in RL support other RL practices (like CFI and RPA), which demonstrates the importance of implementing SPP practices for the effective management of consumer returns.

6.9.4.2.4 Environmental and market-related outcomes of SPP practices in RL

A few *environmental outcomes*, related to environmental responsibility and performance, associate with SPP practices in RL. More specifically, developing a strategic plan for RL can *support environmental responsibility* by reducing challenges associated with environmentally responsible practices. Additionally, integrating RL strategic plans with organisational strategic plans can *improve* the *environmental performance* of organisations, emphasising the importance of environmental drivers to effectively manage RL (see section 2.3).

The *market-related outcomes* of SPP practices in RL include (1) increasing competitive advantage, (2) improving consumer service and satisfaction, and (3) enabling consumer information sharing and CI. Several SPP practice in RL can *increase* the *competitive advantage* of an organisation, including the (1) strategic planning strategies related to understanding and analysing strategic factors in RL, developing a strategic plan for RL, developing RL strategies and integrating RL strategies with organisational strategies, (2) strategic procedure strategy related to formalisation of RL processes, and (3) organisational requirement related to the awareness of the importance of RLM.

Furthermore, SPP practices in RL, including formalisation, developing rules, developing SOPs for RL (strategic procedure strategies) and management involvement (organisational requirement), can *improve consumer service* and *satisfaction.* Moreover, developing a formalisation strategy and formalising RL processes *enables consumer information sharing* and *CI.* For instance, increased visibility in the RL process (operational outcome) (section 6.9.4.2.2) ensures that consumers receive information regarding the processing of product returns. Additionally, formalisation of the RL process provides consumers with clear expectations and enhances coordination and integration with consumers. Consequently, SPP practices in RL support CI practices in RL, which can be critical for managing consumer returns effectively (see section 6.4.2).

6.9.4.2.5 SC outcomes of SPP practices in RL

SPP practices in RL involves several SC outcomes, including (1) addressing SC barriers in RL, (2) SC benefits and SCI, (3) enabling SC information sharing, and (4) improving SC performance. Specifically, the strategic planning strategies of understanding and analysing strategic factors in RL and developing strategic plans for RL can *address SC barriers* (e.g. lack of SC coordination and integration) (see section 2.3.4) in RL. Accordingly, SPP practices, including, implementing an integrated strategic planning model for RL, utilising incentives for strategic plans in RL (strategic planning strategies) and establishing SC partnerships (SC requirement), provide *SC benefits* and enable

SCI, which can be an important practice for the effective management of consumer returns (see section 6.4.1).

Like the market-related outcome of consumer information sharing (section 6.9.4.2.4), formalising RL (strategic procedure strategy) *enables SC information sharing*, through improved visibility in the RL process (operational outcome) and clear expectations of the roles and responsibilities of SC parties. Finally, the strategic planning strategy of integrating RL strategic planning with organisational strategic planning (such as SC planning) can *improve SC performance*, demonstrating the importance of adopting an integrated strategic planning approach in RL (see section 6.9.4.1.1).

Essentially, SPP strategies and requirements in RL can not only be important for economic, operational, organisational, environmental, market-related and SC outcomes, but also support of important RL practices (e.g. IT, SCI, CI, CFI, PM, facility/location and RPA), contributing to the effective RLM of consumer returns. In the next section, SPP practices in RL will be concluded with a description, conceptual framework and summary of findings for SPP practices to manage consumer returns.

6.9.4.3 Description, conceptual framework and summary of findings for SPP practices to manage consumer returns

Based on the findings presented in section 6.9.4, SPP practices in RL can be important for the management of consumer returns, and will be described as follows:

> SPP practices for the management of consumer returns involve (1) strategic planning strategies, including a strategic approach and perspective, strategic considerations for strategic planning, understanding and analysing strategic factors in RL, developing a strategic plan for RL, integrating the strategic plan for RL with the strategic plans of the organisation, implementing an integrative strategic planning model for RL, utilising incentives for strategic planning, developing RL strategies, and integrating RL strategies with organisational strategies, (2) strategic procedure strategies, including a strategic approach, prioritising strategic procedures, strategic considerations for strategic procedures, articulating and defining RL processes, practices, roles and responsibilities, the formal development and implementation of RL programs, developing a formalisation strategy for RL, defining and developing formal rules and controls for RL, the formal development of standard operating procedures (SOPs) and manuals for RL, formalising RL processes, activities and skills, standardising RL processes and the RSC, publishing accessible strategic procedures for RL, the formal implementation of strategic procedures in RL, and developing incentives for strategic procedures, and (3) SPP requirements, including an operational requirement (utilise CRCs), organisational requirements (awareness of the importance of RLM, implement PM practices and management involvement) and a SC requirement (establish SC partnerships).
>
> The SPP strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, RL cost reductions, increase RL budget, cost effectiveness, profitability, and minimise financial loss), (2) operational outcomes (address operational barriers, improve forecasting and visibility, reduce uncertainty in RL process, address IT and infrastructure barriers, improve operational flexibility and efficiency, simplify RL processes, monitoring and measuring accuracy in RL processes and activities, control over RL processes, facilitate and support RL processes, improve RL process efficiency and effectiveness, and facilitating RL/FL integration), (3) organisational outcomes (address organisational barriers, facilitate RL system development, enable and support RL innovation and initiatives, control over the RL function, facilitate and enhance PM in RL, improve RL performance, facilitate RLM, facilitate standardisation in RL, support RL staff, facilitate decision-making, effective management of staff, enhance knowledge management and information sharing, and facilitate CFI and RPA practices), (4) environmental outcomes (environmental responsibility and improve environmental performance), (5) market-related outcomes (competitive advantage, consumer service and

satisfaction, consumer information sharing and CI), and (5) SC outcomes (address SC barriers, SC benefits, SCI, SC information sharing and improve SC performance).

Figure 6.30 provides a conceptual framework of SPP practices to manage consumer returns.

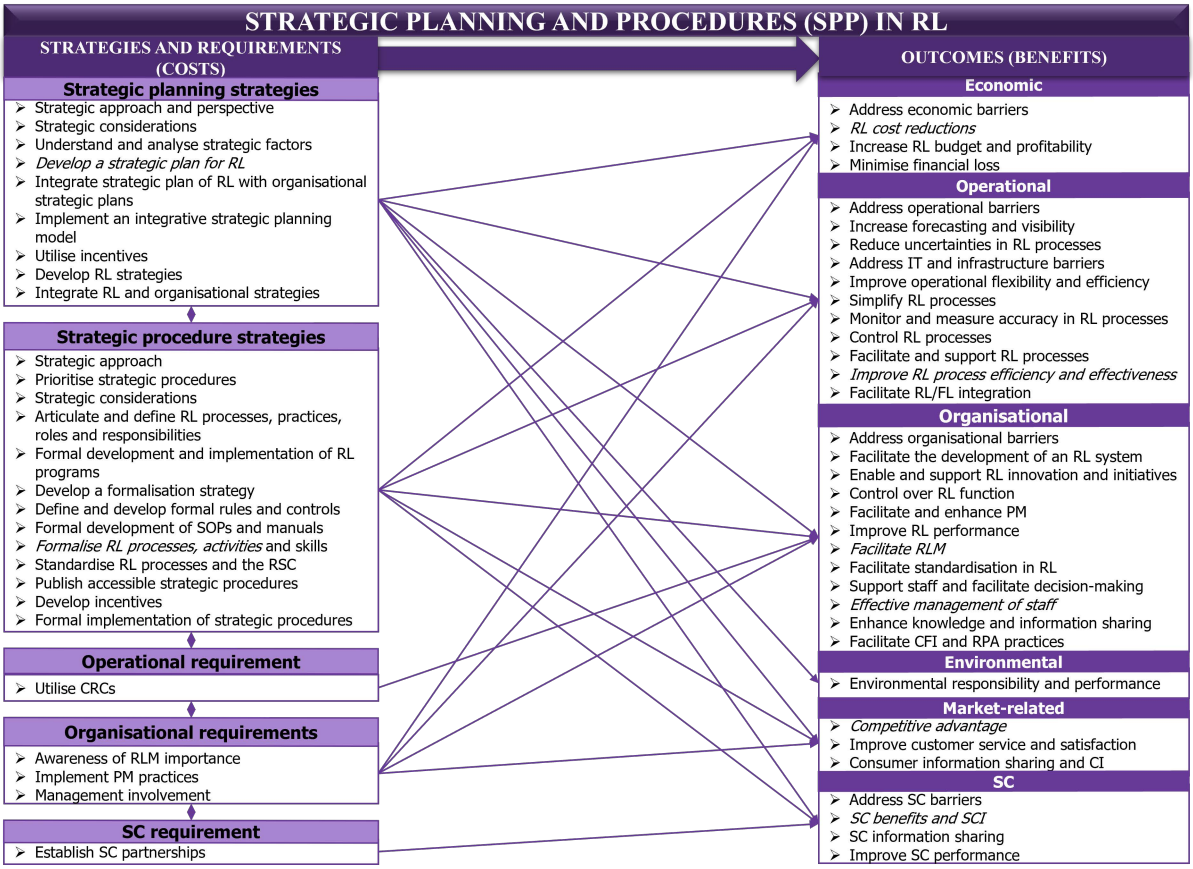

Figure 6.30 Conceptual framework of SPP practices to manage consumer returns
Source: Compiled by researcher

Figure 6.30 illustrates the links between strategic planning strategies, strategic procedure strategies, SPP requirements and SPP outcomes, demonstrating a cost and benefit relationship. The links between the SPP strategies and requirements can be demonstrated by the strategic planning strategy for RL, which links with developing and implementing RL programs (procedure strategy) and management involvement (organisational requirement). Additionally, the operational requirement of CRCs can link with RL standardisation (procedure strategy), and the SC requirement of establishing SC partnerships can link with the implementation of an integrative strategic planning model (planning strategy).

Nonetheless, the main aim of the framework involves the links between the SPP strategies, requirements and outcomes, which can be important for the effective management of consumer returns. Subsequently, the most significant SPP strategies and requirements (associated with the most outcomes) and SPP outcomes (associated with the most SPP practices) are emphasised by *italics*, which will be elaborated upon in Table 6.45.

Based on Figure 6.30 and the discussions given in section 6.9.4, Table 6.45 provides a summary of the findings and managerial implications of the SPP practices to manage consumer returns.

Table 6.45 Summary of findings and managerial implications for SPP practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	• SPP in RL involves (1) strategic planning strategies, including strategic approach and perspective, strategic considerations for strategic planning, understanding and analysing strategic factors in RL, developing a strategic plan for RL, integrating the strategic plan for RL with the strategic plans of the organisation, implementing an integrative strategic planning model for RL, utilising incentives for strategic planning, developing RL strategies, and integrating RL strategies with organisational strategies, and (2) strategic procedure strategies, including a strategic approach, prioritising strategic procedures, strategic considerations for strategic procedures, articulating and defining RL processes, practices, roles and responsibilities, formal development and implementation of RL programs, developing a formalisation strategy, defining and developing formal rules and controls, formal development of SOPs and manuals for RL, formalising RL processes, activities and skills, standardising RL processes and the RSC, publishing accessible strategic procedures, formal implementation of strategic procedures in RL, and developing incentives for strategic procedures. • The strategic planning strategies in RL associates with all the SPP outcome categories, including economic, operational, organisational, environmental, market-related and SC outcomes • From the strategic planning strategies, developing a strategic plan for RL can be the most beneficial for RL • The strategic procedure strategies in RL associates with most of the SPP outcome categories, including economic, operational, organisational, market-related and SC outcomes • From the strategic procedure strategies, formalising RL processes and activities can be the most beneficial for RL • The least significant SPP strategies, with no impact on the outcomes include strategic considerations for strategic planning, strategic approach for strategic procedures, define roles and responsibilities in RL, standardise RSC and develop incentives for strategic procedures • SPP practices in RL involves operational, organisational, and SC requirements • The organisational requirements, including awareness of the importance of RLM, PM practices and management involvement, of SPP in RL associate with most of the outcome categories, including economic, operational, organisational, market-related and SC outcomes • The least significant requirement categories include operational and SC requirements	• Organisations must develop and implement strategic planning and strategic procedure strategies for RL • Organisations that seek various economic, operational, organisational, environmental, market-related and SC benefits in RL must focus on strategic planning strategies • Organisations must focus on developing a strategic plan for RL for optimum SPP benefits • Organisations must focus on strategic procedure strategies, especially, the formalisation of RL processes and activities, for optimum SPP benefits in RL • Organisations must focus on the organisational requirements relating to the awareness of the importance of RLM, PM practices and management involvement to achieve optimum SPP benefits in RL
Outcomes	• SPP practices in RL involve economic, operational, organisational, environmental, market-related and SC outcomes • The most significant outcomes of SPP practices in RL involves organisational outcomes, followed by economic, operational, market-related and SC outcomes • The least significant outcome of SPP practices in RL involves the environmental outcomes • The most significant economic outcomes of SPP practices in RL includes include cost reductions and effectiveness • The most significant operational outcome of SPP practices in RL includes improving RL process efficiency and effectiveness • The most significant market-related outcome of SPP practices in RL includes a competitive advantage • The most significant SC outcomes of SPP practices in RL includes SC benefits and SCI	• Organisations that seek economic, operational, organisational, environmental, market-related and SC outcomes benefits in RL can implement SPP practices in RL • Organisations that seek to reduce RL costs and improve cost effectiveness can consider implementing SPP practices in RL • Organisations that experience inefficiencies in the RL process can consider SPP practices in RL • Organisations that experience RLM and staff management challenges can implement SPP practices in RL • Organisations can implement SPP practices for a competitive advantage in RL • For greater SC benefits and SCI in RL, organisations can consider implementing SPP practices in RL • For the effective management of consumer returns, organisations must identify/implement/consider SPP strategies, requirements and outcomes

Source: Compiled by the researcher

Table 6.45 demonstrates the value of SPP practices as part of the RL practices for consumer returns. Organisations can use the SPP strategies, requirements and related outcomes for effective SPP in RL, which can contribute to the effective RLM of consumer returns. SPP practices in RL will further be explored in the interviews with industry experts (chapter 8).

In the next section, the final RL practice category, management and staff practices in RL will be analysed and discussed.

6.9.5 Management and staff practices to manage consumer returns

Despite receiving limited attention in literature (see Figure 6.3) management and staff practices can be critical to manage consumer returns, as evident from management involvement, staff involvement and staff training requirements for other RL practices. Management and staff practices involve strategies, requirements and related outcomes. In the subsequent sections, the strategies, requirements and outcomes of management and staff practices in RL will be discussed and concluded with a description, conceptual framework and summary of findings to manage consumer returns.

6.9.5.1 Strategies and requirements of management and staff practices in RL

Management and staff practices in RL involve (1) general, top management, RL manager and RL staff strategies, and (2) economic, operational and organisational requirements, which can contribute to the effective management of consumer returns. Table 6.46 provides an overview of the findings related to the *strategies and requirements of management and staff practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.46 Findings related to strategies and requirements of management and staff practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
General strategies	***Prioritise staff and management practices***	Agrawal *et al.* (2016d:24)	• *"The highest priority is to create awareness at senior management […]."* (Prakash & Barua, 2015:603) • *"[…] having a "dedicated returns service department" as the most important […]."* (Ahsan & Rahman, 2016:625)
	Benefit-driven strategies	None	• *"[…] introduction of training programmes […] focussing on […] sensitising their members to the benefits of RL implementation."* (Chileshe *et al.* 2015:195) • *"[…] warehouse and other staff […] have an opportunity to train and understand the importance of RL as a supply chain-management operation."* (Sharif *et al.* 2012:2523) • *"[…] retailers who focus more on […] returns services need to emphasis more on […] skilled and trained personnel to handle returns […]."* (Ahsan & Rahman, 2016:619)
	Perform a cost-benefit analysis	Lee and Lam (2012:592) Ravi *et al.* (2008:4857)	• *"[…] to provide adequate training and contextual significance to all members of its organisation […] Although this may lead to the increasing of operational costs in order to develop RL capability within the organisation, this indeed indirectly provides a better and longer running responsiveness back to customers […]."* (Sharif *et al.* 2012:2528)
	Provide adequate organisation-wide RL training	Partida (2011:64)	• *"[…] provide adequate training and contextual significance to all members of its organisation to maximise its management and financial-resource commitment.* (Sharif *et al.* 2012:2528)
	Improve work conditions	None	• *"Extensive training […] must be combined with improved working conditions."* (Genchev, 2009:148)
	Strategic development of incentives and feedback programmes	None	• *"The organizations [sic] also recognize [sic] the importance of […] feedback, and incentives programs throughout the enterprise […]."* (Partida, 2011:64)
	Maintain management and staff RL initiatives	None	• *"The organizations [sic] also recognize [sic] the importance of maintaining training, feedback, and incentives programs throughout the enterprise […]."* (Partida, 2011:64)
Top management	***Create top/senior management***	Janse *et al.* (2010:502)	• *"[…] create awareness at senior management that must recognize [sic] a need for change and notice the potential improvement opportunities by implementing*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
strategies	***awareness of RL importance***		*RL process."* (Prakash & Barua, 2015:603) • *"[…] developing awareness among senior leadership of the importance of reverse logistics […]."* (Partida, 2011:62) • *"Top management awareness is very crucial for the success of RL implementation."* (Agrawal *et al.* 2016d:20)
	Strategic attainment of top/senior management attention, support and commitment	Abdulrahman *et al.* (2014:468) González-Torre *et al.* (2010:900) Huscroft *et al.* (2013b:309, 313, 315) Lee and Lam (2012:596) Shaik and Abdul-Kader (2012:30) Ye *et al.* (2013:134)	• *"[…] reverse logistics requires closer attention at the senior management […]."* (Rogers *et al.* 2013:44) • *"Substantial support […] and commitment of top management can help deal with a large proportion of the problems faced."* (Agarwal *et al.* 2016:2) • *"Stronger senior management support for greater IT investments […]."* (Genchev, 2009:143) • *"[…] managerial commitment, which encompasses tangible organisation and supply-chain wide policies, competences, culture, and strategy."* (Sharif *et al.* 2012:2519)
	Strategic involvement of top management in RL	Huscroft *et al.* (2013b:315)	• *"Top management initiates, guides, and motivates the organization [sic] for adoption and implementation of RL implementation."* (Agrawal *et al.* 2016d:24)
RL manager strategies	***Establish appropriate and sufficient leadership for RL***	None	• *"[…] significant effect on the implementation of reverse logistics […] include […] sufficient management personnel […]."* (Ho *et al.* 2012:39) • *"Efficient leadership is needed to provide clear vision and value to reverse logistics programs […]."* (Ravi & Shankar, 2015:887)
	Strategically create a full-time RL manager portfolio	Partida (2011:63) Stock and Mulki (2009:50)	• *"Also critical in the companies' view is that RL activities should be assigned as a full-time job preferable at an executive-level with complete responsibility for all returns operations […]."* (Li & Olorunniwo, 2008:384)
	Strategically assign a RL expert manager	Li and Olorunniwo (2008:384)	• *"[…] presence of RL expert at management level should lead to the full realization [sic] of the importance of RL […]."* (Abdulrahman *et al.* 2014:468)
	Assign experienced managers to RL	None	• *"[…] significant effect on the implementation of reverse logistics […] include […] experienced management personnel […]."* (Ho *et al.* 2012:39)
	Provide RL training for management staff	None	• *"[…] training was still perceived to be an important activity […] training was reserved only for management […]."* (Sharif *et al.* 2012:2523)
	Demonstrate RL commitment	None	• *"[…] leadership […] should demonstrate commitment to the reverse logistics activities […]."* (Ravi & Shankar, 2015:887)
RL staff strategies	***Strategic establishment of a RL function***	Sharif *et al.* (2012:2523) Subhashini (2016:11)	• *"[…] there is general agreement that some specific […] group or department should be directly responsible for reverse logistics."* (Stock & Mulki, 2009:36) • *"[…] have a functional unit dedicated to reverse logistics management."* (Janse *et al.* 2010:500) • *"[…] having a "dedicated returns service department" as the most important […]."* (Ahsan & Rahman, 2016:625)
	Strategic development of RL skills and knowledge	None	• *"[…] there is a need […] in developing the appropriate skill levels that are desirable for implementing some of the RL practices among its employees."* (Chileshe *et al.* 2015:194) • *"Enhancing the knowledge and skill proficiency of the staff […]."* (Lee & Lam, 2012:592)
	Strategic development and introduction of training and education programmes	Agarwal *et al.* (2016:3) Lee and Lam (2012:592) Partida (2011:64)	• *"Companies, willing to adopt RL will have to develop their own expertise through various education and training programs."* (Agrawal *et al.* 2016d:20) • *"[…] introduction of training programmes associated with RL […] focussing on mechanisms (such as workshops and seminars) that are aimed at sensitising their members to the benefits of RL implementation."* (Chileshe *et al.* 2015:195)
	Strategic implementation of RL training and education	None	• *"[…] education of staff […] may entail rather high costs, this can be done in phases over a longer time horizon."* (Lee & Lam, 2012:592)
	Strategic attainment of staff support and cooperation	None	• *"[…] significant effect on the implementation of reverse logistics […] include […] staff providing full support and cooperation."* (Ho *et al.* 2012:39) • *"[…] personal involvement of all employees engaged in returns handling […]."* (Genchev, 2009:147)
	Provide regular formal training and skills development opportunities	Abdulrahman *et al.* (2014:468) Agrawal *et al.* (2016d:21) Aitken and Harrison (2013:759) Ravi *et al.* (2008:4857) Selvi and Kayar (2016:26) Sharif *et al.* (2012:2528)	• *"Company should offer training and development programs on regular basis for the employees to enhance their skills."* (Agarwal *et al.* 2016:3) • *"[…] management support and employee training and skills provided to improve the effectiveness and efficiency of the RL."* (Shaik & Abdul-Kader, 2012:30) • *"Extensive training […] of all employees […]."* (Genchev, 2009:147)
	Provide informal training	None	• *"Extensive training and on-the-job advising […]."* (Genchev, 2009:148)
	Produce well-managed, -trained and -skilled staff for RL	None	• *"Quality managed personnel and staff are the backbone of any good company […] with more well-trained staff, companies are more willing to implement reverse logistics."* (Ho *et al.* 2012:42) • *"[…] retailers who focus more on […] skilled and trained personnel to handle returns […]."* (Ahsan & Rahman, 2016:619)
Economic requirement	***Investment***	None	• *"[…] there is a need to invest in developing the appropriate skill levels that are desirable for […] RL practices among its employees."* (Chileshe *et al.* 2015:194)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Financial support	None	• *"Training of staff related to the reverse logistics […] requires financial support."* (Ravi *et al.* 2008:4857)
	Cost	None	• *"[…] education of staff […] may entail rather high costs, this can be done in phases over a longer time horizon."* (Lee & Lam, 2012:592) • *"[…] to provide adequate training and contextual significance to all members of its organisation […] this may lead to the increasing of operational costs […]."* (Sharif *et al.* 2012:2528)
Operational requirement	***Separate RL and FL***	Stock and Mulki (2009:37) Subhashini (2016:11)	• *"RL was isolated from forward logistics, training was still perceived to be an important activity […]."* (Sharif *et al.* 2012:2523)
Organisational requirements	***Organisational capability***	None	• *"[…] any RL function is important and is seen as a vital competence in enterprises […] and requires an organisational capability to control and manage it effectively."* (Sharif *et al.* 2012:2523)
	Implement CFI practices	None	• *"Enterprises must provide reverse logistics training for their employees […] the process can be improved by eliminating the lack of internal tracking and coordination related to reverse logistics."* (Selvi & Kayar, 2016:26)
	RC practices	None	• *"[…] extra care and resources should be dedicated to motivating and constantly enhancing their professional skills and abilities."* (Genchev, 2009:148)
	Management involvement	None	• *"[…] managers consider "skilled and trained personnel" as the most critical service determinant […]."* (Ahsan & Rahman, 2016:624)

Table 6.46 indicates the strategies and the requirements of management and staff practices, which will be discussed in subsequent sections.

6.9.5.1.1 Strategies for management and staff practices in RL

The strategies for management and staff practices in RL can be categorised as general strategies, top management strategies, RL manager strategies and RL staff strategies. The *general strategies* for management and staff practices in RL involve (1) prioritising management and staff practices, (2) benefit-driven strategies, (3) performing a cost-benefit analysis, (4) providing adequate organisation-wide RL training, (5) improving work conditions, (6) strategic development of incentives and feedback programmes, and (7) maintaining management and staff initiatives.

Like RC, RPA and SPP practices, organisations must *prioritise management* and *staff practices* in RL, especially the strategies related to top management awareness and development of a dedicated RL function. Additionally, organisations must develop *benefit-driven* management and staff *strategies* (such as training programmes) focussing on the importance and benefits of RL and on providing good customer service. Furthermore, *performing a cost-benefit analysis* for implementing management and staff practices can be important, for example, focusing on the cost (such as funding requirement for training) (section 6.9.5.1.2) and expected benefits (such as performing RL effectively due to skilled RL staff) (section 6.9.5.2) of implementing management and staff practices.

Although training initiatives can be important for staff and management directly involved in RL (see subsequent paragraphs), *adequate organisation-wide training* on RL must be provided. This strategy can assist with subsequent strategies, like top management awareness, involvement and commitment to RL. Simultaneously, organisations need to implement strategies to *improve work conditions*, ensuring

that organisational buy-in and training in RL can be positively attained. Similarly, organisations must *strategically develop incentives* and *feedback programmes* across the organisation to not only reward RL adoption and implementation but also identify areas of improvement. Finally, organisations must *maintain management and staff initiatives*, like training, incentives and feedback initiatives, ensuring long-term benefits to effectively manage consumer returns.

Top management strategies in RL involves top management awareness, attention, support, commitment and involvement. Particularly, *creating top management awareness* of the importance of RL can be critical for effective adoption and implementation of RL. Top management awareness can be obtained through organisation-wide training (general strategy) in RL. Moreover, *strategic attainment* of *top management attention, support* and *commitment* to RL can be important, addressing various barriers to RL implementation (see sections 2.4.3 and 6.9.5.2) and creating a culture conducive to all stakeholders (e.g. staff, SC partners and consumers). Likewise, direct *involvement of top management* in RL can guide, motivate and sustain RL adoption and implementation needed to manage consumer returns.

RL manager strategies involve (1) sufficient leadership, (2) full-time RL manager portfolio, (3) appointing a RL expert manager, (4) assigning experienced managers, (5) providing manager training, and (6) demonstrating commitment to RL. *Establishing appropriate and sufficient leadership* for RL can be important to compliment top management involvement to develop RL strategies, implement RL and guide and motivate staff in adopting RL. However, organisations must *strategically create a full-time RL manager portfolio* at executive level to be responsible for all RL processes and practices, overseeing the entire RL function. Subsequently, organisations must *strategically assign a RL expert manager* to the full-time portfolio to attain ultimate benefits associated with RL implementation. Assigning an expert to manage RL can involve finding an individual from outside the organisation with experience in RLM, for example, a previously employed managing director of a 3PRL provider that specialises in consumer returns.

Nevertheless, several *experienced* (lower level) *managers* must be *assigned* to manage RL operations/processes and RL staff. Organisations may utilise current management staff (e.g. DC managers) but may need to *provide RL training*, ensuring correct execution of RL processes and activities. However, like top management, RL managers must *demonstrate commitment* to RL, which can be important for guiding and motivating staff to adopt and effectively perform RL operations.

Finally, several *RL staff strategies* can be important, which include (1) establishing a RL function, (2) developing of RL skills and knowledge, (3) developing, introducing and implementing training and education programmes, (4) attaining staff support and cooperation, (5) providing regular formal

training and skills development opportunities, (6) providing informal training, and (7) producing well-managed, -trained, and -skilled staff for RL.

Like creating and appointing a full-time RL manager (strategy), organisations must prioritise (see general strategies) and *strategically establish* a *RL function* dedicated to RL processes and practices for effective RLM. Additionally, organisations must *strategically develop RL skills* and *knowledge* of RL staff, which can be attained through the *strategic development* and *introduction* of *training* and *education programmes* for RL. Linking with benefit-driven (general) strategies, the training and education programmes must not only aim to develop RL skills and knowledge of but also aim to help staff with understanding the benefits of RL implementation.

Subsequently, *training* and *education programmes* must be *implemented strategically*, based on the cost-benefit analysis (general strategy). Evidently, organisations can incrementally implement training and education initiatives to spread the cost of implementation over an extended period (also see section 6.9.5.1.2). However, like top and middle management, organisations must *strategically attain staff support* and *cooperation* for successful RL implementation.

Consequently, organisations must *provide regular formal training* and *skills development opportunities* to RL staff as well as *provide informal* (on-the-job) *training* to ensure cooperation and effective execution of RL processes. Essentially, organisations must aim to *produce well-managed, -trained* and *-skilled* RL staff to effectively perform RL processes and practices to manage consumer returns.

6.9.5.1.2 Requirements of management and staff practices in RL

The requirements of management and staff practices involve economic, operational and organisational requirements. The *economic requirements* of management and staff practices involve investment, financial support and costs. Particularly, developing and implementing training and education opportunities can be costly, requiring investment and funding, emphasising the importance of performing a cost-benefit analysis for management and staff practices (section 6.9.5.1.1).

The *operational requirement* associates with a dedicated RL manager, department and staff, which requires separating RL operations from FL operations. Consequently, organisations must implement separate facility/location strategies (see section 6.8.2) for effective RL manager and staff strategies in RL, demonstrating the importance of adopting a holistic approach to RLM.

Finally, several *organisational requirements*, including (1) organisational capability, (2) CFI practices, (3) RC practices and (4) management involvement, associate with management and staff practices. *Organisational capability* can be important for a dedicated RL department and staff, which

demonstrates the importance of top management awareness, commitment and support in RL (see section 6.9.5.1.1). Additionally, management and staff practices require the *implementation of CFI practices*, encouraging internal information sharing and coordination (see section 6.4.3) needed for effective training and education initiatives.

Likewise, *RC practices* can be important for supporting management and staff practices (also see section 6.9.1), which emphasise investment and financial support requirements and top management commitment to RL. Finally, *management involvement* can be important for RL staff strategies, ensuring well-managed, skilled and trained staff for RL. Essentially, management and staff requirements can be critical for the effective development and implementation of management and staff strategies in RL, which can lead to important outcomes, discussed in the next section.

6.9.5.2 Outcomes of management and staff practices in RL

The outcomes involve the benefits associated with the effective implementation of the strategies and requirements of management and staff practices, which can be important for the management of consumer returns. The outcomes of management and staff practices in RL include (1) economic, (2) operational (3) organisational (4) market-related and (5) SC outcomes. Table 6.47 provides an overview of the findings related to the *outcomes of management and staff practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.47 Findings related to outcomes of management and staff practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Address economic barriers in RL***	None	• *"The cost and risk of (RL) creates a necessity for guidance and support from top level managers […]."* (Huscroft *et al.* 2013b:315) • *"Support is needed to commit the proper level of resources necessary for RL; this includes proper funding […]."* (Huscroft *et al.* 2013b:315)
Operational outcomes	***Address IT and infrastructure barriers in RL***	None	• *"Stronger senior management support for greater IT investments […]."* (Ye *et al.* 2013:134) • *For a reverse logistics initiative to be successful, it is essential that top managers have a supportive attitude and are committed […] required to support structural and infrastructural change."* (Ye *et al.* 2013:134)
	Facilitate and support RL processes	Sharif *et al.* (2012:2523)	• *"[…] retailers who focus more on […] fairness […] of returns services need to emphasis more on […] skilled and trained personnel to handle returns […]."* (Ahsan & Rahman, 2016:619) • *"There is no substitute for full-time effort being devoted to a process such as product returns. Part-time effort does not allow […] day-to-day oversight needed to ensure the process runs smoothly."* (Stock & Mulki, 2009:50)
	Improve staff understanding of RL processes	None	• *"Enterprises must provide reverse logistics training for their employees so that they can familiarize [sic] with stages in the reverse logistics process. Thus, the process can be improved by eliminating the lack of internal tracking and coordination related to reverse logistics."* (Selvi & Kayar, 2016:26)
	Improve RL process	None	• *"[…] RL activities should be assigned as a full-time job preferable at an executive-level with complete responsibility for […] continuous improvement in the RL processes."* (Li & Olorunniwo, 2008:384) • *"There is no substitute for full-time effort being devoted to a process such as product returns. Part-time effort does not allow sufficient time to fully evaluate and investigate potential improvements in the process […]."* (Stock & Mulki, 2009:50)
	RL process efficiency and effectiveness	Li and Olorunniwo, (2008:384)	• *"The management support and employee training and skills provided to improve the effectiveness and efficiency of the RL."* (Shaik & Abdul-Kader, 2012:30)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Ensure successful RL processes	None	• *"Top management support […] ensure continued success of the […] processes […]."* (Huscroft *et al.* 2013b:313) • *"RL […] isolated from forward logistics, training was still perceived to be an important activity to ensure the success of the logistics operation."* (Sharif *et al.* 2012:2523)
	Facilitate RL/FL integration	None	• *"[…] by having a full-time manager in charge of product returns, better coordination of forward and reverse logistics can occur."* (Stock & Mulki, 2009:50)
Organisational outcomes	***Address organisational barriers in RL***	Huscroft *et al.* (2013b:309)	• *"Top management awareness motivates employees and ensures full support from seniors."* (Agrawal *et al.* 2016d:24) • *"Top management awareness has the highest value and is prioritized [sic] as top most factors. Top management initiates, guides, and motivates the organization [sic] for adoption […] of RL […]."* (Agrawal *et al.* 2016d:24) • *"[…] support of top management is essential, since it is management that definitively decides whether to carry out these types of practices […]."* (González-Torre *et al.* 2010:900) • *"A high commitment and/or presence of RL expert at management level should […] help reduce the reported lack of shared understanding of best RL practices as management barrier […]."* (Abdulrahman *et al.* 2014:468) • *"[…] training […] for management […] for warehouse and other staff […] to train and understand the importance of RL as a supply chain-management operation."* (Sharif *et al.* 2012:2523) • *"Having reverse logistics as a separate function would also reduce or eliminate its subordinate status to forward distribution […]."* (Stock & Mulki, 2009:37) • *"[…] introduction of training programmes associated with RL […] focussing on mechanisms (such as workshops and seminars) that are aimed at sensitising their members to the benefits of RL implementation."* (Chileshe *et al.* 2015:195)
	Facilitate strategic decision-making in RL	None	• *"Because of the greater complexity and level of decision-making involved, reverse logistics requires closer attention at the senior management […]."* (Rogers *et al.* 2013:44) • *"For such strategic decisions, it is essential to have top management's support."* (Lee & Lam, 2012:596)
	Facilitate RL system development	None	• *"[…] up-skilling the people involved in the recovery activities are important enablers in developing a RL system."* (Aitken & Harrison, 2013:759)
	Facilitate successful RL implementation	Prakash and Barua (2015:603)	• *"Top management awareness has the highest value and is prioritized as top most factors. Top management initiates, guides, and motivates the organization for […] RL implementation."* (Agrawal *et al.* 2016d:24) • *"Top management awareness is very crucial for the success of RL implementation."* (Agrawal *et al.* 2016d:20) • *"For a reverse logistics initiative to be successful, it is essential that top managers have a supportive attitude and are committed to implementing the initiative […]."* (Ye *et al.* 2013:134) • *"[…] significant effect on the implementation of reverse logistics […] include […] sufficient management personnel, experienced management personnel, and staff providing full support and cooperation."* (Ho *et al.* 2012:39) • *"[…] there is a need to invest in developing the appropriate skill levels that are desirable for implementing some of the RL practices […]."* (Chileshe *et al.* 2015:194) • *"[…] skilled workers are very important for successful implementation."* (Agrawal *et al.* 2016d:21) • *"Quality managed personnel […] to capture the opportunities brought about by the implementation of reverse logistics […] with more well-trained staff, companies are more willing to implement reverse logistics."* (Ho *et al.* 2012:42)
	Successful RL program and function	Agrawal *et al.* (2016d:24)	• *"[…] the importance of maintaining training, feedback, and incentives programs throughout the enterprise to ensure continuous and sustainable improvement of their reverse logistics programs."* (Partida, 2011:64) • *"Top management support […] ensure continued success of the program […]."* (Huscroft *et al.* 2013b:313) • *"Efficient leadership is needed to provide clear vision and value to reverse logistics programs […]."* (Ravi & Shankar, 2015:887) • *"Having trained personnel and experts are prime requirements for achieving success in any organization [sic]."* (Abdulrahman *et al.* 2014:468)
	Develop RL capabilities and expertise	None	• *"[…] to provide adequate training and contextual significance to all members of its organisation […] this may lead to the increasing of operational costs in order to develop RL capability […]."* (Sharif *et al.* 2012:2528) • *"Companies, willing to adopt RL will have to develop their own expertise through various education and training programs."* (Agrawal *et al.* 2016d:20)
	Facilitate RLM	Stock and Mulki (2009:50)	• *"[…] have a functional unit dedicated to reverse logistics management."* (Janse *et al.* 2010:500) • *"[…] any RL function is important and is seen as a vital competence […] and requires an organisational capability to control and manage it effectively."* (Sharif *et al.* 2012:2523) • *"Enhancing the knowledge and skill proficiency of the staff through training contributes to better process management. Although the education of staff […] may entail rather high costs, this can be done in phases over a longer time horizon."* (Lee & Lam, 2012:592) • *"Training of staff related to the reverse logistics is also essential for efficient management of reverse logistics operations. All of these reverse logistics activities*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			requires financial support." (Ravi *et al.* 2008:4857)
	Facilitate training and skills enhancement of RL staff	None	• *"Stronger senior management support for […] better training for employees […]."* (Genchev, 2009:143) • *"Training and development programs for staff […] Company should offer training and development programs on regular basis for the employees to enhance their skills."* (Agarwal *et al.* 2016:3) • *"[…] extra care and resources should be dedicated to motivating and constantly enhancing their professional skills and abilities."* (Genchev, 2009:148)
	Enable high RL staff retention	None	• *"Extensive training and the personal involvement of all employees engaged in returns handling contributes to the high labor [sic] retention rate."* (Genchev, 2009:147)
	Clear roles and responsibilities	Subhashini (2016:11)	• *"Having reverse logistics as a separate function would also reduce or eliminate […] multiple reporting and role conflicts."* (Stock & Mulki, 2009:37)
	Facilitates CFI practices	None	• *"Stronger senior management support for […] better coordination among the different departments involved in handling returns […]."* (Genchev, 2009:143)
	Facilitate RC practices	Genchev (2009:143) González-Torre *et al.* (2010:900) Ye *et al.* (2013:134)	• *"Support is needed to commit the proper level of resources necessary for RL; this includes proper funding, personnel allocation, employee training […]."* (Huscroft *et al.* 2013b:315) • *"[…] adequate training […] to maximise its management and financial-resource commitment […]."* (Sharif *et al.* 2012:2528)
Market-related outcomes	***Increase competitiveness and obtain a competitive advantage***	None	• *"A high commitment and/or presence of RL expert at management level should lead to the full realization [sic] of the […] firms' future competiveness [sic]."* (Abdulrahman *et al.* 2014:468) • *"Quality managed personnel and staff […] to capture the opportunities brought about by the implementation of reverse logistics and to make it competitive advantage to distinguish the company from its competitors."* (Ho *et al.* 2012:42)
	Increase consumer satisfaction and sales	None	• *"Stronger senior management support […] justified by increased customer satisfaction, resulting in more business."* (Genchev, 2009:143)
	Improve customer service and responsiveness	None	• *"[…] retailers who focus more on […] returns services need to emphasis more on […] skilled and trained personnel to handle returns […]."* (Ahsan & Rahman, 2016:619) • *"[…] to provide adequate training and contextual significance to all members of its organisation […] Although this may lead to the increasing of operational costs […] this indeed indirectly provides a better and longer running responsiveness back to customers […]."* (Sharif *et al.* 2012:2528) • *"[…] managers consider "skilled and trained personnel" as the most critical service determinant […]."* (Ahsan & Rahman, 2016:624)
	Facilitate CRM	None	• *"Support is needed to […] effectively managing relationships with […] customers."* (Huscroft *et al.* 2013b:315)
SC outcomes	***Facilitate SCRM***	None	• *"Support is needed to […] effectively managing relationships with partners […]."* (Huscroft *et al.* 2013b:315)
	Facilitate SCI	None	• *"Efficient leadership is needed […] and should demonstrate commitment to […] integrating all the members of the supply chain."* (Ravi & Shankar, 2015:887)

Source: Compiled by the researcher

Table 6.47 presents the outcomes of management and staff practices in RL, including economic, operational, organisational, market-related and SC outcomes, which will be discussed in subsequent sections.

6.9.5.2.1 Economic and operational outcomes of management and staff practices in RL

The *economic outcome* of management and staff practices is limited to *addressing economic barriers in RL*, which relates to a lack of financial support and financial resources for RL, high RL cost and financial risks in RL (see section 2.3.1). Consequently, attaining top management commitment, support and involvement (top management strategies) can address financial problems in RL.

Several *operational outcomes* associate with management and staff practices in RL, which include (1) addressing IT and infrastructure barriers in RL, (2) facilitating and supporting RL processes, (3) improving staff understanding of RL processes, (4) improve RL processes, (5) improving RL process efficiency and effectiveness, (6) successful RL processes, and (6) facilitating RL/FL integration.

Organisations can *address IT* and *infrastructure barriers* in RL through top management commitment and support (top management strategies), demonstrating the importance of top management awareness and support of RL to address operational barriers in RL (see section 2.3.2).

Additionally, implementing benefit-driven management and staff strategies (general strategy), establishing a RL function and producing well-trained and skilled staff (RL staff strategies) can *facilitate* and *support RL processes.* Furthermore, providing regular staff training (RL staff strategy) and implementing CFI practices (organisational requirement) can *improve staff understanding of RL processes* (such as receiving, processing, inspection, sorting and disposition processes).

Management and staff practices, like assigning a RL expert manager and establishing a RL department can *improve RL processes.* Similarly, organisations can *improve* the *efficiency and effectiveness of RL processes* through top management support, and training and skills development opportunities for RL staff. Subsequently, management and staff practices, including top management support (top management strategy), training and skills development opportunities (RL staff strategy) and separating RL and FL operations (operational requirement) can ensure *successful RL processes.*

Although separating RL and FL operations (which forms part of separate facility/location practices in RL) can be an important requirement for a successful RL process, assigning an expert RL manager (RL manager strategy) can *facilitate* effective *integration* of *RL/FL* (which forms part of integrated facility/location practices in RL) (see section 6.8.3). Consequently, organisations must link management and staff practices to facility/location practices for the effective management of consumer returns.

6.9.5.2.2 Organisational outcomes of management and staff practices in RL

Management and staff practices in RL involve various *organisational outcomes,* including (1) addressing organisational barriers, (2) facilitating strategic decision-making, (3) facilitating RL system development, (4) facilitating successful RL implementation, (5) successful RL program and function, (6) developing RL capabilities and expertise, (7) facilitating RLM, (8) facilitating training and skills enhancement, (9) enabling high RL staff retention, (10) clear roles and responsibilities, (11) facilitating CFI practices, and (12) facilitating RC practices.

Management and staff practices in RL can *address* several *organisational barriers* in RL, namely a lack of awareness and commitment to RL, management inattention, resistance to change and a lack of training in RL (see section 2.3.3). Specifically, (1) prioritising management and staff practices (general strategy), (2) creating top management awareness, attaining top management support and top management involvement (top management strategies), (3) appointing an expert RL manager, training

managers and demonstrating commitment to RL (RL manager strategies), and (4) establishing a RL function and providing regular staff training (RL staff strategies) can address a lack of awareness and support for RL, management inattention and a resistance to change (in adopting RL implementation). Additionally, benefit-driven management and staff strategies and developing and introducing training and education programmes for RL staff can address both the resistance to change and a lack of training in RL.

Top management attention and support in RL can *facilitate* with *strategic decision-making* in RL, implying that top management strategies can address a lack of strategic planning in RL (organisational barrier) (section 2.3.3). Therefore, top management strategies in RL may contribute to strategic planning practices in RL (see section 6.9.4). Moreover, like SPP practices, regular training and skill development opportunities for RL staff (RL staff strategy) can *facilitate RL system development.*

Like the outcome of addressing organisational barriers in RL, several management and staff practices can *facilitate successful implementation* of *RL*. Specifically, organisations can (1) prioritise management and staff practices (general strategy), (2) create top management awareness and attain top management commitment and support in RL (top management strategies), (3) establish sufficient leadership with appropriate experience in RL (RL manager strategies), (4) develop staff skills and knowledge in RL, obtain staff support and commitment, and produce well-managed, -trained and -skilled staff (RL staff strategies), and (5) invest in training and education initiatives (economic requirement) to successfully implement RL.

Similarly, management and staff practices in RL enable a *successful RL program* and *function*, which can be obtained through (1) organisational-wide training, incentives and feedback programmes and maintaining management and staff initiatives (general strategies, (2) top management commitment and support for RL (top management strategies), (3) sufficient leadership for RL and appointing an expert RL manager (RL manager strategies), and (4) well-trained and skilled staff in RL (RL staff strategy). Additionally, organisations can *develop RL capabilities* and *expertise* by performing a cost-benefit analysis for management and staff practices, organisational-wide RL training (general staff strategy), developing and implementing training and education programmes for RL (RL staff strategy) and incurring costs (economic requirement), which can result in valuable intangible resources for RL (see RC practices in section 6.9.1).

Several management and staff practices can *facilitate RLM*, including (1) performing a cost-benefit analysis (general strategy), (2) establishing a RL function/department, (3) developing the skills and knowledge of RL staff, (4) implementing RL training and education initiatives (e.g. incremental implementation over a longer period), (5) providing regular training and skills development

opportunities (RL staff strategies), (6) financial support and incurring costs (e.g. training and development costs) (economic requirements), and (7) organisational capability to manage the RL department (organisational requirement).

Although training and skills development form part of RL staff strategies (section 6.9.5.1), certain management and staff practices can *facilitate training* and *skills enhancement of RL staff.* Specifically, attaining top management support (strategy), strategic development of RL staff skills and knowledge, strategic development of training and education programmes for RL, providing regular training and skills development opportunities (RL staff strategies), and implementing RC practices (organisational requirement) can all facilitate staff training and skills enhancement in RL. Additionally, attaining staff support and cooperation, and providing regular RL training to RL staff can *enable high RL staff retention,* which means that organisations can retain skilled and experienced RL staff and reduce the need for continuous training and skill development of new/inexperienced RL staff.

Furthermore, establishing a RL function/department (RL staff strategy) can reduce staff conflict through *clear roles* and *responsibilities* in RL, emphasising the operational requirement of separating RL and FL operations and the link between management and staff practices and separate facility/location practices in RL (see section 6.9.5.2.1). Finally, although implementing CFI and RC practices can be important requirements for management and staff strategies (section 6.9.5.1.2), attaining top management support *facilitates CFI practices* (such as internal integration) and top management support and regular staff training can *facilitate RC practices* (such as committing financial and human resources to RL). Facilitating both CFI and RC practices emphasise the importance of management and staff practices for addressing organisational barriers in RL (such as a lack of internal coordination and a lack of staff resources for RL) (see section 2.3.3).

6.9.5.2.3 Market-related and SC outcomes of management and staff practices in RL

The *market-related outcomes* of management and staff practices in RL include (1) increasing competitiveness and obtaining a competitive advantage, (2) improving customer service and responsiveness, (3) increasing consumer satisfaction and sales, and (4) facilitating CRM. *Competitiveness* can be *increased* by assigning an expert RL manager that demonstrates a commitment to RL (RL manager strategies). Additionally, organisations can obtain a *competitive advantage* through well-managed, -trained and skilled RL staff (strategy), demonstrating the importance of allocating human resources to manage consumer returns (also see section 6.9.1).

Several management and staff practices can *improve customer service* and *responsiveness,* including the (1) general strategies of benefit-driven strategies (focussing on customer service), a cost-benefit

analysis for staff and management practices and organisational-wide RL training, (2) RL staff strategies of well-trained and skilled staff, (3) economic requirement of costs (expenses related to training and skills development initiatives), and (4) organisational requirement of management involvement (e.g. managers understanding the value of skilled and trained staff for RL).

Furthermore, top management support (strategy) can *increase consumer satisfaction* and *sales* since paying more attention to RL can increase RL efficiency (see section 6.9.5.2.1), which positively impact consumer satisfaction. Ultimately, top management support can *facilitate CRM* and indirectly contributes to CI practices in RL (section 6.4.2), essential for the effective management of consumer returns.

Similarly, the *SC outcomes* of management and staff practices in RL involve supply chain relationship management (SCRM) and SCI. Particularly, top management support can *facilitate SCRM,* demonstrating that top management support can be critical for managing external relationships with RL parties (both partners and consumers). Finally, establishing appropriate and sufficient leadership that demonstrate a commitment to RL can *facilitate SCI,* which can address the SC barrier of a lack of support (or collaboration) (see sections 2.4.4 and 6.4.1).

Therefore, management and staff practices in RL can facilitate with integration practices in RL, including SCI, CI and CFI (see section 6.9.5.2.2), emphasising the importance of implementing all RL practices to manage consumer returns. Essentially, management and staff practices can be important for addressing several barriers in RL, including economic, operational, organisational and SC barriers, and providing various economic, operational, organisational, market-related and SC benefits in RL, contributing to the effective RLM of consumer returns.

In the next section, management and staff practices in RL will be concluded with a description, conceptual framework and summary of findings to manage consumer returns.

6.9.5.3 Description, conceptual framework and summary of findings for management and staff practices to manage consumer returns

Based on the findings presented in section 6.9.5, management and staff practices in RL can be important for the management of consumer returns, and will be described as follows:

> Management and staff practices for the management of consumer returns involve (1) general strategies, including prioritising management and staff practices, benefit-driven strategies, a cost-benefit analysis, adequate organisation-wide RL training, improving work conditions, strategic development of incentives and feedback programmes, and maintaining management and staff initiatives, (2) top management strategies, including top management awareness, attention, support, commitment and involvement, (3) RL manager strategies, including sufficient leadership, full-time RL manager portfolio, appointing a RL expert manager, assigning experienced managers, providing manager training, and demonstrating commitment to RL, (4) RL staff strategies, including establishing a RL function, developing of RL skills and knowledge, developing, introducing and implementing

training and education programmes, attaining staff support and cooperation, regular formal training and skills development opportunities, providing informal training, and producing well-managed, -trained, and -skilled staff for RL, and (5) management and staff requirements, including economic requirements (investment, financial support and costs), operational requirements (separate RL and FL operations), and organisational requirements (organisational capability, CFI practices, RC practices and management involvement).

The management and staff strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers), (2) operational outcomes (address IT and infrastructure barriers, facilitate and support RL processes, improve staff understanding of RL processes, improve RL processes, RL process efficiency and effectiveness, successful RL processes, and facilitate RL/FL integration), (3) organisational outcomes (address organisational barriers, facilitate RL system development, facilitate successful RL implementation, successful RL program and function, RL capabilities and expertise, facilitate RLM, facilitate training and skills enhancement, high RL staff retention, clear roles and responsibilities, and facilitate CFI and RC practices), (4) market-related outcomes (competitiveness and competitive advantage, customer service and responsiveness, increase consumer satisfaction and sales, and facilitate CRM), and (5) SC outcomes (facilitate SCRM and SCI).

Figure 6.31 provides a conceptual framework of management and staff practices to manage consumer returns.

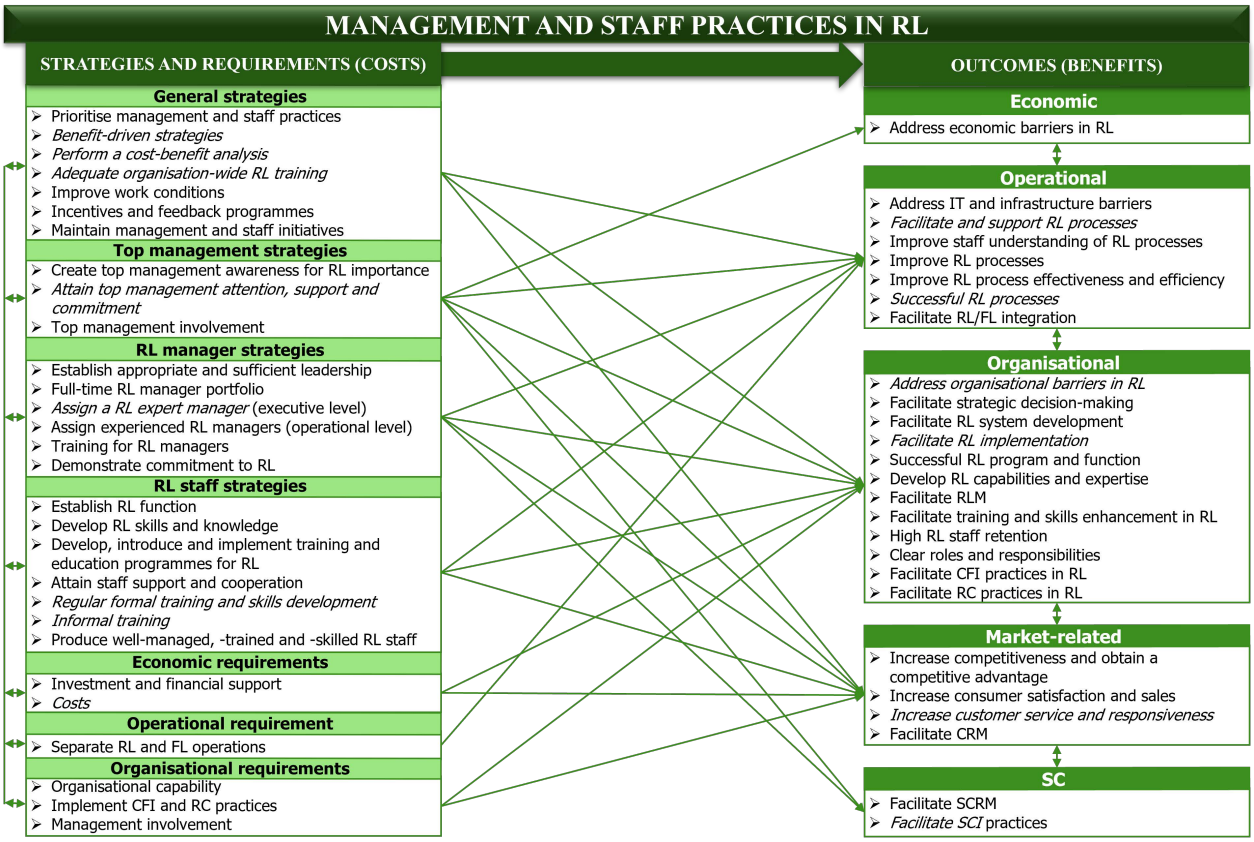

Figure 6.31 Conceptual framework of management and staff practices to manage consumer returns

Source: Compiled by researcher

Figure 6.31 illustrates the links between the strategies, requirements and outcomes of management and staff practices in RL, demonstrating a cost and benefit relationship. The links between the strategies and requirements can be demonstrated by the economic requirements of investment, financial support and costs, which links with performing a cost-benefit analysis (general strategy), top management commitment (top management strategy), assigning a RL expert manager (RL manager strategy),

developing and implementing training and education programmes (RL staff strategies), separating RL and FL (operational requirement) and implementing RC practices (organisational requirement).

Additionally, the framework shows that the management and staff outcome categories can be linked, for example, successful RL implementation (organisational outcome) contributes to successful RL processes (operational outcome), which in turn can enhance consumer service and responsiveness (market-related outcomes). Additionally, addressing organisational barriers (organisational outcome) can facilitate with addressing economic barriers (economic outcome) and IT and infrastructure barriers (operational outcomes) in RL. Nonetheless, the main aim of the framework involves the links between the management and staff strategies, requirements and outcomes, which can be important for the effective management of consumer returns. Subsequently, the most significant management and staff strategies and requirements (associated with the most outcomes) and related outcomes (associated with the most practices) are emphasised by *italics*, which will be elaborated upon in Table 6.48.

Based on Figure 6.31 and the discussions given in section 6.9.5, Table 6.48 provides a summary of the findings and managerial implications of the management and staff practices to manage consumer returns.

Table 6.48 Summary of findings and managerial implications for management and staff practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	•Management and staff practices in RL involves (1) general strategies, including prioritising management and staff practices, benefit-driven strategies, a cost-benefit analysis, adequate organisation-wide RL training, improving work conditions, strategic development of incentives and feedback programmes, and maintaining management and staff initiative, (2) top management strategies, including top management awareness, attention, support, commitment and involvement, (3) RL manager strategies, including sufficient leadership, full-time RL manager portfolio, appointing a RL expert manager, assigning experienced managers, providing manager training, and demonstrating commitment to RL, and (4) RL staff strategies, including establishing a RL function, developing of RL skills and knowledge, developing, introducing and implementing training and education programmes, attaining staff support and cooperation, regular formal training and skills development opportunities, providing informal training, and producing well-managed, -trained, and -skilled staff for RL. •The general management and staff strategies associate with a few outcome categories, including operational, organisational and market-related outcomes •From the general management and staff strategies, a cost-benefit analysis, benefit-driven strategies and providing adequate organisation-wide training, can be the most beneficial for RL •The top management strategies associate with all the outcome categories, including economic, operational, organisational, market-related and SC outcomes •From the top management strategies, strategic attainment of top management attention, support and commitment, can be the most beneficial for RL •The RL manager strategies associates with most of the outcome categories, including operational, organisational, market-related and SC outcomes •From the RL manager strategies, strategically assigning a RL expert manager can be the most beneficial for RL •The RL staff strategies associate with a few outcome categories, including operational, organisational and market-related outcomes •From the RL staff strategies, providing regular formal RL training can	•Organisations must develop and implement general, top management, RL manager and RL staff strategies in RL •Organisations must perform a cost-benefit analysis, focus benefit-driven management and staff strategies and provide organisation-wide RL training for optimum RL benefits •Organisations that seek various economic, operational, organisational, market-related and SC benefits in RL must focus on top management strategies •Organisations must attain top/senior management attention, support and commitment for optimum benefits in RL •Organisations must assign/appoint a RL expert manager for optimum benefits in RL •Organisations must focus on providing regular formal RL training for optimum benefits in RL •Organisations must focus on the economic requirement of costs and on various organisational requirements to achieve optimum management and staff benefits in RL

	be the most beneficial for RL •The least significant management strategies, with no impact on the outcomes include strategic improvement of work conditions and informal RL training. •Management and staff practices in RL involves economic, operational and organisational requirements •The economic and organisational requirements of management and staff practices in RL associate with a couple of outcome categories, including organisational and market-related outcomes. •From the economic requirements, costs can lead to the most benefits in RL •All organisational requirements, including organisational capability, CFI, RC and management involvement can lead to benefits in RL •From the management and staff practices, the operational requirement can be the least significant practice category	
Outcomes	•Management and staff practices in RL involve economic, operational, organisational, market-related and SC outcomes •The most significant outcomes of management and staff practices in RL involves organisational and market-related outcomes •The least significant outcome category of management and staff practices in RL involves the economic outcomes •The most significant operational outcomes of management and staff practices in RL include facilitating and supporting RL processes and successful RL processes •The most significant organisational outcomes of management and staff practices in RL includes addressing organisational barriers in RL and successful RL implementation •The most significant market-related outcomes of management and staff practices include improving consumer service and responsiveness •The most significant SC outcome of management and staff practices include facilitate SCI	•Organisations that seek economic, operational, organisational, market-related and SC benefits in RL can implement management and staff practices in RL •To facilitate and support RL processes, organisations can consider management and staff practices in RL •Organisations can implement management and staff practices for a successful RL process •Organisations that experience organisational and RL implementation barriers can implement management and staff practices in RL •Organisations that seek to improve consumer service and responsiveness can consider management and staff practices in RL •To facilitate SCI in RL, organisations can consider management and staff practices in RL •For the effective management of consumer returns, organisations must identify/implement/consider management and staff strategies, requirements and outcomes.

Source: Compiled by the researcher

Table 6.48 demonstrates the value of management and staff practices as part of the RL practices for consumer returns. Organisations can use the management and staff strategies, requirements and related outcomes for effective management and staff practices in RL, which can contribute to the effective RLM of consumer returns. Management and staff practices in RL will further be explored in the interviews with industry experts (chapter 8).

In the next section, the final conceptual framework and key findings for RL practices will be presented and discussed.

6.10 CONCEPTUAL FRAMEWORK AND SUMMARY OF FINDINGS FOR RL PRACTICES TO MANAGE CONSUMER RETURNS

This section provides the final conceptual framework and summary of findings for RL practices to manage consumer returns. The focus of the conceptual framework for RL practices was on the common strategies, requirements and outcomes (must associate with at least two main practice categories). Therefore, the conceptual framework illustrates the most appropriate strategies, requirements and related outcomes of RL practices for the effective management of consumer returns.

However, the framework only focused on the overall strategies, requirements and outcomes of the main practice categories, namely IT, integration, in/outsourcing, disposition, PM, facility/location, RC, FM, RPA, SPP and management staff practices. Evidently, any unique strategies, requirements and

outcomes for specific (sub) RL practices (e.g. IT, integration and general facility/location practices) can be identified through the separate frameworks, summaries of findings and managerial implications presented in the respective sections throughout the chapter. Since some of the strategies for a specific practice can represent the requirements in another practice (e.g. integrated IT is a strategy in IT but a requirement in SCI), the strategies and requirements were combined and classified as follow: (1) general strategies (e.g. strategic approach and considerations), (2) economic requirements, (3) IT strategies and requirements, (4) operational strategies and requirements, (5) organisational strategies and requirements, (6) market-related strategies and requirements and (7) SC strategies and requirements.

Figure 6.32 demonstrates a conceptual framework of RL practices for the effective management of consumer returns. Specifically, the conceptual framework illustrates a summary of key findings related to all main RL practice categories, focussing on the combined strategies and requirements (costs) and outcomes (benefits). Additionally, the most significant (occurring the most often) strategies, requirements and outcomes associated with the main RL practice categories (at least seven out of eleven practices) are emphasised through *italics*. However, a strategy, requirement and outcome that associates with nine, ten or eleven RL practice categories is marked with a blue dot•. The strategies, requirements and outcomes without italics associate with a minimum of two and a maximum of six main practice categories. For presentation purposes, facility/location practices are referred to as F&L and management and staff practices as M&S.

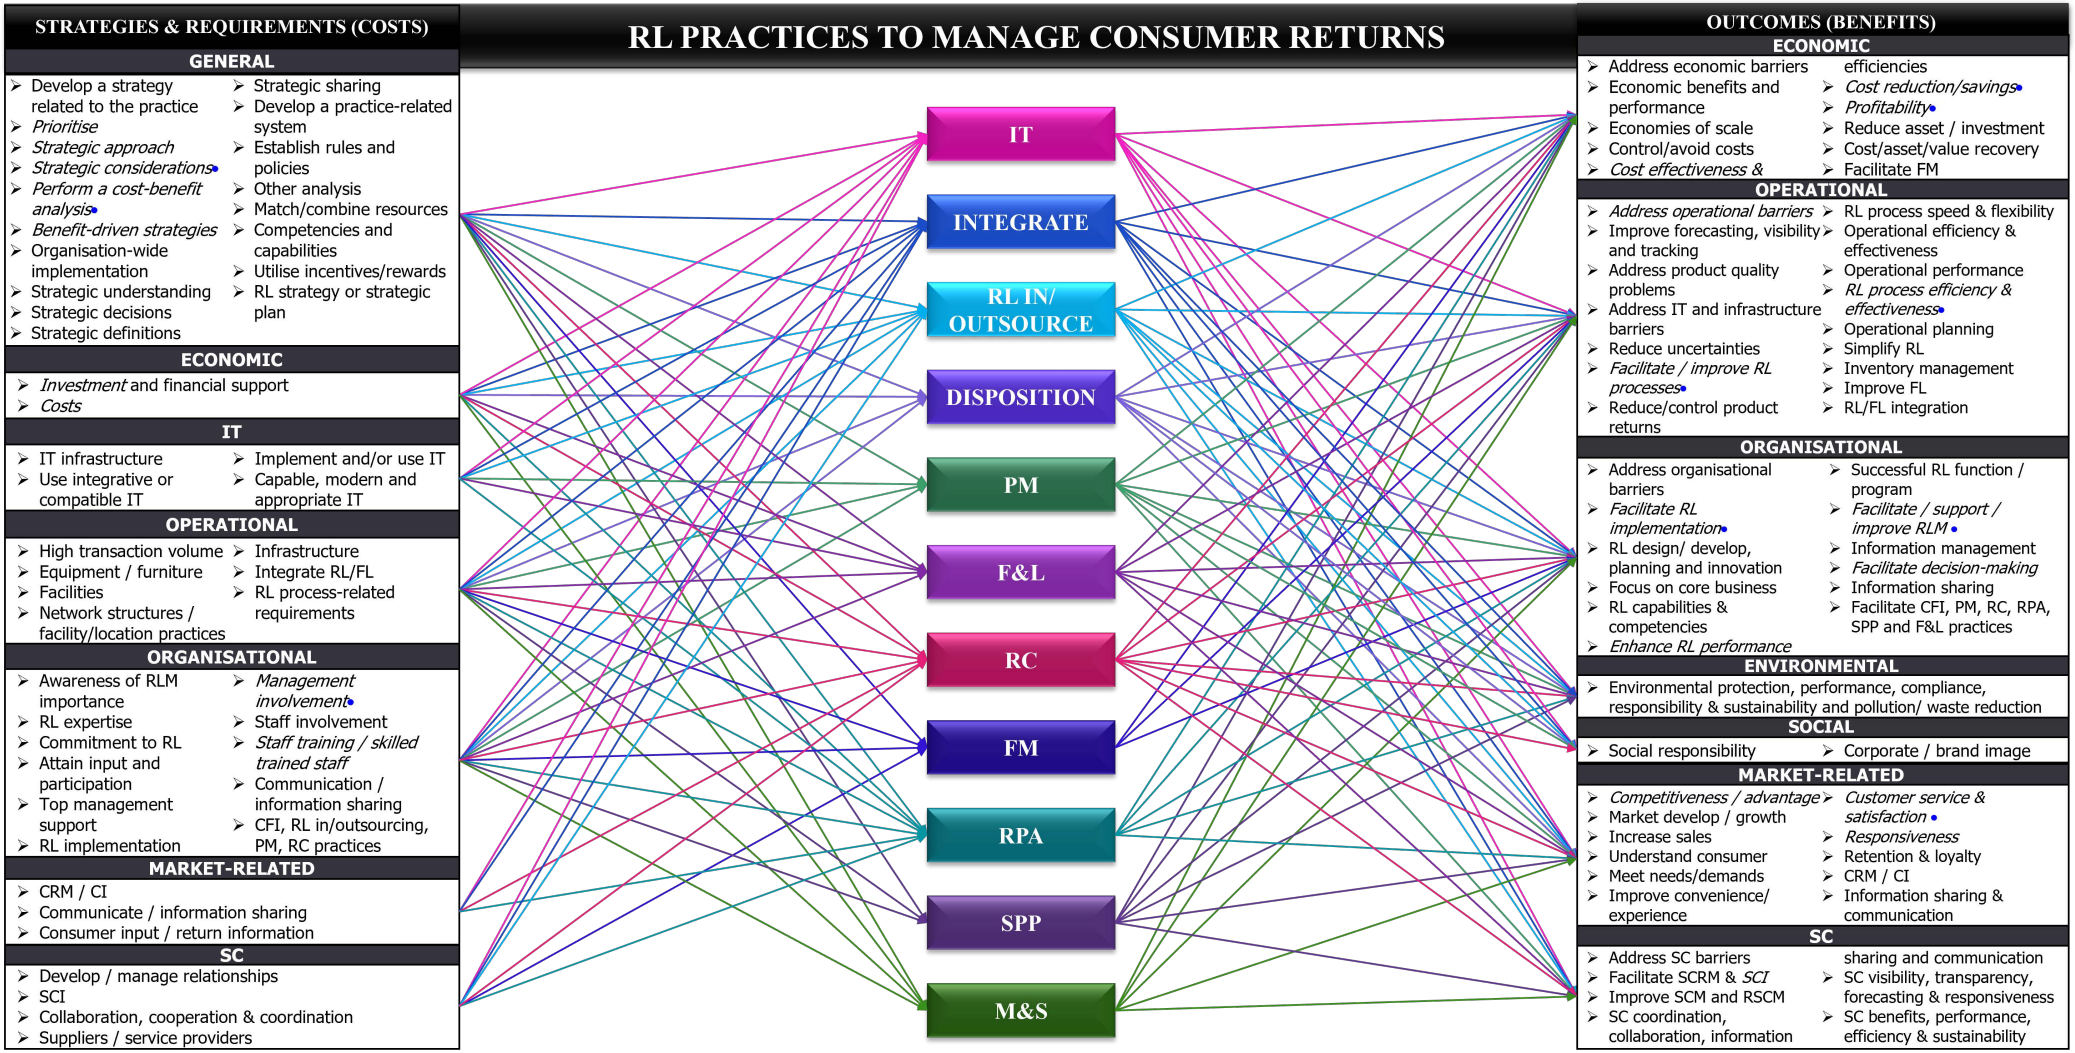

Figure 6.32 Conceptual framework of RL practices to manage consumer returns
Source: Compiled by the researcher

Based on Figure 6.32, Table 6.49 provides a summary of the key findings and managerial implications for RL practices to manage consumer returns.

Table 6.49 Summary of key findings and managerial implications for RL practices to manage consumer returns

FINDING CATEGORY	KEY FINDINGS AND MANAGERIAL IMPLICATIONS
Cost (strategy / requirement) categories	• The general, operational and organisational cost (strategy/requirement) categories associate with all (eleven) practice categories, which means that organisations should prioritise the implementation of general, operational and organisational strategies and requirements for the effective management of consumer returns • The economic cost (requirement) category associates with most (eight) practice categories, which means that organisations can implement economic requirements for the effective management of consumer returns • The IT cost (strategy/requirement) category associates with several (six) practice categories, which means that organisations can benefit from implementing IT strategies and requirements for the effective management of consumer returns • The market-related cost (strategy/requirement) category associates with limited (four) practice categories, which means that organisations can consider implementing market-related strategies and requirements to manage consumer returns • The SC cost (strategy/requirement) category associates with some (six) practice categories, which means that organisations can benefit from implementing SC strategies and requirements for the effective management of consumer returns
Specific costs (strategies/requirements)	• Organisations should prioritise RL practices and develop RL practices strategies that involve strategic approaches, strategic considerations (highest priority), cost-benefit analyses (highest priority) and benefit-driven strategies • Organisations need to focus on investment and cost requirements for effective RL practices • Organisations can prioritise management involvement for effective RL practices • Organisations need to train staff or appoint/use skilled/trained staff for effective RL practices
Practice categories	• IT and integration practices associate with all (seven) cost and benefit categories, which means that organisations must implement IT and integration practices for the effective management of consumer returns • RL in/outsourcing associate with most (six) cost categories and with all (seven) benefit categories, which means that organisations should prioritise the implementation of RL in/outsourcing practices for the effective management of consumer returns • RL disposition practices associate with some (four) cost categories but with most (six) benefit categories, which means that organisations need to prioritise the implementation of RL disposition practices to manage consumer returns • PM practices associate with some (four) cost categories but with all (seven) benefit categories, which means that implementing PM practices should be organisations' highest priority for the effective management of consumer returns • Facility/location practices associate most (five) cost categories and (six) benefit categories, which means that organisations can benefit from implementing facility/location practices to manage consumer returns • RC practices associate with most (six) cost categories and with all (seven) benefit categories, which means that organisations can benefit from implementing RC practices for the effective management of consumer returns • FM practices associate with some (four) cost categories but with few (three) benefit categories, which means that organisations should carefully perform a cost-benefit analysis for the implementation of FM practices to manage consumer returns • RPA practices associate with all (seven) cost categories and most (five) benefit categories, which means that organisations need to carefully perform a cost-benefit analysis for the implementation of RPA practices to manage consumer returns • SPP practices associate with a few (three) cost categories but with most (six) benefit categories, which means that implementing SPP practices can be organisations' highest priority for the effective management of consumer returns • Management and staff practices associate with some (four) cost categories and (five) benefit categories, which means that organisations can benefit from implementing management and staff practices to manage consumer returns
Benefit (outcome) categories	• Economic, operational, organisational and market-related benefit (outcome) categories associate with all (eleven) RL practice categories, which means that organisations seeking various economic, operational, organisational and market-related benefits can implement RL practices • The environmental benefit category associates with most (nine) RL practice categories, which means that organisations seeking environmental benefits can implement various RL practices • The social benefit category associates with some (six) RL practice categories, which means that organisations seeking social benefits can consider implementing some RL practices • The SC benefit category associates with various (eight) RL practice categories, which means that

	organisations seeking SC benefits can implement several RL practices
Specific benefits (outcomes)	• Organisations should implement RL practices for cost effectiveness in RL • Organisations that seek cost reductions/savings and profitability in RL can prioritise the implementation of RL practices • Organisations that experience operational barriers in RL can implement various RL practices • Organisations should prioritise the implementation of RL practices to facilitate and improve RL processes and to improve the efficiency and effectiveness of RL processes • Organisations that experience RL implementation and decision-making challenges can prioritise the implementation of RL practices • Organisations can implement various RL practices to enhance RL performance • Organisations that seek to facilitate, support and/or improve RLM must prioritise the implementation of RL practices • Organisations that seek competitiveness or a competitive advantage in RL can implement various RL practices • Organisations that seek to improve consumer service and satisfaction can prioritise the implementation of RL practices • Organisations can implement various RL practices to increase consumer responsiveness in RL • Organisations that experience SCI challenges in RL can implement various RL practices

Source: Compiled by the researcher

Table 6.49 demonstrates key findings and managerial implications related to RL practices to manage consumer returns. Organisations can use the conceptual framework and key findings to identify the most significant RL costs, practices and benefits to manage consumer returns. Essentially, the relationship between the costs (strategies and requirements), practices and benefits (outcomes) emphasise the importance of the holistic implementation of RL practices for the effective management of consumer returns.

Nevertheless, organisations must identify key barriers, problems or weaknesses in RL and identify and implement the RL practice strategies and requirements (costs) to address the problem areas. Essentially, all RL practices discussed in this chapter, including IT, integration, RL in/outsourcing, disposition, PM, facility/location, RC, FM, RPA, SPP and management staff practices, will contribute to the final framework for the effective RLM of consumer returns in online retailing, which will be presented in chapter 9.

In the next section, this chapter is concluded with a conclusion.

6.11 CONCLUSION

In this chapter, the QCA findings of RL literature for RL practices to manage consumer returns were presented, analysed and discussed. The aim with this chapter was to achieve the *fourth* secondary research objective, which is ***to identify and explore RL literature for RL practices to manage consumer returns (SRO-4)*** (see Figure 5.1). Additionally, the findings presented in this chapter will be used to achieve the primary research objective of this study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*.

The chapter started with the introduction and overview of the chapter (section 5.1), followed by an overview of RL practices (section **Error! Reference source not found.**). Additionally, the findings related to the main RL practice categories were presented and discussed in separate sections, including IT practices (section 6.3), integration practices (section 6.4), RL in/outsourcing practices (section 6.5), disposition practices (section 6.6), PM (performance measurement) practices (section 6.7), facility/location practices (section 6.8) and other RLM practices (section 6.9). The other RLM practices represented smaller RL practice categories (limited findings), which included RC (resource commitment) practices (section 6.9.1), FM (financial management) practices (section 6.9.2), RPA (return prevention and avoidance) practices (section 6.9.3), SPP (strategic planning and procedure) practices (section 6.9.4), and management and staff practices (section 6.9.5).

The QCA findings of RL literature was presented as follows: (1) qualitative data tables, with overviews of the categories, subcategories, sources and key quotations, (2) discussion and interpretation of the findings presented in the qualitative data tables, (3) description and conceptual frameworks for each category, and (4) final conceptual framework (for practices with sub-practice categories) and summary of findings and managerial implications in text tables for each main practice category. The chapter concluded with a final conceptual framework and a summary of key findings for RL practices to manage consumer returns (section 6.10) and a conclusion.

The focus of this chapter was on the costs (strategies and requirements) of implementing RL practices and the resulting benefits (outcomes), which can be important for the management of consumer returns. The main findings showed that (1) all RL practices can be important for managing consumer returns, (2) organisations must focus on general, economic, operational and organisational strategies and requirements for effective RL practices, (3) the most significant costs (strategies/requirements) for RL included strategic approaches, prioritisation of RL practices, strategic considerations, cost-benefit analyses, benefit-driven strategies, investment, costs, management involvement and staff training or skilled/trained staff, (4) PM and SPP practices must be organisations highest priority, followed by RL in/outsourcing, disposition, RC, IT and integration practices, (5) organisations can benefit from implementing facility/location and management and staff practices but must carefully perform a cost-benefit analysis for FM and RPA practices, (6) organisations can realise various economic, operational, organisational, environmental, social and SC benefits through the implementation of various RL practices, and (7) the most significant benefits (outcomes) of RL practices included cost effectiveness, cost savings/reductions, profitability, addressing operational barriers in RL, facilitate and improve RL processes, improve RL process efficiency and effectiveness, facilitate RL implementation and decision-making, enhance RL performance, facilitate/support and improve RLM, competitiveness or a

competitive advantage, improve consumer service and satisfaction, increase consumer responsiveness and facilitate SCI.

Essentially, this chapter will be the foundation for the empirical study (phase four – interviews with industry experts) and contribute to the final framework for the effective RLM of consumer returns in online retailing.

In the next chapter (chapter 7), the research methodology for the interviews with industry experts will be discussed.

Chapter 7 - Research methodology of interviews with industry experts

7.1 INTRODUCTION

In chapter 1 an overview of the research approach and method of this study was given, including the research methods related to the four phases of the study. The study was classified as a multimethod qualitative study, using different qualitative research methods, which in combination will contribute to the primary objective of "*developing a framework for the effective RLM of consumer returns in online retailing*". In chapter 3, the overall research design of this study in terms of justifying qualitative research designs, challenges in qualitative research, research paradigm and assumptions, research approaches to theory development and multimethod qualitative research, as well as the methodology and application of the Qualitative Content Analysis (QCA) of RL literature, were discussed.

In this chapter the qualitative research methodology and application of the interviews with industry experts, which formed part of phase 3 of the study, will be discussed. Figure 7.1 provides a graphical overview of phase 3 of the study and the related secondary objectives that will be reached.

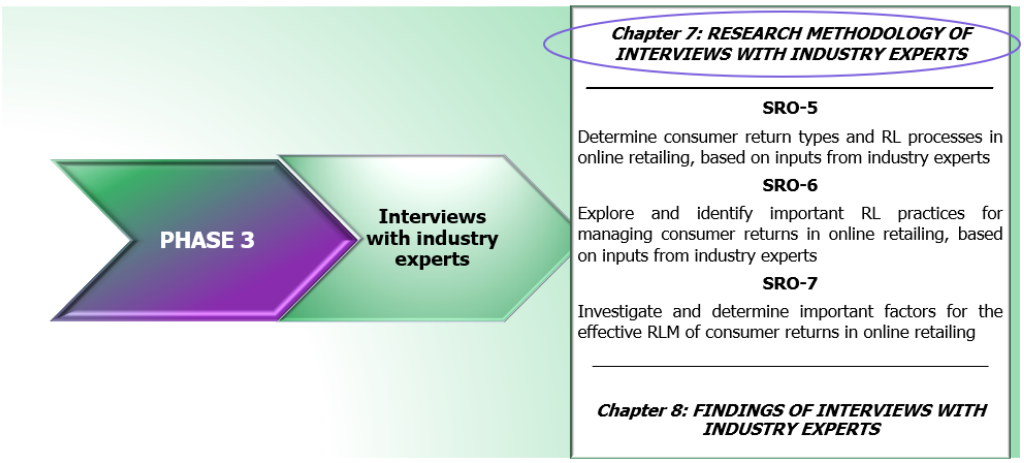

Figure 7.1 Methodology of interviews with industry experts - Aim of chapter 7

Figure 7.2 provides an overview of the main sections of chapter 7.

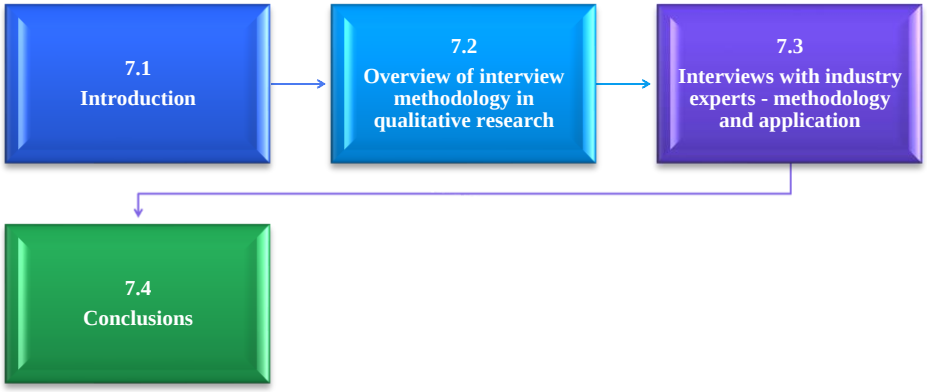

Figure 7.2 Overview of chapter 7
Source: Compiled by the researcher

Figure 7.2 shows that chapter 7 includes (1) the introduction (section **Error! Reference source not found.**), (2) overview of interview methodology in qualitative research (section 7.2), (3) interviews with industry experts: methodology and application (section 7.3), and (4) the conclusion (section 7.4). In the next section, the overview of interview methodology in qualitative research will be given.

7.2 OVERVIEW OF INTERVIEW METHODOLOGY IN QUALITATIVE RESEARCH

Methodology is about the principles that guide research practices (Klenke, 2016a:17). This section focusses on a theoretical overview of interview methods in qualitative research. The section starts with describing in-depth interviews in qualitative research, followed by a distinction between the different interview styles, discussion of the potential problems and challenges of interviews in qualitative research, and a discussion of the motivating factors and advantages of interviews in qualitative research.

7.2.1 Describing in-depth interviews in qualitative research

An interview can be described as a research method for primary data collection in which sampled participants are asked questions related to the topic to gain inputs from their views, knowledge and experiences. The qualitative interview is the most common and one of the most important data gathering tools of a qualitative inquiry (Klenke 2016c:149; Myer & Newman, 2007:3) because it adds richness and credibility to a research study (Myers, 2013:120; Saunders *et al.* 2019:444). In qualitative research, some authors deem it more suitable to use the word conversation instead of interview (Gudkova, 2018:80; Klenke 2016c:125). Therefore, a qualitative interview can be described as a purposeful conversation between two individuals (the interviewer and the interviewee) to collect data on a specific topic (Salkind, 2010:633; Saunders *et al.* 2019:434). Qualitative interviewing provides a way of generating empirical (primary) data, enabling the researcher to study a phenomenon in a "real world" or practical context (Klenke 2016c:125). Consequently, the purpose of the qualitative interview

is to look for new qualitative knowledge about various aspects of the world in which interviewees live, expressed in words, and not in numbers (Gudkova, 2018:82).

In-depth interviewing is a generic name for a technique that engages with the participant in a way that encourages a detailed exchange of information (Harvey, 2019:np). In-depth interviews can be classified as unstructured, semi-structured or structured (see section 7.2.2), ranging from free-form conversations to more formalised approaches (such as interrogation and cross-examination) (Harvey, 2019:np; Klenke 2016c:132). From a qualitative research perspective, an in-depth interview entails a close interaction between the researcher (interviewer) and participant (interviewee), establishing an environment for knowledge exchange (Gudkova, 2018:80). Rather than focusing on the researcher's perspective, it is the participant's account that is sought and highly valued (Klenke 2016c:131). Therefore, the participants are encouraged to accurately describe their experiences, views, emotions and expertise, which the researcher captures and interprets (through qualitative data analysis techniques), resulting in complex descriptions of the specific characteristics of the phenomenon (Gudkova, 2018:82).

Essentially, the general purpose of in-depth interviewing is to discover the participants' perceptions and to explore the topic in detail (Harvey, 2019:np). Therefore, the qualitative interview is obviously and exclusively a social interaction and a conversation between the interviewer and the interviewee in which both participants create narrative versions (questions, probes and answers) about the topic of investigation (Klenke 2016c:134).

Although the interview method for this study is classified as an in-depth interview, in the rest of the chapter the word "interview" will be used instead of "in-depth interview". In the next section, the styles (or forms) of interviews in qualitative research will be explored.

7.2.2 Interview styles in qualitative research

Interviews can be one-on-one or in small groups (focus groups), ranging from highly structured, where predetermined and specific questions are asked, to unstructured, where a topic is explored, without a specific order of predetermined questions (Merriam & Grenier, 2019:14). Evidently, interviews can be classified as structured, semi-structured, or unstructured (Billups, 2021:42; Cassell, 2015:12). The style that the researcher adopts is mostly based on the research goal and the amount of control that the researcher wants to exercise over the responses of the participants (Billups, 2021:42; Salkind, 2010:634). Usually, in qualitative approaches interviews are semi-structured (interview style of this study), or unstructured, encouraging the participants to talk at length around the subject (Cassell, 2015:13; Collis & Hussey, 2021:120). Nevertheless, most qualitative research literature discusses

structured interviews as an interview style that can be used in qualitative studies. Structured, unstructured and semi-structured interview styles will subsequently be discussed.

7.2.2.1 Structured interviews

Structured interviewing refers to a situation in which the researcher asks all interviewees/participants a series of preestablished questions in a set order and within a specific timeframe (Cassell, 2015:12; Gudkova, 2018:78; Klenke 2016c:128; Myers, 2013:121). Structured interviews associate with quantitative research designs (Van Zeeland, Van den Broeck, Boonen, & Tintel, 2021:2), which can be conducted telephonically or online (i.e. emails) with survey research, market/consumer research, and political polling, or face-to-face with intercept research in public places such as shopping malls and parking lots (Myers, 2013:133).

The backbone of the structured interview is the interview protocol (or interview guide, interview schedule or discussion guide), which consists of a list of questions the researcher wants to ask about the topic (Klenke 2016c:128). The structured interview protocol typically includes close-ended questions where the interviewee is asked to choose between several predetermined answers. For example, the question "How satisfied are you with your company's RL process?" may be answered as (1) very satisfied, (2) satisfied, (3) neither satisfied nor dissatisfied, (4) dissatisfied, and (5) very dissatisfied. Additionally, some questions may involve "Yes/No/Do not know" answers, which should be kept to a minimum in qualitative interviewing since the interviewees may be forced into giving responses that may not reflect their true feelings, causing validity problems (Klenke 2016c:128-129).

Although an interview protocol is used in semi-structured interviews, structured interviews offer no room for improvisation by the researcher (Billups, 2021:42; Myer & Newman, 2007:4) as the exact wording and sequence of questions are determined in advance (Billups, 2021:42; Klenke 2016c:128). Therefore, structured interviews minimise the role of the researcher during the interview without the need for probing questions (Billups, 2021:42; Myers, 2013:133). Likewise, the role of the interviewee is limited because the participant is expected to answer a set of structured questions without giving detailed information (Klenke 2016c:128). Essentially, in structured interviews the interactions between the researcher and the participant are kept to a minimum (Billups, 2021:42; Klenke 2016c:128).

The purpose of structured interviews is to ensure consistency across multiple interviews (Cassell, 2015:12; Myers, 2013:133), which enables the researcher to employ a quantitative data analysis from a qualitative data collection tool (Billups, 2021:42; Cassell, 2015:13). Additionally, the nature of the structured interview may enhance the reliability of the results since all interviewees will provide the same answers, regardless of the characteristic of the interviewer (Cassell, 2015:14). Therefore, the

general aim may be to perform some statistical tests on the data and make conclusions regarding the generalisation of the findings (Cassell, 2015:15).

Some advantages of structured interviews relate to easy coding, an inquiry with a clear direction, high reliability, the production of comparable data, and the reduction of researcher bias. Additionally, with structured interviews specific issues (or problems) can be addressed and rules or problem-solving strategies can be discovered (Klenke 2016c:129). Nevertheless, structured interviews involve several disadvantages, including limited flexibility, limited insight into new concepts, and weak insight into procedural knowledge (Klenke 2016c:129).

Essentially, structured interviews can be used in qualitative research for (1) information gathering about a participant's opinion/attitude that can be quantified for analysis, and (2) hypothetical testing where data can be quantified to test theory (Cassell, 2015:13). Evidently, structured interviews may be appropriate for mixed-method research using qualitative and quantitative data collection and analysis techniques. Structured interviewing is unsuitable for this study because the goal of this multimethod qualitative study is to gain an in-depth understanding into the RLM of consumer returns in online retailing.

7.2.2.2 Unstructured interviews

Unstructured interviews involve few, if any, pre-formulated questions, asked in no specific order, and without a set timeframe (Billups, 2021:43; Cassell, 2015:12; Myers, 2013:121). The questions are adapted according to the responses of the participants and will be different for each participant (Cassell, 2015:22). Subsequently, the researcher decides the sequence of questions during the interview conversation (Gudkova, 2018:78) to elicit an authentic account of the participant's subjective experience (Klenke 2016c:129). Additionally, unstructured interviews aim to obtain true meanings that participants assign to their experiences and the complexities of their attitudes and behaviours (Klenke 2016c:129). Therefore, the goal of the unstructured interview is to gain an insider account from an individual about a given phenomenon (Cassell, 2015:22-24).

Unstructured interviews exclude formal interview schedules and rely on the social interactions between the researcher and the participant to elicit information (Klenke 2016c:130). Therefore, an interview protocol is rarely used since the researcher explains the overall topic of the research whereafter the participants are asked to tell their own story (Cassell, 2015:22-24). Unstructured interviews are intended to increase the salience and relevance of the questions (Klenke 2016c:130). Mostly, the researcher uses open-ended questions that emerged from the conversation instead of relying on a predetermined sequence (Klenke 2016c:129). Additionally, unlike structured interviews with close-

ended questions (section 7.2.2.1), the open-ended questions of unstructured interviews often begin with words like “how” or “why” (Gudkova, 2018:78), for example, “How did you become involved in RL?” or “Why is RL important in online retailing?”. By using these open-ended questions, the researcher aims to uncover the participant’s feelings or know-how about the topic (Klenke 2016c:129).

Evidently, the researcher focusses on building rapport with the participants and encouraging them to talk about their own experience/knowledge (Cassell, 2015:22-24), which means that participants can talk freely without any restrictions (Billups, 2021:43; Myers, 2013:121). Additionally, in unstructured interviews, more than in any other interview style, the participant guides the interview process rather than the researcher (Cassell, 2015:22). Although unstructured interviewing allows for greater social interaction between the researcher and participants, the researcher needs to minimise potential biases, limit interactions (or avoid unnecessary interruptions by the researcher), resist the urge to agree or disagree with participants, avoid awkward silences and encourage expressions with neutral probes (Klenke 2016c:130).

Clearly, the more unstructured the interview becomes, the more actively the researcher needs to think throughout the interview process, which requires a high level of skills (Cassell, 2015:12). Nevertheless, unstructured interviews can offer much since it allows participants to talk freely about important experiences (Myers, 2013:122). Additionally, more complex issues can be probed, answers can be clarified, and a more relaxed conversation may elicit more in-depth and sensitive information (Klenke 2016c:130). Evidently, the advantages of unstructured interviews include, (1) complex issues can be uncovered, (2) limited understanding is needed of the problem or topic, (3) important information can be obtained, which can guide future inquires, and (4) general insight into problem-solving methods can be uncovered (Klenke 2016c:130).

However, unstructured interviews also involve several disadvantages and may be a risky approach for inexperienced researchers (Cassell, 2015:12). On the one hand, the participant may not be in a talkative mood and end up saying little, resulting in limited data needed for an in-depth understanding into the topic. On the other hand, the participant may be too talkative, and the interview may last an entire day, resulting in a large amount of data that may be irrelevant to the topic at hand (Myers, 2013:122). Additionally, data collection of unstructured interviewing is time consuming, expensive and only feasible with small samples (Collis & Hussey, 2021:121; Klenke 2016c:130). Consequently, the disadvantages of unstructured interviews include, (1) being time consuming, (2) attention is not focussed on the given issue, (3) limited relevant information is offered, and (4) limited detail is uncovered on key concepts (Klenke 2016c:130).

Although unstructured interviews may be valuable for gaining insight into the RLM practices from industry experts, this study relies to some extent on theory (deductive approach) and the experience of the researcher, which means that an unstructured interview style is less appropriate for this study. Accordingly, the interview style of this study is semi-structured interviewing, which is discussed next.

7.2.2.3 Semi-structured interviews

Semi-structured interviews fit somewhere between structured and unstructured interview styles, involving some preformulated questions, but without a strict adherence and specific order to them (Collis & Hussey, 2021:121; Myers, 2013:122). In contrast to structured and unstructured interviews, semi-structured interviews associate with qualitative research designs that leave more flexibility for both the researcher and participant with a clear list of topics the researcher wants to discuss (Van Zeeland *et al.* 2021:3). Consequently, the subject/topic (or research aim) guides the questions asked in semi-structured interviews, but the mode of asking follows an unstructured interviewing approach (Klenke 2016c:131), meaning that the researcher must improvise and allow new questions to emerge from the conversation (Collis & Hussey, 2021:121; Myers, 2013:121). Essentially, a semi-structured interview style provides a participant with the opportunity to add important insights during the conversation, as well as affords the researcher with some direction with the preprepared questions, ensuring that the focus remains on the topic (Myers, 2013:123).

Like unstructured interviews (see section 7.2.2.2), semi-structured interviews involve a less formal (or detailed) interview protocol (Myer & Newman, 2007:4), developed around a list of topics without fixed wording or ordering of questions (Collis & Hussey, 2021:121; Klenke 2016c:131). Additionally, semi-structured interviews combine unstructured questions with highly structured questions that usually relate to specific information desired from all the participants (Merriam & Grenier, 2019:14), ensuring some consistency across the interviews (Myers, 2013:122). Evidently, the interview protocol will include a list of questions and prompts, but the researcher can deviate from the schedule, depending on the responses of the participants (Collis & Hussey, 2021:121; Cassell, 2015:12).

In terms of the question types, semi-structured interviewing involves a combination of close-ended and open-ended questions (Adams, 2015:493; Klenke 2016c:131), which usually corresponds with the research objectives/questions, asking “how”, “why”, and “what” questions (Azungah, 2018:387; Eriksson & Kovalainen, 2008:94). However, with a less structured approach to the questioning, the researcher may rephrase the questions or add additional questions that may include “what”, “who”, “where”, “when”, “why” and “how” questions, based on the participant’s answers and conversation flow (Klenke 2016c:131).

Unlike unstructured interviews, the researcher plays a larger role in the semi-structured interview process. For instance, the researcher needs to create a semi-structured interview protocol with structured and unstructured questions and demonstrate flexibility, improvisation and openness during the interview (Myer & Newman, 2007:14). Additionally, the researcher must be prepared to explore interesting lines of research, and look for surprises (Myer & Newman, 2007:17).

According to Cassell (2015:13), semi-structured interviews can be in a "distinctive format" or a "thematic format", involving different interview types and aims. The distinctive format involves several semi-structured interview types, including event-based (how participants make sense of different events), comparative (forcing participants to make comparisons), narrative (encourage participants to tell stories), biographical (gain insight from participant through chronological reflection), and visual techniques (encourage participants to project feelings or views onto a visual stimulus). Consequently, distinctive format semi-structured interview types fall outside the scope (or aim) of this study.

The thematic format involves exploratory and theoretical semi-structured interviews. The purpose of an exploratory semi-structured interview is to explore a specific organisational issue from different perspectives (Cassell, 2015:16). The researcher develops the questions around specific themes to gather information about the topic or question (Saunders *et al.* 2019:437; Cassell, 2015:16). In a theoretical semi-structured interview, theory plays a role in the structure of the interview questions and the aim is to collect data for theory development (which was the approach of this study). Consequently, the researcher thematically organises questions to explore different theoretical aspects of an organisational phenomenon (Cassell, 2015:7).

Since semi-structured interviews combine structured and unstructured interview styles, greater flexibility is possible. For instance, the content of a semi-structured interview focusses on key concepts concerning the research question, but the types of questioning (or probing) and a less-structured discussion allows for new concepts to emerge (Klenke 2016c:131). Therefore, semi-structured interviews provide some structure, while simultaneously, allow for improvisation (Billups, 2021:50; Myers, 2013:123). Evidently, the researcher can follow up on interesting issues that the participant raises, which can lead to new insight not previously anticipated by the researcher (Cassell, 2015:12). In fact, this is one of the main benefits of semi-structured interviews since the idea is to discover new realities and delve more deeply into practical or real-world situations (Myer & Newman, 2007:12).

Mostly, semi-structured interviews work well with a somewhat skilled and experienced interviewer (researcher) that may result in more benefits than other interview styles (Eriksson & Kovalainen,

2008:95). Other advantages of semi-structured interviews include, (1) positive rapport between the researcher and participant, (2) higher reliability, (3) addressing and clarifying complex issues, (4) increased consistency across interviews, and (5) reduced prejudgement by the researcher (due to less structured questioning and discussion) (Klenke 2016c:132).

Regardless, an inexperienced researcher who rigidly follows the prepared structure of questions without any improvisation and probing, may miss new lines of enquiry and valuable information from the participant during the interview (Myers, 2013:122). Consequently, the most challenging part of semi-structured interviews can be ensuring that all topics are covered and, at the same time, being prepared to probe for more in-depth responses. Furthermore, it may be difficult to compare the findings because the participants may respond to their own and somewhat varying interpretations of the same questions (Eriksson & Kovalainen, 2008:95). Essentially, the disadvantages of semi-structured interviews include the following: (1) require a skilled interviewer with ability to formulate questions during the interview, (2) require participants that can articulate appropriate answers, (3) time consuming and expensive, (4) depth of information can result in difficult analysis, (5) limited generalisability, and (6) a lack of validity (Klenke 2016c:132).

Nevertheless, with semi-structured interviews the advantages of both structured and unstructured interview styles can be obtained, and with a skilled researcher the risks and disadvantages of both styles can be minimised (Myers, 2013:123). Furthermore, the purpose of semi-structured interviews is to gather information from key informants (i.e. industry experts) who have personal experiences, attitudes, and views related to the topic of interest (DeJonckheere & Vaughn, 2019:2). Additionally, Myers (2013:123) and Eriksson and Kovalainen (2008:94) found that researchers in the field of business and management often use semi-structured interviews for qualitative research for the following reasons (DeJonckheere & Vaughn, 2019:2-3): (1) to collect qualitative, open-ended data; (2) to explore participant knowledge, experience, expertise and perceptions about a particular business topic; and (3) to delve deeply into sensitive (or confidential) information (i.e. trade secrets).

Accordingly, ***a semi-structured interview style (particularly a theoretical semi-structured format)*** was adopted in this study, using theory for the interview questions but also allowing new insights from industry experts through probing and improvisation by the researcher.

7.2.3 Roles of the researcher and participants in interviews

Both the researcher (interviewer) and the participants (interviewees) can be seen as actors in the interview data collection process. Particularly, the researcher plays the part of an interested interviewer, while the participant plays the part of a knowledgeable person in an organisation or field of study

(Myer & Newman, 2007:13). Therefore, the main role of the researcher is to ask questions and the main role of the participant is to provide the answers (Salkind, 2010:633). Evidently, through cooperation in the research process, which depends on the quality of rapport between researcher and participant, both parties act as co-creators of knowledge and meaning (Klenke 2016c:126). Nevertheless, the researcher and participants play various roles that must be understood and performed by both parties during the interview process for successful data collection (Myer & Newman, 2007:13). In the subsequent sections, the roles and skills of the researcher and the role of participants during interview data collection, will be explored.

7.2.3.1 Role of the researcher in interview data collection

Apart from the role of asking questions, the researcher must listen, prompt, encourage, and direct a participant during the interview (Myer & Newman, 2007:15). Additionally, the researcher needs physical, social, emotional and communicative skills, which embodies the act of interviewing (Klenke 2016c:134). Based on literature findings, the roles played, and skills needed by the researcher in interviewing include:

- ***Research instrument or tool***: In qualitative interviewing, the researcher is the primary data collection tool (Klenke 2016c:140) and generates interview data that align with the research purpose of the study (Roulston, 2014:298). Therefore, the researcher must develop skills, acting as a human instrument to collect and interpret interview data (Klenke 2016c:134).

- ***Transparency***: Transparency means that the researcher clearly explains the purpose and goals of the interview (Myer & Newman, 2007:12) as well the roles of gatekeepers and shareholders (Klenke 2016c:135). Additionally, the researcher needs to clarify the goals and expectations for both researcher and participant prior to the interview (Klenke 2016c:135).

- ***Flexible and insightful***: A skilled researcher must be flexible and insightful to obtain an in-depth and detailed understanding of a participant's experience (Klenke 2016c:133). Therefore, the researcher needs to be flexible and ready with subtle improvisations when the actual conversation diverges from the original order on the agenda (Adams, 2015:503).

- ***Social skills***: The researcher must be able to deal with different types of behaviour from participants (Myer & Newman, 2007:12) and cope with alternating phases of openness, withdrawal, trust, distress, and embarrassment (Klenke 2016c:133). Evidently, the researcher must show empathy, understanding, and respect to the participants and create a space for participants to share their personalities and identities (Myer & Newman, 2007:12). Participants

that feel comfortable may be more open, talkative and willing to disclose important information (Myers, 2013:119).

- ***Communication skills***: Because of the complex dynamics involved in in-depth interviewing, the researcher must be a good listener and be skilled at encouraging participants to talk (Klenke 2016c:133). A researcher that talks too much may stifle the participant and restrict the amount of data disclosed (Myer & Newman, 2007:12). Therefore, the researcher must listen intently (Myer & Newman, 2007:14) and be sensitive to nonverbal messages while interviewing (Klenke 2016c:133). Particularly, if participants become side-tracked, the researcher who attentively listens, can pick up a conversation and come back with salient points to help participants to get back on track (Bolderston, 2012:69).

- ***Problem solver***: The researcher must overcome several potential problems in the interview (also see section 7.2.4), for instance, the fear of embarrassment, the fear of exploitation (from the participant) and the fear of silence (i.e. the participant does not talk, or the researcher does not know what to say) (Myer & Newman, 2007:12).

- ***Directing and managing***: As with the other skills of listening and communication, trusting and encouraging, the researcher must be able to move and direct the interview forward toward shared outcomes (Klenke 2016c:126; Myers, 2013:119). Therefore, the researcher must give stage direction and pay attention to stage management in the interview (Myer & Newman, 2007:12). With directing the interview process, the researcher can pursue (with probing) promising avenues of interest (Adams, 2015:503) and delve more deeply into the social situation (Myer & Newman, 2007:12). However, if a participant digresses too far from the main point or questions, the researcher must be able to direct and manage the interview process, while simultaneously, avoid over-directing the interview (i.e. rigidly control the conversation) (Myer & Newman, 2007:12).

Essentially, the researcher needs to be flexible, open, emotionally intelligent, a good listener and communicator, a problem-solver and a manager/leader during the interview to establish good rapport with participants and collect information-rich data. Consequently, an aspiring qualitative researcher must learn the skill of comprehension, reflection and interpretation to ensure successful collection and analysis of interview data (Klenke 2016c:134).

7.2.3.2 Roles of participants during interview data collection

Participants/interviewees can be described as selected (or volunteering) individuals who agreed to participate in a research study by allowing the researcher to interview them (Salkind, 2010:1017). Although limited literature studies refer to the roles of participants/interviewees, a few authors indicated that the essential roles of participants in interviewing relates to participation and communication. Subsequently, the role of participants during the interview can be described as follows:

- ***Unit of analysis:*** An interviewee can be viewed as the unit of analysis in a qualitative interview study (Salkind, 2010:1017).
- ***Informant:*** Participants as the "owners" of data must be willing to disclose information and serve as active co-creators of the interview experience (Klenke 2016c:126, 135). Evidently, to be good informants, participants must be knowledgeable in the field of study and must be willing to share that knowledge during the interview (Salkind, 2010:1017).
- ***Communicator:*** Participants must listen to the questions posed by the researcher and then appropriately answer each of these question during the interview (Myer & Newman, 2007:14).
- ***Collaborator:*** Participants must expect to be treated as equal participants in the research process and must actively collaborate during the interviews (Klenke 2016c:134, 135).
- ***Contributor to research:*** Through the interview process, participants can make major contributions to research in various disciplines (Salkind, 2010:1017).

Essentially, both the researcher and participant play important roles in the interview data collection process, and both needs to collaborate (participate), communicate (talk and listen), work towards a common goal of reaching the primary research objective, and contribute to the field of study.

In the next section, potential problems of interviews as a qualitative method will be discussed.

7.2.4 Potential problems of interviews in qualitative research

According to Myer and Newman (2007:5) a researcher must understand the potential problems and pitfalls of interviews in qualitative research. Researchers may reduce the impact of potential shortcomings and challenges, if they understand, consider and address the potential problems prior to choosing and conducting interviews. Based on various literature sources, the potential problems associated with interviews in qualitative research include, (1) resources, time and effort, (2) interviewer and interviewee problems, (3) difficulties in data analysis and discussion of findings, and (4) challenges

related to organisational research in academia and practice, which will be described in subsequent sections.

7.2.4.1 Potential interview problems - resources, time and effort

Often researchers may be underestimating the resources required to recruit participants, conduct interviews, transcribe recordings and analyse the data (DeJonckheere & Vaughn, 2019:7). Likewise, the process of preparing for the interviews, organising interviews, conducting interviews, and analysing interviews takes considerable time and effort by the researcher (Adams, 2015:493; Cassell, 2015:74). Evidently, interviews as a qualitative research method can create challenges and hold-ups throughout the research process (Cassell, 2015:74).

However, the time-consuming problems of qualitative interviewing can start prior to the interview process because it requires interviewer skills and experience (also see section 7.2.4.2), which necessitate interviewer training (Klenke 2016c:134). Furthermore, finding participants in an interview study can be challenging since participants must afford considerable time and commitment; thus, interviews can also be time-consuming for interviewees (Cassell, 2015:74; King, 2004a:21).

Other time, effort and resource problems associate with developing an interview guide and managing high volumes of data for transcription and analysis, which may be challenging for master and doctoral students (or novice researchers) (Cassell, 2015:74; King, 2004a:21). Additionally, conducting the actual interview not only takes time but also involve considerable concentration from the interviewer (King, 2004a:21), which may result in interviewer fatigue and incomplete data gathering (i.e. rushing the final questions during a three-hour interview) (Myers, 2013:123; Myers & Newman, 2007:4).

Essentially, for interviews to be successful, the researcher/interviewer requires time-management skills, realistic expectations, resources, commitment and training, which will also become more evident from the subsequent discussions.

7.2.4.2 Potential interview problems - interviewer and interviewee

The problems associated with interviewer and interviewees involve, (1) interviewer-specific problems, (2) interviewee-specific problems, and (3) relational problems between interviewers and interviewees, which will be described below.

Researchers need to be smart, sensitive, composed and nimble during the interview, knowledgeable about the topic/subject (Adams, 2015:493), unbiased, and open to the process of listening and understanding the viewpoints of participants (Bolderston, 2012:69). A lack of these characteristics can

result in *interviewer problems* that relate to the way interviews are conducted, interviewer inconsistency and interviewer bias. For instance, the interviewer may fail to probe or ask follow-up questions, fail to actively listen, have a poorly-developed interview guide/protocol and/or ask questions in an insensitive way (DeJonckheere & Vaughn, 2019:7). Furthermore, interviewer inconsistency can distort the outcomes of the research due to variation in the manner that the interviews are conducted (Roller, 2016:16).

Additionally, the interviewer may affect the participants' answers, resulting in measurement error that may impact the findings and conclusions of the interview data (Salkind, 2010:637). Likewise, the interviewer may bias research outcomes by allowing personal beliefs or expectations to skew the manner of questioning and recording of responses (Saunders *et al.* 2019:447; Roller, 2016:16). However, interviewer/researcher bias is mostly unintentional and excludes deliberate provocation of false information from participants (Roller, 2016:16). Nevertheless, interviewer-related problems can be addressed through interviewer training, continuous supervision, monitoring and prompt feedback, and a well-developed interview guide with carefully worded questions (Salkind, 2010:637).

The *interviewee-related problems* include problems with answering questions, interviewee temperament or personality types and interviewee behavioural problems. For instance, interviewees may avoid answering questions or remain silent due to (1) uncertainties about the information required by the researcher, (2) not understanding the questions (or not knowing the answers), and (3) privacy issues (Klenke 2016c:133) or the reluctance to share sensitive or personal information (i.e. non-disclosure agreements with their employers) (DeJonckheere & Vaughn, 2019:7). Interviewees may also be bored with the questioning, become disinterested or fatigued if the interviews last several hours (Myer & Newman, 2007:12). Additionally, it may be hard to engage in conversation with some participants (DeJonckheere & Vaughn, 2019:7) as they may be shy, answering in short/mono syllables, or be overwhelmed by feeling inferior to the researcher (Myer & Newman, 2007:12).

Alternatively, some participants may show off (exaggerates their importance), try to reverse roles and probe the interviewer for information about other interviewees/organisations or may adopt deceptive behaviour and be dishonest about commercially sensitive matters, their positions or performance in their organisations. Furthermore, some interviewees may treat the interview as a confessional experience by revealing sensitive and confidential information about themselves or their organisation (Myer & Newman, 2007:13), which also relates to the challenges of interviews in organisational research (see section 7.2.4.4). Unlike the time constraints and interviewer problems that may be addressed through training, skills and experience, the problems related to interviewing difficult participants can affect both experienced and novice interviewers (DeJonckheere & Vaughn, 2019:7).

Therefore, it is important that interviewers are well-prepared to deal with any interviewee personality type and behaviour.

Apart from the abovementioned problems, *relational problems between interviewers* and *interviewees* may exist due to personalities, moods, and interpersonal dynamics (Klenke 2016c:134). Additionally, physical characteristics (such as gender, race, ethnicity and appearance) may weaken the relationship between the interviewer-interviewee and impact a trusting research environment needed for accurate and useful qualitative data (Roller, 2016:16). Similarly, communication problems between interviewers and interviewees may hamper the interview process and cause inefficiencies in data gathering. For instance, the interviewer/researcher may convey approval or disapproval by responding positively or negatively to the comments made by the participant, which may influence the accuracy of data collection (Bolderston, 2012:69). Likewise, a lack of trust between the interviewer and interviewee may hamper important information needed for a successful research study (Myers, 2013:123-126; Myers & Newman, 2007:4-5). Consequently, researchers must consider potential relationship problems that may occur during interviews, ensuring complete and accurate data collection.

7.2.4.3 Potential interview problems - data analysis and discussion of findings

The difficulties in data analysis relate to the nature of qualitative data, volume of data, time constraints, data management problems and methodological concerns. The subjective and comprehensive nature of interview data can cause many challenges in the analysis and interpretation of the data (Klenke 2016c:134). Mostly, interviews involve the difficult task of analysing a huge volume of data and many hours of transcripts (Adams, 2015:493). Consequently, the more in-depth the data gathered during the interview (i.e. numerous interviews that last several hours), the more challenging and time-intensive the data is to analyse (Forman & Damschroder, 2008:44).

Furthermore, managing large amounts of interview data for analysis can be challenging because researchers need to keep track of data (i.e. electronic copies of transcripts and audio files), store and password-protect data files, and retrieve files. The researcher must also condense or reduce interview data because an hour-long interview alone may generate a 20-page transcript that must be analysed. Consequently, an interview study may generate hundreds of pages of data that must be reduced, interpreted and presented as findings in articles, books, and dissertations with word/page restrictions (Roulston, 2014:306).

Finally, methodological data analysis problems can include uncertainties of analysing the interview data correctly as well as choosing the most appropriate data analysis method for accurate interpretation

of interview data (Roulston, 2014:306). Essentially, researchers must carefully plan their techniques and methods of managing and analysing interview data as to avoid these potential pitfalls.

7.2.4.4 Potential interview problems - organisational research in academia and practice

Despite the general problems related to resources, time, effort, interviewers and interviewees, and data analysis and findings, other problems relate to organisational research both in academia (university degrees or journal articles) and practice (researching organisational practices).

Mostly, in business and management research, a more positivist approach is followed with an emphasis on quantitative techniques. Particularly, supervisors of business management masters' and doctoral students may prefer quantitative techniques, due to a stronger positivist approach in the field or unfamiliarity of qualitative research and interview methods (Cassell, 2015:75). This stigma may also apply to publication in business and management journals that may prefer quantitative techniques and may find interview data unreliable because of the subjective nature of data analysis and smaller sample sizes, making generalisation difficult.

Additionally, interview challenges related to organisational research include gaining access to organisations and recruiting participants, level of entry, elite bias and high-status interviewees. As mentioned in section 7.2.4.1, interviews can be time-consuming for interviewees, which may cause problems in recruiting participants and gaining access to some organisations and occupations (King, 2004a:21; Saunders *et al.* 2019:465). Likewise, the level of entry to an organisation can cause challenges, for example, if a researcher enters at a lower level (such as interviewing a RL administrator), it may prove difficult or even impossible, to interview senior managers (such as a national RL manager) at a later stage (Myers, 2013:123; Myers & Newman, 2007:4).

In contrast, an elite bias may be the result of interviewing only a few high-status individuals (e.g. CEO and CFO) without gaining an understanding of the broader situation by also interviewing lower-level staff (Myers, 2013:124; Myers & Newman, 2007: 5). Subsequently, the findings may be limited to the information from top management of organisations, and it may be difficult to study the phenomenon (subject) holistically and comprehensively. Additionally, business executives are usually well-read, time-constrained, accustomed to dominating conversations, prominent public personalities with reputations on the line, and as such, interested in impression management (Ma, Seidl & McNulty, 2021:81). Consequently, when interviewing people of high status (such as senior managers and professionals), who may be treated with a degree of reverence in their daily interactions, the researcher must set the relationship to an appropriate level. For example, the high-status interviewee may find it offensive if the researcher is over-familiar or appear overconfident with the subject (i.e. RLM in online

retailing) (King, 2004a:19). Conversely, the high-status interviewee may patronise an overly nervous or submissive researcher, which may hamper the level of information obtained (King, 2004a:19, Ma *et al.* 2021:84).

Evidently, the researcher must be respectful, especially working with industry experts (top managers or business owners) but at the same time, confident about the research subject and own level of expertise (King, 2004a:19). Essentially, by understanding the potential problems/challenges of interviews (as discussed throughout section 7.2.3), the researcher can adequately prepare for the interview process, which can contribute to the advantages of interviews, discussed in the next section.

7.2.5 Motivating factors and advantages of interviews in qualitative research

Despite the problems and challenges of interviews (section 7.2.3), some valuable advantages can be obtained from interviews as a qualitative research method (Adams, 2015:493). Qualitative interviews can be a powerful research tool, and researchers should not only understand its challenges but also have an appreciation of its advantages (Myer & Newman, 2007:5). Particularly, when used to its full potential, a qualitative interview can be a powerful data gathering technique (Myer & Newman, 2007:5), offering researchers numerous advantages (Akinyode & Khan 2018:165; Cassell, 2015:73). These advantages, which can be viewed as motivating factors, include (1) advantages related to interviewers and interviewees, (2) advantages related to exploratory research and in-depth information, (3) flexibility and advantages related to research aims, data collection and analysis, and (4) appropriateness for organisational research, which will be discussed in subsequent sections.

7.2.5.1 Advantages related to interviewers and interviewees

Interviews in qualitative research can benefit the interviewers and interviewees in several ways. For instance, interview techniques establish rapport between the researcher and participants, which may be valuable for networking and future engagements (i.e. easier access to reinterview or obtain additional information) (Akinyode & Khan 2018:165). However, as mentioned earlier (see section 7.2.4.2), researchers need interpersonal skills to develop a rapport with the participant to encourage conversation and benefit from these opportunities (Bolderston, 2012:68).

Nevertheless, interviews give researchers the opportunity to explain questions if a participant misunderstands any question (Akinyode & Khan 2018:165). Likewise, interviews allow the participants to express their viewpoints, by using their own words rather than being restricted to predetermined response categories (such as in a questionnaire) (Bolderston, 2012:68; Klenke 2016c:134). Additionally, De Villiers, Farooq and Molinari (2021:12) observed that professional

participants (i.e. industry experts and senior managers) can be enthusiastic about their work and field of expertise, appreciating the opportunity to share their experiences and insights. Similarly, King (2004:21) indicated that participants commonly enjoy the interview experience since interviews can help them clarify their thoughts on a particular topic.

Other advantages relate to familiarity, as most individuals (such as industry professionals) are familiar with the term interview and may understand the expectations surrounding an interview, which may help the researcher at the recruiting stage as participants will know what to expect (Cassell, 2015:73). Essentially, interviews can benefit both the interviewers and interviewees and provide high credibility and face validity, allowing researchers the flexibility to apply their knowledge, expertise and people skills to explore interesting or unexpected ideas raised by participants (Klenke 2016c:134), which associates with other advantages (i.e. exploratory research and flexibility) discussed below.

7.2.5.2 Advantages related to exploratory research and in-depth information

As mentioned in section 7.2.5.1, interviews can provide researchers with the opportunity to obtain valuable information from the experiences, expertise and viewpoints of participants (Klenke 2016c:134). Furthermore, qualitative interviews are ideal for examining topics, exploring different levels of meanings (King, 2004a:21) and giving insights (or a better understanding) about the topic for further investigation (Akinyode & Khan 2018:165). Consequently, interviews allow researchers to conduct exploratory research about a topic or field of study (Akinyode & Khan 2018:165).

Additionally, the researcher can adapt the questions to explore emerging topics and obtain in-depth information from participants during interviews (Bolderston, 2012:68; Saunders *et al.* 2019:444), which is not possible with quantitative methods (such as surveys) or other qualitative methods (such as observations or document analysis) (King, 2004a:21). Therefore, interviews are appropriate when more than a few of the open-ended questions require follow-up queries for further exploration (Adams, 2015:493-494; Collis & Hussey, 2021:121). Essentially, interviews can be valuable if limited knowledge about a topic/subject is available, allowing a researcher to conduct exploratory research, obtain in-depth information about a topic and create new knowledge (Akinyode & Khan 2018:165).

7.2.5.3 Flexibility and advantages related to research questions, outcomes and organisational research

Interviews are highly flexible and can be used for various research questions, within a variety of epistemological positions (Cassell, 2015:73). In other words, interviews are adaptable and can be used to answer several types of research questions, making it one of the most flexible research methods

available (King, 2004a:20). Furthermore, interviews are suitable for probing and asking key informants (such as managers) open-ended questions, enabling the researcher to obtain unchartered (or new) knowledge and information that can be used to address a problem (Adams, 2015:493). The flexibility of interviews also relates to different interview styles (such as structured, semi-structured and unstructured styles) and both qualitative and quantitative forms of analysis, which can enhance the research outcomes and findings of a study (Cassell, 2015:73).

The final motivating factors for interviews relate to organisational research. According to Cassell (2015:74), interviews can be applied to any field but added that interviews are particularly suited for studies interested in organisational practices and the experiences of key individuals who can answer questions regarding the subject. Additionally, interviews can address focused questions about certain aspects of organisational life, for instance, specific decision-processes and the management of processes (King, 2004a:21). While interviewing business executives can be challenging (see section 7.2.4.4), top executives, CEOs and senior managers frequently possess a special understanding of management practices, enabling researchers to obtain valuable information and insights in to organisational practices and strategies that are frequently unattainable through other data collection methods (e.g. questionnaires) (Ma *et al.* 2021:83-84).

Essentially, the possibility of adapting questions (during the interview) and using different types of questions (open and close-ended questions) and/or interview styles (i.e. semi-structured style), makes interviewing a flexible and appropriate method that can be used to answer the research questions, provide new knowledge and reach meaningful conclusions. Additionally, the interview method can be used for a variety of purposes, depending on the research objectives and scope of the study (Cassell, 2015:4), and can be suitable for gaining valuable insight from business executives or industry professionals on appropriate organisational practice (Ma *et al.* 2021:83). In sum, Cassell (2015:75) suggested that the advantages of interviews in terms if meaningful insights and high-quality data far outweigh the problems and challenges of interviews (as discussed in section 7.2.3), making interviews a valuable research method.

Based on the abovementioned motivating factors (throughout section 7.2.5), *the interview method is appropriate for this study as it affords the researcher with the flexibility to explore RL processes and practices based on inputs from industry experts (professionals and senior management) to obtain insight into (1) types of consumer returns, (2) RL processes, (3) RL practices and (4) RLM factors in online retailing.*

In the next section, the methodology and application for the interview process of industry experts will be discussed.

7.3 INTERVIEWS WITH INDUSTRY EXPERTS – METHODOLOGY AND APPLICATION

Interviewing involves several steps, namely, determining the interviewees, preparing for the interview, and conducting the interview (Salkind, 2010:633). Since this study involved a thematic semi-structured interview style, the steps described by DeJonckheere and Vaughn (2019) were adapted to explain the methodology and practical process of the interviews with industry experts. Table 7.1 provides an overview of the research process (sequential steps) followed for the semi-structured interviews with industry experts.

Table 7.1 Overview of the interview process with industry experts

Stage	Process of interviews with industry experts
1	Defining the purpose and research question of interviews with industry experts
2	Considering ethics issues and practices of interviews with industry experts
3	Developing the interview protocol for interviews with industry experts
4	Sampling procedures and identifying participants for interviews with industry experts
5	Pre-interview planning for interviews with industry experts
6	Conducting the interviews with industry experts
7	Post-interview reflection
8	Data analysis of interviews with industry experts
9	Demonstrating the trustworthiness strategies employed in interviews with industry experts

Source: Compiled by the researcher from DeJonckheere and Vaughn (2019:3)

In this section, the methodology as well as the practical application of the abovementioned steps will be given, to explain the research process of interviews with industry experts.

7.3.1 Stage 1: Defining the purpose and research question of interviews with industry experts

The aim of the interviews with industry experts was to (1) *determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5)*, (2) *explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6)*, and (3) *investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7).*

In multimethod research designs, defining the purpose and framing the research question for each method can be crucial, affecting when, to what extent, and in what way data from different methods were integrated (Brannen & O'Connell 2015:260). Evidently, the purpose of the interviews with industry experts was to gain practical insight from industry on the main themes of the study, namely, consumer return types, RL processes, RL practices and important factors for the effective RLM of consumer returns in online retailing, which was also used to (1) triangulate (confirm/compare) the

findings from the QCA on RL literature (consumer return types, RL processes and RL practices), (2) identify themes that can contribute to the effective RLM of consumer returns in online retailing, and (3) develop a framework based on the thematic analysis of interview findings, which can contribute to the final framework for effective RLM of consumer returns in online retailing.

With the above aims in mind, the main research questions for the interviews with industry experts include:

1. *What are the reasons and types of consumer returns in online retailing?*
2. *What are the RL processes of consumer returns in online retailing?*
3. *What are important RL practices for managing consumer returns in online retailing?*
4. *What are important factors for the effective RLM of consumer returns in online retailing?*

The focus of the first two questions was to triangulate the findings of the interviews with the findings QCA of RL literature findings through a deductive approach and a descriptive analysis. The focus of research question three above was to triangulate the interview findings with the QCA findings through an inductive approach and a reflexive thematic analysis. The final question focused on identifying important factors for the effective RLM of consumer returns from the interview findings through an inductive approach and a reflexive thematic analysis. These deductive and inductive approaches will be discussed in section 7.3.8 focussing on the thematic analysis (TA) of interviews with industry experts. Regardless of the approach, all the questions that drove the interviews with industry experts aimed to contribute to the primary objective/question of the study, which was to develop a framework for effective RLM of consumer returns in online retailing.

In the next section, the ethical consideration for interviews with industry experts will be discussed.

7.3.2 Stage 2: Consider ethics issues and practices for interviews with industry experts

A “good” qualitative study is one that was conducted in an ethical manner, adding to the trustworthiness of a study (Merriam & Grenier, 2019:29). In chapter 3, the philosophical approach of the study was explained, which indicated that axiology, referring to the role of values and ethics in research, can be added to the ontology, epistemology and methodology of a study (Klenke, 2016a:17). In qualitative research, ethical dilemmas mostly emerge during data collection and dissemination of findings (Merriam & Grenier, 2019:30). However, an ethical attitude must be present from the start of a research study, incorporating integrity, objectivity, respect, sensitivity and tact towards participants throughout the research process (DeJonckheere & Vaughn, 2019:4). In chapter 1 (see section 1.7), a brief outline of the ethical implications of the study was given, which mentioned the ethical principles outlined in Policy on Research Ethics of the University of South Africa (2016).

The focus of this chapter will be on the ethical considerations for the primary data collection method of qualitative interviews. Although ethics must be considered at an early stage (stage 2) of the interview process (before recruitment and data collection), ethical practices must be applied throughout the interview process. Therefore, the ethics issues and practices covered in this section, applies to the (1) pre-interview process, including interview design stage (i.e. formulating research questions and aim) and gaining access to participants, (2) during the interviews (data collection), and (3) post-interview process, including data analysis and presentation/publication of findings. Figure 7.3 provides an overview of ethics at different stages of the interviews with industry experts.

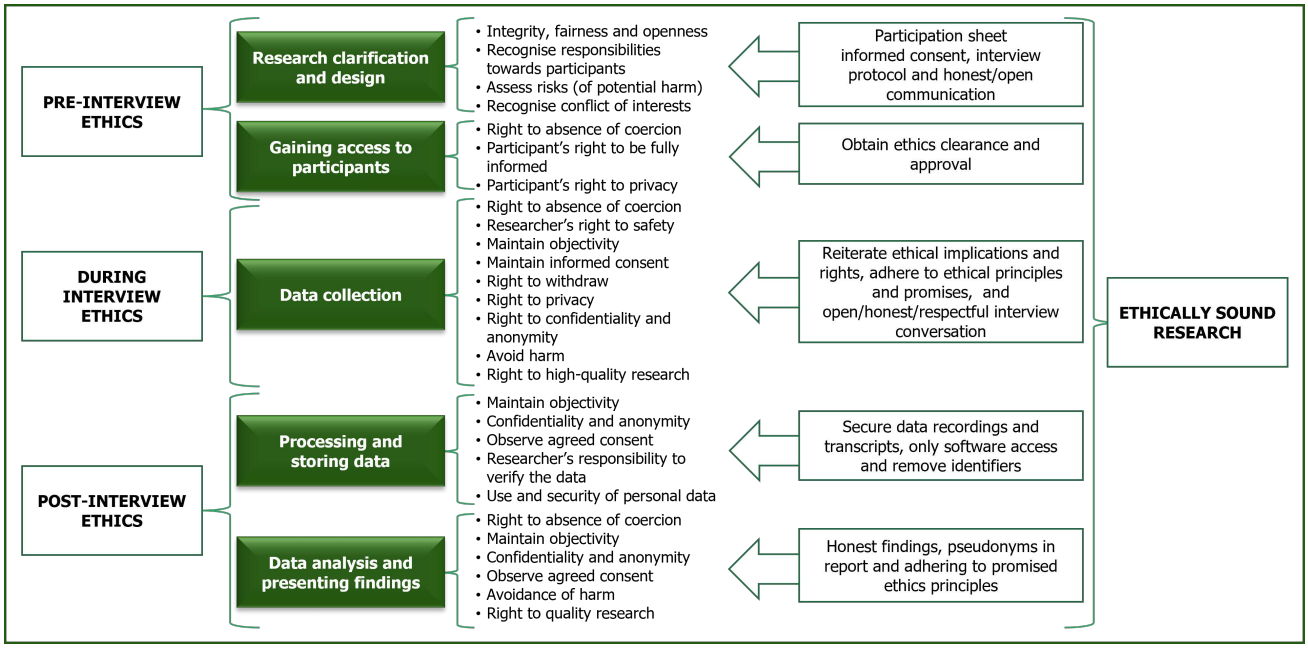

Figure 7.3 Ethics during different stages of the interview process
Source: Compiled by researcher and adapted from Saunders *et al.* (2019:264)

In subsequent sections the ethics applied during the different stages of the interviews with industry experts as presented in Figure 7.3, will be discussed.

7.3.2.1 Pre-interview ethics

Pre-interview ethics start during the research design stage, continues with gaining access to prospective participants and ends with pre-interview communication with participants. In the early stage of the research, ethics in interviewing involve permissions, which include obtaining ethics approval from ethics committees (internal) and obtaining permission from third parties and gatekeepers (external) (Myer & Newman, 2007:23).

7.3.2.1.1 Ethics approval for interviews with industry experts

According to the Policy on Research Ethics of the University of South Africa (Unisa) (2016) students and academics require ethics clearance before data collection. *Therefore, the researcher applied for ethics clearance from the Research Ethics Review Committee (RERC) of the College of Economic and Management Science (CEMS), Unisa, before the interviews with industry experts.*

Researchers must complete a lengthy *application form*, providing details on the risk level of the study, research proposal (including purpose and objectives of the research), research design and methodology, including primary data collection and data analysis techniques, and trustworthiness of the research. Additionally, *approval letters* from institutions to assist with the research must be attached (see Appendix E.3), a *participation sheet* must be completed (Appendix E.1) and the *research instrument* (interview protocol) (Appendix D.1) must be submitted. Evidently, the application for ethics clearance was a rigorous process, which enhanced the integrity and objectivity of the study and recognition of responsibilities towards participants.

Ethics clearance was obtained on 14 June 2018, which allowed the researcher to continue with the primary data collection of interviews with industry experts in an ethically responsible manner. The ethics clearance application was extended to 2024, ensuring that the ethics principles remain valid in the finalisation of this study. Appendix E.4 provides a copy of the original and extended ethics clearance certificates for the study.

7.3.2.1.2 Ethics in gaining access and recruitment of industry experts

Before interviews and during the recruitment phase, prospective participants must be informed about the research, including the purpose of the research and the dissemination of findings (Myers, 2013:52). Potential participants must receive sufficient information and assurance to understand the implications of participation and reach a fully informed and freely given decision about participation, without any pressure or coercion (Saunders *et al.*, 2019:226). Approval usually requires that prospective participants sign a consent form agreeing to participate, after being informed of potential risks and benefits (Klenke 2016c:149), the research topic, question types and data storage (Bolderston, 2012:73).

After being carefully and truthfully informed about the research, the researcher must ask participants for their informed consent before data collection can start (Klenke 2016c:148). Informed consent entails communication between the researcher and participants that allows participants to (1) understand the consequences of participation, and (2) reach fully informed and conscious decisions about participation, without threat or intimidation (Myers, 2013:51; Saunders *et al.* 2019:257).

Evidently, the purpose of informed consent relates to protecting the welfare of each participant and promoting positive feelings before and after completing a study (Salkind, 2010:603).

According to Salkind (2010:605) three conditions must be met for a valid informed consent, including (1) the participant must understand the information presented, (2) consent must be voluntary, and (3) the participant must be competent to give consent. Specific elements of informed consent include:

- *Explain research* – purpose of research, potential duration of participant and description of procedures written in clear and understandable language (Leedy & Ormrod, 2021:136).
- *Describe risks* – indicate potential discomfort harm (Leedy & Ormrod, 2021:136), loss, or damages, including inconvenience or physical, psychological, social, economic, and legal risks, which might occur (Salkind, 2010:605).
- *Describe benefits* – indicate the benefits to the participants and society (Leedy & Ormrod, 2021:136), including scientific knowledge, insight, training and learning, empowerment, and future opportunities, psychosocial benefits (e.g. increased self-esteem), and community or organisational benefits (e.g. improved policies) (Salkind, 2010:605).
- *Describe alternatives to participation* – provide additional resources and alternative data collection methods (e.g. telephone interview or online meeting software) (Salkind, 2010:605).
- *Assurance of confidentiality or anonymity* – keep the names and other identifying information associated with the interviewee anonymous (Klenke 2016c:149; Leedy & Ormrod, 2021:136) (e.g. using numbers or code names instead of the names of the participants).
- *Contact details* – provide contact information of the researcher or other individual(s) (i.e. supervisor and ethics chair) that participants can contact for any questions or for ethical concerns (Leedy & Ormrod, 2021:136; Salkind, 2010:605).
- *Describe right of withdrawal* - participation is voluntary and participant can withdraw from the study at any time without penalty (Leedy & Ormrod, 2021:136; Salkind, 2010:605).
- *Copy of consent* – a copy of the signed consent form must be given to participants (Salkind, 2010:605)
- *Summary of findings* – offer participants the opportunity to receive a summary of the findings (Leedy & Ormrod, 2021:137)

Salkind (2010:607) and Lobe *et al.* (2020:5) indicated that a researcher may send participants the informed consent form, which can be the most common way for online interview data collection (remote interviewing).

During the *interview recruitment stage* of this study, *prospective participants received* an email/message (call to participate discussed in 7.3.4) with the *participation information sheet* that

contained significant details about the study, including (1) introduction and information about the researcher (2) the overall aim of the research, (3) the aim of the interviews, (4) the reasons for selecting the participants, (5) benefits and risks of the study, (6) confidentiality, (7) data protection, (8) incentives, (9) ethics clearance, (10) contact details of the researcher and the ethics representative of Unisa, and (11) the informed consent form.

Additionally, participants that indicated interest in the study, *received the interview protocol* (discussed in section 7.3.3) via email, which contained further information, interviewee rights and the interview questions. Finally, selected industry experts (participants in sample) received via email, an *electronic copy of informed consent to read and sign before the interview*. All *participants* selected in the sample, *consented to take part in the study and the signed informed consent forms,* which were saved in a secure folder on the researcher's personal computer (also see section 7.3.2.3)

Essentially, the participation sheet (Appendix E.1), informed consent form (Appendix E.2) and interview protocol (Appendix D), developed during the process of ethics clearance and approved by the research ethics committee of Unisa, ensured an ethically sound pre-interview process.

7.3.2.2 Ethics during interviews with industry experts

Ethics during the interviews involve keeping pre-interview promises (made to participants), adhering to institutional ethics principles and policies and conducting interviews in a respectful, honest and harm-free manner. Subsequently, the same principles applicable to the pre-interview ethics (see section 7.3.2.1.2) applied to the ethics during the interviews (also see Figure 7.3).

Treating participants with *respect* involve respecting their time, respecting their position within an organisation and respecting their knowledge (Myer & Newman, 2007:23). In this study the *researcher treated the industry experts* with *respect* through open/honest communication, adhering to scheduled interview times, acknowledging their expertise and importance to the field, fulfilling pre-interview promises (i.e. voluntary participation) and allowing them to share their expertise and answer questions without interruptions or disrespectful comments by the researcher.

Apart from showing respect, the most important rules to be observed during the interviews involve the prohibition of causing harm to the participants, the right of participants to withdraw from research at any time, and the right to anonymity and confidentiality (Stasik & Gendźwiłł, 2018:239-240). *Protection from harm* means that the researcher protects the interviewee from physical, emotional, psychological, or any other kind of damage, which may cause psychological stress, legal or political repercussions, or ostracism of peers or staff (Klenke 2016c:149). During the interviews with industry

experts, the researcher maintained a low-risk (minor inconvenience in terms of time) and *harm-free* atmosphere, reiterating the rights of the participants. Specifically, each industry expert was assured that they can *withdraw from the interview at any stage* and *can choose not to answer specific question/s without any coercion, harm or consequences*.

Confidentiality requires that the researcher guarantees to keep the names and other identifying information associated with the participant anonymous (Klenke 2016c:149). Additionally, the principle of *autonomy* can be enhanced by giving participants the choice to decide the degree of their collaboration in the study (Cardano, 2020:69). In this study, the researcher *verbally assured the industry experts* that their details and information will be *treated as strictly confidential* and that their *identity (using pseudonyms) will be protected* throughout the study and in future publications, assuring their *anonymity*.

Using online remote interviewing, may involve *privacy* concerns, as a researcher may be intruding into participant's personal space, especially with video recording (Roberts, Pavlakis & Richards, 2021:3). Although, video recording of interviews may be common, the digital environment can lead to additional awareness and privacy concerns (Van Zeeland *et al.* 2021:2). Recording the audio alone can help protecting participants' confidentiality, especially using the participant's chosen pseudonym (e.g. P1) on the audio recording (Roberts *et al.* 2021:9). Consequently, in this study the researcher maintained a level of *privacy, anonymity and confidentiality* by conducting the *remote online interviews* by using the *audio-only* option (without video or face-to-face contact) (Klenke 2016c:149) along with audio-only recording. Furthermore, the researcher asked the industry experts for *permission to record the conversation* for accuracy and quality purposes, assuring that the recordings are kept secured without third-party access (apart from transcript and analysis software used for analysis) (see section 7.3.2.3).

Essentially, the researcher ensured that all ethical principles were maintained during the interviews with industry experts by (1) treating them with respect, (2) informing them of their rights (e.g. right to withdraw), (3) guaranteeing confidentiality, anonymity and privacy, and (4) asking for permission to record the interviews.

7.3.2.3 Post-interview ethics

Like the pre-interview and interview stages, post-interview ethics continue to maintain informed consent, confidentiality, privacy, anonymity and safety of participants (see Figure 7.3). However, these ethical principles apply to the storage and processing of data, data analysis and presentation of findings.

According to Myer and Newman (2007:17) researchers must keep recordings and transcripts confidential and secure. In this study, the researcher *stored the interview recordings and transcripts* on a personal computer and on the "cloud" (Dropbox) in a *secure and password-protected folder*. Additionally, the researcher used the *latest antivirus software*, *firewall protection* and *personal (password protected) internet services* to ensure security of the data.

Apart from the researcher and supervisor, *no third-party person had access to the data recordings and transcripts*. The researcher used Sonix, a secure online automated software transcription service, to transcribe the audio recordings (speech-to-text) (see Appendix D.3). Furthermore, the researcher solely accessed and used ATLAS.ti software for the analysis of transcriptions, which was securely saved on the researcher's personal laptop. *Other interview documentation*, including the emails between the researcher and participants and informed consents forms (see section 7.3.2.1.2) were *saved in an encrypted folder* and then removed from the researcher's Microsoft Outlook inbox. All electronic records will be *stored for a maximum of five years*, whereafter the records will be securely deleted from the Dropbox folder and hard drive of the researcher's computer.

Additional ethics principles in the qualitative data analysis stage of interviews include anonymity and confidentiality, which must be protected throughout the transcription process (Cassell, 2015:47). Additionally, the researcher must practise integrity and quality in data analysis to produce most authentic and valid conclusions (Schutt & Chambliss, 2014:354) without prejudice to participants' right to privacy (Cardano, 2020:69). Consequently, *a pseudonym was assigned to each industry expert* (e.g. P7) to disguise their identities and maintain confidentiality and anonymity during presentation of findings (Myers, 2013:51). Table 7.6, in section 7.3.4.5, lists the details on the final sample of the study, including the pseudonyms assigned to the participants.

Essentially, after the interviews with industry experts, the researcher adhered to the ethical commitments made to the participants and intuition, by keeping transcripts/recordings and the technology confidential and secure (Myer & Newman, 2007:23). The researcher practised honesty and transparency throughout the pre-interview, interview and post-interview stages, about the research methods, data, and presentation of findings (Myers, 2013:50), producing a trustworthy and ethically sound research study (as illustrated in Figure 7.3).

7.3.3 Stage 3: Developing the interview protocol for interviews with industry experts

Besides the importance of participants consenting to be interviewed, the most important element in interview data collection is the content of an interview protocol (Adams, 2015:496). The purpose of the interview protocol is to achieve the research objectives of a study by including carefully considered

information and questions (Klenke, 2016c:132). Evidently, designing good questions and developing a well-crafted interview protocol (or discussion guide) is essential for the success of a study (Adams, 2015:496; Bolderston, 2012:69). Although the interview protocol for this study was developed during the ethics clearance pre-interview stage (see section 7.3.2.1), this section will provide details on the interview protocol structure, forming part of stage 3 of the interview process.

Depending on the interview style (structured, semi-structured and unstructured) (see section 7.2.2), interview protocols vary in level of detail and structure (King, 2004a:15). Generally, an interview protocol lists the topics that the researcher wants to cover during the interview (King, 2004a:15; Silverman & Patterson, 2021:70) and outlines the purpose of the study, ethical information, the main interview questions, probes and follow-up questions (Bolderston, 2012:69). Roller (2016:18) explained that the interview protocol must start broadly and progressively narrow to subject-specific matters. In other words, a funnel approach can be used in the interview protocol to lead the researcher on a path towards meeting the research objectives (Roller, 2016:19).

Based on various literature sources, the suggested structure of an interview protocol includes (1) the introduction, (2) opening questions, (3) research-specific questions, and (4) closing questions and the conclusion. In subsequent sections, a theoretical explanation of the interview protocol structure will be provided to motivate the structure of the interview protocol used in the interviews with industry experts. Where appropriate, examples from the interview protocol used in this study were added to the theoretical discussion, however, the final interview protocol (after piloting) can be viewed in Appendix D1.

7.3.3.1 The introduction of the interview protocol

The introduction of the interview protocol (also known as the interview preamble) provides important information about the study, setting the tone of the interview (Cassell, 2015:28). Specifically, the introduction can include: (1) *details of the researcher* (interviewer) and other parties/institutions associated with the research (i.e. supervisor and university), (2) *purpose of the research*, (3) *the objective of the interview*, (4) *interview process* or summary of the interview questions, (5) *reasons for recruiting* the participant, (6) *ethics* (issues of consent, assurance of confidentiality and anonymity, and permission to record the interview), (7) intended *use of the interview data*, and (8) a question that affords participants with an opportunity to comment or *ask any questions* (Bolderston, 2012:69; Cassell, 2015:28; Myer & Newman, 2007:14; Roller, 2016:18).

The interview protocol for this study covered these abovementioned elements, which was basically a summary of the participant information sheet, provided during the recruitment stage. The introductory part of the interview can be viewed in Appendix D.1.

7.3.3.2 Opening questions in the interview protocol

The opening questions in the interview protocol must be designed to (1) ease participants into the interview, (2) set the foundation for the interview questions and (3) make participants feel more comfortable for the duration of the interview (Cassell, 2015:30). Opening questions can relate to the content of the overall research question, which enable participants to talk about their experience (DeJonckheere & Vaughn, 2019:5). Additionally, the researcher can ask participants for demographical details, for instance, ethnicity, age, job title or any other details that associate with the research objective (Cassell, 2015:31).

Some examples of opening questions in the interview protocol include, "can you tell me more about yourself?", "what is your job title and how many years of experience do you have in your current job?", "what is your level of expertise in the field?", or "can you tell me more about your background?" (Cassell, 2015:30; Myer & Newman, 2007:16). Any one of these questions may encourage participants to open-up, talk about something they feel comfortable with, and provide valuable information (Cassell, 2015:30), which can enrich the findings and add to the validity and trustworthiness of a study (Myer & Newman, 2007:16).

In this study the *opening question* in the interview protocol was *"Can you please tell me more about your background and level of expertise in the field of RL?"* (Appendix D.1). Essentially, the opening questions can be useful for setting the stage in the interview before delving into more research-specific (key) questions (Cassell, 2015:30).

7.3.3.3 Research-specific questions in the interview protocol

Researchers can identify research-specific questions from academic literature, own knowledge and experience, informal preliminary discussions with other individuals (knowledgeable in the field) and exploratory research (King, 2004a:15; King, 2004b:258). Research-specific questions can be divided into sections around various themes or different aspects of the research objectives (Cassell, 2015:30). The *interview protocol* for the interviews with industry experts *consisted of two parts*, with different research objectives, the *first set of research-specific questions* (Section B) was *based on the research objective related to consumer returns and RL processes* (SRO-05), and the s*econd set of research-specific questions* (Section C) was *based on the research objectives related to RL practices and RLM*

factors (SRO-06 and SRO-07) (see section 7.3.1). The questions for each section were identified from literature, which was also used for the coding framework from the QCA of RL literature (see Appendix A.2). Appendix D.1 shows the research-specific questions included in Section B and Section C of the interview protocol.

In terms of the interview protocol structure, research-specific questions can include main questions and follow-up questions to elicit in-depth and detailed information from participants (Klenke 2016c:132). The *main questions* in the interview protocol must be developed to encourage participants to freely talk about the topics or themes of the study (DeJonckheere & Vaughn, 2019:5). Like the interview protocol structure, main interview questions in the protocol can follow a funnel approach, starting with broader questions that can be the foundation for narrower more research-specific questions (Roller, 2016:18). For example, a *broader main question* can be, "*can you tell me about the parties involved in RL*?", while a *narrower main question* can be "*can you please tell me more about the information systems and technologies implemented to manage the RL processes of consumer returns in online retailing*?". Nevertheless, both broader and narrower main questions must relate to the (1) purpose of the interview, (2) research objectives of the study and (3) phenomenon under investigation (DeJonckheere & Vaughn, 2019:5; Klenke 2016c:132; Roller, 2016:18).

The main research-specific questions in the interview protocol can be supplemented with *follow-up questions*, which consist of planned and unplanned probing questions (Cassell, 2015:30). Planned probing questions can be used to answer specific aspects of a main question or to elicit more details from a participant (DeJonckheere & Vaughn, 2019:5). Therefore, *planned probing questions*, like "*can you elaborate on that*?" or "*can you give me an example of that*?", can increase the richness and depth of main question responses and can demonstrate the level of detail required by the researcher (Klenke, 2016c:132).

In contrast, *unplanned probing* questions arise during the interview and depend on the responses of participants. Consequently, during an interview, unplanned probes and questions can be added to the interview protocol to obtain greater details and information from participant-specific responses (DeJonckheere & Vaughn, 2019:5). Additionally, through unplanned questions, like "*if I understand you correctly…*?", a researcher can request clarification and encourage participants to elaborate more about their statements (Cassell, 2015:31). Evidently, the interview protocol can be modified during interviews by adding new probes or even whole topics based on participant responses (King, 2004a:15) (also see section 7.3.6).

Essentially, the research-specific questions in the interview protocol aims at achieving rich and in-depth information, by exploring key words, ideas and themes related to the research question(s) and using follow-up questions to encourage participants to reveal more information (Klenke, 2016c:133).

7.3.3.4 Closing questions and conclusion in the interview protocol

The conclusion part of the interview protocol can cover open-ended questions, snowball referrals, future communication and closing comments. The open-ended question in the conclusion aims to add new insight or additional information, like "do you have any other questions or anything else to add?" (Cassell, 2015:31; Myers, 2013:141). Importantly, the closing questions in the interview protocol need careful consideration and must be designed to (1) make participants feel satisfied with the information they provided, and (2) satisfy the researcher with the interview outcomes (i.e. covered all areas of interest) (Cassell, 2015:31). In this study, the *open-ended closing question* was, *"Do you have anything to add to our discussion that you believe is important in the RLM of consumer returns in online retailing?"*.

One of the most important aspects in the conclusion of the interview protocol involves snowballing or snowball sampling, which involve asking a participant to recommend other individuals that may qualify as participants in the study (Cassell, 2015:31; Myers, 2013:141; Myer & Newman, 2007:15). Since *snowball sampling* was used in this study (see section 7.3.4.1) the interview protocol included the following question: *"Do you know of any other individual/s that qualify to participate in this study?"*.

Additionally, the interview protocol conclusion can include future contact possibilities, for example, follow-up emails to clarify any uncertainties in participant responses (Myer & Newman, 2007:15) and, if requested, emails to provide feedback on the findings (e.g. an executive summary of findings will be sent to the participant) (Myer & Newman, 2007:15). In this study, *future communication* in the conclusion of the interview protocol included: *"Do you want to a summary of the findings once the research has been published?"*.

Finally, the conclusion of the interview protocol must conclude with thanking the participants, ending the interview on a positive note (Cassell, 2015:31; Myers, 2013:141). For example, in this study the *closing remarks* included, *"Thank you for taking the time out of your busy schedule to meet with me. You have been very helpful."*

In sum, the development of the interview protocol starts early in the interview planning stage but can be modified during interviews, by using probes/topics that emerged spontaneously in the interview and dropping or re-formulating incomprehensible questions or questions that consistently fail to elicit

responses relevant to the research question(s) (King, 2004a:15). Nevertheless, the interview protocol must be well-designed before data collection starts, enabling the researcher to adequately prepare for the interviews and conducting successful interviews. Appendix D.1 provides the final version of the interview protocol that was used during the interviews with industry experts.

In the next section, the sampling and recruitment procedures for the interviews with industry experts will be discussed.

7.3.4 Stage 4: Sampling procedures and identifying participants for interviews with industry experts

In general, sampling can be defined as "a selection of specific data sources from which data are collected to address the research objectives" of a study (Gentles *et al.* 2015:1775). Sampling may involve the selection of participants using probability sampling and nonprobability sampling techniques (Salkind, 2010:1304; Salkind, 2021:80). The goal for both probability and nonprobability samples, is to generalise information collected from the sample to the relevant population (Salkind, 2010:1396; Salkind, 2021:80).

However, probability sampling techniques are not always appropriate for a research study because of insufficient information available about a population, limited access to potential participants, or a research design that involves nonstatistical criteria (Salkind, 2010:922; Saunders *et al.* 2019:296). Additionally, sampling for qualitative interview methods (unstructured or semi-structured) is usually purposeful in nature (Bolderston, 2012:68; Shaneen *et al.* 2019:25), involving non-probability techniques (Leedy & Ormrod, 2021:272; Salkind, 2010:924). Therefore, this study used *non-probability sampling* techniques to identify industry experts.

According to Daniel (2012:88) five main steps can be followed to select and recruit a non-probability sample, including (1) define the target population and choose the sampling techniques, (2) identify the inclusion and exclusion criteria, (3) create a plan to recruit participants that satisfy inclusion and exclusion criteria, (4) determine the sample size, and (5) finalise the sample of selected participants. Based on these steps of Daniel (2012:88), the subsequent sections will provide a theoretical and practical overview of sampling procedures and recruitment methods for the interviews with industry experts.

7.3.4.1 Target population and sampling techniques

The first important step in sampling procedures and identifying participants involve identifying the population or entire group of interest, which include all participants of theoretical interest to the researcher (Salkind, 2010:1303; Salkind, 2021:80). In contrast to the entire population (e.g. all industry experts in RL), a target population can be a more manageable starting point for sample selection (Saunders *et al.* 2019:295). Because one of the aims of the study was to gain input from industry experts in the field of RLM, the *target population* was individuals that are *industry experts in RL with knowledge or work(ed) in the online retailing industry in South Africa*.

Once the targeted population was defined, it was necessary to choose the most appropriate sampling technique to recruit the participants from the targeted population. A sample can be described as a subset of a population, which can be a set of people, animals, countries, regions, organisations and institutions. The notion of subset implies that a sample is smaller than the population to which it is connected (Salkind, 2010:1395; Salkind, 2021:80). Researchers mostly prefer a sample over an entire population (known as a census) because a sample is cost-effective, convenient and fast with the potential to improve the quality and reliability of a research study (Salkind, 2010:1304).

As mentioned in the introduction of section 7.3.4 the sampling for this study was *a non-probability sampling*. In nonprobability sampling, randomisation is not important in selecting a sample from a population, therefore, not all potential participants have an equal chance of selection (Etikan *et al.* 2016:1; Salkind, 2010:1305). Instead of extracting a sample from an existing and a clearly defined population, non-probability sampling often begins with a sample and then creates a population (e.g. RL experts in South Africa) that fits the sample (Salkind, 2010:1396). Evidently, nonprobability sampling is conducted without the knowledge that those chosen in the sample are representative of the entire population (Salkind, 2010:922).

Although various nonprobability sampling techniques can be used in qualitative research (such as theoretical sampling and expert sampling), the four main nonprobability sampling types include convenience sampling, purposive sampling, quota sampling and snowball sampling (Salkind, 2010:1396; Trotter, 2012:399). Table 7.2 provides an overview for the main non-probability sampling techniques, including the definition/description, reasons and purpose, appropriate research studies and other names or types.

Table 7.2 Overview of non-probability sampling techniques

Technique	Definition/description	Reasons and purpose	Appropriate research studies	Other names / types
Convenience	Convenience sampling is a nonprobability sampling technique in which participants are selected	Affordable and easy to conduct, proximity and availability of participants close to the researcher	Mostly suitable for qualitative research designs but can also be used in surveys	Accidental sampling, availability sampling and haphazard sampling

	from the population because of their availability and convenience to the researcher (Daniels, 2012:82).	(Etikan, et al. 2016:2; Salkind, 2010:1396; Shaneen *et al.* 2019:36).	(quantitative designs).	(Daniels, 2012:83; Salkind, 2010:1396; Saunders *et al.* 2019:324).
Purposive	Purposive sampling is a nonprobability sampling technique in which participants of a target population are selected based on inclusion and exclusion criteria that fits the purpose of a study (Daniel, 2012:87; Etikan et al. 2016:1; Saunders *et al.* 2019:321).	Selection of participants, due to their special significance in a study (Collis & Hussey, 2021:119; Salkind, 2010:923). Aim to understand a phenomenon (Collis & Hussey, 2021:119; Forman & Damschroder, 2008:43; Suter, 2012:350). Enables the selection of participants who can answer the research questions (Shaneen *et al.* 2019:28).	Appropriate for qualitative and exploratory studies aimed at contributing new knowledge to a certain field of study (Salkind, 2010:924). Longer research (i.e. doctoral thesis) to reach conclusions (Etikan, et al. 2016:3).	Judgemental, expert and informant sampling (Daniels, 2012:88).
Quota	Quota sampling is a nonprobability sampling technique in which the targeted population gets divided into mutually exclusive subcategories (Daniel, 2012:102). Close to stratified random sampling (probability sampling) but excludes random selection of respondents from a population (Salkind, 2010:1396). Normally, researchers solicit participation from the subcategories until the targeted number of participants are recruited (Daniels, 2012:103).	Select quotas of participants that fit into a specific subcategory (i.e. number of men and women needed in the sample) (Salkind, 2010:1305). Combination of convenience and purposive sampling techniques because the researcher targets a specific number of participants with specific characteristics to satisfy the aim of a study (Daniels, 2012:103). Guarantees inclusion of participants of sub-population and less data errors (Daniels, 2012:106).	Short-term qualitative or quantitative research projects Surveys, educational and gender-based studies.	Accidental quota, purposive quota, stratified purposive quota, demographic balancing, purposive heterogeneity sampling (Daniels, 2012:103). Proportional and non-proportional quota sampling types (Daniels, 2012:104).
Snowball	Snowball sampling involves seeking information from key informants about details of other key informants that fit the purpose of a study (Suri, 2011:72). Snowball sampling often takes place during data collection (such as during interviewing) in which each person interviewed can become a source of new contacts to other potential participants (Gudkova, 2018:88).	Hard-to-reach populations (Leedy & Ormrod, 2021:272) Peers of hidden population are better equipped to locate and gain participation of other members of targeted population than the researcher (Daniels, 2012:111). Increases the initial sample (Cassell, 2015:34; Shaneen *et al.* 2019:34).	Qualitative research interviews	Referral, respondent/participant driven, nominated sampling (Daniels, 2012:111).

Source: Compiled by the researcher

Based on Table 7.2, purposive and snowball non-probability sampling designs were chosen for the interviews with industry experts. The specific *purposive sampling* used for this study, included judgemental sampling, expert and informant sampling. In *judgement sampling*, the researcher uses subjective judgement to select specific participants with qualities that fits the research aim of a study (Daniel, 2012:91; Etikan, *et al.* 2016:2; Saunders *et al.* 2019:321). In *expert sampling*, participants are selected because of their expertise, and in *informant sampling*, participants are selected for their special knowledge in a subject area (Daniel, 2012:91). The specific criteria used for identifying the industry experts with purposive sampling techniques will be discussed in section 7.3.4.2.

Snowball sampling was selected because industry experts can be *hard-to-reach* due to busy schedules (i.e. top managers and directors), absence of available contact details and access problems. Furthermore, snowball sampling can *complement purposive sampling*, which requires access to key informants/participants to satisfy the research objective(s) of a study (Suri, 2011:66). Evidently, snowball sampling can help the researcher to obtain additional interview data by asking potential participants and industry experts for contact details of other potential participants (Myer & Newman, 2007:14; Shaheen *et al.* 2019:34). Lastly, industry experts can be limited to a few individuals,

especially in specialised areas (such as RL in online retailing), which may result in a smaller sample. Using snowball sampling can address this problem by *increasing the sample size*.

More details on selecting industry experts using purposive and snowball sampling techniques will be given in the subsequent sections.

7.3.4.2 Inclusion and exclusion criteria to select industry experts

The inclusion and exclusion criteria, make up the selection or eligibility criteria that can be used to rule participants in or out from the target population and sample in a research study (Salkind, 2010:629). Therefore, inclusion and exclusion criteria set the stage for recruiting the most appropriate participants in a study (Hornberger & Rangu, 2020:2). Establishing inclusion and exclusion criteria for study participants is a standard and necessary practice for high-quality results and meaningful findings (Patino & Ferreira, 2018:84). Consequently, inclusion and exclusion criteria directly influence the recruitment and feasibility of a study (Hornberger & Rangu, 2020:3). Therefore, researchers must not only define the appropriate inclusion and exclusion criteria before recruitment but also evaluate the potential impact of the criteria on the validity of results (or trustworthiness of findings) of a study (Patino & Ferreira, 2018:84).

Some common pitfalls associated with inclusion and exclusion criteria include, (1) using opposite criteria to define the inclusion and exclusion criteria (for example, the inclusion criterion is participants that speak English and the exclusion criterion is participants that do not speak English), (2) selecting inclusion/exclusion criteria unrelated to answering the research question (for example, adding gender to a study that focusses on non-gender issues), and (3) not describing key inclusion/exclusion criteria that relates to the aim of study (for example, not defining the education level of participants that needs to be specialist in the field of study) (Patino & Ferreira, 2018:84).

Evidently, to screen the eligibility of participants, researchers must use valid and reliable criteria that must be applied in a consistent and repeatable manner (Salkind, 2010:629). In other words, well-defined and clear inclusion and exclusion criteria can ease replication for other researchers, which can enhance the significance and reliability of the findings (Hornberger & Rangu, 2020:3,4) (also see section 7.3.9).

The inclusion and exclusion criteria developed in this study aligned with the sampling techniques in terms of the criteria of judgement (judgemental sampling) and specialised knowledge (expert sampling and informant sampling) because the aim was to get input from individuals that qualify as industry experts in RL. In the subsequent sections, the inclusion and exclusion criteria of industry experts will be discussed.

7.3.4.2.1 Inclusion criteria of industry experts

Inclusion criteria are a set of predefined characteristics that can be used to identify participants to be included in a research study (Merriam & Grenier, 2019:14; Salkind, 2010:629). Therefore, inclusion criteria will explain the different requirements individuals must meet to participate in a study (Hornberger & Rangu, 2020:2).

Depending on the aim of a research study, typical inclusion criteria can relate to (1) technology requirements (e.g. the participant requires internet access and virtual meeting software), (2) education or experience requirements (e.g. the participant requires a postgraduate degree), (3) language requirements (e.g. participants must speak English), (4) demographical requirements (e.g. age, ethnicity, and gender), and (5) geographical requirements (e.g. reside in South Africa) (Hornberger & Rangu, 2020:6-7).

Inclusion criteria can provide a more comprehensive picture of the characteristics of a population and show readers the reasons for recruiting specific participants (Salkind, 2010:924). Additionally, clearly defined inclusion criteria can improve the reliability, validity and feasibility of a study, which can minimise selection bias and classification errors, as well as reduce the costs and resources needed to recruit participants (Salkind, 2010:629).

Nevertheless, stringent inclusion criteria may reduce the generalisability of the study, hamper recruitment and sampling of participants, and eliminate characteristics that may be theoretically or methodologically important (Salkind, 2010:629). Additionally, if the researcher fails to adhere to the inclusion criteria and recruit ineligible participants, it may not only lead to inaccurate data, but also skew the results/findings of a study, which ultimately, may lead to false conclusions (Hornberger & Rangu, 2020:8). Therefore, it is important that inclusion criteria respond to the scientific research objective of a study, necessary to ensure consistency of findings (Salkind, 2010:629).

Based on the abovementioned literature on inclusion criteria, *this study defines an industry expert in RLM as follows*:

An industry expert in RLM can include an owner/CEO/manager of an organisation that specialises in RL as a service for online retailers or possesses managerial experience in the RL processes and practices in online retailing.

Table 7.3 provide the inclusion criteria used for selecting participants in the sample of industry experts, including a description and justification for each criterion.

Table 7.3 Inclusion criteria for interviews with industry experts

Type	Description	Justification
Technology	The participant must have ***access to the Internet*** for email correspondence, ***social media networking*** and ***virtual meeting software*** (such as Microsoft Teams) and/or Internet/online calls (such as Skype).	Internet access was important due to the Corona Virus (Covid-19) pandemic and lockdown regulations in South Africa from March 2020, causing limitations to the interview techniques and methods of communication.
Experience/ education	The participant must have ***more than five years***' experience in RL or returns management and must be familiar with the return processes and practices of online retailers and knowledgeable about consumer returns. The participant must at least have some form of ***undergraduate qualification***.	Because the objective of the interviews was to gain input from industry on the RL processes, RL practices and RLM factors of consumer returns in online retailing, it was important to identify participants with the knowledge and expertise needed for trustworthy and contributory findings. Additionally, undergraduate qualifications may enhance the level of knowledge of the industry expert.
Language	The participant must be ***proficient in English*** (reading, speaking and writing).	Most South Africans can speak English as a first or second language. English was used for all communication, correspondence and interview meetings.
Demographic	The participant can be any race and gender but must have (or recently had) a ***job description*** of ***owner, director, chair of organisation or manager***.	Race and gender have no impact on the study and the only demographical inclusive requirement relates to job description. An industry expert as defined earlier must at least be in higher positions in firms. Lower order staff (e.g. supervisors and operational staff) may lack the necessary holistic expertise to provide meaningful input.
Geographic	The participant ***must reside in South Africa*** at the time of the interviews and have some degree of experience in the field of RLM in South Africa.	Because the unique contribution of the study lies with the lack of research of RL in South Africa and lower online shopping usage (pre-Covid), it was important to provide South African online retailers with a framework for the effective RLM of consumer returns. Evidently, the industry experts must be able to provide input appropriate for the South African market. However, the industry experts can also have work experience outside South Africa. The other requirement regarding "must reside in South Africa at the time of the interview" relates to the interview times and Internet connection speed.

Source: Compiled by the researcher

The inclusion criteria from Table 7.3 formed the foundation for recruiting the most appropriate participants (industry experts) with the ability to provide meaningful input into the RLM of consumer returns in online retailing. However, exclusion criteria can be important to avoid selecting participants that may negatively impact the accuracy/reliability of the findings. In the next section, the exclusion criteria of this study will be described.

7.3.4.2.2 Exclusion criteria of industry experts

Exclusion criteria can be described as specific features of potential participants who may meet the inclusion criteria of a study, but have additional characteristics that may influence the success of a study or increase the risk for an unfavourable result (Patino & Ferreira, 2018:84). Evidently, the exclusion criteria consist of qualities about potential participants or the external factors around them that may go against the purpose of a study or interfere with it (Hornberger & Rangu, 2020:2).

According to Patino and Ferreira (2018:84), common exclusion criteria involve potential participants that are likely to: (1) be lost to follow-up (e.g. not responding to follow-up emails), (2) miss scheduled appointments (such as a scheduled interview), (3) provide inaccurate data, and (4) have presuppositions that may bias the results of a study, or increase their risk for adverse events. Essentially, exclusion criteria must list the features of a potential participant that, if met, immediately deems that person

ineligible to participate in a study (Hornberger & Rangu 2020:2). Evidently, exclusion criteria should not be the opposite of predefined inclusion criteria but rather complement it with features that help a researcher select the most appropriate participants to reach the aim of a study.

Mostly, the *exclusion criteria* for this study related to participant conduct (or the lack thereof) and ethical requirements (see section 7.3.2). Table 7.4 provides an overview of the exclusion criteria of the study, including a description and justification of each.

Table 7.4 Exclusion criteria for interviews with industry experts

Type	Description	Justification
Unresponsiveness	A prospective participant who received the calls to participate in the study but ***fails to respond***.	Individuals who failed to respond to the first and second calls to participate might not be interested in the study and were excluded.
Failure to communicate	A potential participant who satisfies the inclusion criteria and shows interest in participation but ***fails to respond to follow-up communication***.	For ethical reasons no coercion or intimidation was used to recruit prospective participants. Failing to respond to follow-up correspondence means that the prospective participant showed no further willingness to participate.
Missed interviews	A participant who satisfies the inclusion criteria and agreed to participate and accepted a scheduled interview meeting but ***fails to attend the interview meeting*** and ***fails to respond to follow-up interviews*** or correspondence.	Participants that missed scheduled interviews without informing the researcher or failed to attend or respond to rescheduled interviews and follow-up communication indicated disinterest or unwillingness to participate and were excluded.
Timeframe problems	A participant who shows interest but ***cannot participate*** during the allocated primary data collection ***interview timeframe***.	Interviews were scheduled during August to November 2020. Prospective participants that were unavailable to participate (i.e. due to a busy schedule) during the allocated interview timeframe, were excluded from the study.
Informed consent	A participant who agreed to participate but ***refuses to give consent***.	According to the Policy on Research Ethics of the University of South Africa (2016) informed consent must be obtained from participants. Therefore, a participant who refused (or failed to provide) informed consent, was excluded from the sample.
Withdrawn	A participant who ***withdrawn from the study*** before or during the interviews.	Based on the ethical requirements, participants have the right to withdraw from the study, meaning that those that withdrew were excluded from the study sample.
Outside participation requirements	An individual who falls ***outside*** one or more of the ***inclusion criteria***.	Based on the inclusion requirements, individuals (1) with no to limited managerial experience or in non-managerial positions, (2) with no to limited experience in the field of RL, (3) without some form of qualification, and (4) without the necessary resources to participate in the study, were excluded from the study sample.

Source: Compiled by the researcher

Naturally, the sample must exclude any individual outside the inclusion criteria and within the exclusion criteria. Evidently, the criteria must be held to a high standard, meaning that a willing participant must be included/excluded in a study, if that participant meets the inclusion/exclusion criteria (Hornberger & Rangu 2020:2).

In the next section, the recruitment plan of participants that satisfy inclusion and exclusion criteria, will be discussed.

7.3.4.3 Recruitment process of industry experts

The recruitment of participants, based on inclusion and exclusion criteria (section 7.3.4.2), involved several strategies. In this research, purposive and snowball sampling techniques applied to the recruitment strategies of industry experts. The main recruitment strategies included, (1) SAPICS, (2) LinkedIn, (3) Google, and (4) interviews, which will be discussed in subsequent sections and summarised in Table 7.5.

7.3.4.3.1 Recruitment of industry experts through SAPICS

According to DeJonckheere and Vaughn (2019:3), gatekeepers or informants can be valuable sources to gain access to potential participants. As mentioned in section 7.3.2 (ethics application process), the researcher approached *two professional associations*, namely the Chartered Institute of Logistics and Transport (*CILTSA*) and South African Production and Inventory Control Society (*SAPICS*), to facilitate with the recruitment of targeted participants. Both associations agreed to forward the call to participate to their members via email (see Appendix E3). Unfortunately, the call to participate was hampered by the Covid-19 epidemic because South Africa was under full lockdown from March 2020 to August 2020. Apart from essential industries, all businesses were closed, resulting in CILTSA being non-operational during the recruitment stage of the study.

Nevertheless, *SAPICS* was operational during the recruitment stage, and on *23 July 2020*, SAPICS *forwarded the call to participate (via email) to their members*. Using SAPICS to disseminate the call to participate email to their members can be viewed as a combination of snowball and purposive sampling techniques. SAPICS sending the email message to their members can fit the *snowball (referral) sampling technique*, because prospective participants were recruited on behalf of the researcher. However, the prospective participants that responded to the initial call message from SAPICS, were instructed to email the researcher, who then *purposively identified industry experts* based on the *inclusive and exclusive* criteria. Using SAPICS as a recruitment strategy, resulted in the selection of *two participants* that satisfy the inclusion/exclusion criteria of this study.

Table 7.5 provides a brief overview of the SAPICS recruitment strategy and procedures and Appendix D.3 shows examples of the call messages.

7.3.4.3.2 Recruitment of industry experts through LinkedIn

The next recruitment strategy involves social networking. The researcher used *LinkedIn* (a social networking platform) to *purposively identify potential participants* and select industry experts. The key

terms “reverse logistics”, “reverse logistics manager”, “product return manager” and “online retailing logistics manager” were entered into the search function on LinkedIn to identify potential participants. The prospective participants outside the researcher’s contact list on LinkedIn received invites to connect.

All *prospective participants* (54 individuals) from the researcher’s contact list on *LinkedIn, received the call to participate* via the *messaging function* on LinkedIn *between 23 July 2020 to 31 August 2020*. Some prospective participants responded on LinkedIn’s messaging platform in the following ways: (1) showing disinterest (e.g. “not interested”, “too busy”, or “no thank you”), (2) indicating that they fall outside the inclusive/exclusive criteria of the study (e.g. “not a RL expert”, “not in managerial position”, or “limited experience in RL”), or (3) showing interest in the research (e.g. “I would like to participate”). Other prospective participants responded directly to the researcher via email, indicating an interest in the study. All respondents were thanked for their time, and those respondents that showed interest in the study received an email from the researcher (see Appendix D.3.1).

The researcher then *selected* the prospective *participants* that agreed to participate based on the *inclusion/exclusion criteria* of the study (section 7.3.4.2). However, like the SAPICS and interview recruitment strategies, LinkedIn recruitment included *snowball sampling* since all prospective participants on LinkedIn were asked for the contact details of or to forward the LinkedIn message (call to participate) to individuals in their network that may qualify to participate. A few prospective participants provided details of other individuals (10) that may qualify to participate, and these suggested participants received the standard LinkedIn call to participate message used to recruit industry experts. The LinkedIn recruitment method resulted in the selection of *eight participants* who satisfied the inclusion/exclusion criteria of this study.

Examples of all the messages and communication between the researcher and the LinkedIn participants (with personal identifiable information redacted) can be viewed in Appendix D.3.2. A summary of the LinkedIn recruitment strategy can be viewed in Table 7.5.

7.3.4.3.3 Recruitment of industry experts through Google

To further increase the sample size, the researcher used *Google* to search for organisations that offer RL as a service to online retailers or large online retailers (non-members of SAPICS and unavailable on LinkedIn), operating in South Africa. The key terms in the Google search included “reverse logistics and service”, “reverse logistics South Africa”, “reverse logistics firms”, “returns management service”, “consumer returns”, “online returns”, and “online retailer South Africa”. After visiting various websites, twenty-two *organisations* were identified and contacted *via email*, using the *contact details*

provided on their *websites*, or via their "contact-us" function. The email message to the organisations (see Appendix D.3.3) closely resembled the initial call to participate email sent to SAPICS members. From the twenty-two organisations, *one owner of a third-party RL (3PRL) provider* firm that specialises in RL services for retailers, responded and agreed to participate. Further details of the Google recruitment method can be viewed in Table 7.5.

7.3.4.3.4 Recruitment of industry experts through interviews

The final recruitment strategy entailed ***snowball sampling*,** which means that interview participants provide details of other individuals that may qualify to participate in the study (Eriksson & Kovalainen, 2008:65; Silverman & Patterson, 2021:75). Evidently, the final sample size was only determined after the last interview was completed. As explained in section 7.3.3.4, all industry experts were asked to recommend other industry experts based on the inclusion/exclusion criteria (section 7.3.4.2) in one of the closing questions in the interview protocol. Several interviewed industry experts suggested other industry experts (six individuals) and provided their contact details.

The researcher emailed all six snowballed suggested industry experts, providing the same information that other LinkedIn and SAPICS recruits received. Three prospective participants responded, and *two participants qualified* as industry experts according to the inclusion/exclusion criteria that agreed to be interviewed.

Table 7.5 provides and overview of the recruitment and sampling procedures of the interviews with industry experts.

Table 7.5 Recruitment and sampling of industry experts

Recruit	Communication method	Sample technique	Recruitment date/s	Targeted participants	Total responses	Participants selected
SAPICS	Email from SAPICS to members and emails received by researcher from prospective participants	Snowball /purposive	23 July 2020	Unknown	7	**2**
LinkedIn	Messaging function of LinkedIn and follow-up with emails	Purposive /snowball	23 July 2020 - 31 August 2020	Total 64 • 54 targeted • 10 referrals	36	**8**
Google	Website contact and email communication	Purposive	27 August 2020	22	1	**1**
Interview	Verbal and email communication	Snowball	August - October 2020	6	3	**2**

Source: Compiled by the researcher

Table 7.5 shows a summary of the recruitment process for SAPICS, LinkedIn, Google and Interviews, including the communication methods, sampling techniques, the recruitment dates, the number of

targeted participants, the total responses and the number of industry experts selected. The final sample will be described in section 7.3.4.5. In the next section, a theoretical and practical overview of sample size considerations in qualitative research will be given.

7.3.4.4 Sample size considerations

In quantitative research the underlying motivation behind selecting a sampling method is the desire for a sample that is representative of the population of interest (Salkind, 2010:1305). Calculating the adequacy of probabilistic samples size can be generally straightforward and estimated mathematically based on preselected parameters and objectives (Salkind, 2010:923). In contrast, qualitative research excludes calculations and statistical claims with limited or no guidelines to determine the sample size (Cassell, 2015:34; Saunders *et al.* 2019:315). However, sample size is less important in qualitative research (Klenke, 2016a:9) because the focus is on the depth of understanding and knowledge rather than the breadth of results (Boddy, 2012:430; Saunders *et al.* 2019:315).

Nevertheless, qualitative researchers can use various means to identify an appropriate sample size, including (1) research design and methodology, (2) sampling and characteristics of the population, (3) principle of saturation and (4) other factors. These ways of determining the sample size in qualitative research will be discussed in subsequent sections, followed by a summary of the sample size considerations employed for the interviews with industry experts.

7.3.4.4.1 Determining the sample size based on the research design and methodology

Researchers can base the sample size on the research design and the type of research. For instance, an in-depth study that focus on a particular phenomenon (e.g. RL in online retailing) only needs a small sample for an intensive investigation instead of a broad overview (generalised view) with a large sample (Forman & Damschroder, 2008:43; Shaneen *et al.* 2019:37). For example, an in-depth study with a single case study involving a single research participant can generate great insight, implying that the smallest sample size in this type of qualitative study can be a sample of one (Boddy, 2012:430; Saunders *et al.* 2019:317). Myers (2013:123) concurred, stating that no ideal sample size can be established in qualitative research, for example, in one journal, two qualitative articles were published, the one article contained a sample of two in-depths interviews and the other article contained a sample size of 65 email interviews.

Similarly, a researcher must consider the research methodology when determining the sample size (Salkind, 2010:1305). For example, an interview method that is part of a multimethod design, needs a small sample of interviews, alongside other data types (e.g. content analysis on literature), which can be

used in an exploratory or confirmatory (e.g. triangulation) way (Cassell, 2015:34-35). Furthermore, some methodologies (such as a mail questionnaire or an in-depth case study in a small organisation) may result in a lower response/participation rate, which can be used to justify smaller sample sizes. Evidently, researchers can consider the anticipated response/participation rate when determining the sample size (Salkind, 2010:1305).

7.3.4.4.2 Determining the sample size based on sampling and characteristics of the population

A researcher can determine and justify a sample size by referring to the sampling technique chosen for the study. According to Saunders *et al.* (2019:321), purposive sampling techniques can be more appropriate for smaller samples. For example, an expert sampling technique (see section 7.3.4.1) that involves a group of experts, specialising in a particular field (such as RL experts in online retailing), rarely exceeds a sample of 15 participants (Trotter, 2012:399). Similarly, the quality of the sample can be important, for instance, a smaller sample that consists of participants with the knowledge and expertise to address the research questions can be more valuable than a larger sample, consisting of participants with limited knowledge or interest to address the research questions (Cassell, 2015:35).

Additionally, the sample size depends on the extent to which key characteristics of a population vary. Therefore, if the population has homogeneous (similar) characteristics of interest, then a smaller sample can be representative of that population (Leedy & Ormrod, 2021:206; Salkind, 2010:1305). Accordingly, Boddy (2012:430) indicated that in a single organisation/market/country or in a relatively homogeneous population, any qualitative sample size over 12 focus groups or more than 30 in-depth interviews may be too extensive and may require justification. Essentially, if the population includes individuals with, for example, the same interest, occupation, background and demographics (e.g. RL managers of online retailers in South Africa), a smaller sample size can be justified (Salkind, 2010:1305).

7.3.4.4.3 Determining the sample size based on the principle of saturation

Determining the final sample size before interview data collection commences can be challenging (Merriam & Grenier, 2019:27) since many qualitative methods rely on the notion of saturation, meaning that any additional data adds nothing new to the findings (Klenke, 2016a:9; Myers, 2013:123). Consequently, saturation can be described as the point in a study when sufficient information was gathered to continue with the final analysis and reach meaningful conclusions (Glinka & Hensel, 2018:251). Nevertheless, based on qualitative research literature the principle of saturation can be determined through data collection, analysis and findings or conclusions.

Saturation in data collection means that no new data needs to be collected (Morse & Maddox, 2014:526; Suter, 2012:361) due to informational redundancy, implying that further data collection contributes little or nothing new to the study (Gentles *et al.* 2015:1781; Klenke, 2016a:9; Saunders *et al.* 2019:315). In other words, the researcher repeatedly sees and hears the same information during data collection (e.g. interviews) (Merriam & Grenier, 2019:27). However, the concept of data saturation depends on the nature of the data source and the interview questions, for example, the more purposive the sample is (i.e. specific inclusion criteria using expert sampling) and the more precise the interview questions (semi-structured or structured) are, the sooner data saturation can be reached (Suri, 2011:72). Likewise, data saturation can be influenced by the scope of a study, for instance, the narrower the scope of the study, the sooner the point of data saturation can be reached (Shaneen *et al.* 2019:37). Regardless, the researcher must be engaged with (or emerged in) data collection for long periods of time, to not only obtain an in-depth understanding of the subject, but also to identify the point of data saturation (Merriam & Grenier, 2019:27).

Like saturation in data collection, qualitative data analysis eventually reaches a point of saturation, which signals the completion of the study. Particularly, at this point, new data only confirms previously defined categories and themes, meaning further interviews add little to what is known about an emerging category, as evidenced by the same recurring code and category patterns in additional data (Suter, 2012:350, 361, 362). Evidently, saturation of data analysis (also known as theoretical saturation) means that analysis of subsequent cases (i.e. more interview transcripts) adds no new insight or deeper understanding about the analytical categories and the relationships between them (Stasik & Gendźwiłł, 2018:235).

Finally, saturation related to the findings means that the data and emerging findings appears saturated (Merriam & Grenier, 2019:27). Therefore, saturation is reached when the results/findings allow some degree of generalisation from the target population (Boddy, 2012:428). Nevertheless, it is important that researchers describe how and why saturation was reached, which can strengthen the findings and conclusions of a study (Suter, 2012:350).

In sum, data saturation involves the stage when further collection and analysis of evidence/data provides little or no new themes, insights, perspectives or information, findings and/or conclusions in a qualitative study (Suri, 2011:72).

7.3.4.4.4. Other factors to determine the sample size

The other factors to determine the sample size can relate to practical considerations, volume of data, type of analysis, level of study or the institutional/journal requirements. The practical considerations in

determining the sample size can relate to the time, budget and resources available to the researcher (Salkind, 2010:1305). Therefore, for a researcher with limited time, money and other resources, a smaller sample size may be the only feasible option. Additionally, the sheer volume of data can inhibit a meaningful and timely qualitative data analysis, for example, Boddy (2012:430) indicated that a qualitative sample size of over 30 participants can produce high volumes of data, which can become too unwieldy for a qualitative researcher to analyse.

Finally, the type of study or the institutional/journal requirements can play a role in determining the sample size for a qualitative study. For example, a master dissertation may require a smaller sample, while a doctorate thesis may require a larger sample, depending on the institutional (i.e. university) requirements. Evidently, a student can ask the supervisor, who may be more familiar with the demands required for a dissertation or an institution, for the minimum requirements of an acceptable sample (Cassell, 2015:35).

Regardless of these measures of determining an appropriate sample size, no clear answers can be given to establish how large a sample must be to represent the target population (Salkind, 2010:1305; Saunders *et al.* 2019:315). However, in qualitative research, this may be a nonsensical question that must be replaced with the question, "can the findings of this qualitative study bring something new to the understanding of the subject or research phenomenon?" (Stasik & Gendźwiłł, 2018:237). Consequently, a qualitative researcher must consider this question throughout data collection, analysis and write-up of the findings, ensuring meaningful conclusions and a contribution to the field of study.

7.3.4.4.5 Determining the sample size of interviews with industry experts

Based on the discussions on determining a sample size in qualitative research, a sample size of 13 industry experts was identified as appropriate for an in-depth investigation into the RL processes and practices for the RLM of consumer returns in online retailing.

The researcher identified the following elements to *justify the sample size of 13 industry experts*:

- ***Type of research***: The interviews with industry experts can be classified as an in-depth investigation into the RL of consumer returns in online retailing, which means that a smaller sample size can be appropriate.
- ***Research methodology***: The interviews with industry experts formed part of a multimethod qualitative study, which means that a smaller sample can be appropriate.
- ***Sampling technique***: The interviews with industry experts used purposive sampling (specifically expert sampling), and snowball sampling aimed at individuals with expertise in RL

in online retailing, which means that a smaller sample can be justified as fewer individuals can be classified as experts.

- ***Principle of saturation***: Saturation was identified during the data collection and analysis stages of the interviews with industry experts and the researcher determined that no new insights could be obtained from a higher sample size (i.e. 14 industry experts). Additionally, the average time duration for the interviews was 76 minutes and a total 16 hours of interview data was obtained, justifying the sample size of 13 participants.

Although ethics may be a less obvious measure to determine the sample size, the researcher also considered the ethics associated with the qualitative interview method. McGrath, Palmgren and Liljedahl (2018:1002) indicated that due to the time-consuming nature of interviews, researchers must only include as many participants as needed to provide meaningful insights and experiences to reach a study's objectives. Essentially, the researcher considered various aspects to determine the appropriateness of the final sample of RL industry experts, which will be summarised in the next section.

7.3.4.5 Final sample of industry experts

Based on the discussion of sampling techniques, inclusion and exclusion criteria, recruitment process and sample size considerations, the final sample of industry experts was determined. Table 7.6 provides details on the final sample of industry experts including participant pseudonyms, job position and area of expertise, business type or industry, recruitment and sample technique, interview technique and interview data and duration.

Table 7.6 Final sample of industry experts

Expert	Job position and area of expertise	Business type / industry	Recruited / sample technique	Interview technique	Interview date and duration
P1	**Operations manager** with expertise in online retailing and RL.	Third party RL provider	LinkedIn, purposive	Microsoft Teams	4 August 2020, 120 minutes
P2	**Supply chain professional / Owner** with extensive knowledge in various aspects of SCM, including RLM.	Supply chain and logistics consultancy firm	SAPICS, purposive / snowball	Microsoft Teams	5 August 2020, 90 minutes
P3	**Returns (RL) manager** with extensive knowledge in managing RL processes of an online retailer.	Large online retailer	LinkedIn, purposive	Skype	12 August 2020, 45 minutes
P4	**CEO/Owner** with expertise in RL in South Africa for all business types, including online retailers.	Third party RL provider	LinkedIn, purposive	Microsoft Teams	25 August 2020, 80 minutes
P5	**General manager** (former post) with experience in online retailing and expert in RLM of large online retailers.	Large online retailer	LinkedIn, purposive	Microsoft Teams	27 August 2020, 105 minutes

P6	**Logistics manager** with specialised knowledge about the logistics processes and operations in multichannel retailing, including RL processes.	Large multichannel retailer	LinkedIn, purposive	Microsoft Teams	28 August 2020, 90 minutes
P7	**CEO/Owner** that specialise in RL with expertise in the RLM of various industries in South Africa.	Third party RL provider	Google, purposive	Microsoft Teams	2 September 2020, 75 minutes
P8	**Logistics manager** with expertise in the SCM, logistics and RLM of last mile multichannel retailing.	Large multichannel retailer	Snowball	Microsoft Teams	14 September 2020, 45 minutes
P9	**Regional Manager** with expertise in the operations of online retailers and extensive knowledge in managing RL processes of online retailers.	Large online retailer	LinkedIn, purposive	Microsoft Teams	15 September 2020, 50 minutes
P10	**Head of sales and logistics** with extensive skills and expertise in the sales, logistics and RL of a large manufacturer with an online retailing channel.	Large manufacturer and multi-channel retailer	LinkedIn, purposive	Microsoft Teams	21 September 2020, 90 minutes
P11	**Demand planning and sales centre manager / Supply chain professional** with extensive knowledge of the SCM and RL processes.	Fast mover consumer goods (FMCG) distributor	SAPICS, purposive / snowball	Microsoft Teams	23 September 2020, 45 minutes
P12	**Head of Logistics** (former post) with extensive knowledge and experience in online retailer operations, specialising in the RLM of consumer returns.	Large online retailer	LinkedIn, purposive	Zoom	8 October 2020, 90 minutes
P13	**Supply chain manager** with extensive knowledge and expertise in the SCM and RLM of a large multichannel retailer in South Africa.	Large multichannel retailer	Snowball	Microsoft Teams	12 October 2020, 60 minutes
SUMMARY OF SAMPLE OF INDUSTRY EXPERTS					
13 experts	Owners/CEO, directors, managers with expertise in SCM, logistics and operations, RL processes and RLM	Online and multichannel retailer (or manufacturer), 3PRL providers and distributor	Purposive/ snowball	Microsoft Teams, Skype and Zoom	August to October 2020, 45 – 120 minutes (Average 76 minutes)

Source: Compile by the researcher

Essentially, Table 7.6 shows that the sample size included 13 industry experts with job positions ranging from CEOs and owners of 3PRL providers, 3PL providers and supply chain consultants to upper and middle management positions from online retailers, multichannel[21] retailers and even manufacturing multichannel retailers. From a RL perspective collective expertise included RL processes, RL practices and the RLM of organisations that sell products through an online platform to consumers. The sampling techniques included purposive and snowball sampling and the interview

[21] For presentation purposes the term multichannel was used to represent both multi- and omnichannel retailers. Therefore, multichannel retailers represent retailers with brick-and-mortar outlets and one or more online channel, which can include mobile and/or web-based channels.

techniques mostly included Microsoft Teams with one Skype and one Zoom interview. The interviews were conducted between August and October 2020 and lasted an average of 76 minutes.

In the next section, stage 5, pre-interview planning for interviews with industry experts will be discussed.

7.3.5 Stage 5: Pre-interview planning for interviews with industry experts

The qualitative interview can be viewed as a formal conversation (especially in the business field); therefore, every person (researcher and participant) must prepare for it (Gudkova, 2018:85). Careful planning around the technical aspects of interviews can be the difference between a successful interview and an unsuccessful interview (DeJonckheere & Vaughn, 2019:4).

In the preparation phase, the researcher must plan and make decisions about (1) familiarisation and piloting of the interview protocol (Salkind, 2010:634), (2) setting the stage and scheduling interview times and locations convenient for both participant and researcher (DeJonckheere & Vaughn, 2019:4; Myer & Newman, 2007:13), (3) reconfirming interviews (Salkind, 2010:634) and resending interview information (Cassell, 2015:37-38), and (4) preparation for using online video software as remote interview technique (Saarijärvi & Bratt, 2021:395).

In subsequent sections a theoretical and practical overview of the preparatory phase of interviews with industry experts will be given.

7.3.5.1 Familiarising and piloting the interview protocol

Prior to the interview, the researcher must be acquainted with the interview protocol and interview questions, which ensures a smooth interview process (Salkind, 2010:634). Familiarisation with the interview protocol took place during the pretesting and pilot study of the interview protocol. Pretesting provides an estimated time of the interview, so to provide the participants with some estimate of the interview duration (Adams, 2015:496). A pilot study refers to a trial run or pretesting of a particular research instrument or procedure (Salkind, 2010:1033). Evidently, the researcher practiced and evaluated the interview questions through a pilot study of the interview protocol (see section 7.3.3) (Cassell, 2015:35-36).

An interview pilot study helps with: (1) anticipating participant responses to questions (Cassell, 2015:35), (2) ensuring that the tools used during the interview are viable and workable, (3) ensuring that the instructions for the interview are understandable and clear (Billups, 2021:80), (4) discovering potential problems with the interview protocol, (5) saving time and money by avoiding logistical

design deficiencies prior to the real interviews, (6) taking corrective actions and adjusting the interview protocol, and (7) improving the overall interview process (Salkind, 2010:1033).

Ideally, a pilot study must be conducted with individuals that resemble the targeted participants of a study population (Cassell, 2015:35-36; Salkind, 2010:1033). However, Castillo-Montoya (2016:827) mentioned that finding individuals that closely resemble the targeted participants can be challenging in studies with smaller samples. Therefore, if the sample contains hard-to-access people (such as industry experts in RL), meaning that few individuals qualify to participate in the study, the second-best option includes individuals with similar characteristics to the target population (such as academics specialising in RL) (Cassell, 2015:36). Essentially, another researcher in the field, not directly involved in the research, can be used for the pilot interview to enhance the quality and trustworthiness of the interview protocol.

Since this study targeted highly specialised participants in the field of RL and online retailing (see section 7.3.4.2), the researcher conducted the *pilot study with a senior academic* (independent professor) specialising in supply chain management and RL. The pilot interview was conducted with the *professor in July 2020*, which involved a mock interview. The professor was asked to answer the questions but at the same time consider (take note of) problematic (hard-to-understand) questions or terms. The *pilot interview lasted 45 minutes*, which included the researcher's introduction, opening questions, main questions and closing questions and remarks. Once the mock interview was completed, the next step was to evaluate the results, which included interviewer debriefing (Salkind, 2010:1033).

The 45 minutes was determined as the minimum duration of the interviews, which was deemed appropriate to obtain meaningful insights from the participants. Although no questions were added or removed, it was determined through the pilot interview that the wording of some questions needed adjustments and that the focus should be more on the detailed questions within the main question category. For example, a general question is: "Can you tell me more about the general practices that should be implemented for reverse logistics?", while a specific question is "In your opinion should online retailers standardise or formalise reverse logistics?". Therefore, the researcher will briefly mention the focus of the section by referring to the main question, for example, "I would like us to talk about some of the general practices in RL" and then follow by asking the specific questions associated with the main question, like "should online retailers standardise or formalise their RL processes?"

Additionally, the professor suggested that the researcher must explain or give examples of certain terms to avoid potential confusion and uncertainties during the actual interviews. For example, the term "disposition" should include the disposition options as examples (such as reuse, repair or sell to third

parties) and "consumer integration" must include the example of "sharing information with consumers". Evidently, the interview protocol required minor adjustments, and once incorporated, the professor indicated that the interview questions, interview format and interview style can be used for the interviews with industry experts.

7.3.5.2 Setting the stage and scheduling of interview

Setting the stage as part of preparing for interviews begins in the recruitment phase (see section 7.3.4.3) and continues with scheduling the interviews (Myer & Newman, 2007:13). Although the action of building rapport usually takes place during interviews, establishing rapport can occur prior to the interview (McGrath *et al.* 2018:1003). In fact, all communication prior to the actual online interview builds upon the participants' impressions and trust of the researcher (Nehls, Smith & Schneider, 2015:149).

Managing expectations, early with transparent communication, can be essential for the foundation of a successful interview (Nehls *et al.* 2015:149). The researcher can establish early rapport by setting expectations, giving participants information about the interview and explaining the importance (or purpose) of the interviews (McGrath *et al.* 2018:1003; Myer & Newman, 2007:13). Providing information about the interview enable participants to: (1) understand the aims of the research study, (2) understand the purpose of the interview, (3) think more about the topic and their own goals for participating, (3) explore the nature of the relationship with the researcher, and (5) give informed consent to participate in the research (Nardon, Hari & Aarma, 2021:5). The *industry experts received the interview protocol* and *participant sheet* (see Appendix E.1) via email, detailing the purpose of the study, reasons for being selected as a participant, ethical implications, feedback on the findings, and contact details of the researcher and the researcher's supervisor.

Next, the *scheduling phase of the interviews with industry experts* commenced. Cassell (2015:41) commented that arranging interviews in the field of business and management can be challenging due to the busy diaries of owners/managers in organisations, which makes time an important factor when scheduling interviews. Nevertheless, in remote online interviewing it can be important to add extra time to the interview schedule to account for potential connectivity issues and slower internet speed, which may result in slower conversations (IPA, 2020:18). Since the minimum duration of the interview was determined to be 45 minutes (see section 7.3.5.1), the researcher *scheduled* the interviews with industry experts for *60 minutes* to mitigate potential network issues.

Due to the Covid-19 pandemic and lockdown measures, scheduling the interviews with industry experts entailed sending emails to the industry experts, requesting them to *select a date and time*

between August and October 2020 and the *online video platform* (Microsoft Teams, Skype or Zoom) that will suite them for remote online interviewing. Once the industry expert indicated a date, time and platform, the researcher used the *scheduling tool* of the relevant *application* (e.g. Microsoft Teams create a team option) to schedule the interviews (also see section 7.3.6.1.4). Next, the industry expert received an *interview invite via email* from the relevant application requesting acceptance of the invite.

Upon *accepting the invite* the email calendar of the industry expert automatically reflected the date, time and online discussion platform. The *diarised entry into the calendars* of the industry expert and researcher aided as a reminder of the event, ensuring that both parties remember the date, time and online video platform of the interview. Some screenshots of the scheduling tools and interview scheduling emails with participants can be viewed in Appendix D.4. More details on using online video software as an interview technique will be given in section 7.3.6.1.

7.3.5.3 Reconfirming interviews and resending interview information

A few days before the interview, the researcher must either telephone or send an official letter to the participant to confirm the scheduled time, date, and place of the interview (Salkind, 2010:634). However, the researcher reconfirmed the online meeting platform instead of "the place" (location) of the interview since all interviews were scheduled to take place remotely. Evidently, *each industry expert was contacted via email a few days before their scheduled interview to confirm the date, time and online meeting platform*. Appendix D.4. demonstrates an example of the confirmation email before the interview date. Two industry experts requested new dates and times due to unforeseen circumstance, which the researcher rescheduled using the same scheduling method as the original interview (section 7.3.5.2). However, all interview online platforms remained unchanged based on the original selections made by the industry experts.

Due to the time duration between the recruitment phase (July 2020), which involved sending the interview protocol and participant information sheet to each selected participant, and *the scheduled interviews* (August/October 2020), each *industry expert received*, via email, *the participant information sheet and interview protocol* a *few days before the scheduled interview*. Providing the participation information sheet and interview protocol prior to the interview can be important to remind the industry expert about the purpose of the interview and reiterate the expectations (Cassell, 2015:37), equipping them with adequate information to prepare for the interview.

7.3.5.4 Preparation for using online video software for interviews with industry experts

Since the study involved remote interviewing with online video software (Microsoft Teams, Zoom and Skype), which will be discussed in section 7.3.6, preparation can be important for a successful online interview. Online video interviews require few practical considerations prior to the formal interview, which involve (1) familiarisation of online video software (Irani, 2019:6), (2) preparation of the environment, (3) testing equipment, (4) testing online video software (Saarijärvi & Bratt, 2021:395), (5) testing internet connection and (6) preparing for internet connection problems (IPA, 2020:5).

Familiarisation of *online video software* helps the researcher to be comfortable with the functionality and features of the software (Irani, 2019:6; Silverman & Patterson, 2021:106), avoiding potential distractions during the interview and troubleshooting any technical problems (Irani, 2019:6). Accordingly, the researcher *studied the user manuals* and explored the functionalities and features of Microsoft Teams, Zoom and Skype to troubleshoot technical problems prior to the interviews and avoid potential user errors that may disrupt the interview conversation.

Preparing the environment can eliminate or reduce potential environmental distractions during the interviews. For example, for a remote interview conducted in a home environment it may be advisable to use a private room where children, pets, and other environmental interruptions can be avoided (Nehl *et al*. 2015:150). Evidently, the lockdown restrictions resulted in conducting the interviews with industry experts from home, and the researcher prepared the environment by *informing other household members* about the need for *privacy and silence during the interviews*.

Testing equipment and technology shortly (e.g. 15 minutes) before the actual interview can be important to ensure functional equipment and online video software and a stable internet connection, reducing the possibility of unnecessary delays in the interview (Nehl *et al*. 2015:149). Equipment testing can involve *testing of recording devices*, *computer and other accessories* used for the interviews. Although Microsoft Teams, Zoom and Skype all include built-in recording functions, the researcher used an additional recording device as a backup and tested it before the interview to ensure a quality recording (Irani, 2019:6; Silverman & Patterson, 2021:107). Additionally, *the* researcher *updated all software* to prevent forced restarts and problems with computer performance (e.g. full memory) that may interrupt the interview conversation.

Likewise, the *online vide software application* (Microsoft Teams, Zoom or Skype) *was opened and tested shortly before the scheduled interview*, ensuring that all functionalities and features work, including built-in audio, microphone and recording functions. For example, in Microsoft Teams the

researcher used the “test call” function, which facilitated in testing the audio, speakers and the microphone, important for quality recordings and smooth conversation flows.

Finally, to reduce potential *internet connectivity* problems, the researcher (1) used a *reliable internet connection* (2) *connected* to the online video software *15 minutes before the scheduled interview*, (3) allowed *additional time for each interview* (see section 7.3.5.2) to provide buffer time in anticipation of network problems, (4) *prepared a contingency plan* for severe connectivity issues (IPA, 2020:5) and (5) *forfeited the video option* to optimise the audio recording (Oliffe, Kelly, Montaner & Yu Ko, 2021:5). Specifically, the *contingency plan* included contacting the industry expert via SMS to decide on either rescheduling the interview, trying another online video platform or continuing the interview telephonically. Additionally, the *audio-only (camera-off) option* not only aligned with the ethics requirements of the interviews with industry experts (see section 7.3.2) but also helped address the standard internet connection problems experienced in South Africa. Fortunately, minor network problems occurred without the need to implement the additional contingency measures.

The abovementioned preparatory measures will also be explored in section 7.3.6.1.3, which discusses the mitigating factors for the potential problems of using online video software as an interview technique. In the next section stage 6, conducting the interviews with industry experts, will be discussed.

7.3.6 Stage 6: Conducting the interviews with industry experts

In stage 6, the primary data collection of the *interviews with industry experts commenced*, taking place during *August and October 2020*. The dates, times and duration of the interviews can be viewed in Table 7.6. In this section, the interview data collection techniques used for the interviews with industry experts will be discussed, followed by a discussion on the actual interviews with industry experts, involving building rapport, questioning, time management and recording.

7.3.6.1 Data collection techniques of interviews with industry experts

The data collection techniques in interviewing can include face-to-face (in-person), telephone, videophone or through the Internet, and e-mail (Merriam & Grenier, 2019:14; Salkind, 2010:633). Nevertheless, in the Covid-19 era, face-to-face interview data collection has been complicated by the constraints of lockdown, social distancing and the prioritisation of the safety of participants and researchers (Roberts, Pavlakis & Richards, 2021:1). Evidently, the lockdown restrictions limited the interview techniques to remote interviewing, which means that the options available for the interviews

with industry experts included email interviews (asynchronous method), telephonic interviews and online meeting/video software interviews (real-time or synchronous method).

Remote interviews, including e-mail, telephone, or internet, can be used to interview participants in a familiar environment, which may allow them to be more comfortable expressing their opinions (Bolderston, 2012:72) and complete the interview at their convenience (Salkind, 2010:636). Furthermore, remote interviews can increase access to hard-to-reach participants (e.g. participants from different geographic regions), the scope of the study and reduce data collection costs (Silverman & Patterson, 2021:110). Consequently, remote interviews can potentially reduce reactive bias and can be more efficient in terms of time and cost (Bolderston, 2012:73). Nevertheless, for e-mail or internet interviewing, the use of technology can be restricted to those participants who own and can use the necessary hardware and software (Bolderston, 2012:73). Therefore, to promote equity and equality in research, Saarijärvi and Bratt (2021:396) suggested that researchers use *preference-based interview techniques*, whereby participants can select from a variety of options. (Saarijärvi & Bratt, 2021:396). For this reason, industry experts were given the opportunity *to choose the remote interview technique and online meeting software* that they are comfortable with and have access to (see section 7.3.5.2).

Although any type of remote interview technique (email, telephone or online) was a possibility for this study, the industry experts received a choice between telephone and online video software needed for real-time synchronous conversation and engagement purposes. *All participants chose online video software* as their preferred interview technique. Consequently, the discussion below focusses on remote interviewing using online video software as the interview data collection technique chosen for this study.

7.3.6.1.1 Overview of remote interviewing with online video software

New technology, social distancing, travel bans, and other restrictions have had practical implications for the traditional face-to-face interview methods, resulting in researchers exploring and switching to alternative data collection technique, including online video interviews (Saarijärvi & Bratt, 2021:392). Additionally, the Covid-19 pandemic increased usage of online video platforms (such as Zoom and Microsoft Teams) by academics and practitioners to perform work and communicate with others (De Villiers, Farooq & Molinari, 2021:2; Lobe, Morgan & Hoffman, 2020:2). Consequently, with digitisation and the Covid-19 pandemic, online data collection, such as video/remote interviews, will continue to grow in the future (De Villiers *et al.* 2021:2).

Online video interviews closely resemble a traditional face-to-face interview in that it takes place in real time using online video software (Hine, 2015:507). Nevertheless, online video interviews can be

characterised by synchronous communication in time, but asynchronous communication in place, as opposed to traditional face-to-face interviews, characterised by synchronous communication in time in place (Saarijärvi & Bratt, 2021:393). De Villiers *et al.* (2021:2) describe online video interviews as "*qualitative research interviews (i.e. semi-structured and unstructured in-depth interviews) conducted using online video communication technologies, including hardware (such as computers and smartphones) and software (such as Skype, Zoom and WhatsApp), which allow the interviewer and interviewee to see (video) and talk (audio) to each other in real-time*."

This study used remote interviewing using online video software as the data collection tool, not only due to the Covid-19 pandemic but also for the following reasons (Roller, 2016:22):

- Natural setting – ability to adopt a natural, social conversation environment.
- Rapport building – ability to promote rapport between the researcher and participant.
- Technological functions – ability to use applications that can share content, schedule interviews and recording of interviews.
- Verbal and non-verbal cues – ability to obtain insights from synchronous real-time communication.
- Extended coverage – greater expansion and access to participants beyond the immediate region of the researcher.
- Cost efficiency – exclude travel and accommodation costs, which lower the total cost of a study.

Clearly remote online interviews can be a viable option to conduct qualitative interviews for a variety of reasons. However, some limitations must be considered for online video interviews, including access to reliable and stable internet and technology, good hardware (e.g. microphone and camera) and privacy and confidentiality concerns (Saarijärvi & Bratt, 2021:393). In the sections below some of the motivating factors and key consideration of using online video software as a data collection technique will be explored, followed be a brief description of the online video software platforms used for the interviews with industry experts.

7.3.6.1.2 Motivating factors for remote interviewing with online video software

Online video interviews as a qualitative data collection technique, offer various advantages, especially, in terms of time, costs, and access to a geographically diverse participant pool (Archibald, Ambagtsheer, Casey & Lawless, 2019:4; Silverman & Patterson, 2021:110; Van Zeeland *et al.* 2021:14), comfort and privacy (Archibald *et al.* 2019:3), data quality and health and safety matters (IPA, 2020:15).

- *Time efficiency and logistical factors*

Before the Covid-19 pandemic, Irani *et al.* (2019:3) identified that online video software for qualitative interviewing gained increasing attention among researchers because of logistical convenience. Consequently, remote interviewing enables logistical ease of arranging compatible interview times (Nehls *et al.* 2015:146) and improves flexibility in task management because neither the researcher nor the participants need to allocate time for travelling (IPA, 2020:13).

Furthermore, scheduling remote interviews may be easier than traditional in-person interviews (Nehls *et al.* 2015:148) since it not only allows for flexibility in scheduling time and venue choice (i.e. office or home, or other) (IPA, 2020:14) but also provide participants with more options to fit the interview in their busy work schedules (Irani *et al.* 2019:3). Therefore, the researcher and participants can easily shift between other meetings or tasks before/after the online interview (IPA, 2020:13), making remote interviewing a more time efficient data collection technique. Other time savings may relate to the features of online video platforms (like Zoom and Microsoft Teams), including electronic scheduling, built-in recording feature and download options to save video/audio versions of the interviews (Oliffe *et al.* 2021:4).

Essentially, using online video interviews was ***beneficial*** for both the researcher and the industry *experts* ***due to greater time efficiency***, *eliminating* the need for *complicated logistical arrangements*.

- *Cost efficiency*

Related to the time efficiency, Nehls *et al.* (2015:146) identified that remote video interviews can be a cost-effective way of conducting research. In fact, various researchers found that remote interviews associate with cost savings through eliminated travel expenses (e.g. airfare, lodging or vehicle hire) and venue hire expenses (e.g. expenses for meeting rooms and catering) (Archibald *et al.* 2019:4; De Villiers *et al.* 2021:6; IPA, 2020:14; Oliffe *et al.* 2021:4; Roberts *et al.* 2021:9).

Essentially, ***the researcher avoided travel expenses***, including airfare, vehicle hire expenses, accommodation costs and other related expenses because many industry experts resided in the Western Cape, 1200 kilometres away from the researcher's location in Johannesburg, South Africa.

- *Greater access to participants*

Associated with the benefits of eliminated travel time and expenses, online video interviews overcome geographical barriers, serving to increase the sample size of a study (Nehls *et al.* 2015:146; Silverman & Patterson, 2021:110). Subsequently, remote interviewing creates opportunities to include participants

residing in an array of geographical dispersed locations (e.g. rural areas, cross-border locations, overseas locations or long-distance locations) to participate in a research study (Archibald *et al.* 2019:4; De Villiers *et al.* 2021:14; Irani *et al.* 2019:3; Oliffe *et al.* 2021:4; Saarijärvi & Bratt, 2021:396).

Essentially, the researcher was able to send the call to participate *to any potential industry expert, regardless of their location in South Africa*, which likely increased the sample size.

- *Comfort and privacy*

Online remote interviewing creates a neutral place for data collection, allowing participants to be in the comfort of their own space (Silverman & Patterson, 2021:111). In fact, Irani (2019:5) found that participants prefer remote interviewing due to its convenience, flexibility, and ease of use. Furthermore, managers/business owners may be more willing to participate and talk openly and honestly in remote interviews because of greater privacy and the comfort of familiar surroundings (e.g. office or home) (De Villiers *et al.* 2021:11; Irani *et al.* 2019:3; Nehls *et al.* 2015:148). Some participants might be more apprehensive to be seen in a public location with the researcher, meaning that remote interviews alleviate privacy concerns (Nehls *et al.* 2015:146). Likewise, the privacy of remote interviews enables uninhibited discussion of sensitive or confidential topics (e.g. trade secrets), which allows the researcher to obtain richer information (Hine, 2015:507).

Additionally, remote interviews afford participants and the researcher the opportunity to access computer files and documents, which would not be possible in a traditional face-to-face interview in a restaurant or conference room (De Villiers *et al.* 2021:11). Essentially, remote online interviews allowed both the researcher and industry experts to *converse in a comfortable and private setting*, without concerns of discussing confidential topics in a public setting.

- *Improved data quality*

Van Zeeland *et al.* (2021:4) and IPA (2020:16) indicated that using online video software for interviewing, ensures easy and high-quality recording. While face-to-face interviews may result in recording imbalances in terms of clarity of voices (due to changes in the proximity to the recorder/microphone) and background noises (such as wind, tapping, or chatter) that may affect the transcription quality, remote interviews with online video software ensures clarity in the audio-recording and the subsequent transcription quality (IPA, 2020:16).

Essentially, the quality of video software recordings allows for fast and clear transcription, meaning that researchers can use technology applications or online services that offer instant artificial intelligence (AI) transcription given the clarity of the audio (IPA, 2020:16). *This clarity of audio*

recordings allowed the researcher to utilise an online transcription service, namely Sonix, ensuring *efficient transcription* of the interview data obtained from industry experts (see section 7.3.8.2.1).

- *Compliance with health and safety requirements*

The final motivating factor relates to the Covid-19 pandemic, which allowed the researcher to continue with data collection, while complying with the government-mandated lockdown and social-distance measures (IPA, 2020:15). Therefore, conducting interviews remotely via online video software, *eliminated the risk of exposing* the researcher and industry experts to the *Corona virus* and *comply with the health and safety requirements* implemented during the Covid-19 pandemic.

7.3.6.1.3 Key considerations for remote interviewing with online video software

Despite the advantages of remote interviews, researchers must be aware of some concerns about using online video software as a data collection technique (Lobe *et al.* 2020:1). Some drawbacks of using online video software for interviewing include (1) technology requirements, (2) costs, (3) technical issues, (4) confidentiality and privacy concerns, (5) environmental distractions and (6) non-verbal communication concerns. Nevertheless, some mitigating factors can be implemented to reduce these drawbacks, which will be mentioned in the discussion below.

- *Technology requirements*

Before using online video software as a data collection method, researchers must consider whether their potential participants have access to the technology and equipment needed to participate, as well as possess the ability and skill to use the software (Irani, 2019:6). Consequently, remote interviews using video software can exclude participants without access to computers or smart devices (with camera and microphone), Internet connection, or that lack the necessary skills to use these technologies (Van Zeeland *et al.* 2021:2).

Therefore, the researcher and participants need access to a computer (desktop computer, laptop or tablet) or smartphone, with the functionality and compatibility to support video calls (De Villiers *et al.* 2021:6; Nehls *et al.* 2015:147). Compatibility can be evaluated by visiting the application software website (e.g. Skype, Zoom or Ms Teams), which provides the hardware requirements to use the software with additional functionality for testing the equipment (De Villiers *et al.* 2021:6-7). Additionally, the quality of the internet connection must be considered, as both parties need good internet connections (Nehls *et al.* 2015:147). However, Lobe *et al.* (2020:2) indicated that an average internet connection may be sufficient for online video software interviews.

Researchers using video software for remote interviews may under-represent participants who may not feel comfortable or possess the skill to use video technology (Irani, 2019:5). Although Oliffe *et al.* (2021:3) and Zeeland *et al.* (2021:13) found that the social distancing and lockdown measures imposed during Covid-19 resulted in participants with more experience using online video software (also see section 7.3.5.4), lowering the barriers related to technology requirements.

Essentially, technological challenges of online video interviewing associate with a lack of technology and a lack of digital skills (Van Zeeland *et al.* 2021:4). However, in addition to the standard of using video software for communication due to Covid-19 restrictions, the *participants in this study were educated, professionals and technologically competent industry experts* (inclusion criteria) (section 7.3.4.2), which *mitigated the technology challenges* associated with online video interviews.

- *Cost considerations*

Closely related to the technology requirements can be cost considerations because researchers and participants may incur additional costs for the required hardware, software and internet connection for remote video interviewing (De Villiers *et al.* 2021:6-7). Consequently, researchers must determine if participants are willing to use their personal internet data for the interviews (De Villiers *et al.* 2021:7). Other potential costs, associate with Covid-19 restrictions and working from home arrangements, which involve indirect costs like electricity and printing (Oliffe *et al.* 2021:4). One solution can be to offer participants financial compensation, whilst following ethical requirements (De Villiers *et al.* 2021:7; IPA, 2020:14).

Due to the ethical restrictions imposed on the study, no incentives were given to the industry experts to participate in the study. However, in the participation information sheet, the researcher disclosed that participants may be responsible for internet data and other related costs associated with online video software interviews. Nevertheless, the researcher *mitigated the cost implications* by giving the *participants the choice between telephonic interviews* (free for participants) and *online video interviews*.

- *Technical issues*

Like the cost considerations, technical challenges relate to the technology requirements of online video software. The greatest challenge of online video interviews can be unstable and unpredictable internet connection (IPA, 2020:15), which can cause several problems. For instance, connectivity problems can disrupt the conversation flow with pauses or uneven breaks during the interviews (Nehl *et al.* 2015:152;

Van Zeeland *et al.* 2021:2), which can impact the quality and recording of the interview data (IPA, 2020:15; Irani, 2019:5; Van Zeeland *et al.* 2021:2).

Additionally, technical interruptions and longer response times may create impressions of impoliteness or hesitation (Van Zeeland *et al.* 2021:2), which may reduce the ability to build/maintain rapport (De Villiers *et al.* 2021:14). Furthermore, connectivity issues can distract the researcher and participants, focussing on fixing the technical problems, instead of focussing on the original purpose of the interview (Irani, 2019:5). However, Van Zeeland *et al.* (2021:13) found that interview participants experienced in using online video software, tend to be less bothered with technical issues and delays.

Regardless, several *mitigation strategies* can help address or *prevent potential technical issues* during the online video interviews (also see section 7.3.5.4), which include (1) *testing the hardware* (i.e. computer, headsets, mic and camera), (2) *testing the software* and the recording function of the online software to avoid an unrecorded interview, (3) *plug in all equipment* that may runout of battery power (De Villiers *et al.* 2021:7), (4) *add time to the interview schedule* to make room for technical delays (Nehl *et al.* 2015:150), (5) *forfeiting the video option* (or camera-on option) to optimise the audio recording for slower internet connections (Oliffe *et al.* 2021:5).

- *Ethical considerations*

Despite the comfort and privacy advantages associated with remote interviews (see section 7.3.6.1.2), online video interviews may involve ethical issues related to confidentiality and privacy of the interview data (IPA, 2020:15). For instance, an uninvited person can be present in the room or others can overhear the conversation, hampering information disclosure or confidentiality of the data (Lobe *et al.* 2020:1-2; Saarijärvi & Bratt, 2021:393). However, Lobe *et al.* (2020:2) suggested that using headsets or earphones may be useful to add more privacy during the interview conversation.

Other ethical considerations relate to using the video or camera-on option during the remote interview. Some participants may be uncomfortable with showing their home environments, specifically without dedicated offices or professional looking backgrounds, while other participants may be more introverted and less confident in front of a camera talking to a stranger (De Villiers *et al.* 2021:13). Although the researcher had limited control over the confidentiality of the interview data on the participant's side (IPA, 2020:15), the researcher *mitigated the privacy and discomfort* problems through *audio-only recording* of interviews (also see section 7.3.2.2)

- *Environmental distractions*

Like the abovementioned ethical considerations, online video interviews may involve environmental distractions, outside the control of the researcher (Lobe *et al.* 2020:2; Van Zeeland *et al.* 2021:2). Particularly, working from home (because of lockdown restrictions) may impact the researcher's ability to maintain a professional approach, due to distractions and background noises (e.g. pets barking or family members talking) (De Villiers *et al.* 2021:7; Van Zeeland *et al.* 2021:2). Likewise, environmental distractions and noise can originate from the participant's home or work environment, impacting the quality of the interview recording (also see technical issues).

To mitigate these environmental distractions, the researcher can use and suggest the that participants use headset or earphones during the interviews (De Villiers *et al.* 2021:7). Alternatively, the researcher can suggest that participants find a quiet place with the least interruptions and disturbance (Lobe *et al.* 2020:2). However, De Villiers *et al.* (2021:7) suggested that when a distraction occurs, it may be beneficial to be open and honest about being home-based and apologise for background disturbances, which may build rapport between the researcher and participant.

As mentioned in the pre-interview planning phase (section 7.3.5.4), the researcher prepared the environment with a *private room and requesting household members to keep noise levels down*, which may *alleviate* some of the *environmental distractions*. Furthermore, at the beginning of each interview, the researcher apologised for potential background noises and distractions due to conducting the remote interview from home.

- *Non-verbal communication considerations*

Remote interviews can impact the ability to capture non-verbal communications, especially using audio-only recordings (IPA, 2020:16). Evidently, online video software may reduce the ability to observe and assess a participant's environment, which can be important for rich contextual data useful for qualitative data analysis (Irani, 2019:4-5). Additionally, the lack of physical proximity between the researcher and participant can hamper support and expression of compassion necessary for research studies that involve sensitive topics (Irani, 2019:4). Consequently, a lack of non-verbal communication and physical distance between researcher and participant may create emotional distance (Van Zeeland *et al.* 2021:2), which may affect interviewer/interviewee rapport. Nevertheless, this study seeks in-depth information from industry experts about the RL processes, RL practices and RLM factors of consumer returns in online retailing, excluding the need for non-verbal communication and emotional connection between the researcher and the industry expert.

Table 7.7 summarise the motivating factors, considerations and mitigating strategies for using online video software as a data collection technique.

Table 7.7 Summary of factors important for online video software interviews

Elements	Motivating factors	Key considerations	Mitigating factors
Time and scheduling	• Time efficiency because of no travel requirements for researcher and participants • Flexibility and ability to adapt environment (i.e. home or work) and easy rescheduling capability	• None	• None
Costs	• Cost efficient because of no travel and venue-hire costs	• Participants must use own internet data expenses to participate	• Give options to participant to choose interview technique • Disclose cost implications beforehand
Access to participants	• Greater access to participants residing in geographical dispersed locations	• Underrepresent participants that may not feel comfortable or possess the skill to use online video software	• COVID-19 increase the use of video software as communication tools that overcome problems with skill and comfort of using video software
Technology and technical matters	• Suitable for tech-savvy participants that can easily navigate the platform and troubleshoot issues	• Requires internet connection, compatible devices and installation of video software • Requires knowledge and skill to use online video software • Internet connectivity issues and technical glitches cause delays and disruptions in the interview conversation	• Give options to participants to choose remote interview technique • Test equipment and software prior to interviews • Schedule additional time for interviews • Audio-only interviews
Documentation and data quality	• High quality recordings due to the built-in recording capabilities of online video software • Improved data and recording quality allow for AI transcription software or online services • Faster transcription due to clarity in voices	• Environmental distraction and background noise may influence data quality	• Prepare environment to reduce noise and distractions • Share interview setting with participants (i.e. interview from home) • Use headsets or earphones during recording
Ethical and safety considerations	• Greater privacy and comfort of familiar surroundings • Compliance with health and safety requirements – compliance with lockdown and quarantine protocols	• Other parties may be present in the interviews. • Researcher has no control over the confidentiality of the data • Privacy problems with video recordings	• Request private locations • Use of headsets or earphones to ensure privacy of information • Audio-only option (keep camera/video switched of) during the interviews

Source: Compiled by researcher and adapted from IPA (2020:11-13)

Essentially, online interviewing via software meeting platforms provides a valuable opportunity to address the challenges of social distancing while maintaining efficient and effective qualitative data collection (Lobe *et al.* 2020:6). Although remote online video interviewing can be an efficient and effective method for qualitative data collection, several considerations or potential drawback must be considered, including the environment, nature of participants in the sample, the type of interaction needed and the purpose of the data collection method (IPA, 2020:19). In the next section a brief overview of the online video software used for the interviews with industry experts will be given.

7.3.6.1.4 Online video software used for remote interviews with industry experts

Several online video software can be used for conducting qualitative research interviews (Saarijärvi & Bratt, 2021:394), including digital video-conferencing tools, like Zoom, Skype and Microsoft (Ms) Teams (Van Zeeland *et al.* 2021:1). Roberts *et al.* (2021:6) suggested that researchers must carefully consider the features of the online video platforms in planning their research. For example, Roberts *et al.* (2021:6) selected Zoom for remote interviews, due to the institutional license to the software, however discovered that their participants mostly used Ms Teams, which complicated their interviews. Consequently, in this study the researcher asked the industry experts early in the interview process (recruitment and scheduling) to *choose the online interview software* that they are comfortable with, giving the researcher the opportunity to *learn the features and functionality* of the different software (also see section 7.3.5.4).

Industry experts chose three online interview platforms, including *Zoom, Skype* and *Ms Teams*. Although most of the industry experts (11) selected Ms Teams for their online interviews, the researcher discovered no literature (apart from mentioning it) on using Ms Teams for online interviews. In contrast, researchers discussed Zoom and Skype as online tools for interviewing extensively. However, some researchers discussed older versions of Skype (i.e. 2012 to 2016), compared Skype with traditional face-to-face interviews and/or described experiences of using Skype as a research tool, excluding a discussion on the specific features of Skype.

In subsequent sections, the features, advantages and disadvantages of Zoom will be discussed based on recent literature, the features, advantages and disadvantages of Skype will be discussed based on recent literature and internet sources, and the features, advantages and disadvantages of Ms Teams will be discussed based on internet sources.

- *Using Zoom for online interviews*

Zoom can be described as a unified communication platform that supports real-time audio, video conferencing and chat functionality (Lobe *et al.* 2020:2; Qureshi, 2020:2). Additionally, Zoom offers several features that can be important for remote interviewing, which include sending e-schedule compatible interview invites, a built-in recording feature and download options for saving audio and/or video recordings of the interview (Oliffe *et al.*, 2021:4). Furthermore, Zoom offers a free basic plan, enabling users to download the Zoom App or sign in on the web-based version (Lobe *et al.* 2020:2).

Various researchers indicated that Zoom can be distinguished from other online video software programmes in terms of its user-friendliness, requiring little training and set-up (Lobe *et al.* 2020:2;

Qureshi, 2020:4). For example, Archibald *et al.* (2019:4) found that the Zoom secure log-in function, using a standard username, was less frustrating to the participants in their study, compared to the login difficulties of Skype. Additionally, Zoom provides additional security in terms of the access to the interviews and the recording function.

Particularly, the researcher can set a password to control entrance to the Zoom interview session, avoiding the possibility of unauthorised persons to gain access to the interview. This can be critical for adhering to the ethical principles of anonymity and privacy of participants (Lobe *et al.* 2020:3). Moreover, Zoom offers the researcher the ability to record and store interview data without the need for third-party software, which can be significant for sensitive data (Archibald *et al.* 2019:2).

Researchers that utilise the paid option of Zoom can gain access to additional features, which include automatic transcription that allows researchers to refine the transcription during the playback of the original recording (Lobe *et al.* 2020:3). Subsequently, researchers can avoid the use of third-party transcription services, enhancing the security of data. In this study, only one participant selected Zoom for remote interviewing, which meant that the researcher used the *basic version of Zoom*, without the high-quality transcription option. Nevertheless, the other advantages, like e-scheduling of the interview, securing access to the interview, built-in recording function and secure recording of the interview data, allowed the researcher to conduct the remote interview Zoom securely and efficiently.

Despite the numerous advantages, using Zoom for remote interviewing involve some drawbacks, in terms of connectivity issues and technical difficulties. For instance, in Archibald *et al.* (2019:4) both researchers and participants experienced challenges in establishing an initial connection on Zoom. Additionally, participants with slow Internet speed and outdated computer features (i.e. webcam and microphone functionalities), experienced technical difficulties, like dropped calls and poor audio/video quality (Archibald *et al.* 2019:5).

Consequently, to use Zoom for online interviewing effectively means that both the researcher and participant requires high Internet speed and access to cell phones, tablets or computers with good audio and video capabilities. Fortunately, in this *study neither the researcher nor participant experienced connectivity issues, drop-calls or other technical difficulties before or during* the *interview session on Zoom*.

Essentially, Archibald *et al.* (2019:5) found that the benefits of using Zoom for data collection significantly outweighed the challenges encountered. This means that using Zoom as an online video/meeting software can be a valuable technique to collect interview data, adhering to ethical principles and adding to the trustworthiness of interviews with industry experts.

- *Using Skype for online interviews*

Even prior to the Covid pandemic, the use of Skype as a video-calling tool for remote interviewing is discussed in literature (Van Zeeland *et al.* 2021:4). Anderson (2021b:1-2) described Skype as one of the most popular video conferencing software worldwide, offering free HD video and audio calling, through various devices. Particularly, Skype software can be installed on desktop, phone, tablet and Alexa devices or can be used through Microsoft Edge or Chrome Web browsers (Anderson, 2021b:5). However, unlike Zoom, both researchers and participants must sign into an established (free or paid) Skype account, which can be problematic for participants without Skype accounts (Lobe *et al.* 2020:4). Nevertheless, since this study *offered participants a choice* of *online video software, no Skype account issue occurred*.

Like Zoom, Skype offers free and paid subscription plans (Lobe *et al.* 2020:4), however, in this study the *basic free version of Skype was used* since the paid version offers less expensive Skype to landline local/international calls (Anderson, 2021b:4). Additionally, the basic version of Skype offers all the necessary features for effective online remote interviews, including scheduling of calls, reminder notifications on cell phone or desktop, instant messaging, file transfers, screen sharing (Anderson, 2021b:7), and audio/video recording (Lobe *et al.* 2020:4).

The audio/video recording feature of Skype gives the researcher (interviewer) a legal warning about acquiring consent from the participant (interviewee) when activating the recording function. The audio/video recording remains accessible for 30 days in the Skype session Cloud and can be downloaded by the researcher to a local device (Lobe *et al.* 2020:4). Subsequently, Like Zoom, Skype allows researchers to conduct remote interviews with privacy features, secure video and audio functionalities and hassle-free recording (Lobe *et al.* 2020:4; Zeeland *et al.* 2021:4).

Nevertheless, the drawbacks of Skype relate to connectivity issues and security concerns (Anderson, 2021b:10). Like Zoom, the quality of calls over Skype depends on the Internet speed of both researcher and participant. Subsequently, with slow or intermittent Internet connection speed, the interview may be interrupted by dropped calls (Anderson, 2021b:10). Nevertheless, this study *mitigated the possibility of dropped calls* during the interview, through some suggestions by other researchers. Particularly, Lobe *et al.* (2020:4) suggested that *one-to-one calls* (interviewer and interviewee) and *disabling the video functionality* can reduce connectivity issues in Skype and Cassell (2015:26) suggested that keeping Internet traffic to a minimum during the Skype interview can reduce Internet bandwidth problems.

In terms of potential security concerns, Anderson (2021b:10) explained the popularity of Skype across the world drawn some hackers to steal personal information. Although Microsoft offers end-to-end encryption and new updates, the possibility remains that a Skype account can be hacked without proper security measures (Anderson, 2021b:10). In this study, *the researcher downloaded the cloud recording of the Skype interview* immediately after the interview and *deleted the call history*. Additionally, the researcher ensured that the *latest Antivirus software was installed* on the device and the *latest Skype version was utilised* for the Skype interview with the one industry expert.

- *Using Ms Teams for online interviews*

Ms Teams can be described as a cloud-based team collaboration software that is part of the Microsoft 365 and Office 365 suite of applications (O'Neill, 2021:1). Ms Teams was launched in 2017, intended to be an upgraded replacement of Skype Business, has proven to be one of Microsoft's most popular and fastest growing business application (Anderson, 2021a:4; IPA, 2020:7; Perry, 2019:2).

While Ms Teams offers a basic free version, users can access the full version by upgrading to the Office 365 suite, which means that organisations can receive high-quality communication software for free (Anderson, 2021a:4). Furthermore, the Covid-19 pandemic compelled organisations worldwide to make use Ms Teams as a communication platform for remote working (O'Neill, 2021:1), which increased its popularity. Consequently, *the researcher and most industry experts* (11) had *access* to the *full Ms Teams version* and were familiar with using Ms Teams for remote meetings and collaborative efforts during the Covid-19 pandemic.

The core capabilities in Ms Teams include messaging, voice calling, video meetings, real-time file sharing and editing, team management and cloud storage (Anderson, 2021a:4; IPA, 2020:7; O'Neill, 2021:1; Qureshi, 2020:1). This means that a researcher can use Ms Teams for sophisticated online interviews using audio and/or video, with the added benefits of scheduling and recording the interviews (Perry, 2019:3). Another important factor for remote interviewing is that Ms Teams can be installed on any operating system, including Android, iOS, macOS and Windows systems and works in various web browsers, including Chrome, Firefox, Safari and Microsoft Edge, making it widely available to a variety of users (O'Neill, 2021:3).

For this study the *most important features* of Ms Teams included the video meeting, calendar, external collaboration and integration functionalities. Although audio-only interviews were conducted, the *video meetings function* of Teams allowed for virtual interviews with *recording and transcription functionalities* (O'Neill, 2021:2). Additionally, fully integrated with Ms Outlook the ***c****alendar function* of Ms Teams can help users to keep track of schedules and appointments (O'Neill, 2021:2), which was

beneficial to remind the researcher and industry experts of scheduled interviews. The *external collaboration function* enables users to invite people outside their organisations to join internal channels for messaging, meetings and file sharing (O'Neill, 2021:2), meaning that the researcher could schedule remote interviews with the industry experts regardless of the organisation they belonged to.

In terms of the *integration functionality*, Ms Teams integrates with many other applications including internal applications like Excel, OneDrive, PowerPoint, SharePoint and Word, external applications, like Cisco Webex Meetings and Zoom (O'Neill, 2021:3) and custom integrations, making Ms Teams a convenient platform for using multiple applications (Perry, 2019:3). Since the researcher made use of transcription software Sonix (see section 7.3.8.2.1) and the qualitative analysis software of ATLAS.ti, the integration capability of Ms Teams proved to be valuable for the interviews with industry experts.

Other advantages of using Ms Teams for the remote interviews with industry experts related to stable connections and ethical considerations. A study by IPA (2020:10) indicated that in comparison to Zoom and Google Meets, Ms Teams performed the best for remote online interviewing with the least difficulties in establishing a connection and the least occurrences in disconnection. Therefore, using Ms Teams for remote interviewing reduced the likelihood of Internet connectivity problems during the interviews with industry experts. Nevertheless, since eleven interviews were conducted using Ms Teams, some *minor connectivity issues* were experienced due to unstable networks, which included one *dropped call, time lags and* a few *scattered sentences* but to a limited extent (also see section 7.3.7).

In terms of ethical considerations related to data protection, privacy and confidentiality, Ms Teams offers several security features and allow the researcher to control interview data (O'Neill, 2021:5). Specific security features of Ms Teams include, (1) Advanced Threat Protection (ATP), (2) private channels, (3) end-to-end encryption (E2EE) for one-to-one ad hoc VoIP call, (4) meeting controls (O'Neill, 2021:5), (5) multi-factor authentications, (6) Rights Management Services, (7) single sign on (SSO), and (8) secure Real-time Transport Protocol technology for audio and video data (Qureshi, 2020:4). Along with data encryption capabilities, private channels may be the most important security feature of Ms Teams for remote interviewing as it keeps conversations private, meaning that only the invited members (researcher and participant) can access the channel (O'Neill, 2021:5).

Although Ms Teams provides many features and benefits for remote interviewing, the variety of features may be *challenging for first-time users* and may require some training (Qureshi, 2020:3). Nevertheless, the researcher addressed this challenge by allowing the *industry experts to choose the online video software that they feel comfortable with*.

Despite the difference in features, advantages and disadvantages, Zoom, Skype and Ms Teams proofed to be valuable research tools for the interviews with industry experts, allowing the researcher to conduct remote interviews with industry experts across South Africa, securely and efficiently. In the next section, the actual interviews with industry experts will be discussed.

7.3.6.2 Actual interviews with industry experts

In this section, the actual or physical interview process with industry experts will be discussed with some literature to motivate the procedures adopted by the researcher. Conducting the actual interviews with industry experts (hereafter participants) involved important elements, including (1) introduction and building rapport, (2) interview conversation and questioning, (3) closing the interview conversation, (4) managing the interview time, and (5) recording the interview, which will be discussed in subsequent sections.

7.3.6.2.1 Introduction and building rapport with the industry expert

De Villiers *et al.* (2021:12) observed that business practitioners and managers can be busy and often like to dive straight into the research interview. Nevertheless, before questioning the participant an introduction of the researcher and the purpose of the interview can be important in building rapport and establishing trust. Evidently, critical to the success of qualitative research and interview experiences can be a relationship of trust between participants and the researcher (Nardon *et al.* 2021:6). According to Klenke (2016c:126), building rapport early in an interview can involve providing an overview of the study, intended use of the data, confidentiality and anonymity measures, and obtaining permission to record the interview.

Subsequently, at the beginning of each interview conducted in this study, *the researcher greeted the participant* in a friendly manner, followed by a *brief self-introduction* (Salkind, 2010:634). Next, since the interviews were conducted remotely without video functionality, the researcher *confirmed the identity of the participant* (Bolderston, 2012:72), followed by *thanking the participant* for taking the time to participate in the study (Salkind, 2010:634). As part of developing rapport, the researcher *introduced the participant to the study* (Klenke 2016c:126) by mentioning the key elements of the interview protocol (see Appendix D.1).

Particularly, the researcher explained that the *purpose of the interview* was to determine the RL processes, RL practices and management factors for the effective RLM of consumer returns in online retailing and explained that *the reason for recruiting the participant* was because of their knowledge

and expertise in the field of RLM. Moreover, the researcher explained that the *interview was expected to last* at a *minimum of 45 minutes* and *requested an open and informal discussion* (Salkind, 2010:634).

Following the expectations, the *ethics implications* were briefly described. Specifically, the matter of confidentiality was addressed (Adams, 2015:501) by explaining that the information will be regarded *as strictly confidential*, and that the *participant's identity and details will not be revealed* in the findings of the study. Moreover, the participant was assured that they can *opt out to answer any question* and *may stop the interview at any stage without consequence*. Then the researcher asked the participant for *permission to record the interview* and explained the reason to do so was for accuracy and quality of the findings (Bolderston, 2012:70; DeJonckheere & Vaughn, 2019:4; Salkind, 2010:634). Lastly, a *confirmation on the informed consent* was given since all participants signed the consent forms prior to the actual interview.

The researcher *concluded the introduction* of the interview, by *asking the participant if they have any questions* before the start of the interview. Once the researcher introduced the study, discussed all elements of the interview protocol introduction and established rapport with the participant, the main interview conversation can start (Klenke 2016c:128), which will be described in the next section.

7.3.6.2.2 Main interview conversation and questioning

Since the researcher's stance during the interviews can be critical for successful data gathering, the researcher adopted the following approaches as recommended by DeJonckheere and Vaughn (2019:7) for the interviews with industry experts: (1) *prioritise listening over talking*, (2) *use clear English* without jargon, (3) engage in the interview process through *active listening*, (4) express *empathy*, (5) demonstrate *openness*, and (6) demonstrate *gratitude*.

Although the introduction of the interview can be critical for establishing rapport, the interview conversation and questioning can continue with rapport building. For instance, Klenke (2016c:126) and Billups (2021:45) indicated that a useful *opening question to establish rapport* can be to ask the participant about themselves. Subsequently, the first question that the researcher asked the participant was "*can you please tell me more about your background and level of expertise in the field of reverse logistics*?". This proved to be valuable since most participants demonstrated their passion for RL and enjoyed sharing their experiences with the researcher, which allowed for the natural conversational flow from their background and experience to answering the research-related questions.

For the research-related questions, the approach used for questioning the participants can be described as *solution-focused questioning*, which involve *respecting the participant's expertise* and leverage the

responses to improve business practices while also informing research (Nardon *et al.* 2021:8). The interview protocol, discussed in section 7.3.3 and provided in Appendix D.1, formed a basis for the conversation between the researcher and participants. The *research-related questioning* started with asking the participant about the *reasons and types of consumer returns, RL processes, the facilities* used for consumer returns *and the roles and responsibilities of parties* involved in the RL processes for consumer returns in online retailing.

Many participants demonstrated their knowledge of the RL processes in online retailing and provided in-depth knowledge about different return processes, activities, parties and facilities. Although these questions focused on triangulating the interview and QCA findings through a deductive approach and descriptive analysis, most participants discussed various practices to manage each process effectively, providing valuable data for the inductive and reflexive thematic analysis (see sections 7.3.1 and 7.3.8).

Thereafter, the participant was asked various questions about *RL practices* that can contribute to the effective RLM of consumer returns in online retailing. The questions covered all RL practices discussed in chapter 6, including IT, integration, RL in/outsourcing, disposition practices, performance measurement (PM), facility/location strategies, resource commitment (RC), financial management (FM), return prevention and avoidance (RPA), strategic planning and procedures (SPP), including standardisation and formalisation of RL, and management and staff practices (see Appendix D.1). The participants provided valuable inputs to not only triangulate the interview and QCA findings on important RL practices for managing consumer returns but also emphasised various problems, solutions, considerations and benefits as important *management factors* for the effective RLM of consumer returns in online retailing.

Part of the questioning included several *probing questions* to elicit more details from the participants (DeJonckheere & Vaughn, 2019:6; Klenke, 2016c:132). Mostly, the *planned probes* as outlined in the interview protocol (see Appendix D.1) was sufficient to obtain more details from the participant. These probing questions included *"can you tell me more about that?", "why do you say so?",* and *"why do you feel this way?"*.

Nevertheless, as discussed in section 7.3.3, *unplanned probes* and questions can be added to the interview protocol to obtain greater details and more information from participant-specific responses (DeJonckheere & Vaughn, 2019:5; Roberts, 2020:3201). Therefore, an interview protocol can be modified during interviews by adding new probes or even whole topics based on participant responses (King, 2004a:15). The researcher adapted the questions and included unplanned probes/prompts and questions, depending on the response of the participant. These unplanned prompts in the interview

conversation with participants included (1) *waiting time* to give the participant some time to formulate their answer, (2) *echoing* by summarising the participant's words, and (3) *expansion* by asking the participant to elaborate more (DeJonckheere & Vaughn, 2019:6).

Additionally, in some cases the questions in the interview protocol were altered. For instance, a question that was modified related to the description of the RL processes, the researcher originally required more information on the facility processes, however, some participants started with the customer, logging a return (outside the facility, prior to receipt), which resulted in adapting the question "can you maybe tell me about the RL processes and activities that take place in facilities?", to "can you maybe tell me about the RL processes and activities in online retailing, from the consumer to disposal/redistribution?".

Furthermore, to engage in *active listening*, from time-to-time the researcher *restated the participant's words*, showing interest and providing assurance to the participant that the researcher understands their answers (Adams, 2015:502). According to Nardon *et al.* (2021:6), active listening can be the most important element of the interview conversation to establishing a relationship of trust between the researcher and participant.

7.3.6.2.3 Closing the interview conversation

At the closure of the interview conversation, the researcher asked the participant if they *want to add anything to the discussion*, which can be important for the effective RLM of consumer returns in online retailing. However, due to the comprehensiveness of the questions on the RL processes and practices *most participants were satisfied that the questions covered everything*. Furthermore, following the *snowball sampling* technique adopted in the study (see sections 7.3.3.4 and 7.3.4.3) the participants were asked for *details of other individuals* who may qualify to participate in the study (Cassell, 2015:31). As mentioned in 7.3.4.5, two experts were recruited following this technique, which demonstrated the importance of this question.

Finally, the researcher *thanked the participant* for their time, stating that their input was highly valued (Cassell, 2015:31), but was also *asked to contact the researcher* if they *think of anything else* they would like *to share related to the study*. Section 7.3.3 provides more details on the type of questions and the format of the interview protocol, which were used to drive the interview conversation with industry experts.

7.3.6.2.4 Managing interview time

Since the participants volunteered their own time, the researcher ensured that the interviews started at the scheduled time (Bolderston, 2012:72). However, as can be seen from Table 7.6 the average interview time of 76 minutes with participants were beyond the scheduled 60 minutes. According to Gudkova (2018:89) qualitative research interviews can be relatively long, lasting between several hours or even days. Additionally, Bolderston (2012:70) explained that the timing of interviews can depend on the complexity of questions, number of questions, the level of discussion and the availability of the participant and researcher.

Although the aim was to avoid lengthy interviews because of participants' busy schedules, *most participants were open to talk about topics that they were clearly enthusiastic about*. The *researcher apologised* if the *interviews lasted longer than the scheduled 60 minutes but none of the participants indicated that this was a problem*. However, the shorter interviews (within or closely to the aimed timeframe) were mostly due to faster conversation, less detailed answers or a participant with other obligations.

Since two interviews lasted 45 minutes, the pilot test estimate of 45 minutes was accurate for a normal question and answer session. Essentially, the *durations of the interviews depended* on the *depth of the participant's answers* and their *availability and willingness to engage in longer conversations* than the scheduled 60 minutes.

7.3.6.2.5 Interview recording method

According to Salkind (2010:1161), qualitative research interviews are often audio or videotaped to aid in data analysis. However, Cassell (2015:42) stated that video-recordings must only be used if video data will be used for analysis. In this study only *audio recordings* were utilised for the interviews with industry experts because of (1) *the irrelevance of visual data*, (2) *ethics implications* (e.g. permission was granted for audio-only recording) (see section 7.3.2.1), (3) potential *connectivity issues* with using online video software for remote interviewing (see section 7.3.6.1.4) and (4) potential *privacy concerns* using remote video recordings (see section 7.3.6.1.3). Fortunately, *all participants consented* that their *interviews may be recorded* (see section 7.3.6.2.1), which allowed the researcher to focus on the conversation and gain access to the exact words of participants for effective data analysis (DeJonckheere & Vaughn, 2019:4).

As discussed in sections 7.3.5.4 and 7.3.6.1.4, all online video software platforms (Zoom, Skype and Ms Teams) used for the interviews with industry experts included *built-in recording functionalities*,

which was tested before the scheduled interviews to ensure proper recording (Nehl *et al.* 2015:150). However, as suggested by Saarijärvi and Bratt (2021:394), *computer audio speaker* instead of head or earphones was used during the interviews and the *cell phone voice recorder* of the researcher was *used as a backup* in case the integrated recording functionality of the video software failed. Additionally, the researcher *used handwritten notes* during the interviews for *additional backup*, as suggested by DeJonckheere and Vaughn (2019:4), Salkind (2010:635) and Silverman and Patterson (2021:77).

Fortunately, the *integrated recording functions of the online video software worked well for all interviews*, albeit some technical glitches with connectivity issues (i.e. drop calls, time lags and scattered sentences), which will be elaborated upon in the post-interview reflection (section 7.3.7). As soon as possible *after each interview* the researcher *downloaded the recordings from the video software applications* and *saved the recordings in a secure folder* on the researcher's laptop for transcription (discussed in section 7.3.8.2).

Specific experiences during the interviews with industry experts and other phases, like the recruitment and preparation phases, will be discussed in the next section.

7.3.7 Stage 7: Post-interview reflection

Qualitative research can be strengthened by the inclusion of the researcher's perspective (Nehl *et al.* 2015:151). Nardon *et al.* (2021:9) found that researchers must exercise reflexivity and continually consider the impacts of interviews on participants and on themselves. *Reflection* can be defined as reviewing and reliving interview data collection to gain insights and *reflexivity* can be defined as the active role that a researcher plays in shaping surroundings, circumstances and relationships (Nardon *et al.* 2021:2). According to DeJonckheere and Vaughn (2019:7), post-interview reflection can form the basis of qualitative data analysis, enhancing the quality of interview data. Moreover, reflection can be a powerful tool, allowing the researcher the opportunity to gain experience, revisit assumptions, make sense of problems, and find new solutions (Nardon *et al.* 2021:2).

However, post-interview reflection involves many valuable learning opportunities for researchers. According to Nehl *et al.* (2015:151), researchers' reflection on the process of remote interviews can enhance both the study and the field, even providing suggestions for future research. For the interviews with industry experts, the researcher reflected on the impact of remote interviewing on the sampling procedures, including inclusion criteria, recruitment and sample size, and the use of online video software for the remote interviews with industry experts, which will be discussed in subsequent sections.

7.3.7.1 Reflection on the sampling procedures for remote interviews

Due to the Covid-19 pandemic, the research had to alter the interview options by excluding face-to-face interviews. Subsequently, potential participants that may be uncomfortable with the use of technology (such as online video software) may be reluctant to participate in the study. To mitigate this possibility, the researcher provided telephonic interviews as an option for the remote interviews. Nevertheless, potential participants that shown interest in the study preferred the use of online video software, which may be attributed to an increase in familiarity with using online video software, like Ms Teams, for remote working (see section 7.3.6.1). Additionally, the researcher altered the inclusion/exclusion sampling selection criteria by including technology as an inclusion criterion, restricting the sample to participants with access to the Internet for email correspondence, social media networking, online video software and online calls (see section 7.3.4.2).

Although the additional inclusion criterion may impact the sample size, the researcher found that industry experts in the field of SC and logistics management are tech-savvy and educated individuals all with access to the Internet and online video software for remote interviews. Subsequently, if the researcher selected operational RL staff as potential participants in the study, the Covid-19 pandemic might have restricted the sample size. In fact, like Archibald *et al.* (2019:4), the researcher reflected on using remote interviews to gain access to various participants (i.e. across South Africa) with the added benefits of cost and time savings. Particularly, industry experts are busy individuals with limited time to attend physical meetings under normal circumstances, but due to the Covid-19 pandemic and the use of online video software for remote interviewing, the researcher gained access to industry experts across South Africa.

In terms of the recruitment of potential participants, the Covid-19 pandemic hampered the planned recruitment of participants through CILTSA being non-operational during full lockdown (from March 2020). Subsequently, the researcher relied on other unplanned recruitment strategies, like Google and social networking, to gain access to professional individuals (see section 7.3.4.3). Therefore, the effort and time to recruit industry experts was a challenging part of the remote interview process.

7.3.7.2 Reflection on using online video software for remote interviews with industry experts

The most insightful part of the remote interview process was the experience of using online video software for the interviews with industry experts. Given the diversity of users' experiences and capacities and the continuous innovations in digital technologies, Archibald *et al.* (2019:5) encourage researchers using digital and online data collection methods to include an evaluation of their experiences. For example, Archibald *et al.* (2019:3) evaluated their experiences with using Zoom as an

interviewing platform, particularly noting the benefits of using online video interviews. Likewise, in the lockdown contexts of Covid-19 and using online meeting software for interviews, Oliffe *et al.* (2021:3) found that their participants seemed more relaxed talking in their living rooms and home offices, sensing a spontaneity with participants talking frankly and freely about their experiences and feelings. Moreover, a study conducted by IPA (2020:18) using remote interviews and online video software as a data collection technique, found that their participants were comfortable, eager to answer questions, volunteered information without prompts, provided insight and supported responses with detailed experiences.

In this study, the researcher reflected on the benefits of using Ms Teams, Skype and Zoom for interviewing industry experts during the lockdown period in South Africa Like the studies by Archibald *et al.* (2019:3), IPA (2020:18) and Oliffe *et al.* (2021:3), the researcher noted that the participants were comfortable and relaxed and freely shared their expertise and knowledge about RL. Although some participants had limited time, due to other engagements, the researcher found that even with less-detailed discussions valuable insight was gained into the RLM of consumer returns in online retailing. Furthermore, participants' openness, willingness to share expertise and passion in the field of RL, helped the researcher to gain insight into the value and importance of the study and identify key focus-areas for data analysis.

Nevertheless, Roberts (2020:3198) indicated that researchers must also reflect on the challenges that occurred during the interviews. In this study, the researcher reflected on the few technical difficulties and other challenges experienced during the remote interviews with industry experts. Since online interviews can be barred by technical problems, like unreliable Internet connection or use of older machines or mobile devices, resulting in dropped calls, lost call connection, or lag (Archibald *et al.* 2019:5), Archibald *et al.* (2019:4) found that the technical difficulties experienced in their online interviews resulted in the unintended benefit of establishing rapport, through a collaborative problem-solving process. Likewise, in this study the researcher experienced "bonding" and rapport building opportunities with the participants because of a few technical difficulties. For example, one participant enjoyed sharing their experience to such an extent that the interview conversation was continued while fetching a child from school. However, by doing so, the participant switched applications from desktop to cell phone Ms Teams, which eventually resulted in a dropped call. Although this interrupted the conversation flow, the participant eagerly continued with the conversation once the connection was re-established, and the experience resulted in further rapport building. In another interview, the researcher could not find the recording option on Ms Teams, even after ten interviews. This resulted in a light-hearted discussion in which the participant attempted to assist the researcher in finding the recording

option. The researcher found that this experience added to the rapport-building with the participant, which provided the foundation of a valuable interview conversation.

However, the researcher observed unavoidable challenges associated with remote interviews, using online video software (also see section 7.3.6.1.3). For example, like Oliffe *et al.* (2021:4), the researcher had no control over the comings and goings of the participants, where one participant continued the discussion while driving to pick up a child from school and another accepted a parcel from a courier while working from home. Evidently, these factors increased the length of the interviews and disrupted the flow of the conversation. Without criticising the participants, these examples demonstrated the problems associated with online interviewing using Ms Teams, Skype or Zoom (Oliffe *et al.* 2021:4). Other problems of online interviews associated with background noise interruptions from both the researcher's environment, (i.e. building construction activities), and the participants' environments (i.e. noisy warehouse activities), which influenced the quality of the recording or the inability to hear the person speaking. Nevertheless, using appropriate transcription software (see section 7.3.8.2) enabled the researcher to address these problems.

Despite some of the challenges, the researcher gained valuable experience while using online video software for remote interviewing. Additionally, reflecting on the challenges and other experiences during the remote interviews helped the researcher with the familiarisation process in data analysis (section 7.3.8.2) by recalling the interview conversations.

While the preceding discussion focused on reflection, in the next section will focus on reflexivity, continuing the active role of the researcher in analysing the interview data through a reflexive thematic analysis.

7.3.8 Stage 8: Data analysis of interviews with industry experts

Qualitative analysis emphasises the importance of remaining open to the data, rather than simply applying concepts imported from the literature (Roulston, 2014:305). Some common methods of qualitative analysis include *thematic analysis (hereafter TA)*, constant comparative methods, discourse analysis, content analysis, and narrative analysis (Salkind, 2010:1162). A good qualitative analysis discovers patterns, coherent themes, meaningful categories and new ideas (Suter, 2012:352).

The qualitative data analyst can choose from various approaches based on the philosophical assumptions, methodology, theory development (Saunders *et al.* 2019:642), research objectives and the preferences and experiences of the researcher (Schutt & Chambliss, 2014:333). According to Myers (2013:166), qualitative researchers can either follow a top-down approach (deductive) to test theory, or

a bottom-up approach (inductive) to build theory. Specifically, a deductive approach in qualitative data analysis means that data gets analysed based on an existing theoretical framework (Thornberg, 2022:246). In contrast, an inductive approach to qualitative data analysis involves the interpretation of data by exploring patterns, themes, concepts and theories with limited engagement in existing theory (Thornberg, 2022:248). However, Thornberg (2022:245) and Myers (2013:166) indicated that qualitative researchers can use a combination of deduction (top-down) and induction (bottom-up) approaches.

While some qualitative data analysis methods fit a more inductive approach (such as grounded theory) or a more deductive approach (content analysis), TA can be used across the continuum of deductive, inductive (Kiger & Varpio, 2020:3) and abductive approaches (Saunders *et al.* 2019:652). Evidently, Braun and Clarke (2006:86)[22] mentioned that a combination of a more inductive approach and theoretical/deductive approach can be used in TA. Since the research approaches of this study for theory development included a combination of deduction, induction and abduction (see section 3.2.4), the qualitative data analysis method used for the interviews with industry experts was a *combination of deductive and inductive approaches to TA*.

In subsequent sections an overview of TA will be provided, followed by the six phases of TA in terms of theory and practical application for the interviews with industry experts.

7.3.8.1 Overview using thematic analysis for interview data

King and Brooks (2019:2) define TA as "*forms of qualitative data analysis that principally focus on identifying, organising and interpreting themes in textual data*." In other words, a TA systematically identifies, organises, and offers insight into patterns of meaning (themes) across a dataset in relation to the topic and research questions being explored (Braun & Clarke, 2012:2; Maguire & Delahun, 2017:3353). Subsequently, a TA can be a flexible and useful research tool appropriate for researchers that seek to examine texts (interviews, field notes, documents), apply codes and develop themes, which can potentially provide a rich, detailed and complex account of the data (Braun & Clarke 2006:78; Salkind, 2010:1162).

The reason for using TA to analyse the data obtained from the interviews with industry experts was four-fold. *Firstly*, unlike other approaches (such as grounded theory or discourse analysis), TA requires no detailed theoretical and technological knowledge, offering a more accessible form of analysis for

[22] Braun and Clarke (2006) can be described as seminal authors cited by most researchers (post 2006) that used thematic analysis as a qualitative data analysis method.

novice qualitative researchers (Braun & Clarke, 2006:80; Braun & Clarke, 2012:3). *Secondly*, TA can be used for any approach to theory development, including deductive, inductive and/or abductive (Saunders *et al.* 2019:652). *Thirdly*, the flexibility of TA allows for a wide range of theoretical and epistemological frameworks, study questions, designs, and sample sizes (Kiger & Varpio, 2020:2), which fits multimethod qualitative studies (Braun & Clarke, 2012:3). *Finally*, TA is often used in qualitative organisational research (King, Brooks & Tabari, 2017:180), which fits the field of this study (RLM in online retailing).

The flexibility of TA as a method means it can be undertaken with different guiding theories, coding practices and theme development (Braun & Clarke, 2021:331). Nevertheless, the theoretical position of a TA must be made clear, and researchers must always reflect on the philosophical and theoretical assumptions (Braun & Clarke 2006:81; Braun & Clarke, 2021:338), which can be essential for high-quality qualitative data analysis (Terry & Hayfield, 2020:433).

Braun and Clarke (2021:331) mentioned that a TA can be used for a more deductive or more inductive analytic process (grounded in the data). As mentioned in the introduction of section 7.3.8, a combination of deductive and inductive approaches was used to analyse the interview data. The deductive approach was necessary to triangulate the findings from the QCA (testing theory), and the inductive approach was necessary to seek and identify new patterns and themes that can contribute to theory (creating new theory). Accordingly, the study used two approaches (or types) of TA described by Braun and Clarke (2021), namely a codebook TA and a reflexive TA.

According to Braun and Clarke (2021:331) a 'codebook' TA represents a group of methods that broadly sit within a qualitative paradigm with some pragmatic compromises, starting with a semi-structured coding framework for developing the analysis. Evidently, the *codebook method* of TA involve a deductive approach, using *deductive codes, constructed from*: (1) *theoretical frameworks* or themes drawn from the *existing literature* and converted into a coding framework (Linneberg & Korsgaard, 2019:264), (2) relevant *empirical work* (Forman & Damschroder, 2008:48) derived *from other research methods* (such as QCA method) employed in a study (Bowen, 2009:32), and (3) *research questions* and *data collection categories* (such as the interview protocol) (Forman & Damschroder, 2008:48). This codebook approach was used during the initial coding phase of the TA (see section 7.3.8.3), using similar techniques and processes employed in QCA method (see section 3.3).

To discover new themes and patterns from the interview data, the researcher moved beyond a codebook approach and incorporated a *reflexive TA*. The reflexive method of TA involves an *inductive approach*

where coding forms an essential part of theme development, which includes immersion in the data, reading, reflecting, questioning, imagining, wondering, writing, retreating and returning (Braun & Clarke, 2021:332). Unique to a reflexive TA is the equal status of the researcher, the research questions (or objectives) and the data (i.e. interview transcripts), contrasting other approaches (e.g. content analysis) of objective distance between the researcher and the data (Terry & Hayfield, 2020:433). Evidently, a reflexive TA embraces more *subjective skills and qualitative research values*, where a code can be used as an analytic tool to develop new themes (Braun & Clarke, 2021:340, 344).

TA builds around six iterative phases, which facilitates continuous engagement with the dataset (Terry & Hayfield, 2020:434). These six phases originally created by Braun and Clarke (2006) and adapted by Braun and Clarke (2021:331) include (1) familiarisation of data and writing notes, (2) generating codes and systematic coding of data, (3) generating themes from coded data, (4) developing and reviewing themes, (5) refining, defining and naming themes, and (6) writing the report (see Table 7.**8** for the description).

Nevertheless, Braun and Clarke (2021:331) commented that the six-phase approach can be used as a guideline where researchers can blend the phases together, allowing for a recursive analysis. Evidently, each phase can only be as useful as the quality of engagement it produces, so moving backward or forward between phases can be conducive to a TA (Terry & Hayfield, 2020:434). Nonetheless, the most important aspects of a TA must be the finished product, regardless of the specific steps to follow (Braun & Clarke, 2006:86).

As indicated in section 7.3.3, the interviews with industry experts focussed initially on consumer returns, RL processes, parties and facilities (Part B of interview questions), followed by more detailed questions on RL practices for the effective RLM of consumer returns (Part C of interview questions). Since *practices can change* and be specific to industries, organisational types and positions in the supply chain, the *RL practices* identified in the QCA findings and discussed in the interviews *formed part of the reflexive TA*. In contrast, *consumer returns, RL processes, parties and facilities can be more standard*, which can be more suitable for a deductive *codebook approach*. Subsequently, the aim of the deductive approach was to identify if the consumer returns, RL processes, parties and facilities identified in the QCA of RL literature (chapters 4 and 5) applied to online retailing, while the reflexive approach was used to supplement and support the QCA findings, which focused on important RL practices for RLM (chapter 6). In terms of the final research question (section 7.3.1), a *reflexive TA* was used to identify *important RLM factors* for the effective management of consumer returns in online retailing, which involved theory development.

Subsequently, the TA of this study involved *two types of analysis*, namely a *descriptive analysis* (using the deductive codebook approach) *and reflexive TA* (using an inductive approach). Although a descriptive analysis is different from a TA in terms of the development of themes, the descriptive analysis was derived from the first two phases of the TA. Evidently, the *codebook approach strictly applied to the first few phases of the TA*, and the *reflexive approach applied to all phases of the TA*.

Table 7.**8** provides an overview of the six phases of the TA that was adopted for the interviews with industry experts, including the descriptions from Braun and Clarke (2006:87), the type of analysis and research questions (RQs).

Table 7.8 Phases of a thematic analysis for interviews with industry experts

Phase	Name	Brief description	Type of analysis	Applicable RQs
1	Familiarisation of data and writing notes	Involves transcribing of interview data, reading and re-reading the transcripts and jotting down notes.	• Descriptive analysis • Reflexive TA	• What are the reasons and types of consumer returns in online retailing? • What are the RL processes of consumer returns in online retailing? • What are important RL practices for managing consumer returns in online retailing? • What are important factors for the effective RLM of consumer returns in online retailing?
2	Generating initial codes and systematic coding process	Systematically coding the interview data across the entire data set and organising interview data relevant to each code.	• Descriptive analysis • Reflexive TA	• What are the reasons and types of consumer returns in online retailing? • What are the RL processes of consumer returns in online retailing? • What are important RL practices for managing consumer returns in online retailing? • What are important factors for the effective RLM of consumer returns in online retailing?
3	Generating themes	Grouping initial codes into themes and gathering all interview data relevant to the themes.	• Reflexive TA	• What are important RL practices for managing consumer returns in online retailing? • What are important factors for the effective RLM of consumer returns in online retailing?

Source: Researchers own compilation from Braun and Clarke (2006:87)

Before discussing the phases, it should be noted that like the QCA of RL literature, *ATLAS.ti was used to facilitate the analysis* process of the interviews with industry experts. Since the process of adding documents, importing a codebook, creating a coding frame, assigning codes to passages (or quotations) and related functionalities in ATLAS.ti was extensively discussed in section 3.3.2, using ATLAS.ti for the interview data will be limited to a brief description and references to sections and appendices for chapter 3. Evidently, to avoid unnecessary repetition, the following procedure from the QCA of RL literature also applied to the interview data:

- ***Preparing the project and adding the documents*** (see section 3.3.2.6.1 and Appendix B.1)
- ***Preparing the codes*** in ATLAS.ti (see section 3.3.2.6.2 and Appendix B.2 and B.3)
- ***Coding the documents*** in ATLAS.ti (see section 3.3.2.6.3 and Appendices B.4 and B.5)
- ***Generating output reports*** in ATLAS.ti (see section 3.3.2.6.4 and Appendices B.6 and B.7)
- ***Inductive coding*** on code categories (see section 3.3.2.6.5 and Appendix B.8)

The subsequent sections provide more details on the theory and practical application of the TA phases (Table 7.**8**) for the interviews with industry experts.

7.3.8.2 Phase 1: Familiarisation of data from interviews with industry experts

The first phase in the TA process is becoming familiar with the entire data set (Kiger & Varpio, 2020:4). Evidently, the aim of this phase is to become intimately familiar with the collected data content and noticing aspects that might be relevant to the research question (Braun & Clarke, 2012:6). Additionally, the researcher needs to engage with the data, to become familiar with the depth and breadth of the content (Braun & Clarke, 2006:87).

While it may be tempting to begin the coding of data and searching for themes immediately, familiarisation of the entire data set provides a valuable orientation to the raw data and can be foundational for all subsequent steps (Kiger & Varpio, 2020:5). Nevertheless, with interview data, the researcher comes into the analysis with prior knowledge, obtained while interviewing participants, and some initial analytic interests or thoughts (Braun & Clarke, 2006:87).

Phase 1 consists of transcribing of interview recordings, editing of transcripts, reading, re-reading transcripts, listening to audio-recordings and taking initial notes (Braun & Clarke, 2012:5), which will be described in subsequent sections.

7.3.8.2.1 Transcription of data recordings from interviews with industry experts

Research that involves interviews also involves the transcription of audio recordings into text to facilitate the analysis process (Nascimento & Steinbruch, 2019:2). Therefore, the verbal data from the interviews with industry experts required transcription to conduct the TA (Braun & Clarke, 2006:87). If researchers use voice-recognition software (applicable to this study) or transcription services to facilitate this step, it can be important to compare the transcripts against the original audio recordings for accuracy (Kiger & Varpio, 2020:5). Although transcription can be a time-consuming process, the time spent transcribing the data can be valuable as it informs the early stages of the analysis and serves as an excellent way to become familiar with the data (Braun & Clarke, 2006:88; Kiger & Varpio, 2020:5). Evidently, transcription can be used as a form of familiarisation as the researcher develops a greater understanding of the data (Braun & Clarke, 2006:88; Saunders *et al.* 2019:653).

The use of voice recognition software can greatly facilitate the task and accuracy of transcription (Klenke 2016c:141). However, the best approach after transcription is to verify the accuracy of the transcript (Forman & Damschroder, 2008:46). In this study, the *online software service provider Sonix* was *used to initially transcribe the audio*. The transcription platform, provided by *Sonix, allowed the researcher to edit and further transcribe* the written text by listening for the accuracy of the interview transcripts. Therefore, the researcher played a key role in the transcription process of the interviews with industry experts, especially, since the software was developed by a US-based company, affecting the level of accuracy of South African dialect. Evidently, *each transcript was listened to and edited*, ensuring that the *"speech-to-text" transcription of Sonix was accurate*.

Although a denaturalised approach to transcription was followed (e.g. removing unnecessary spoken words) (see section 7.3.8.2.2), at this stage of transcription, the researcher focussed more on the accuracy of speech and not on the grammatical problems. Essentially, the first part of the *transcription process* involved *reviewing of the transcripts* for each interview to not only *obtain a high level of accuracy* for data analysis but also to *become familiar with the data*. Appendix D.5 provides an example of using the transcription platform of Sonix, to edit the transcripts from the interviews with industry experts.

After establishing the accuracy of the transcripts, each transcript was exported, from the Sonix platform, and saved as a Microsoft Word document in a secure folder (on the researcher's laptop), ready for the next stage of editing and reading of transcripts.

7.3.8.2.2 Editing and reading of transcripts and initials notes from interviews with industry experts

In this step, the researcher needs to refine, read and re-read (or immerse in) the entire dataset until a thorough understanding of the content can be established (Braun & Clarke, 2012:6; Maguire & Delahun, 2017:3356). Evidently, *familiarisation of the interview data* continued with the *editing of interview transcripts*, followed by the *reading and re-reading* of the *edited transcripts*.

Because TA is a less prescriptive form of qualitative data analysis, no set of guidelines can be followed when producing a transcript (Braun & Clarke, 2006:88). Unlike narrative and discourse analysis, the transcribed conversation in TA requires less details (e.g. adding repeated words and verbal utterance). Nevertheless, transcripts must retain information from the verbal account in a way to reflect the true meaning of its original nature (e.g. punctuation added can alter the meaning of data) (Braun & Clarke, 2006:88).

The approach of transcription involves the decision to either include the written text as it was spoken (naturalised approach) or making adaptations between what was said and what was written (denaturalised approach) (Nascimento & Steinbruch, 2019:6). A naturalised approach involves notations, including duration, pitch and loudness, to analyse the behaviour of participants, and paralinguistic components, which include audible breathing, crying, aspiration and laughter (Kowal & O'Connell, 2014:68, 73). Because these features can be difficult to transcribe, they are usually omitted from transcripts in qualitative research (Kowal & O'Connell, 2014:73).

Consequently, the researcher used a *denaturalised approach* to transcription, which means that grammatical errors, repeated (or unnecessary) words, paralinguistic elements, cultural accents (Nascimento & Steinbruch, 2019:7), and other utterances that cannot contribute to the topics of talk (e.g., 'um,' 'uh,' 'yeah,' and so forth) are removed (Roulston, 2014:299). Because the focus of the TA was not on the way things were said and more about what was said, a spelling and grammar check was performed. Evidently, the researcher *deleted all repeated words*, for example, "the the" changed to "the", *corrected spelling mistakes* (from the original transcripts), for example, "center" was changed to "centre", *addressed grammatical problems* (mostly punctuation issues) and *removed utterances* (such as "um" and "uh").

Additionally, if the participant speaks English as a second language (mostly the case in South Africa), Nascimento and Steinbruch (2019:11) mentioned it may be better to demonstrate the words correctly in the transcripts and leaving the text concise and clear to readers. Since *English was the second language of most participants*, the researcher *added context using brackets* to the discussions that might be unclear to readers unfamiliar with South African dialect. For example, the participant can refer to the

online retailer and the consumer in the same sentence using the word "I" or "they" for both, which can be confusing to the reader. Therefore, in these instances, the researcher emphasised the meaning in brackets, like "they [the online retailer] said to them [the consumer] …", to clarify the meaning. Nevertheless, the researcher ensured that the information provided by the industry experts remained accurate and authentic, ensuring that the TA produced accurate findings.

While editing involved reading of transcripts, which adds to the familiarisation stage, the researcher must at least *read the entire data set once before coding begins* (in phase 2). Braun and Clarke, (2006:87) and Braun and Clarke (2012:5) described the type of reading needed for the TA as actively, analytically and critically reading the words, searching for meanings and patterns and starting to think about the meaning of the data.

Furthermore, making notes while reading and listening to the interview data can be important for familiarisation (Braun & Clarke, 2012:5). However, notetaking at this stage must be observational and casual rather than systematic and inclusive, which associates with coding (Braun & Clarke, 2012:6; Terry & Hayfield, 2020:436). Regardless, notes aid in the process of analysis and can be viewed as memory aids and triggers for coding and analysis, during the next phase (generating codes and coding) (Braun & Clarke, 2006:88; Braun & Clarke, 2012:6). While initial notes can be important in familiarisation, the researcher mostly focussed on creating notes in the subsequent phases (phases 2 to 5), which aided in the development of inductive codes and themes.

Phase 1 concluded with creating a project named "Interviews with industry experts" in ATLAS.ti and *adding the transcripts* to ATLAS.ti. Therefore, thirteen transcripts were imported into ATLAS.ti and the details of each interview and any other notes were added to the document comment function. ATLAS.ti automatically numbered the documents (D1, D2, D3 and so forth), which corresponded with the interview participants pseudonyms of (P1, P2, P3 and so forth). Next, *each document was named* according to the *quotation identifier* that was used during the writeup (presentation of analysis in chapter 8), for example, "(P1, operations manager, 3PRL provider)", referring to the participant identifier, job description and type of business (see Appendix B.1 – preparing materials to be imported in ATLAS.ti).

Essentially, familiarisation can be important because it provides a foundation for the rest of the TA (Braun & Clarke, 2006:87). At the end of this phase, the researcher must be thoroughly familiar with the entire body of data or data corpus (e.g. all the interview transcripts and notes) (Maguire & Delahun, 2017:3356).

7.3.8.3 Phase 2: Generating codes and coding process of data from interviews with industry experts

After familiarisation (transcribing, listening, reading and notetaking) of the data, phase 2 begins with the systematic analysis of the data, through coding (Braun & Clarke, 2012:6). Coding can be viewed as an important step in moving from raw data to findings, while maintaining coherence between the research objective(s) and the findings (Linneberg & Korsgaard, 2019:262). Evidently, the researcher starts with organising the interview data in a meaningful and systematic way (Maguire & Delahun, 2017:3355) by generating codes (inductively or deductively) and coding the transcripts with the identified codes. Phase 2 of this study also involved a descriptive analysis based on the coding process, comparing the QCA of RL literature findings with the interview findings for consumer returns and RL processes.

In the subsequent sections the processes for generating codes, coding of interview data and the descriptive analysis will be explained.

7.3.8.3.1 Generating codes of data from interviews with industry experts

Generating codes deepens the researcher's level of engagement with the data, affording greater clarity about the data (Terry & Hayfield, 2020:436). Codes identify and provide a label for a feature of the data (semantic or latent) relevant to the research question or interesting to the analyst (Braun & Clarke 2006:88; Braun & Clarke, 2012:6). Codes can be distinguished from themes in terms of width (Braun & Clarke, 2006:88), for example, in a brick-built house, themes represent walls and the roof (broader than codes), and codes represent individual bricks and tiles (narrower than themes) (Braun & Clarke, 2012:6).

Some codes can mirror participants' language and concepts (e.g. returns logistics activities), while other codes can reflect the researchers' conceptual and theoretical frameworks (e.g. RL process) (Braun & Clarke, 2012:6). Evidently, codes can be a mixture of *descriptive codes* (semantic codes), which describe the content of the data, remaining close to a participant's words and the meanings they ascribe to those words, and *interpretative codes* (latent codes), which provide an interpretation about the data content based on the researcher's theoretical knowledge, extending beyond a participant's words or meaning (Maguire & Delahun, 2017:3355; Terry & Hayfield, 2020:436). Nevertheless, all codes must be well-defined, relevant to answering the research question(s) and fit logically into a larger coding framework (Braun & Clarke, 2012:6; Kiger & Varpio, 2020:5).

Code development can be based on inductive and deductive reasoning, which often starts with deductively developed codes but remains open to new topics suggested by the data (inductive codes)

(Forman & Damschroder, 2008:49). As indicated in section 7.3.8.1, this study used a *combination of a deductive and inductive approach*, meaning that initial codes were created from theory, using a pre-established code framework, while inductive codes were added during the coding process (identified from the data) (Braun & Clarke, 2006:89; Nowell *et al.* 2017:2). *Deductive codes* aimed at *triangulating the interview findings with the QCA findings for consumer return types and RL processes*, which required a predetermined coding frame. Evidently, parts of the *coding frame developed during the QCA* of RL *literature also applied to the initial coding* of the *interview data* (see Appendix A.2). Additionally, the TA required *inductive codes to identify RL practices* and *RLM factors* that can be important for the effective RLM of consumer returns in online retailing.

7.3.8.3.2 Coding process for interviews with industry experts

Coding enables researchers to make sense of their data and helps with a rigorous process of analysis (Terry & Hayfield, 2020:436). Coding reduces data into smaller chunks of meaning (Maguire & Delahun, 2017:3355), allowing the researcher to simplify and focus on specific characteristics of the data (Nowell *et al.* 2017:5). Like familiarisation (phase 1), the coding process involves reading all the transcripts and assigning codes to each data extract/quotation (such as a sentence or paragraph in a transcript) relevant to the research question (Braun & Clarke, 2012:6).

Evidently, coding involves working systematically through the entire data set, giving full attention to each data item (e.g. each transcript and each interview question), and identifying interesting aspects in the data relevant to the research question (Braun & Clarke, 2006:89; Maguire & Delahun, 2017:3355). This process can be repeated throughout each data item in the entire dataset and as the coding progresses, data extracts can be uncoded, coded once, or coded many times, as relevant to the research objectives (Braun & Clarke, 2006:89; Braun & Clarke, 2012:7).

The *coding process* followed *for the interviews with industry experts was completed in several steps* based on the *researcher's interpretation of theory*. These steps will be described in subsequent paragraphs.

- *Step 1: Preparing for coding*

Coding can be done manually or electronically with the assistance of a computer program (Kiger & Varpio, 2020:5). As mentioned in section 7.3.8.1, *ATLAS.ti software was used for the coding process*. The initial coding frame from the QCA of RL literature (Appendix A.2) that involved pre-receipt RL processes, post-receipt RL process and consumer return codes was imported from Microsoft Excel to start initial coding of the interview transcripts in ATLAS.ti. All deductive codes with descriptions were

reviewed, ensuring that the initial code categories and subcategories were successfully imported into ATLAS.ti (see Appendix B.2). Subsequently, the preparation for the coding of interview data commenced with deductive codes as part of the codebook approach in TA (see section 7.3.8.1).

- *Step 2: Coding of interview transcripts*

Initial coding of the interview data in ATLAS.ti started in *September 2021*, which involved meticulous coding of each transcript with pre-established codes by the researcher. As the interview data was coded with the deductive codes, inductive codes were identified and added to the coding list, using the "apply code" function of ATLAS.ti. Evidently, several coding rounds were required to ensure that all the interview data was coded with the same codes.

- *Step 3: Creating notes for inductive codes*

After the first coding round, the researcher *created memos (or notes) in ATLAS.ti for each inductive code*. The researcher commented on the quotations for the applicable code during the second coding round to get an overall understanding of the data, which can assist with theme development. Appendix D.6 provides an example of commenting on the quotations for each quotation, using the memo function of ATLAS.ti.

- *Step 4: Recoding broad inductive codes*

Commenting on the quotations for each code, the researcher noted that *some codes contained data too diverse* to be classified as codes, which *required further inductive coding*. For example, the inductive code "RL drivers" contained too many data extracts, which meant that "RL drivers" may be too broad as a code and could possibly be a theme or subtheme.

The researcher used the *ATLAS.ti functionality* of *assigning new inductive codes* to the *quotations* (data extracts) *originally assigned* to the *broad inductive code*, eliminating the need to recode the entire dataset (i.e. all interview transcripts). Appendix D.6 provides an example of assigning additional inductive codes to broad inductive codes, using ATLAS.ti. The same process was followed for all broad inductive codes, resulting in an extensive coding framework. Nevertheless, the original inductive codes were used as code categories, which could help with generating themes (in phase 3).

- *Step 5: Recoding transcripts and finalising the coding framework*

According to Braun and Clarke (2012:7) the number of codes depends on the topic, dataset and precision in coding, meaning that any number of codes can be produced in stage 2. Additionally, Terry

and Hayfield (2020:437) mentioned that coding must continue until sufficient codes and assigned quotations can be used to build some candidate themes.

Evidently, step 5 involved *coding the interview transcripts in several rounds* to ensure that (1) deductive codes were thoroughly applied to relevant quotations for the descriptive analysis, and (2) an extensive list of inductive codes can be used for the development of themes. Additionally, the researcher focused on the research questions during the coding process, ensuring that (1) quotations assigned to deductive codes can be used for effective comparison between QCA of RL literature findings and interview findings, and (2) quotations assigned to the inductive codes can be used for the reflexive TA, development of themes and answering of research questions related to RL practices and factors for RLM.

At the conclusion of the coding process, *phase 2* resulted in a *code list consisting of 19 deductive codes* (pre-established from the QCA of RL literature) and *58 inductive codes* (identified from the interview data), which can be viewed in Appendix D.6. Following the coding process, the researcher initiated the descriptive analysis part of phase 2, described next.

7.3.8.3.3 Descriptive analysis based on the deductive coding of interview data

Since the researcher used a deductive approach to compare the QCA findings with the interview findings for consumer returns and RL processes (discussed in chapters 4 and 5) *phase 2 concluded with a descriptive analysis*. Subsequently, the descriptive analysis excluded theme development and essentially, ended the codebook approach to the TA.

As indicated in Table 7.**8**, the descriptive analysis associated with the first two research questions, namely (1) *"what are the reasons and types of consumer returns in online retailing?",* and (2) *"what are the RL processes of consumer returns in online retailing?".* Subsequently, output reports were created (see section 3.5.6.4) for deductive codes related to the research questions, including customer return request (CRR), gatekeeping, collection, transportation, receiving, inspection, sorting, disposition (including reuse, repair, refurbish, exit options), redistribution and consumer returns (see Appendix D.6 for deductive codes).

Since the output reports are in docx. format, the researcher used the *navigation pane in Ms Word* to enter key terms from the QCA findings for an initial quick comparison. For example, in the interview findings output report for the code "consumer returns", the keyword "unwanted" was entered in the navigation pane to identify matching quotations about unwanted returns between the interviews and QCA of RL literature findings. Evidently, *each subcategory identified in the QCA* of RL literature *was*

entered as keywords for *quick comparison with the interview data*. Additionally, the researcher initially *used the quotation tables* from the *QCA findings* (chapters 4 and 5) and *added an additional column to match interview quotations* with *QCA of RL literature quotations* for effective comparison. Appendix D.6 provides examples of using the navigation pane in Ms Word to enter keywords and using the data tables from the QCA of RL literature chapters for the descriptive analysis.

The *presentation of findings* for the descriptive analysis involved a *comparative approach*. According to Saunders *et al.* (2019:712), in a comparative approach the structure of the presentation of findings involves different but related qualitative datasets that are analysed and presented for easy comparison. Subsequently, for an effective comparison, the presentation style for the descriptive analysis includes a combination of the quotation tables used for the presentation of the QCA findings (see chapters 4 and 5), containing the inductive categories and subcategories from the QCA findings, with the addition of categories identified in the interviews. Additionally, the tables for the descriptive analysis include a simplified matrix, comparing the two sets of data (QCA versus interviews) per category/subcategory. However, the descriptive analysis tables exclude quotations from the QCA (which can be viewed in chapters 4 and 5) to avoid unnecessary cluttering and duplication of findings. Instead, the final column in the descriptive analysis tables include some quotations from the interview findings to support the comparison and discussion of findings.

In chapters 4 and 5, a description was created for each main category based on the QCA of RL literature findings. Based on the descriptive analysis findings for the interviews with industry experts, the description for each main category is redefined to answer the research questions (RQ1 and RQ2). Based on the recreated descriptions, each main section concludes with a descriptive analysis summary in the form of a data matrix, containing overlapping categories and subcategories between the different consumer return types, different pre-receipt RL processes and different post-receipt RL processes. Following the data matrix some key findings are discussed with important implications and RLM considerations for online retailers

Essentially, at the end of phase 2, all interview transcripts were thoroughly coded, the quotations relevant to each code was collated in preparation for generating themes (Braun & Clarke, 2012:7; Kiger & Varpio, 2020:5) and a descriptive analysis was performed on the deductive codes to compare interview findings with QCA of RL literature findings. In the next section, phase 3 focuses on the reflexive TA part of this study, which involves generating themes from the inductive codes produced in phase 2.

7.3.8.4 Phase 3: Generating themes from coded data of interviews with industry experts

Originally phase 3 of the TA was named "searching for themes" (Braun & Clarke 2006), which was renamed "generating themes" by Braun and Clarke (2021) because of confusion around the conceptualisation of themes as pre-existing entities that reside in data (i.e. themes that emerged from the data). Evidently, generating themes highlight the active role of the researcher in theme creation, to avoid the claims of themes "emerging" from the data (Braun & Clarke, 2021:343).

Phase 3 starts after the initial coding process (phase 2), shifting the analysis from codes to themes (Braun & Clarke 2006:89; Braun & Clarke, 2012:7). A theme can be defined as a pattern that captures something significant or interesting about the data and/or research question (Braun & Clarke, 2006:82; Maguire & Delahun, 2017:3356). Basically, a theme represents a broad category involving multiple codes that seem to be related to each other and that points to an idea important to the research question (Saunders *et al.* 2019:657). Themes can be constructed by analysing, combining, comparing and visually mapping the relationship between codes (Kiger & Varpio, 2020:5).

The flexibility of TA allows researchers to determine themes in several ways (Braun & Clarke, 2006:82). Some inductive codes (identified in phase 2) can form main themes and subthemes or can be sorted into a miscellaneous theme category (all codes without an applicable theme category), which may end up as part of new themes, or being discarded (Braun & Clarke, 2006:90; Braun & Clarke, 2012:8; Nowell *et al.* 2017:8). Furthermore, important questions that must be answered at this stage of the TA includes, "what counts as a pattern or theme?", and "how large must a theme be?", which relates to prevalence within the data items and across the entire data set (Braun & Clarke, 2006:82).

Nevertheless, no clear method exists for determining the prevalence of a theme, and the researcher's own judgement must be used. However, Braun and Clarke (2006:82) emphasised that the significance of a theme must rather depend on capturing something important in relation to the research questions (Braun & Clarke, 2006:82). Therefore, the focus must be on the research aim and only the data, codes and themes that can answer the research question(s) must be included in the analysis of the study (Braun & Clarke, 2012:8). As mentioned in phase 2 (see section 7.3.8.3), *the research questions* were used to *guide the identification of inductive codes and assigning appropriate quotations to the codes*. Subsequently, focussing on the research questions in earlier phases simplified the process of generating themes in line with the research questions.

Furthermore, Braun and Clarke (2021:342) warned that "themes" developed prior to any analysis and coding, may result in topic summaries, which can impede true analytic work. For themes to be patterns of shared meaning underpinned by a central concept, means that themes must be analytic outputs, not

inputs (Braun & Clarke, 2021:342). Evidently, the researcher *generated initial themes and subthemes based on the following criteria*: (1) *sufficiently supported by the interview data* (multifaceted) (Braun & Clarke, 2021:341), (2) *answering research questions* (Braun & Clarke, 2012:8), (3) representing something *significant of the data* (Maguire & Delahun, 2017:3356) and (4) *excluding deductive topic summaries* from categories identified in the QCA of RL literature (e.g. IT practices, integration practices and RL in/outsourcing practices).

Generating themes can be an active and creative process (Braun & Clarke, 2021:343), which involves (1) reviewing the coded data to identify areas of similarity and overlap between codes, (2) sorting codes into potential themes, (3) collating and clustering codes that share some unifying feature within the identified themes, and (4) exploring the relationship between codes, themes, and different levels of themes, like main themes and subthemes (Braun & Clarke 2006:89; Braun & Clarke, 2012:7-8). The subsequent paragraphs provide an overview of the steps that the researcher followed, based on suggestions from Braun and Clark (2006:89) and Braun and Clark (2012:7-8), to generate themes from coded interview data.

- *Step 1: Returning to coded interview data*

At this stage of phase 3, the researcher reviewed all coded interview transcripts to identify overlaps and similarities between codes. For example, the researcher noted that RL problems and RL drivers can both be problematic for the effective RLM of consumer returns, which means that RL problems and RL drivers must be grouped into a potential theme. Like phase 2 (step 3), the *researcher used the memo function of ATLAS.ti to record observations related to the overlaps and similarities between codes*, which can be used to explore the relationships between codes.

- *Step 2: Explore code relationships and sort related codes into potential themes*

Based on the initial notes created during the coding phase (step 3 of phase 2) and notes created in step 1of phase 3, the researcher used the *network function of ATLAS.ti* to *explore code relationships*. The network function in ATLAS.ti, enables linking of codes through a "relations manager". For example, the code "RL driver" is a part of "RL problems", "RL benefits and importance of RLM" is important for "RLP – Poor RLM" and "RLD – Management inefficiencies", and "RLD – Lenient returns" can cause problems with "RLP – cost-related problems".

Based on the relationships between codes and notes, additional networks were created to sort the codes with significant relationships into potential themes. Appendix D.7 shows examples of studying the

relationships between codes and sorting codes into potential themes, using the network function in ATLAS.ti.

- *Step 3: Creating summaries for potential themes*

After grouping codes into potential themes, a *new memo was created in ATLAS.ti* to *summarise each potential theme*. Specifically, based on observations from notes (phase 2, step 3 and phase 3, step 1) and identification of relationships between codes (phase 3, step 2), each potential theme was summarised, which involved mentioning *key factors important to the theme*, asking *questions about the codes and contents of the theme*, and *listing codes* associated with the theme.

For example, "*Understanding the significance of RLM - consequences of mismanagement, problems, costs, drivers, benefits. Why is it important to manage RL? What are the implications if ignored? [Codes: RL drivers, RL problems, RL benefits and importance]. Subthemes - RL drivers, RL problems and RL benefits and importance".* Appendix D.7 shows the memo for generating themes, with the comments, questions, codes applicable to each theme and identified subthemes.

- *Step 4: Create a thematic map for generated themes in phase 3*

In the final step of phase 3, a *thematic map* was created to *provide an overview* of generated candidate (main) *themes and subthemes*. Five candidate themes were generated, namely (1) significance of RLM, (2) decision-making factors in RLM, (3) relationships and information for RLM, (4) RL reduction and recovery and (5) business management for RLM. Additionally, each theme included several subthemes (12 in total), some of which were broad codes (e.g. RL drivers), while others represented a combination of several codes. Although phase 3 resulted in a thematic map of generated themes, the researcher may be uncertain about keeping, discarding, or modifying the thematic map and themes for final analysis (Kiger & Varpio, 2020:6). Subsequently, Figure 7.4 represents an initial thematic map outlining the themes and related subthemes generated in phase 3 of the TA.

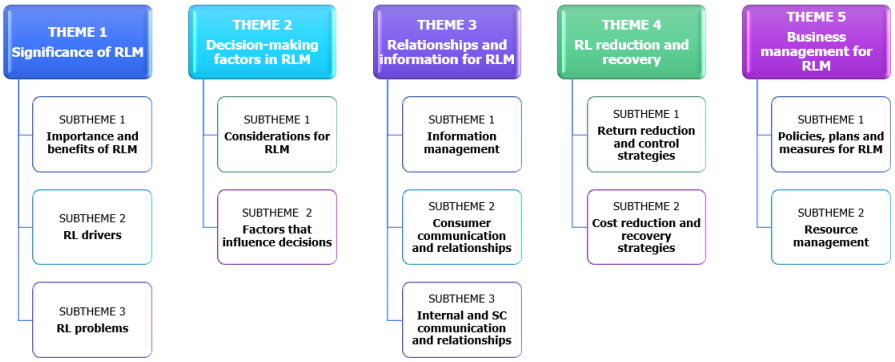

Figure 7.4 Initial thematic map generated in phase 3 of the TA
Source: Compiled by the researcher

Essentially, at the end of phase 3, all codes were organised into broader themes using a thematic map (Figure 7.4) outlining the candidate themes and subthemes in preparation of reviewing the themes in phase 4 of the reflexive TA (Braun & Clarke 2006:90; Braun & Clarke, 2012:8; Maguire & Delahun, 2017:3356), which will be discussed in next section.

7.3.8.5 Phase 4: Developing and reviewing themes of data from interviews with industry experts

Phase 4 can be a time consuming and recursive process of reviewing and refining candidate themes, including re-coding of the entire data set (Braun & Clarke 2006:90; Braun & Clarke, 2012:8; Terry & Hayfield, 2020:438). In this phase, the researcher may find that some candidate themes cannot be classified as themes (i.e. themes without sufficient data to support them, or data that may be too diverse), while others can be collapsed into one theme (i.e. two separate themes might form one theme) or be broken down into separate themes (Braun & Clarke 2006:90).

Phase 4 involves two levels of analysis, including reviewing themes against coded data extracts and reviewing the themes in relation to the entire dataset (Braun & Clarke, 2012:8). Since this phase involved significant effort and time, the section starts with a theoretical overview on developing and reviewing themes and concludes with a practical overview of the process the researcher followed to develop a thematic map from reviewed themes.

7.3.8.5.1 Theoretical overview of developing and reviewing themes

In this section, the theory of the two levels of analysis, namely reviewing themes against coded data extracts and reviewing the themes in relation to the entire dataset (Braun & Clarke 2006:90), will be briefly described.

The first level, *reviewing themes in coded data extracts*, involves reading collated extracts (i.e. ATLAS.ti output reports) for each theme and determining if collated extracts form a coherent pattern (Braun & Clarke 2006:91; Nowell *et al.* 2017:9). Reviewing themes can be guided by asking the following questions (Braun & Clarke, 2012:8):

- Is this a theme or rather a code?
- How valuable is this theme (does it explain something useful about the dataset and the research question)?
- What are the boundaries of this theme (what does it include and exclude)?
- Is this theme adequately supported by the data (are there enough data to support the theme)?
- Does this theme lack coherence (are the data too diverse in this theme)?

Additionally, other questions that may be asked include, (1) “Are overlapping themes, separate themes?”, (2) “Are there themes within themes (subthemes)?”, and (3) “Are there other themes within the data?” (Maguire & Delahun, 2017:3358).

Based on the questions, the researcher can review themes in the coded data extracts to (1) identify problematic candidate themes, determining if the theme itself is problematic, or if the theme includes irrelevant data extracts (Braun & Clarke 2006:91), (2) rework and recreate themes (e.g. combining some themes or splitting broader themes), (3) move inappropriate codes within initial themes to other more relevant themes, and (4) discard initial themes and initial codes from the analysis (Braun & Clarke 2006:91; Braun & Clarke, 2012:8; Kiger & Varpio, 2020:6).

Reviewing themes in the entire data set involves considering the validity of individual themes in relation to the data set and determining if the candidate thematic map/table reflects the meanings evident in the data set as a whole (Braun & Clarke 2006:91). Evidently, reviewing themes in the entire data set, enables further engagement with the data and returning to the data with the redeveloped candidate themes as an interpretative framework (Terry & Hayfield, 2020:438).

Level two involves a similar set of questions asked for level one but relates to the entire data set (Kiger & Varpio, 2020:6). Evidently, level two requires rereading of the entire data set to (1) determine if the themes ‘work’ in relation to the data set (i.e. all interview transcripts), (2) code any additional data within themes missed in earlier coding stages (Braun & Clarke, 2006:91) and (3) review and refine problematic themes until a satisfactory thematic map/table can be realised (Braun & Clarke, 2006:91-92). Nevertheless, Braun and Clarke (2006:92) warns that coding and generating themes can be an endless process, which means that the researcher must avoid over-enthusiasm with endless re-coding and reviewing of themes.

7.3.8.5.2 Practical overview of developing and reviewing themes

As described in the preceding section, the process of developing and reviewing themes involve creating new themes, adapting pre-established themes (see Figure 7.4 the thematic map for phase 3) and discarding irrelevant themes (Braun & Clarke, 2012:9). Phase 4 proved to be valuable as new ideas formed by recognising that the boundaries of some themes needed to be altered (Terry & Hayfield, 2020:439).

Based on the researcher’s interpretation of the theoretical suggestions, discussed in section 7.3.8.5.1, a ***five-step approach*** was followed, documenting the process of ***reviewing themes in the coded data*** extracts (level one) and ***entire data set*** (level two).

- *Step 1: Creating output reports and read quotations for themes from phase 3.*

Step 1 involves the first level of analysis in phase 4, namely reviewing themes in coded data extracts. *In ATLAS.ti, an output report was created for each theme*, which contained all the codes and related quotations associated with the theme. Appendix D.8 shows an example of the output report created in ATLAS.ti for Theme 1 "Significance of RLM". Next, each output report was read, to consider if a theme lacks coherence, contains sufficient quotations or contains too much data, must be combined with another theme or must be divided into separate themes.

- *Step 2: Asking and answering questions for each theme from phase 3*

Like step 1, step 2 involved the first level of analysis in phase 4, namely reviewing themes in coded data extracts. While reading the quotations for each theme, the researcher asked the questions identified by Braun and Clarke (2012:8) and Maguire and Delahun (2017:3358). The researcher again used the *memo function of ATLAS.ti to record observations* for each theme in relation to these questions, as well as more detailed comments on quotations for further analysis. Appendix D.8 provides an example of the detailed comments created from reading the quotations of each candidate theme.

After reading all quotations from each theme, a *table was compiled to answer the questions proposed by Braun and Clarke (2012:8) and Maguire and Delahun (2017:3358)*. Table 7.9 provides an overview of the questions, answers and conclusions/findings for each theme.

Table 7.9 Questions and answers for reviewing themes in coded data extracts in phase 4

QUESTIONS	THEME ANSWERS	CONCLUSIONS/FINDINGS
Braun and Clarke (2012:8): *1. Is this a theme or rather a code?* *2. How valuable is this theme (does it explain something useful about*	**Theme 1 – Significance or RLM** 1. This theme is not a code as was established in the coding process. 2. The theme is important, but not sufficiently on its own to answer the research question. 3. This theme includes problems of poor practices and management, drivers of returns as well as the outcomes of RLM. It excludes practices to improve RLM. 4. This theme includes insufficient quotations, in comparison to other themes. The same quotations applied to several codes, reducing the data. 5. The data of this theme can apply to several themes, which may indicate that it is too diverse. 6. This theme associates with other themes, which indicates that it must form part of other themes. 7. Yes, the subthemes identified are still valid. 8. Not in theme 1	Theme 1 is valuable in terms of emphasising of "how not to manage returns". However, the research questions cannot be answered by this theme alone. Additionally, this theme involves insufficient quotations, and the data is diverse in terms of problems versus benefits. However, the importance of the data indicates that this theme can apply or be combined with other themes. The subthemes remain valid, indicating that these subthemes can be adopted in other themes.
	Theme 2 – Decision-making factors for RLM 1. This theme is not a code because it contains too many elements. 2. The theme is important, but not sufficiently on its own to answer the research question. It is important to help with the implementation of practices for RLM but cannot function as a separate theme. 3. This theme lacks clear boundaries since it applies to various practices. The RLM considerations and decision-making elements of this theme apply to other themes. 4. Although this theme contains many quotations, it is insufficient,	Theme 2 can be valuable for effective RLM. However, this theme cannot answer the research questions separately. While this theme consists of many quotations, the number of quotations is insufficient in comparison to other themes. The data is coherent to a degree, but this

QUESTIONS	THEME ANSWERS	CONCLUSIONS/FINDINGS
the dataset and the research question)? *3. What are the boundaries of this theme (what does it include and exclude)?* *4. Is this theme adequately supported by the data (are there enough data to support the theme)?* *5. Does this theme lack coherence (are the data too diverse in this theme)?* **Maguire and Delahun (2017:3358):** *6. Are overlapping themes, separate themes?* *7. Are there themes within themes (subthemes)?* *8. Are there other themes within the data?*	in comparison to other themes. 5. The data of this theme can be useful to other themes, but the quotations mostly focus on considerations that can be important for practices, implying that the theme can be considered coherent. 6. This theme associates with other themes, which indicates that it must form part of other themes. 7. The subthemes are too broad, which means that more subthemes are needed. Or data in the subthemes can be included in other themes. 8. Some data can apply to other themes, which implies that the data can be included in other themes.	theme might be more valuable as a subtheme and part of other candidate themes. The subthemes are too broad and can apply to other themes. Essentially, this theme must be separated, and quotations can be used for several subthemes in other potential themes.
	Theme 3 – Relationships and information management for RLM 1. This theme is not a code it contains a high number of quotations and several code categories. 2. The theme is especially important, consisting of several practices that can help answer the research questions. 3. This theme focuses on relationships, information, communication and consumer service. This theme mostly involves practices that can be important for the consumer service performance of online retailers. However, data from other themes can be included in this theme. 4. This theme is adequately supported by the data. 5. The data is coherent to some extent but quotations for some subthemes can apply to other themes. 6. The only overlapping is with other Themes 1 and 2 that can apply to this theme. 7. Some subthemes are too narrow, with limited quotations, while others are too broad to be subthemes. 8. Yes, one subtheme can be a separate theme, and the quotations from subthemes can apply to other themes.	Theme 3 is extremely valuable and can be important for effective RLM. This theme contains many practices that can address the problems identified in Theme 1. This theme also associates with Theme 2, requiring considerations. While this theme is adequately supported by the data, some data can apply to other themes. Therefore, some categories and quotations can be moved to other themes and a separate candidate theme can be created from the data in Theme 3.
	Theme 4 – Reduction and recovery 1. This theme is not a code since it contains a high number of quotations and several code categories. 2. The theme is especially important, consisting of various practices that can help answer the research questions. 3. This theme focuses on product return prevention, cost savings, accounting, cost management and cost recovery. This theme mostly involves practices that can be important for financial performance and self-preservation of online retailers, excluding consumer centrism. However, data from other themes can apply to this theme. 4. This theme is adequately supported by the data 5. The data is coherent to some extent 6. Since the quotations of this theme can be important to other themes, this theme might need separation. 7. The subthemes in this theme are especially broad, indicating that these subthemes can potentially be separate themes. 8. Yes, both subthemes can potentially be separate themes.	Theme 4 is extremely valuable and can be important for effective RLM. This theme contains many practices that can address the problems identified in Theme 1. This theme also associates with Theme 2, requiring considerations. This theme can be divided because of high numbers of coded quotations and applicable quotations from other themes (1-3). Essentially, the two subthemes can potentially become two candidate themes, which include some data from other themes.
	Theme 5 – Business Management for RLM 1. This theme is not a code because it contains several code categories. 2. The theme is important, consisting of several practices that can help answer the research questions. 3. This theme focuses on business management practices, which can be general organisational practices that can be applied to RL. Specifically, this theme focusses on resources and the management of resources through measurement and control. However, data from this theme can apply to other themes, which makes exclusion difficult. 4. This theme is adequately supported by the data but not sufficiently as a stand-alone theme. 5. The data is coherent to some extent but can apply to several themes. 6. Since the quotations of this theme can be important to other themes, this theme could potentially form part of other themes. 7. Most subthemes are too narrow to be subthemes but too broad to	Theme 5 is valuable, but it can be viewed as requirements for effective RLM. Some practices can be valuable in addressing the problems identified in Theme 1. While this theme involves various quotations that can be important for RLM, the data might be better served in other themes. Therefore, this theme must be removed as a theme, but the quotations must be added to other themes.

QUESTIONS	THEME ANSWERS	CONCLUSIONS/FINDINGS
	be codes. However, this theme involves several code categories, which can be added to other themes. 8. No, not in this theme. However, the data of this theme can apply to other themes.	

Source: Compiled by the researcher

Answering the questions proposed by Braun and Clarke (2012:8) and Maguire and Delahun (2017:3358) proved to be valuable in reviewing the themes. The *result of this step* means that (1) *Themes 1 and 2 can be added as subthemes in other themes*, (2) the *quotations from Theme 3* can be included *in other themes* but data within the theme can justify *a new theme*, (3) *Theme 4 can be split into two new themes*, and (4) the quotations of *Theme 5 can be added to other themes*.

Consequently, the researcher developed *three new themes*, which included (1) *prevention and control* (contents from original Theme 4), (2) *service* (contents from original Theme 3) and (3) *costs* (contents from original Theme 4) for the effective RLM of consumer returns. Additionally, the *subthemes* involved *problems* (content from original Theme 1), *solutions* (content from original Themes 3 – 5), *considerations* (content from original Theme 2) and *benefits* (content from original Theme 1).

- *Step 3: Develop visualisations for redeveloped themes, subthemes and related categories*

Step 3 concludes level one of reviewing themes in coded data extracts, allowing the researcher to initiate level two of reviewing themes in the entire data set. Researchers may be different in their approaches to generate, review and finalise their themes. In this study, the researcher used visualisation to review themes, subthemes and related categories. The *visualisations* were created in *Ms PowerPoint*, which helped the researcher to gain a *clear picture* of the themes, subthemes and potential categories within the subthemes.

Before developing the visualisations, the researcher *returned to the notes from step 2 (phase 4)* and assigned codes to comments, for each theme. For example, for the data extracts, adding “PC” for prevention and control, “S” for service and “C” for costs. This enabled the researcher to focus only on the comments and quotations related to each theme, Appendix D.8 provides an example of adding these theme codes to the initial comments from step 2.

Several diagrams were created to explore each new theme, including Theme 1 – prevention and control, Theme 2 – service and Theme 3 – costs. The visualisations created for Theme 3 were used as examples

to support to explain the development of visualisation for each theme. Figure 7.5[23] shows the diagrams developed for the cost theme to aid in the subsequent discussions.

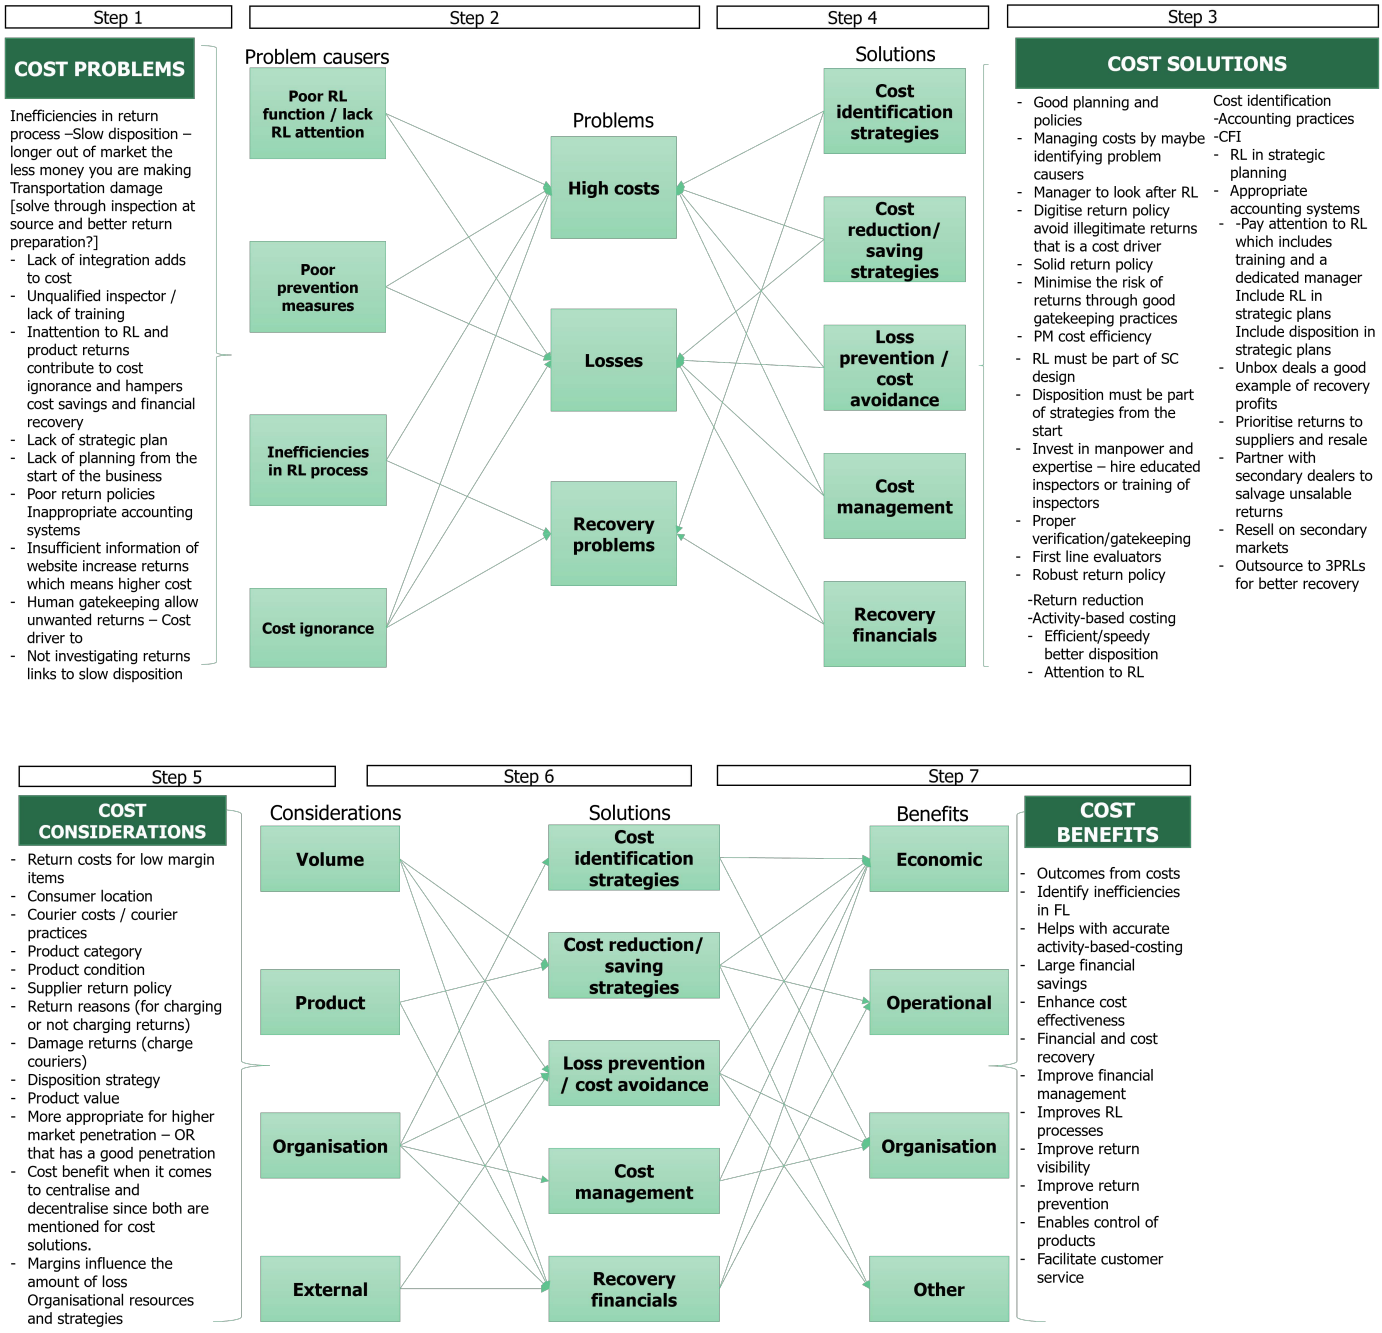

Figure 7.5 Visualisation for phase 4 - reviewing themes in coded data extracts
Source: Compiled by the researcher

[23] This diagram is rough work that the researcher used to get a better understanding of the themes. Attention was not paid to the editing of the content. It can be viewed as a rough sketch, representing the actual visualisations created in PowerPoint. The written content represents a summary from the notes developed in step 2 in phase 4.

The diagram *initially started* with a shape, named *"cost problems"*, and a textbox, containing key points derived from researcher's notes (see *diagram step 1*). From the key points, the researcher noted that cost problems include cost problem causers, which can be classified as a poor RL function, poor preventative measures, inefficiencies in the RL process and cost ignorance. Subsequently, four additional shapes were added to the diagram for each *problem causer* category. Furthermore, in reviewing the comments and quotations the researcher noted that the *problem causers* can *contribute to common cost problems*, which included high costs, losses and cost recovery problems (added as additional shapes to the diagram). Additionally, the *links* between the *problem causers and common problems* were indicated with *arrows* (see *diagram step 2*).

Consequently, the subthemes from the original theme 1 "significance of RLM", formed a subtheme "cost problems" in the new theme "costs". Once the problems were identified, the researcher returned to the comments and quotations, searching for *solutions to the problem causers* and *problems*. Repeating step 1 of the diagram, a new shape was added to the diagram, named *"cost solutions"* and a textbox, containing key points from the notes (see *diagram step 3*). Subsequently, like step 2 of the diagram, *solution categories*, including cost identification strategies, cost saving/reduction strategies, loss prevention and cost avoidance, cost management and recovery financials, were identified and added as shapes. Additionally, the *links between the solutions* and the *problems*, derived from the notes and quotations, were indicated with *arrows* (see *diagram step 4*).

Since, the researcher identified in step 2 that the original Theme 2 "decision-making factors for RLM" can apply to other themes, a new shape was added named "*cost considerations*" (on a separate diagram due to space limitations in PowerPoint). Additionally, like other diagram steps, the key points derived from the notes were added to a textbox below the cost considerations shape (see *diagram step 5)*, enabling the identification of categories, including volume, product, organisation and external considerations. Additionally, as noted in step 2 of reviewing the themes, the "considerations" can be important for the implementation of solutions, which required a *linking* between the cost *consideration categories* and cost *solution categories* (see *diagram step 6*).

Likewise, from the original Theme 1 "significance of RLM", a new subtheme was created for "*cost benefits*", with listed key points for the identification of benefit categories. Since the benefits can be viewed as the results of implementing the solutions, the visualisation was concluded with *arrows, linking* the *benefit categories* to the *solution categories* (see *diagram step 7*).

The same steps for developing visualisations for Theme 3 were applied to prevention and control (theme 1) and service (theme 2) themes, which resulted in the same subthemes, including problem

causers, problems, solutions, considerations and benefits. Essentially, developing visualisations for each theme provided a clear view of the themes, including subthemes and identified categories, the relationships between the subtheme categories and the boundaries of each theme.

- *Step 4: Returning to the entire data set and asking and answering questions for redeveloped themes*

Step 4 involves the second level of analysis in phase 4, namely *reviewing themes in the entire data* set (section 7.3.8.5.1). The second level of analysis in phase 4 means returning to the entire data set, reading quotations and asking and answering questions for redeveloped themes. Subsequently, the same approach was followed for step 2 of phase 4, but involved *reading all transcripts*, not only the output reports that contained coded data for each theme. Reading of transcripts enabled the researcher to *code any quotations missed* during the coding process (phase 2) and *determine if the redeveloped themes* can *apply to the entire data set*.

As indicated in section 7.3.8.5.1, the questions used in level one (reviewing themes in coded data extracts) can be used for level two of reviewing themes in the entire data set. Subsequently, following the approach in step 2 (asking and answering questions for each theme from phase 3), the *researcher created a table to ask and answer questions* in level two of phase 4. Table 7.10 provides an overview of the questions, answers and conclusions/findings for redeveloped themes (identified in steps 2 and 3).

Table 7.10 Questions and answers for reviewing theme in the entire data set in phase 4

PHASE 4 - QUESTIONS	PHASE 4 - THEME ANSWERS	CONCLUSIONS/FINDINGS
Braun and Clarke (2012:8): *1. Is this a theme or rather a code?* *2. How valuable is this theme (does it explain something useful about the dataset and the research question)?* *3. What are the boundaries of this theme (what does it include and exclude)?*	**Theme 1 – Prevention and control** 1. This theme is not a code as was established in level one of phase 4. 2. The theme is extremely valuable, and all participants mentioned the importance of prevention and control for RLM. 3. This theme includes prevention and control problem causers, problems, solutions, considerations and benefits related to return prevention and control of product returns, products and people. 4. Yes, this theme is adequately supported by the entire data set. 5. No, the content of this theme is coherent. 6. While all themes include the same subthemes, the quotations/content separate Theme 1 from other themes. It will not be feasible to combine this theme with another theme, which can cause a lack of cohesion. 7. Yes, the subthemes identified are still valid. 8. No, in reading all transcripts no other themes can be applied to the entire data set.	Theme 1 is highly significant for the effective RLM of consumer returns. Therefore, prevention and control can be viewed as RLM factors, answering the research question "what are the factors for the effective RLM of consumer returns?". Additionally, the theme can answer the research question "what are the RL practices of consumer returns in online retailing?", which can represent prevention and control solutions and considerations. The problem causers and problems, emphasise what to avoid for effective prevention and control, while the benefits emphasise the rewards of implementing prevention and control solutions and related considerations for successful return prevention and control. Essentially, Theme 1 represents the entire data set since all participants emphasised that prevention and control can be important for RLM.
	Theme 2 – Service 1. This theme is not a code as was established in level one of phase 4. 2. The theme is extremely valuable, and all participants mentioned the importance of focusing on consumer service for RLM.	Theme 2 is highly significant for the effective RLM of consumer returns. Therefore, service can be viewed as a RLM factor, answering the research question "what are the factors for the effective RLM of consumer returns in online retailing?".

4. Is this theme adequately supported by the data (are there enough data to support the theme)? *5. Does this theme lack coherence (are the data too diverse in this theme)?* **Maguire and Delahun (2017:3358):** *6. Are overlapping themes, separate themes?* *7. Are there themes within themes (subthemes)?* *8. Are there other themes within the data?*	3. This theme includes service problem causers, problems, solutions, considerations and benefits related to consumer service. 4. Yes, this theme is adequately supported by the entire data set. 5. No, the content of this theme is coherent. 6. While all themes include the same subthemes, this theme is different from other themes in terms of consumer centrism. Therefore, it cannot be combined with other themes. 7. Yes, the subthemes identified are still valid. 8. No, in reading all transcripts no other themes can be applied to the entire data set.	Additionally, the theme can answer the research question "what are the RL practices of consumer returns in online retailing?", which can represent service solutions and considerations. The problem causers and problems, emphasise what to avoid for effective consumer service, while the benefits emphasise the rewards of implementing the solutions and related considerations for successful consumer service in RLM. Essentially, Theme 2 represents the entire data set since all participants emphasised that service can be important for RLM.
	Theme 3 – Costs 1. This theme is not a code as was established in level one of phase 4. 2. The theme is extremely valuable, and all participants mentioned the importance of managing costs to effectively manage RL. 3. This theme includes cost problem causers, problems, solutions, considerations and benefits related to cost savings, cost management and recovery. 4. Yes, this theme is adequately supported by the entire data set. 5. No, the content of this theme is coherent. 6. While cost associates with prevention (since poor prevention can increase costs), combining cost and prevention and control themes can cause the service theme to be limited in terms of quotations and scope. Additionally, not all cost categories can apply to prevention and control and vice versa, which can cause a lack of coherence. 7. Yes, the subthemes identified are still valid. 8. No, in reading all transcripts no other themes can be applied to the entire data set.	Theme 3 is highly significant for the effective RLM of consumer returns. Therefore, cost can be viewed as a RLM factor, answering the research question "what are the factors for the effective RLM of consumer returns?". Additionally, the theme can answer the research question "what are the RL practices of consumer returns in online retailing?", which can represent cost solutions and considerations. The problem causers and problems, emphasise what to avoid for effective cost savings, cost management and cost recovery, while the benefits emphasise the rewards of implementing cost solutions and related considerations for cost-effective management of consumer returns. Essentially, Theme 3 represents the entire data set since all participants emphasised that cost savings, cost management and cost recovery can be important for RLM.

Source: Compiled by the researcher

Reading all transcripts and answering the questions proposed by Braun and Clarke (2012:8) and Maguire and Delahun (2017:3358) confirmed that the *themes identified in level one of phase 4 applied to the entire dataset*. Essentially, no new themes or changes were made to the redeveloped themes, allowing the researcher to conclude phase 4 with a thematic map.

- *Step 5: Developing a thematic map for phase 4 of the reflexive TA*

Although phase 5 involves naming of candidate themes (section 7.3.8.6), the researcher considered creative names to finalise the subthemes of all candidate themes. Particularly, the researcher used *wordplay* with the letter *"P"* for each subtheme, which involved renaming (1) *"problem causers"* to *"pitfalls"*, (2) *"solutions"* to *"practices"*, (3) *"considerations"* to *"parameters*" and (4) *"benefits"* to *"profits"*. Only "*problems" remained unchanged*.

Additionally, studying the quotations to review the breadth of each subtheme and using the visualisations (developed in step 2 of phase 4) to explore relationships between subthemes, the researcher *combined* some *subthemes*. Specifically, "*pitfalls and problems*" represented the first subtheme because (1) both requires the implementation of practices (solutions) and parameters

(considerations) and (2) participants discussed pitfalls and problems concurrently, meaning that pitfalls and problems shared the same quotations.

Additionally, it was noted that the parameters cannot only be import for the implementation of practices but also for addressing pitfalls and problems and realising profits. Consequently, the researcher *combined the practices and parameters*, and renamed subtheme 2, "*propositions*". Nevertheless, within the proposition theme, parameters still represent important factors for the effective implementation of practices. Evidently, both practices and parameters are needed for addressing pitfalls/problems and realising benefits to effectively manage consumer returns.

Figure 7.6 represents the thematic map for the reflexive TA developed in phase 4.

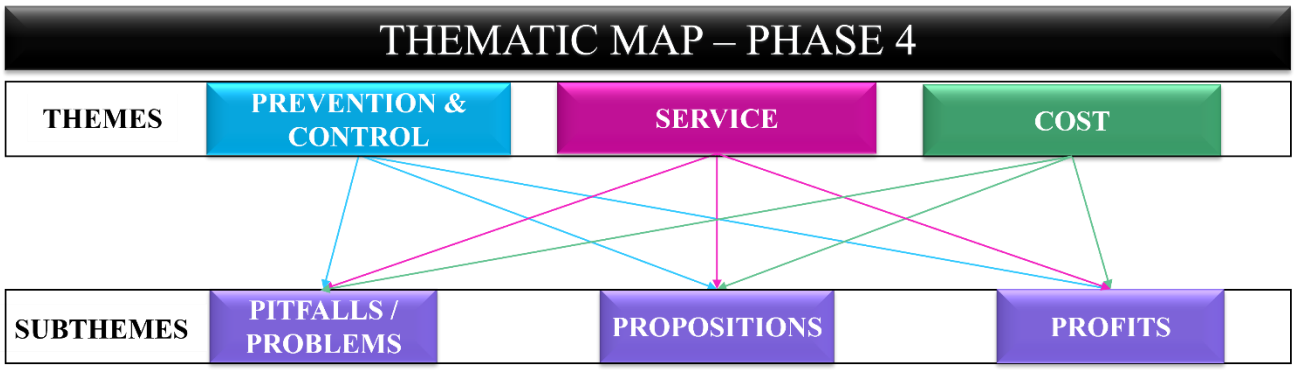

Figure 7.6 Thematic map for revised themes in phase 4 of reflexive TA
Source: Compiled by the researcher

The thematic map demonstrates the links between the candidate themes and subthemes, derived from phase 4 of the reflexive TA. Essentially, phase 4 ended with a thematic map representative of the entire dataset (Braun & Clarke, 2006:92), including themes that captured the most important and relevant elements of the data in relation to the research question (Braun & Clarke, 2012:9; Kiger & Varpio, 2020:6). In the next phase, the process of refining, defining and naming (candidate) themes for the interviews with industry experts will be described.

7.3.8.6 Phase 5: Refining, defining and naming themes of data from interviews with industry experts

Once the thematic map adequately represented the data, phase 5 of the TA commenced. Phase 5 represented the deep analytic work necessary in a TA, which involves shaping the analysis into specific detail (Braun & Clarke, 2012:9). This phase involved refining, defining and naming themes for the final analysis (Braun & Clarke 2006:92). Refining and defining a theme mean identifying the essence of each theme and determining the aspects of data that captures the theme or stating the uniqueness of each theme (Braun & Clarke 2006:92; Braun & Clarke, 2012:9). As themes are refined and

redeveloped, appropriate names for the themes can be created. Naming each theme involves giving a short but informative, concise and catchy title to the theme (Braun & Clarke, 2006:93; Braun & Clarke, 2012:9; Nowell *et al.* 2017:10).

In terms of the procedures in phase 5, Braun and Clarke (2006:92) and Braun and Clarke (2012:9) indicated that phase 5 involves revisiting the collated data extracts (quotations) for each theme, selecting appropriate quotations and organising these quotations to support a comprehensible narrative or story about the theme. Each extract (consisting of one or more quotations) must provide vivid and compelling examples that clearly illustrates the analytic points, demonstrating the interpretation of the data and providing structure to the analysis (Braun & Clarke, 2006:92).

Furthermore, the narratives must answer the key questions for phase 5, including "what is the theme saying?", "how do the subthemes interact and relate to the main theme?", and "how do the themes relate to each other?" (Maguire & Delahun, 2017:33511). Finally, the analytic narrative, created for each theme, must explain the significance of the extracts in relation to other themes and the research question (Braun & Clarke, 2012:10).

Like previous phases, the researcher created a few steps to complete phase 5 based on the suggestions from Braun and Clarke (2006:92), Braun and Clarke (2012:9-10) and Maguire and Delahun (2017:33511), which will be described in subsequent paragraphs.

- *Step 1: Revisiting data and selecting and organising quotations to support theme narratives*

Before the essence of each theme can be captured, Braun and Clarke (2006:92) and (2012:9) indicated that phase 5 involves revisiting the collated data extracts (quotations) for each theme, selecting and organising one or two quotations to support a comprehensible narrative or story about the theme.

Firstly, the researcher identified the *importance of each theme* by revisiting the quotations assigned to the original inductive code "benefits and importance of RLM" (see step 2 in section 7.3.8.3.2) to identify the importance of each theme. From these quotations, the researcher *identified* several *quotations to support the justification of each theme*, which will be used to introduce each theme in chapter 8 (findings of interviews with industry experts). Next, from the quotations of each theme, the researcher *identified one or two* (if needed three) quotations *representing the subthemes*, including pitfalls and problems, practices and parameters (propositions), and profits of each theme.

The researcher referred to the *visualisations developed in phase 4* (see step 3 in section 7.3.8.5.2), to identify categories and related quotations *to develop the quotations tables*. Due to the

comprehensiveness of quotations, Appendix D.9 only shows the selection of quotations for Theme 1, which was also applied to Themes 2 and 3. These quotation tables were also used as the foundation for selecting quotations in phase 6 of the analysis, which will be discussed in section 7.3.8.7.

Essentially, revisiting the interview data and selecting key quotations from the coded data extracts for each theme enabled the researcher to explore the essence and uniqueness of each theme and develop narratives for each theme, which will be described in subsequent steps.

- *Step 2: Exploring the essence and uniqueness of themes for refining, defining and naming themes*

Following the selection and organisation of quotations, the researcher explored the essence and uniqueness of themes. Studying the content related to the subthemes of pitfalls and problems, propositions and profits for each theme, helped the researcher to identify the essence of each theme and determining the aspects of data that captures the theme or stating the uniqueness of each theme (Braun & Clarke 2006:92; Braun & Clarke, 2012:9).

Following the same approach of using visualisations in phase 4 of the analysis (step 3 in section 7.3.8.5.2), the researcher created *illustrations in Ms PowerPoint* to *identify the essence and uniqueness of each theme*. Using the key elements from the quotation tables created in step 1 of phase 5, the researcher compared the themes, listing the key elements of each subtheme for all candidate themes.

Figure 7.7 shows an example of using a visualisation to explore the essence and uniqueness of themes based on key points for the subtheme "profits".

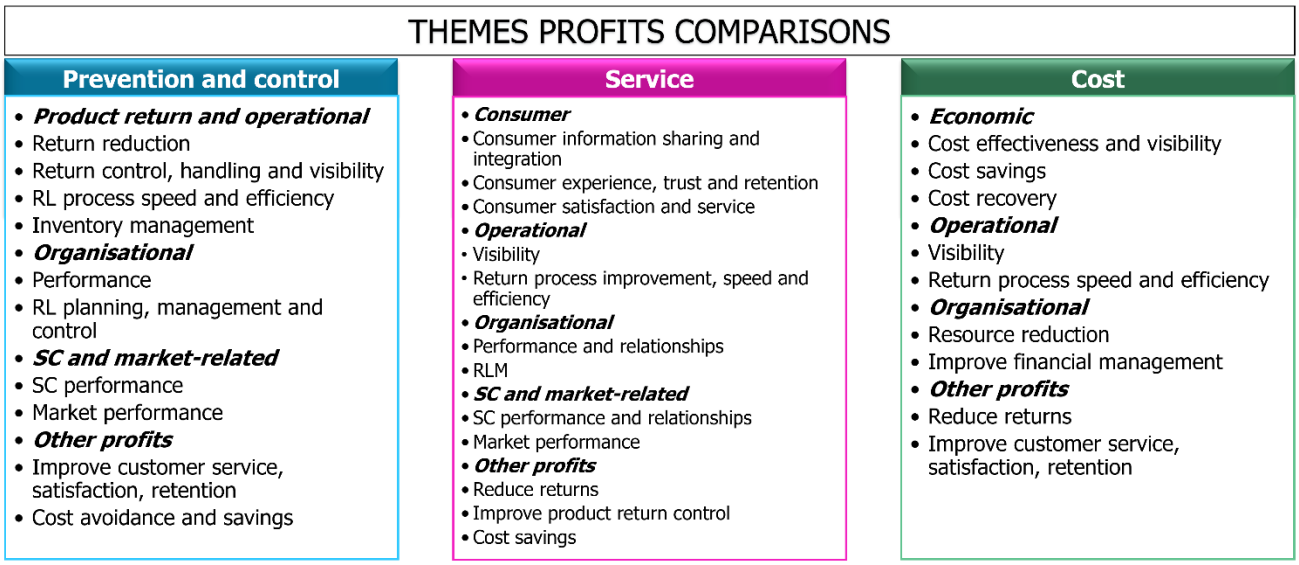

Figure 7.7 Comparison of themes in phase 5 of the reflexive TA
Source: Compiled by the researcher

Consequently, the researcher created visualisations for the pitfalls and problems, propositions and profits, which enabled the development of comprehensive narratives, describing the essence and uniqueness of each theme, discussed in the next step.

- *Step 3: Narratives for capturing the essence and uniqueness of themes*

After revisiting data extracts, selecting and organising quotations, and exploring the essence and uniqueness of themes through visualisations, the researcher *developed narratives for each theme*. Since the candidate themes shared common subthemes, the researcher started with describing the subthemes to articulate the relationship between themes.

Based on selecting and organising quotations (step 1, phase 5) and exploring the essence and uniqueness of themes (step 2, phase 5), the *subthemes of this study were described as follows*:

- ***Subtheme 1 – Pitfalls and problems*** *represent poor practices and related problems that can hamper the effective RLM of consumer returns in online retailing. The problems can be viewed as the consequences of pitfalls, which means that pitfalls must be used as a starting point for addressing problems in RLM.*
- ***Subtheme 2 – Propositions*** *involve various* ***practices*** *and* ***parameters*** *that online retailers can implement to address pitfalls and problems and realise profits (benefits). The parameters can be important for the effective implementation of practices, which means that both parameters and practices contribute to the efficient and effective RLM of consumer returns in online retailing.*
- ***Subtheme 3 – Profits*** *represent the benefits or outcomes of successfully implementing propositions and demonstrate the importance of implementing/considering appropriate practices/parameters for the effective RLM of consumer returns in online retailing.*

Subsequently, *based on the quotation tables* (created in step 1 of phase 5) and *comparative visualisations* (developed in step 2 of phase 5), *a table was compiled to answer the questions* proposed by Maguire and Delahun (2017:33511), including "what is the theme saying", "how do the subthemes interact and relate to the main theme?" and "how do the themes relate to each other?", enabling the researcher to develop a narrative for each candidate theme. Additionally, the narrative involved *stating the essence, uniqueness* (Braun & Clarke, 2006:92; Braun & Clarke, 2012:9) *and significance of each theme* in relation *to the research questions* (Braun & Clarke, 2012:10).

Table 7.11 provides an overview of the questions and theme narratives description of the essence and uniqueness of each theme.

Table 7.11 Theme narratives in phase 5 of reflexive TA

THEME NARRATIVES - ESSENSE AND UNIQUENESS
THEME 1 – PREVENTION AND CONTROL
Theme 1 involves return prevention and control initiatives for the effective RLM of consumer returns in online retailing. While online retailers can reduce consumer returns and implement preventative measures, they can never eliminate it; hence, they need to implement RL process, returned product and RL function control measures to manage consumer returns effectively and efficiently. Theme 1 involves three subthemes, namely prevention and control pitfalls and problems (subtheme1), propositions (subtheme 2) and profits (subtheme 3). The subtheme "***prevention and control pitfalls and problems***" involve operational inefficiencies, poor RLM, poor systems and websites and poor return prevention practices that can result in problems with product returns, (e.g. high or unnecessary consumer returns), inventory problems (e.g. counterfeit stock or loss of product) and other problems for online retailers (e.g. consumer dissatisfaction, brand damages and loss of managerial control), impacting the performance and sustainability of the online retailer. The subtheme "***prevention and control propositions***" involves various practices and parameters that online retailers can implement to address prevention and control pitfalls/problems and realise prevention and control profits (benefits), contributing to the efficient and effective RLM of consumer returns. Specifically, prevention and control propositions include proactive prevention, reactive prevention, product return control practices and prevention and control parameters, including, volume, product, organisational, cost versus benefit and external parameters (e.g. SC, market, legislation and environmental). Additionally, the subtheme involves key practices/parameters and support practices that associate with the RL practices identified as important in the QCA of RL literature findings. The final subtheme, "***prevention and control profits***" represents the benefits or outcomes of successfully implementing prevention and control propositions in RL. Therefore, prevention and control profits demonstrate the importance of implementing appropriate prevention and control practices and parameters for the effective RLM of consumer returns in online retailing. The profits associated with prevention and control include product return and operational profits, organisational profits, SC and market-related and other theme profits. The ***prevention and control theme*** (theme 1) ***links to other themes*** (themes 2 and 3) in terms of the common subthemes of pitfalls and problems, propositions and profits. Moreover, the prevention and control theme relate to other themes in terms of specific (1) pitfalls, including operational inefficiencies, poor prevention, inattention to RL, poor RL planning, lack of resources, poor systems, a lack of integration, (2) problems, including loss of products, consumer dissatisfaction and uncertainty and a loss in sales, (3) support practices, including IT, integration, RL in/outsourcing, disposition, performance measurement (PM), facility/locations, resource commitment (RC), financial management (FM), return prevention and avoidance (RPA), strategic planning and procedures (SPP) and management and staff practices, (4) parameters, including volume, products, organisational, cost versus benefit, SC and market, legislation and environmental parameters, and (5) profits, including reducing product returns, visibility, RL process speed and efficiency, organisational performance, RLM, SC and market performance, improvements in customer service, satisfaction and retention and costs savings/avoidance. The ***prevention and control theme is unique*** in terms of specific (1) pitfalls, including poor performance measurement and poor information sharing with consumers, (2) problems, including high and fraudulent returns, disorganised and contaminated inventory, liabilities, loss of managerial control and poor reporting, (3) practices, including FL proactive prevention and RL proactive prevention, reactive prevention examination and investigations, return process and product control, including enhancement of product return visibility, product segregation and inventory management, and RL function control, including establishing control mechanisms and maintaining RL function control, and (4) profits, including improvements in inventory management, RL planning and control. In essence, the ***prevention and control theme can be significant*** in answering the following research questions: • ***"What are important RL practices for managing consumer returns in online retailing?"*** Prevention and control propositions, including proactive prevention, reactive prevention and return control practices and prevention and control parameters with related key practices/parameters can be important RL practices for managing consumer returns in online retailing. Additionally, the support RL practices for the effective implementation of prevention and control propositions, including IT, integration, RL in/outsourcing, disposition, PM, facility/location, RC, FM, RPA, SPP and management and staff practices, identified in the QCA of RL findings and confirmed by the interview findings, can be important RL practices for managing consumer returns in online retailing. • ***"What are important factors for the effective RLM of consumer returns in online retailing?"*** Return prevention and control are important factors that require the identification and mitigation of prevention and control pitfalls and problems, implementation of prevention and control practices, consideration of prevention and control parameters and the subsequent realisation of prevention and control profits for the effective RLM of consumer returns in online retailing.
THEME 2 – SERVICE
Theme 2 involves service initiatives for the effective RLM of consumer returns in online retailing. All participants mentioned throughout their discussions the importance of consumer service to manage consumer returns effectively and efficiently. Therefore, "service" was identified as an important factor in RLM, which means that online retailers must pay attention to service for the effective RLM of consumer returns. Theme 2 involves three subthemes, namely service pitfalls and problems (subtheme1), propositions (subtheme 2) and profits (subtheme 3).

The subtheme "***service pitfalls and problems*"** involves operational culture, poor RLM and information-related pitfalls that can result in consumer problems (e.g. poor experience, frustration, dissatisfaction and uncertainty) and online retailer problems (e.g. poor communication, poor return processes, service failures, and a loss of trust, sales and consumer), impacting consumer relationships and the service performance and sustainability of the online retailer.

The subtheme "***service propositions***" involves various practices and parameters that online retailers can implement to address service pitfalls/problems and realise service profits, contributing to the efficient and effective RLM of consumer returns. Specifically, service propositions include service-orientated return practices, including service-orientated communication and return processes, service performance practices, including service evaluation, improvements and management, and service parameters, including, volume, product, organisational, cost versus benefit and external parameters (e.g. SC, market and legislation). Additionally, the subtheme involves key practices/parameters and support practices that associate with the RL practices identified as important in the QCA of RL literature findings.

The final subtheme, "***service profits***" represents the benefits or outcomes of successfully implementing service propositions in RL. Therefore, service profits demonstrate the importance of implementing appropriate service practices and parameters for the effective RLM of consumer returns in online retailing. The service profits include consumer-related profits, operational profits, organisational profits, SC and market-related profits and other theme profits.

The ***service theme*** (theme 2) ***links to other themes*** (themes 1 and 3) in terms of the common subthemes of pitfalls and problems, propositions and profits. Moreover, the service theme relate to other themes in terms of specific (1) pitfalls, including inattention to RL, poor RL planning, lack of resources, poor systems and a lack of integration, (2) problems, including consumer dissatisfaction and uncertainty and a loss in sales, (3) support practices, including IT, integration, RL in/outsourcing, PM, facility/locations, RC, FM, RPA, SPP and management and staff practices (4) parameters, including volume, products, organisational, cost versus benefit, SC and market and legislation parameters, and (4) profits, including customer service, satisfaction and retention, visibility, RL process speed and efficiency, organisational performance, RLM, SC and market performance, reducing product returns, improving product return control and costs savings.

The ***service theme is unique*** in terms of specific (1) pitfalls and problems, including organisational preservation pitfall, and poor return experience, unmet expectations, consumer frustration and anger, poor communication, poor return processes problems, service failures, and a loss of consumer trust and consumers/market share problems, (2) practices, including service-orientated return communication, service-orientated return processes, and service performance evaluation, improvements and management, and (3) profits, including consumer information sharing and integration, and improved consumer experience and trust, profitability, organisational relationships and SC relationships.

In essence, the ***service theme can be significant*** in answering the following research questions:

- ***"What are important RL practices for managing consumer returns in online retailing?"***

Service propositions, including service-oriented return practices, service performance practices and service parameters with related key practices/parameters can be important RL practices for managing consumer returns in online retailing. Additionally, the support RL practices for the effective implementation of service propositions, including IT, integration, RL in/outsourcing, PM, facility/location, RC, FM, RPA, SPP and management and staff practices, identified in the QCA of RL findings and confirmed by the interview findings, can be important RL practices for managing consumer returns in online retailing.

- ***"What are important factors for the effective RLM of consumer returns in online retailing?"***

Service is an important factor that requires the identification and mitigation of service pitfalls and problems, implementation of service practices, consideration of service parameters and the subsequent realisation of service profits for the effective RLM of consumer returns in online retailing.

THEME 3 – COSTS

Theme 3 involves cost effectiveness, savings, recovery and management for the effective RLM of consumer return in online retailing. All participants mentioned throughout their discussions the importance of costs. Therefore, "cost" was identified as a RLM factor, which means that online retailers must pay attention to costs for the effective RLM of consumer returns.

Theme 3 involves three subthemes, namely cost pitfalls and problems (subtheme1), propositions (subtheme 2) and profits (subtheme 3). The subtheme "***cost pitfalls and problems***" involves operational inefficiencies, poor RLM, poor financial practices and poor integration that can result in financial problems, (e.g. poor pricing and a loss of sales, money and profits), cost/expense problems (e.g. high cost and poor cost visibility) and recovery problems (e.g. no/limited recovery and loss product value), impacting the economic sustainability of online retailers.

The subtheme "***cost propositions***" involves various practices and parameters that online retailers can implement to address cost pitfalls/problems and realise cost profits (benefits), contributing to the efficient and effective RLM of consumer returns. Specifically, cost propositions include cost identification, cost-effective return, cost recovery and cost control practices and cost parameters, including, volume, product, organisational and external parameters (e.g. SC, legislation and environmental). Additionally, the subtheme involves key practices/parameters and support practices that associate with the RL practices identified as important in the QCA of RL literature findings.

The final subtheme, "***cost profits***" represents the benefits or outcomes of successfully implementing cost propositions in RL. Therefore, cost profits demonstrate the importance of implementing appropriate cost practices and parameters for the effective RLM of consumer returns in

online retailing. The profits associated with the cost theme include economic profits, operational profits, organisational profits and other theme profits.

The ***cost theme*** (theme 3) ***links to other themes*** (themes 1 and 2) in terms of the common subthemes of pitfalls and problems, propositions and profits. Moreover, the cost theme relates to other themes in terms of specific (1) pitfalls, including operational inefficiencies, poor prevention, inattention to RL, poor RL planning, lack of resources and poor integration, (2) problems, including a loss of sales and a loss of products, (3) support practices, including IT, integration, RL in/outsourcing, disposition, performance measurement (PM), facility/locations, resource commitment (RC), financial management (FM), return prevention and avoidance (RPA), strategic planning and procedures (SPP) and management and staff practices, (4) parameters, including volume, products, organisational, SC, legislation and environmental parameters, and (5) profits, including cost savings, return visibility, RL process speed and efficiency, reduction of product returns and improvements in customer service, satisfaction and retention.

The ***cost theme is unique*** in terms of specific (1) pitfalls, including poor financial management, poor accounting and poor costing practices, (2) problems, including poor pricing, loss of money and profits, inaccurate view of financial performance, high and unnecessary costs and expenses, poor cost visibility, obsolete products, no/limited recovery and loss of product value, (3) practices, including cost identification, cost-effective returns, cost recovery and cost control practices, and (4) profits, including cost effectiveness, cost visibility, cost recovery, resource reduction and improved financial management.

In essence, the ***cost theme can be significant*** in answering the following research questions:

- ***"What are important RL practices for managing consumer returns in online retailing?"***

Cost propositions, including cost-effective return, cost recovery and cost control practices and cost parameters with related key practices/parameters can be important RL practices for managing consumer returns in online retailing. Additionally, the support RL practices for the effective implementation of cost propositions, including IT, integration, RL in/outsourcing, disposition, PM, facility/location, RC, FM, RPA, SPP and management and staff practices, identified in the QCA of RL findings and confirmed by the interview findings, can be important RL practices for managing consumer returns in online retailing.

- ***What are important factors for the effective RLM of consumer returns in online retailing?***

Cost is an important factor that require the identification and mitigation of cost pitfalls and problems, implementation of cost practices, consideration of cost parameters and the subsequent realisation of cost profits (benefits) for the effective RLM of consumer returns in online retailing.

Source: Compiled by the researcher

Essentially, the narratives for each theme, presented in Table 7.11, enabled the researcher to identify the essence and uniqueness of each theme, the relationships between themes and the importance of each theme in answering the research questions. Based on the narratives, phase 5 concluded with naming each theme and finalising themes in preparation for phase 6, which will be described in step 4 next.

- *Step 4: Naming candidate themes and finalising thematic framework for presentation*

Based on the narratives for each theme, the researcher concluded phase 5 with naming the candidate themes to reflect the essence of themes. While the researcher preferred to *keep the original theme names*, including *prevention and control, service and cost*, the *phrase* "*for the effective RLM of consumer returns*" *was added* to the name of each theme, *reflecting* the overall *purpose* of identifying practices and factors for the effective RLM of consumer returns.

After completing the narratives for the themes and subthemes, the *thematic framework* created during phase 4 (reviewing themes) was adjusted to reflect the refined, defined and named themes. Evidently, the result of phase 5 involved (1) simplified (singular focus) themes, (2) themes that related to each

other (without overlap), and (3) themes that addressed the research question(s) (Braun & Clarke, 2012:9), which developed into a final thematic framework (Maguire & Delahun, 2017:33511).

Figure 7.8 shows the final thematic framework that was used as a foundation for presenting the findings, discussed in phase 6.

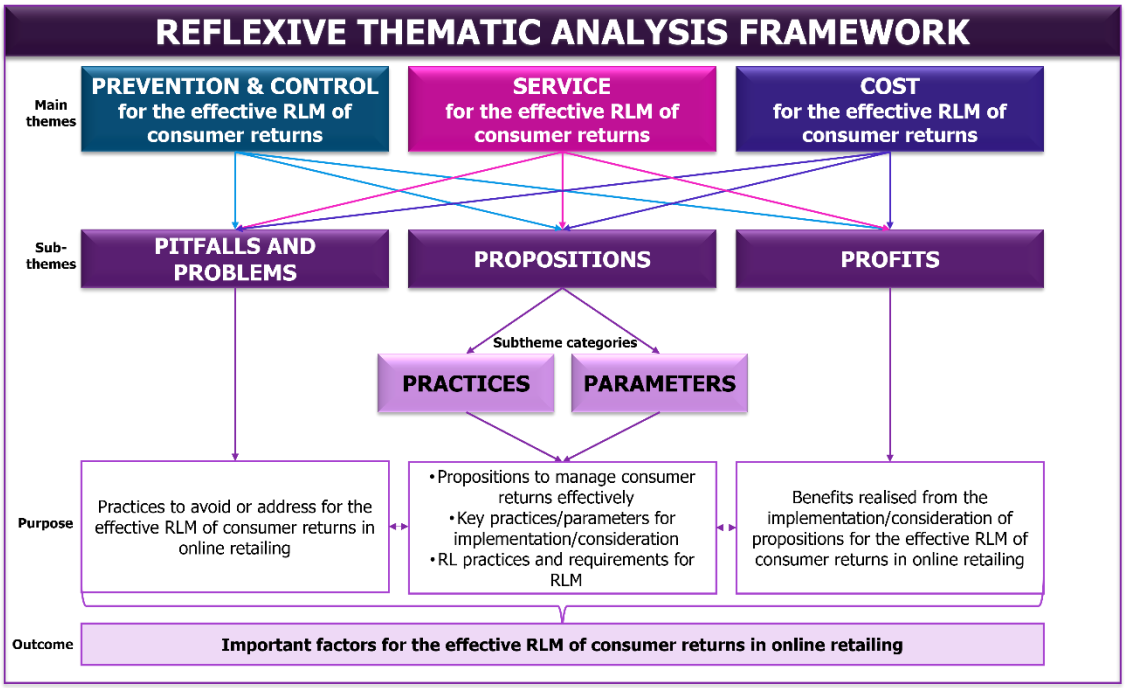

Figure 7.8 Reflexive TA framework for the interviews with industry experts
Source: Compiled by the researcher

Figure 7.8 shows the final thematic framework derived from the thematic map from phase 4 (Figure 7.5) and theme narratives (step 3, phase 5), demonstrating the links between the main themes, subthemes, the purpose of each theme and subtheme and the resulting outcomes. The thematic framework shows the (1) *renamed main (candidate) themes*, namely prevention and control for the effective RLM of consumer returns, service for the effective RLM of consumer returns and costs for the effective RLM of consumer returns, (2) *subthemes*, namely pitfalls and problems, propositions and profits, (3) *subtheme categories*, namely practices and parameters, (4) *purpose* of each subtheme, and (5) *outcome* of the themes and subthemes, linking with the research questions of "*what are important RL practices for managing consumer returns in online retailing?"* and *"what are important factors for the effective RLM of consumer returns in online retailing?"*. The final thematic framework, presented in Figure 7.8 was used to structure the presentation of the findings, which will be discussed in the next section.

7.3.8.7 Phase 6: Write-up of data from interviews with industry experts

Phase 6 involves the final analysis and write-up of the report, which starts after defining, refining and naming themes in phase 5 (Braun & Clarke 2006:93). Writing in a TA is the product of all the creative work and engagement with the data from the previous phases (Terry & Hayfield, 2020:440). In qualitative research the findings are mostly presented in text format and written using a combination of the researcher's and participants' voices, through quotations chosen by researcher (Cardano, 2020:143)

The write-up of a TA must involve a complicated discussion of the data, which must be convincing, clear, complex and embedded within the scholarly field, to convince readers of the merit and validity of the analysis (Braun & Clarke 2006:93; Braun & Clarke, 2012:10). Themes must be presented in sufficient depth and detail to convey the richness and complexity of the data (Braun & Clarke, 2006:82; Braun & Clarke, 2012:8). In other words, themes must be presented in a logical and meaningful way (themes relating to each other) to provide a compelling account about the data (Braun & Clarke, 2012:11), and the arguments must be supported by referring to the literature (Nowell *et al.* 2017:11).

Like the previous phases in the TA, researchers can use key questions for phase 6 of the TA, including (1) "what is the meaning of this theme?", (2) "what are the assumptions underpinning the theme?", (3) "what are the implications of this theme?", (4) "what conditions have given rise to the implications of the theme?", and (5) "what is the overall story that the different themes reveal about the topic or research question?" (Braun & Clarke 2006:94).

Although these questions can guide the write-up of findings, the researcher essentially answered these questions in phase 5 (see Table 7.11), providing detailed narratives to support the discussion of findings. Instead, the researcher focused on selecting quotations to produce a comprehensive report for each theme, write-up and presentation styles and methods of linking interview findings with literature findings, before producing the final write-up of findings. Accordingly, the following steps, incorporating both suggestions from theory and practical applications, were used to complete phase 6 of the analysis.

- *Step 1: Selecting quotations and creating quotation tables for write-up of interview findings for the reflexive TA*

According to Braun and Clarke (2006:93), the write-up must provide sufficient evidence for the themes, meaning sufficient quotations (data extracts) must be selected to support the discussion and analysis of findings. Using the tables created in step 1 of phase 5 (section 7.3.8.6), the researcher created *quotation tables for each theme*, which included columns for the subtheme categories, main

elements, key points, key quotations, and comments (observations). Subsequently, the quotations tables created in step 1 of phase 6 are more comprehensive in comparison to the quotation tables from phase 5 and were used for the write-up of findings.

Due to the comprehensive of the quotation tables and number of quotations, Appendix D.10 provides an extract from Theme 2 (service for the effective RLM of consumer returns), focusing on the pitfalls and related problems.

- *Step 2: Selecting the write-up and presentation styles for reflexive TA*

When writing up an analysis, Terry and Hayfield (2020:440) suggest that the findings and the *discussion of the findings are presented in one section*, which was the approach used in this study to present the findings of the interviews with industry experts. In terms of write-up styles, Merriam and Grenier (2019:16) indicated that write-ups can vary from intimate, first-person accounts to more formal, creative and artistic presentations. Due to a more formal approach of this study (as required in the economic and management science field), a *formal write-up style* was selected, which excluded writing in the first person. However, the researcher *developed* various *frameworks* to *illustrate overviews and summarise key findings* for each theme and subtheme.

According to Nowell *et al.* (2017:11) the presentation style may include (1) short quotes that aid in specific points of interpretation and demonstrate the prevalence of the themes, or (2) extensive passages to provide evidence of the original discussion. Furthermore, Braun and Clarke (2006:93) indicated that quotations must be embedded within an analytic narrative, going beyond a description of the data, to support the arguments in relation to the research question of the study. However, quotations must be identifiable as an example that support the argument (Braun & Clarke 2006:93).

Subsequently, in this study, the researcher selected the *presentation style* of *short to medium-sized quotations* (from the quotation tables) that were *embedded into the discussion* and analysis of interview findings. Additionally, the quotations (participants' voices) were formatted to be distinguished from the discussion and analysis of findings (researcher's voice). Specifically, after discussing key findings in one or two paragraphs, the researcher referred to the supporting quotations, before *inserting the quotations* by using and selecting the "styles" function in Ms Word. The "*quotation style*" in Ms Word automatically *indents the quotations, reduces font size* and *reduces line spacing*, which effectively distinguishes the discussion of findings from supporting quotations.

- *Step 3: Selecting the method of linking interview findings with literature*

Norwell *et al.* (2017:11) indicated that adding literature to the write-up can demonstrate if the findings support, contradict or add to the body of knowledge, which contributes to the validity of the analysis (Nowell *et al.* 2017:11). *Literature was incorporated* into the interview findings in *two ways*, which involved (1) *reviewed literature from Chapters 1 and 2* in the *discussion of findings* of all *subtheme subcategories*, and (2) *reference* to the literature findings identified in the *QCA of RL literature* from *Chapter 6* as part of the support RL practices to effectively implement the *key practices/parameters*. To avoid cluttered sections, the researcher only referred to the main findings of Chapter 6 (e.g. various integration strategies), excluding the literature quotations presented in various tables from Chapter 6.

- *Step 4: Final write-up of interview findings for the reflexive TA*

Finally, the researcher commenced with the *final write-up of findings* for the reflexive TA, based on (1) *theme narratives* (step 3 of phase 5), (2) *thematic frameworks* (step 4 of phase 5), (3) *theme quotation tables* (step 1 of phase 6), (4) selected *write-up and presentation styles* (step 2 of phase 6) and, (5) selected *methods of incorporating literature* to support/contradict interview findings (step 3 of phase 6). Table 7.12 provides an overview of the format used for the final write-up of interview findings.

Table 7.12 Presentation format of interviews with industry expert findings in the reflexive TA

SECTIONS	SECTION ELEMENTS
Main theme introduction	• Introduce the theme, add quotations to support the importance of theme and provide a broad overview through a figure. Add literature from chapters 1 and 2.
Subtheme	• Introduce the subtheme, provide an overview of the theme through a figure, and add literature from chapters 1 and 2. • Discuss the findings following the subtheme main categories and subcategories. • Incorporate quotations through the discussion of findings. • Add literature to the main categories, introductions and conclusions. • For propositions add references to chapter 6 as support practices for implementing key practices/parameters • Finalise the subtheme with a broad framework, illustrating key findings • Provide a data table to summarise key findings of the subtheme.
Main theme conclusion	• Finalise the main theme with a broad framework, illustrating the key findings from all subthemes. • Provide a data table to summarise the key findings for all subthemes and include literature from chapters 1 and 2 in the conclusion.

Source: Compiled by the researcher

The application of the format given in Table 7.12 can be viewed in sections 8.3 to 8.5. Essentially, the final analysis and write-up provided a concise, coherent, logical and interesting account of the data, within and across themes (Braun & Clarke 2006:93; Braun & Clarke, 2012:11).

In the next section, the final stage of the interviews with industry experts will be discussed.

7.3.9 Stage 9: Demonstrating the trustworthiness strategies employed in interviews with industry experts

As qualitative research becomes systematically acknowledged and valued, it is important that qualitative research is conducted in a rigorous manner to produce meaningful findings (Nowell *et al.* 2017:1). The validity of qualitative research is often referred to as trustworthiness or credibility (Suter, 2012:346). In qualitative research, it is the rich, thick descriptions through words (not numbers) that demonstrate the trustworthiness of findings (Merriam & Grenier, 2019:16). A difficult task for qualitative researchers is to take large amounts of qualitative data (such as interviews) and share what the data reveal in a credible way (Suter, 2012:364). Consequently, qualitative research must be conducted in a rigorous, methodical, and ethical manner, such that the results can be trusted, and applied to practice (Merriam & Grenier, 2019:23).

Contrasting quantitative research that involves measurable rigors of relevance, reliability, validity, objectivity and generalisability (Stasik & Gendźwiłł, 2018:236), trustworthiness in qualitative research are pragmatic choices for researchers concerned about the acceptability and usefulness of their research for various stakeholders (Nowell *et al.* 2017:3). Nevertheless, related concepts used by qualitative researchers include dependability, credibility, transferability, confirmability, transparency and traditional reliability and validity (Salkind, 2010:1163; Suter, 2012:364).

In this study the standard criteria for establishing trustworthiness in qualitative research was adopted, which included (1) credibility (findings accurately and fairly represent the data), (2) transferability (findings can be applied to other settings and contexts), (3) confirmability (researcher is unbiased in the findings) and (4) dependability (consistent and sustainable findings) (DeJonckheere & Vaughn, 2019:7). These standard criteria for the trustworthiness of the interviews with industry experts will be briefly discussed in subsequent sections.

7.3.9.1 Credibility of interviews with industry experts

According to Suter (2012:363) many researchers argue that credibility, which refer to the believability of findings, can be the most important criterion for judging a qualitative study. Credibility can be demonstrated by triangulation of data (multiple data sources), producing believable conclusions through strong evidence, clear logic, valid data, and the ruling out of alternative explanations (Suter, 2012:363). According to Stahl and King (2020:26-27) multiple forms of triangulation can be used to establish credibility in qualitative research, including data triangulation (various data sources), investigator triangulation (two or more researchers), theoretical triangulation (various theoretical orientations) and environmental triangulation (various viewpoints or perspectives).

In this study the following forms of *triangulation* was used to ensure *credibility* of the interviews with industry experts: (1) *data triangulation* using different sources of data (i.e. 289 literature articles and 13 interview transcripts), (2) *theoretical triangulation* using multiparadigm as a theoretical framework (i.e. pragmatism involves elements of positivists and interpretivists) and various approaches to theory development (i.e. deductive, inductive and abductive approaches) (see section 3.2.5.3), and (3) *environmental triangulation* recruiting different industry experts representing various positions, business types and industries (see Table 7.6).

7.3.9.2 Transferability of interviews with industry experts

Transferability can be described as evidence supporting the generalisation of findings to other contexts, like including different participants (e.g. operational staff in RL) in different situations (Suter, 2012:363). However, the term generalisability in qualitative research must be distinguished from the positivist-orientated research using statistics, large and random samples sample (Merriam & Grenier, 2019:28). Particularly, qualitative research uses non-probability sampling techniques, involving small and purposively selected samples since the aim is to understand a particular phenomenon in depth, which cannot be generalised statistically (Merriam & Grenier, 2019:29).

Subsequently, in qualitative research transferability of findings depend on the transparency of the data collection and analysis process (Saarijärvi & Bratt, 2021:395). In other words, to demonstrate transferability of findings in a qualitative research study a detailed methodological and rich description can be critical (Merriam & Grenier, 2019:29; Saarijärvi & Bratt, 2021:395). Audit trails can be a strategy used in qualitative research, involving detailed description of the sampling, data collection and data analysis, for transferability (Merriam & Grenier, 2019:22). Additionally, researchers can describe influential parties (such as gatekeepers and membership associations) that other researchers can use for data collection and detailed timeframes for data collection (Stahl & King, 2020:27).

In this study, *transferability* was achieved through *detailed methodological discussions* and related applications of the interviews with industry experts (section 7.3). Particularly, transferability can be demonstrated through the detailed description of (1) *developing the interview protocol*, (2) *sampling procedures*, including inclusion/exclusion criteria, recruitment process (including disclosing memberships and gatekeepers used), sample size considerations and presentation of the final sample, (3) *pre-interview planning procedures*, including piloting, scheduling, reconfirming and preparation for using online video software, (4) *data collection techniques*, including motivating factors and key considerations for remote interviews and the features, advantages and disadvantages of the online video software used for the remote interviews, (5) *actual interviews*, including the introduction and building

rapport, interview conversation and questioning, time management and interview recording, (6) *post-interview reflection* about the sampling procedures and using online video software for remote interviews, and (7) *data analysis*, including an overview of thematic analysis (TA), followed by detailed discussions of the phases of TA.

7.3.9.3 Confirmability of interviews with industry experts

According to Suter (2012:363) confirmability can be described as objectivity and the control of researcher bias. However, unlike quantitative research, confirmability in qualitative research means pursuing objectivity through precision and accuracy in research practices or involving more than one researcher in a single study (Stahl & King, 2020:28). Additionally, unbiased interpretations can be achieved by actively seeking potential contradictory evidence predicted by alternatives (Suter, 2012:363) and using triangulation (Abdalla *et al.* 2018:7). However, Stahl and King (2020:28) indicated that confirmability must be restricted in qualitative research since objectivity mostly suit emergent design positivism (such as mixed method research).

Nevertheless, in this study confirmability was realised using rich descriptions that contain a strong sense of the participants inputs by allowing readers to gain realistic impressions of the data (Bolderston, 2012:74). Subsequently, *confirmability* was obtained by *providing sufficient quotations* in the data analysis from various industry experts to demonstrate unbiased interpretations. Additionally, confirmability was achieved utilising *between-methods triangulation*, which means that the biases of one approach (interviews with industry experts) was mitigated by the *inclusion of other sources of data and methods*, like a literature review and QCA of RL literature (Salkind, 2010:1538) (also see section 3.2.5.2). Consequently, confirmability was obtained by using various (recent) literature sources and the findings of the QCA of RL literature to corroborate or contradict the interview data and findings.

7.3.9.4 Dependability of interviews with industry experts

Dependability in qualitative research relate to the construct of reliability in quantitative research (Suter, 2012:363) and can be described as the trust element in trustworthiness (Stahl & King, 2020:27). A qualitative researcher can demonstrate dependability by providing evidence to support the claim that similar findings can be obtained if the study were replicated (Suter, 2012:363). Like other standard elements of trustworthiness researchers described several strategies that can enhance dependability of a study, including triangulation, rich documentation, audit trails, peer examination (Merriam & Grenier, 2019:28; Suter, 2012:363) and describing the researcher's role or reflexive auditing (Merriam & Grenier, 2019:28; Stahl & King, 2020:28). However, researchers can use other traditional measures like

code-recode consistency (Suter, 2012:363) and reliability checks of transcripts (Kowal & O'Connell, 2014:70) to enhance dependability of the interview data.

This study utilised several approaches to demonstrate ***dependability*** of the interviews with industry experts, including (1) ***multiple methods of data collection***, like a multimethod qualitative study for obtaining dependable data (Merriam & Grenier, 2019:28), (2) ***rich documentation***, like a coding framework with clear definitions (Nowell et al. 2017:7) and well-defined and clear inclusion and exclusion criteria to ease replication for other researchers (Hornberger & Rangu, 2020:3,4), (3) ***peer review feedback*** on the interview protocol (Castillo-Montoya, 2016:824) through the ethical clearance process (see section 7.3.2), (4) ***reflexive*** auditing that involved describing the role of the researcher (Stahl & King, 2020:28) during the recruitment of industry experts, preparation for the interviews, data collection using online video software for remote interviewing and describing post-interview reflection, and thematic analysis of interview data, (5) ***CAQDAS (ATLAS.ti) software*** to analyse and re-analyse data quickly, efficiently and reliably (Tummons, 2014:174) and TA for several coding rounds and theme development (see section 7.3.8), and (6) ***Sonix transcription software*** that mimic reliability checks, like using several independent transcribers to verify validity and reliability of the transcripts (Kowal & O'Connell, 2014:70) (see section 7.3.8.2).

Essentially, the elements of trustworthiness (credibility, transferability, confirmability and dependability) of the interviews with industry experts were demonstrated through the (1) detailed and step-by-step description of the interviews with industry experts (in section 7.3) with supporting appendices, (2) description of the researcher's role in the interview process, (3) use of a multiparadigm and multimethod qualitative research design, (5) use of software to support the collection and analysis of the interview data, and (4) provision of sufficient data to support the findings of the interviews with industry experts (discussed in chapter 8).

In the next section the conclusion of chapter 7 will be provided.

7.4 CONCLUSION

In this chapter, the research methodology of the interviews with industry experts that applied to phase three of the study was discussed. Particularly, the chapter started with an overview of interviews as a research method, which included (1) description of in-depth interviews in qualitative research, (2) interview styles in qualitative research, (3) roles of the researcher and participants in interviews, (4) potential problems of interviews and (5) motivating factors and advantage of interviews.

Thereafter, the methodology and application of interviews with industry experts were discussed based on several stages adapted from DeJonckheere and Vaughn (2019:3). The stages for the interviews with industry experts included, (1) defining the purpose and research questions, (2) considering ethical issues and practices, (3) developing the interview protocol, (4) sampling procedures and identifying participants, (5) pre-interview planning, (6) conducting the interviews, (7) post-interview reflection, (8) data analysis of interview and (9) demonstrating trustworthiness of interviews.

In terms of the first stage of the interviews with the industry experts, the purpose of the interviews with industry experts were based on secondary objectives 5 - 7 of the study, which included (1) determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5), (2) explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6), and (3) investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7). Additionally, four key research questions were identified, which related to the types of consumer returns, RL process in online retailing, important RL practices for managing consumer returns and factors for the effective RLM of consumer returns in online retailing.

The ethics section (stage 2) focused on (1) pre-interview ethics, including interview design stage (i.e. formulating research questions and aim) and gaining access to participants, (2) during the interview ethics (data collection), and (3) post-interview ethics, including data analysis and presentation/publication of findings. The interview protocol (stage 3) included a discussion on the structure of the interview protocol used for the interviews with industry experts, which included the introduction, opening questions, research-specific questions, and closing questions and the conclusion of the interview protocol.

Next, the sampling procedures and identifying participants (stage 4) included a detailed discussion based on the five steps of Daniel (2012:88) that can be followed to select and recruit a non-probability sample, which included (1) define the target population and choose the sampling techniques, (2) identify the inclusion and exclusion criteria, (3) create a plan to recruit participants that satisfy inclusion and exclusion criteria, (4) determine the sample size, and (5) finalise the sample of selected participants. Thereafter, the pre-interview planning (stage 5) included a discussion about (1) familiarisation and piloting of the interview protocol, (2) setting the stage and scheduling interview times and locations, (3) reconfirming interviews and resending interview information, and (4) preparation for using online video software as remote interview technique.

In terms of stage six, conducting the interviews, the interview data collection techniques used for the interviews with industry experts were discussed, followed by a discussion on the actual interviews with industry experts, which included building rapport and introduction, main questioning, closing the conversation, time management and recording. Thereafter, post-interview reflection (stage 7) was briefly discussed, which focused on the researcher's reflection on the impact of remote interviewing on the sampling procedures, including inclusion criteria, recruitment and sample size, and the use of online video software for the remote interviews with industry experts.

Stage eight, the data analysis of the interviews with industry experts, focused on an overview of TA and the six phases of TA in terms of theory and practical application for the interviews with industry experts. The six phases of TA based on Braun and Clarke (2006) and adapted by Braun and Clarke (2021:331) included: (1) familiarisation of data and writing notes, (2) generating codes and systematic coding of data, (3) generating themes from coded data, (4) developing and reviewing themes, (5) refining, defining and naming themes, and (6) writing the report. Finally, stage nine, trustworthiness of the interviews with industry experts were discussed, which included the credibility, transferability, confirmability and dependability of interviews with industry experts.

In the next chapter (chapter 8), the findings of the interviews with industry experts will be presented and discussed.

Chapter 8 - Findings of the interviews with industry experts

8.1 INTRODUCTION

Although RL was always a part of the supply chain, the significant increase in online retail sales and consumer buying behaviour led to higher volumes of returns, complicating the effective management of consumer returns (Eliav, 2022:2). Unfortunately, many online retailers view returns as a costly and unwanted burden, failing to recognise the importance of reverse logistics management (RLM) (Schooling, 2023:1). An undermanaged RL function can lead to various challenges, like operational challenges (Franklin, 2022:1), consumer dissatisfaction and higher return costs (Foo & A-Jalil, 2021:45). Evidently, online retailers must gain a deeper understanding of the importance of RLM to increase RL process efficiencies, reduce costs and maintain consumer satisfaction and loyalty (Eliav, 2022:1)

This chapter focuses on the final phase (three) of this study, which involved interviews with industry experts. Figure 8.1 provides the secondary research objectives associated with phase 3 of this study.

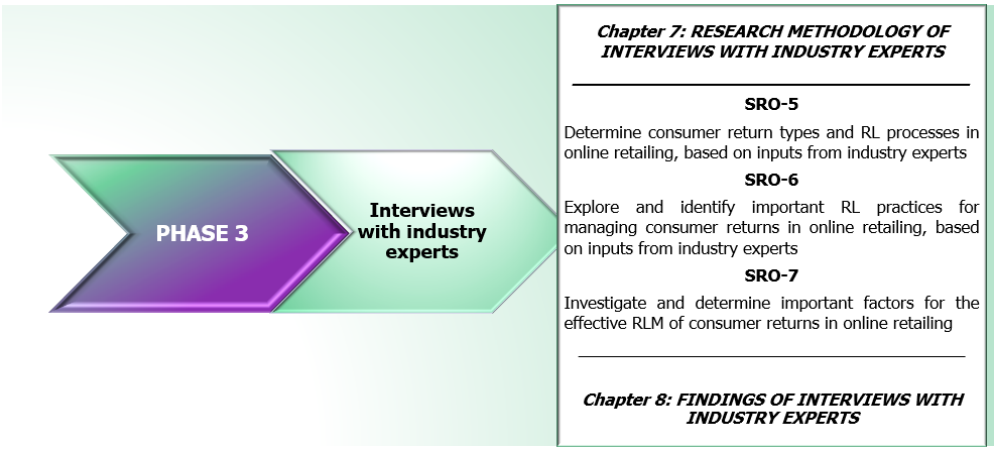

Figure 8.1 Findings of interviews with industry experts - Aims of chapter 8
Source: Compiled by the researcher

The purpose of the interviews with industry experts was to gain practical insight from industry on the main themes of the study, namely, RL processes, RL practices and RLM factors for the effective management of consumer returns in online retailing. More specifically, the aim of the interviews with industry experts was to (1) *determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5),* (2) *explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6),* and (3) *investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7).* Furthermore, the interview findings presented in this chapter contributes to the

primary objective of the study, which is to *develop a framework for the effective RLM of consumer returns in online retailing.* Therefore, key findings from the interviews with industry experts will (in combination with other research findings from phases one and two) be included in the framework for the effective RLM of consumer returns in online retailing, presented in chapter 9.

Figure 8.2 provides an overview of the main sections of chapter 8.

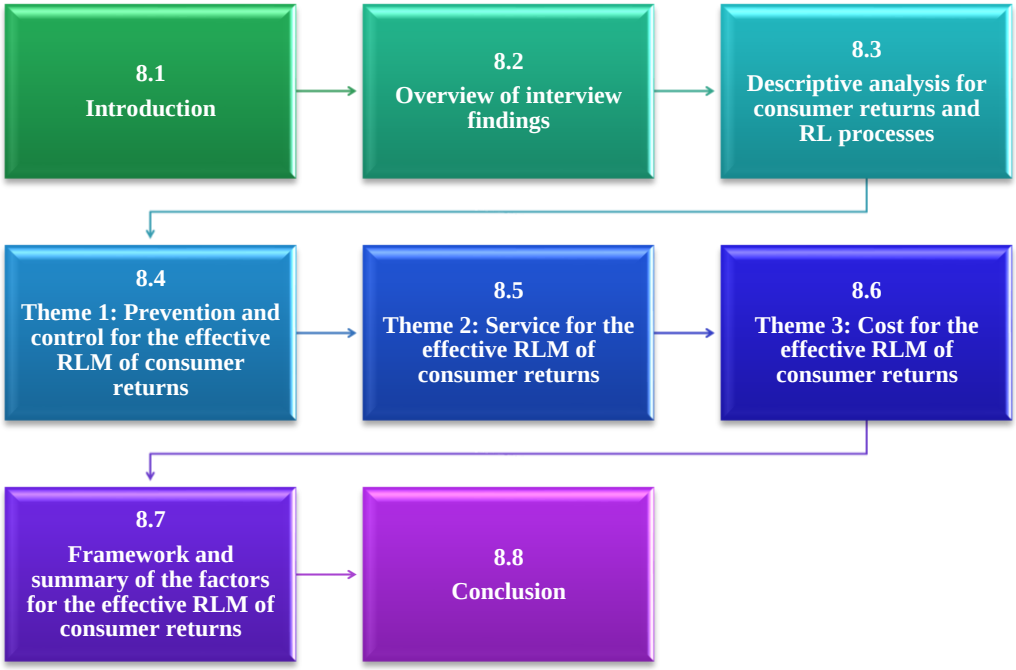

Figure 8.2 Overview of chapter 8
Source: Compiled by researcher

Figure 8.2 provides an overview of chapter 8, starting with the introduction (this section), followed by an overview of the interview findings (section 0), whereafter the descriptive analysis for consumer returns and RL processes will be presented (section 8.3). Thereafter, themes one to three from the reflexive thematic analysis (TA) will be presented, including Theme 1 – prevention and control for the effective RLM of consumer returns (section 8.4), Theme 2 – service for the effective RLM of consumer returns (section 8.5) and Theme 3 – cost for the effective RLM of consumer returns (section 8.6). The chapter concludes with a framework and summary of the factors for the effective RLM of consumer returns in online retailing (section 8.7) and a conclusion (section 8.8).

8.2 OVERVIEW OF THE INTERVIEWS WITH INDUSTRY EXPERTS

In chapter seven a detailed discussion of the interviews with industry experts was given. This section serves as a reminder of the research questions and aims of the interview findings with industry experts and an overview of presenting the descriptive analysis and reflexive TA.

The aim of chapter eight was to (1) triangulate the interview and QCA of RL literature findings related to consumer returns, RL processes and RL practices, (2) identify important factors for the effective

RLM of consumer returns in online retailing, and (3) develop frameworks from the interview findings for the effective RLM of consumer returns in online retailing. The main research questions for the interviews with industry experts included:

5. *What are the types of consumer returns in online retailing? (RQ-1)*
6. *What are the RL processes of consumer returns in online retailing? (RQ-2)*
7. *What are important RL practices for managing consumer returns in online retailing? (RQ-3)*
8. *What are important factors for the effective RLM of consumer returns in online retailing? (RQ-4)*

The focus of the first two research questions was to triangulate the findings of the interviews with the findings QCA of RL literature findings through a deductive approach and a descriptive analysis. The focus of the third research question was to triangulate the interview findings with the QCA findings through an inductive approach and a reflexive TA. The final question focused on identifying important factors for the effective RLM of consumer returns in online retailing from the interview findings through an inductive approach and a reflexive TA.

In the subsequent sections overviews of the descriptive analysis and reflexive TA will be provided.

8.2.1 Overview of the descriptive analysis of the interviews with industry experts

The presentation of findings for the descriptive analysis involves a comparative approach, which enables the triangulation of two sets of qualitative data. The participants were asked to explain the various return types and return processes that can occur in online retailing. Additionally, the participants were asked about the parties involved in consumer returns and facilities used for RL processes. These questions enabled effective triangulation between the interview findings and the QCA of RL literature findings. However, other questions asked about RL practices produced additional content that enabled a rich comparison between the interview findings and the QCA findings.

For an effective comparison, the presentation style for the descriptive analysis includes a combination of the quotation tables used for the presentation of the QCA findings (see chapters 4 and 5), containing the inductive categories and subcategories from the QCA findings, with the addition of categories identified in the interviews. Additionally, the tables for the descriptive analysis include a simplified matrix, comparing the two sets of data (QCA versus interview findings) per category/subcategory. However, the descriptive analysis tables exclude quotations from the QCA (which can be viewed in chapters 4 and 5) to avoid unnecessary cluttering and duplication of findings. Instead, the final column in the descriptive analysis tables include some quotations from the interview findings to support the comparison and discussion of findings. Following the tables, a discussion of the key findings is given, focussing on the similarities and differences between the interview findings and QCA of RL literature findings.

In chapters 4 and 5, a description was created for each main category based on the QCA of RL literature findings. Based on the descriptive analysis findings for the interviews with industry experts, the description for each main category is redefined to answer the first two research questions (i.e. RQ1 and RQ2). Based on the recreated descriptions, each main section concludes with a descriptive analysis summary in the form of a data matrix, containing overlapping categories and subcategories between the different consumer return types, different pre-receipt RL processes and different post-receipt RL processes. Following the data matrix, some key findings are discussed with important implications and RLM considerations for online retailers.

8.2.2 Overview of the reflexive thematic analysis (TA) of the interviews with industry experts

In section 7.8, the research methodology for the reflexive TA of the interviews with industry experts was provided, including a broad thematic framework, showing the themes, subthemes and aims of each theme. Based on the broad thematic framework, Figure 8.3 provides a detailed overview of the developed themes from the reflexive TA of the interviews with industry experts.

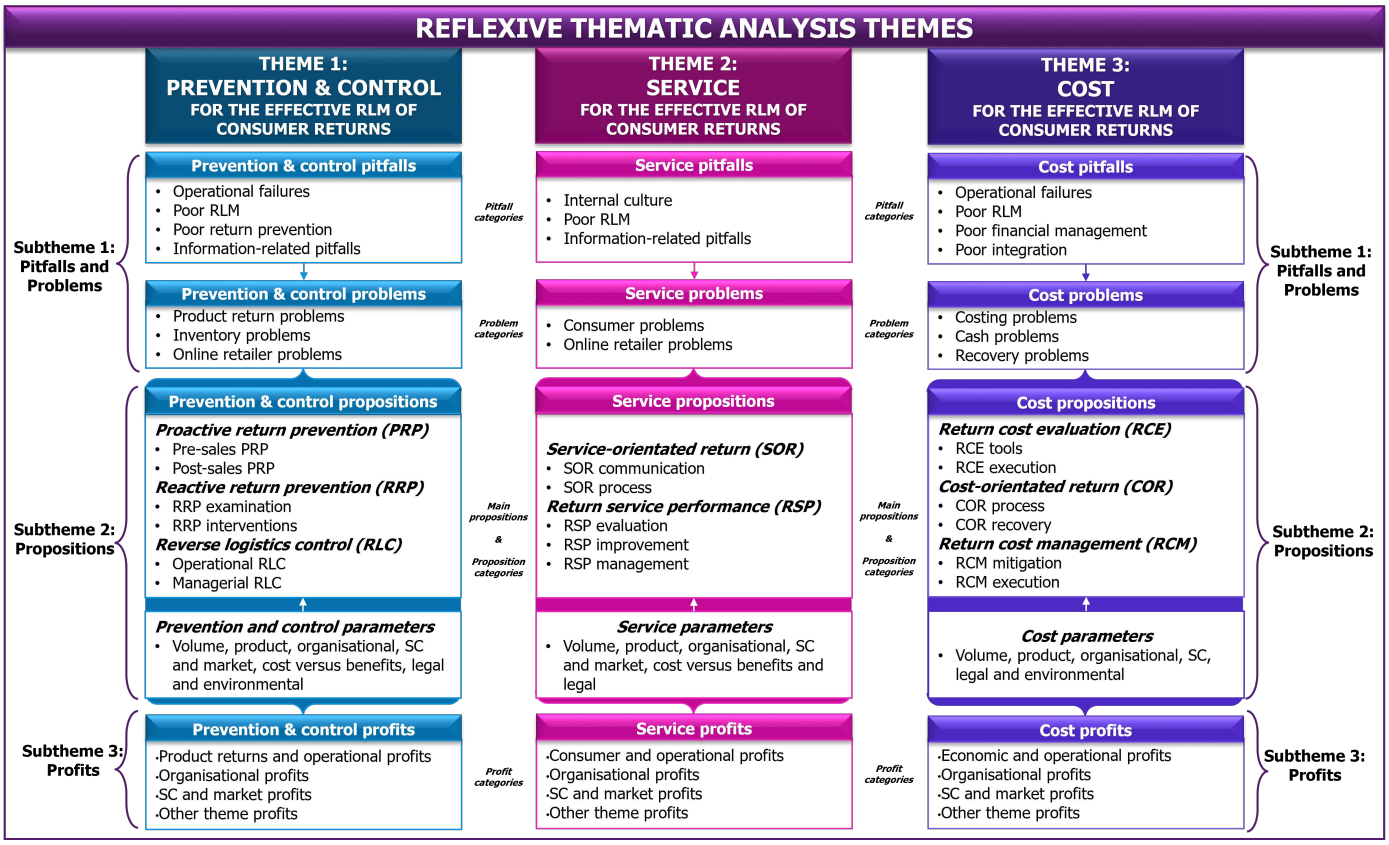

Figure 8.3 Detailed overview of the themes from the reflexive TA
Source: Compiled by the researcher

Specifically, Figure 8.3 shows the main themes, namely, Theme 1 - *Prevention and control for the effective RLM of consumer returns* (section 8.4), Theme 2 - *Service for the effective RLM of consumer returns* (section 8.5), and Theme 3 - *Cost for the effective RLM of consumer returns* (section 8.6). Additionally, the overlapping subthemes are illustrated, including *pitfalls and problems* (*subtheme 1*),

propositions (*subtheme 2*) and *profits* (*subtheme 3*). Moreover, a broad overview of each theme is provided, showing the (1) pitfall categories and problem categories, (2) main propositions and proposition categories, and (3) profit categories. To avoid repetition of explaining the pitfalls, problems, propositions and profits for each theme, the following should be noted for each subtheme:

- ***Pitfalls and problems (subtheme 1)***
  - The *pitfalls represent poor practices* that can hamper the effective RLM of consumer returns in online retailing.
  - The *problems represent* the *consequences* of the *pitfalls* (poor practices), which complicate the effective RLM of consumer returns
  - The pitfalls consist of *pitfall categories* (listed in Figure 8.3) and *related pitfalls,* which may consist of *pitfall elements* (not listed in the framework for simplification).
  - The *problems* include *problem categories* (listed in Figure 8.3) and *related problems* (not listed in the framework).
  - While a distinction can be made, the *pitfalls and related problems* (consequences) are *discussed concurrently* in the interview findings since the participants discussed the pitfalls and related problems concurrently in the interviews.
  - Corresponding *literature from chapters one and two* is identified (if applicable) in the discussions of each *pitfall category* and related *problems*.
  - The pitfalls and problems of each theme concludes with a *framework and summary of findings,* demonstrating the relationships between the pitfalls and problems.
- ***Propositions (subtheme 2)***
  - The propositions involve various proposition categories, practices and parameters that online retailers can implement to address the pitfalls/problems (subtheme 1) and realise profits (subtheme 3), contributing to the effective RLM of consumer returns in online retailing.
  - The *main propositions* of each theme consist of unique *proposition categories* related to the theme. All themes include '*parameters'* as a *proposition category*.
  - The *parameters* involve important factors that online retailers must consider for the effective implementation of the propositions.
  - The proposition categories include *key practices or key parameters* (not included in Figure 8.3 for simplification) that can be critical for the effective implementation of the proposition categories.
  - Some key practices/parameters consist of *key practice/parameter elements,* which can be important for the implementation of the respective key practice/parameter.
  - The *propositions can be linked*, meaning that certain key practices and parameters within the propositions must be implemented and/or considered for the effective implementation of the corresponding (linked) key practice/parameter.

- The propositions of all themes include *requirements* for implementation, representing *support RL practices* that can facilitate the implementation of the key practices/parameters.
- The interview findings were triangulated with the QCA of RL literature findings, which were presented as *support practices* in the discussions of the interview findings.
- As a part of the *literature integration*, the discussion of the interview findings contains *references to specific strategies* associated with the RL practices discussed *in chapter 6*, which will be added to the discussions of each key practice/parameter.
- Corresponding *literature from chapters one* and *two* is identified (if applicable) in the discussions of each key practice and key parameter.
- The propositions of each theme conclude with a framework and summary of findings. A *broad framework is illustrated*, demonstrating the links between the support practices, main propositions and proposition categories. The *summary of findings is presented in a table* (detailed framework), focusing on the proposition categories, key practices/parameters, support practices and linked proposition categories. Furthermore, numeric summaries for the key practices/parameters and proposition categories are provided to demonstrate the number of requirements (costs) per key practice/parameter and per proposition category.

- ***Profits (subtheme 3)***
  - The profits represent the *benefits or outcomes realised* through the successful implementation and consideration of the propositions.
  - The profits of each theme consist of *profit categories* (listed in Figure 8.3), *profit subcategories* and *related profits* (not listed in the framework for simplification).
  - The profits of all themes include *other theme profits* as a profit category, which can consist of profits related to prevention and control (theme 1), service (theme 2) and cost (theme 3).
  - Corresponding *literature from chapters one and two* is identified (if applicable) in the discussions of each profit.
  - The profits of each theme *exclude a framework* and *summary of findings* since no relationships between the profits are identified. However, the findings related to the profits are provided in the final framework of each theme.

Consequently, *each theme concludes* with an *overall framework, summary and analysis of findings*. Specifically, a *broad framework is illustrated*, which identifies the links between the profits/pitfalls, propositions and profits. Additionally, the most significant pitfalls, propositions and profits are highlighted. The *summary of findings* is presented in a *table* (detailed framework), focusing on the proposition categories, key practices/parameters and related pitfalls and problems addressed, and profits realised. Furthermore, the summary table provides columns giving an overview of the costs (total requirements, including the number of key practices/parameters and support practices identified

from the summary of findings from the propositions) versus the benefits (total benefits, including the number of addressed pitfalls and problems and realised profits) per key practice/parameter and proposition category. Including the cost versus benefits can be important since Anderson (2020:7) indicated that organisations find balancing the costs versus benefits challenging for effective RLM. Consequently, providing the costs versus benefits can help online retailers to effectively implement propositions for the effective RLM of consumer returns. Following the table, some practical examples are provided, demonstrating the application of the summary framework, which can help online retailers explore important factors for the effective RLM of consumer returns.

Essentially, the introduction and conclusion of each subtheme associate with the key points discussed in this section. Therefore, to eliminate repetition in the analyses and discussions of the different themes, reference to this section will be provided where applicable in the relevant sections of each theme. In the next section, the descriptive analysis for consumer return types and RL processes in online retailing is provided.

8.3 DESCRIPTIVE ANALYSIS FOR CONSUMER RETURN TYPES AND RL PROCESSES IN ONLINE RETAILING

The interviews with industry experts contained rich findings, covering most, if not all, of the consumer return types and RL processes discussed in the QCA findings of RL literature. This section provides a descriptive analysis that compares the findings from the interviews with industry experts with the findings from the QCA of RL literature (hereafter QCA findings). The aim of this section is not only to triangulate the QCA findings and interview findings but also to identify the consumer return types and RL processes that can occur in the online retailing industry of South Africa. Figure 8.4 provides an overview of the consumer return types, pre-receipt processes and post-receipt processes that will be compared between the interview findings and QCA findings.

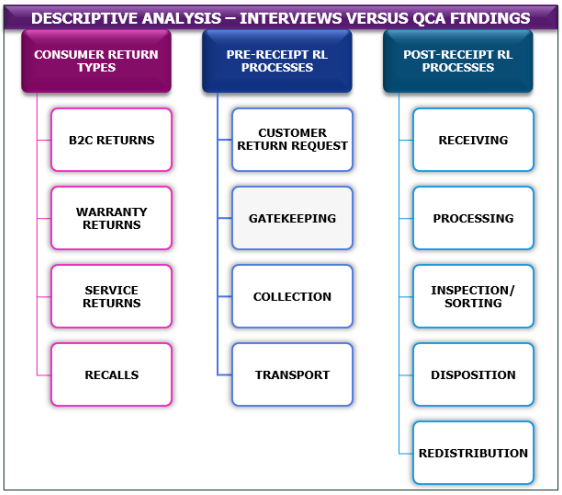

Figure 8.4 Descriptive analysis overview
Source: Compiled by the researcher

In the subsequent sections, the descriptive analysis for the consumer return types, pre-receipt RL processes and post-receipt RL processes will be presented and discussed.

8.3.1 Descriptive analysis for the consumer return types in online retailing

Consumer returns involve the return of products by consumers to the online retailer (or seller) for various reasons. The consumer return types identified in the QCA findings were discussed in section 4.3 and consisted of business-to-consumer (B2C) returns, end-of-use (EoU) returns, warranty returns, service returns and product recalls. The participants indicated that B2C returns are the most common return types in online retailing, with only a few mentioning warranties, service returns and product recalls. Due to the absence of legislation in South Africa that drives organisations to accept used product returns, the acceptance of EoU returns is uncommon in the online retailing industry of South Africa. Subsequently, the comparison excludes EoU returns and only focuses on the return types that correspond between the interview findings and QCA findings.

Table 8.1 provides an overview of the findings related to consumer returns in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings with supporting quotations from the interviews.

Table 8.1 Comparison between the QCA and interview findings of consumer returns

TYPES	CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
B2C	***Product condition***	New and unused	X	X	• "But those are essentially unwanted returns that are in perfect condition […]." (P1, operations manager, 3PRL provider firm) • "An example might be I might use reasons for returns such as […] dead-on-arrival […]." (P12, Head of logistics, online retailer) • "Look, the types of returns are diverse […] from incorrectly chosen products […]." (P7, owner, 3PRL provider firm) • "So, if, if the item is found to be in working condition and then […] it was actually just the consumer who purchased the incorrect product and didn't read that it's not compatible with the device, etc." (P5, general manager, online retailer) • "[…] with online more so than others, is that people buying it and they haven't tried it on in the store and they either find that the colour is wrong, or the sizing doesn't fit and." (P8, logistics manager, multichannel retailer) • "[…] the majority of our returns that we've had now are all buyer's remorse, I don't really need this product […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "We've got different reasons that the customers can select for returns […] So most common is, I've changed my mind, obviously, at being an online store, […]." (P3, returns manager, online retailer) • "The type of returns that we've identified […] in terms of the customer is not really happy with the colour […] the actual specifications of the products hasn't [sic] met his standard." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "So, you might well say this customer has returned […] Jimmy Choo stilettos, saying that as an unwanted item. In other words, they've decided that they know they don't want them […]." (P1, operations manager, 3PRL provider firm) • "However, also what happens is from a return perspective is that we deliver a product, and the customer hasn't actually ordered the product or there was a duplicate purchase order." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "We've got different reasons that the customers can select for returns. So one of them might be product defective or damaged." (P3, returns manager, online retailer) • "So, as we are actually not really in charge of quality of products […] So then obviously the quality side gets pushed into the supplier." (P3, returns manager, online retailer) • "Yes, and the reason for return […] you know it there is almost like a no questions asked return policy […]." (P8, logistics manager, multichannel retailer) • "[…] the consumer who purchased the incorrect product and didn't read that it's not compatible with the device, etc. […] The product is still in perfect condition. We can
		Defective upon arrival	X	X

Source: Compiled by the researcher

Table 8.1 shows that all consumer return types, except EoU returns, identified in the QCA findings can occur in online retailing. The findings for each consumer return type will be discussed in the subsequent sections.

8.3.1.1 Descriptive analysis for B2C returns

Most findings related to B2C returns *corresponded* between the interview findings and QCA findings. The participants confirmed that B2C returns in online retailing include products in new/unused or defective on arrival *conditions*. Furthermore, most *return reasons/causes* identified in the QCA

findings correspond with the interview findings, including the (1) consumer error reasons of order errors, false failures, problems experienced with products, buyer's remorse, change of mind, dissatisfaction and unwanted, (2) organisational error return reasons of wrong delivery, quantity issues, damaged or defective and quality issues and (3) other reason of lenient return policies. Specifically, the participants indicated that the most common consumer error return reasons include a change of mind and unmet expectations because of the inability to touch, feel and see the product in person. The participants added that product categories can play a role in the return reasons, for example, clothing can involve incorrect size and electronics incorrect specifications.

In terms of organisational error returns, damages and wrong deliveries are mostly prevalent in online retailing because of in-transit damages and the possibility of delivering incorrect orders or missing items in the order. However, the participants indicated that defects or dead-on-arrival products (i.e. products delivered in defective conditions) are often part of the return reasons provided by consumers. Finally, the participants confirmed that online retailers use the *disposition options* of reuse and repair for B2C returns. Corroborating the QCA of findings, the participants indicated that new/unused B2C returns can be resold as new on the website and defective or damaged products can be repaired.

In terms of the *differences* between the interview and QCA findings, the participants omitted supply and demand as a cause for B2C returns, indicating that South African online retailers may not accept season related returns. Additionally, the disposition option of refurbishment was not mentioned by the participants. In fact, refurbishment as a disposition option was omitted from the interview findings, indicating that South African online retailers and 3PRL providers are not directly involved in refurbishment activities. Instead, the participants indicated that organisational error return reasons, like defective or quality issues, are mostly pushed to the supplier, which associates with the exit (disposition) option of the ship to the vendor.

In section 4.3.1, a description, based on the QCA of RL literature findings, for B2C returns was proposed. Based on the findings of the descriptive analysis, B2C returns in online retailing will be redescribed as follows:

> B2C returns in online retailing involve consumers returning new/unused products in good or defective/damaged condition for various reasons, including (1) consumer errors (push returns), involving, order errors, false failure returns, problems with the product, buyer's remorse or a change of minds, dissatisfaction and unwanted products, (2) organisational errors (push and pull returns), involving wrong deliveries, inaccurate quantities, defective/damaged products and quality issues, and (3) other reasons, involving lenient return policies. Depending on the condition and return reasons, B2C returns can be directly reused, repaired or shipped to the supplier.

8.3.1.2 Descriptive analysis for warranty returns

Although a few participants mentioned warranty returns, Table 8.1 shows that most findings from the interviews *corresponded* with the QCA findings. The participants confirmed that warranty returns

include products in used and/or defective conditions that are returned because of product/quality failures, warranty claims, false failures and defects. For example, the participants confirmed that computers can be returned under warranty and repair can be an appropriate disposition option for warranty returns.

Regarding the *differences* between the interview and QCA findings, the participants excluded vehicles as a product type and refurbishment as a disposition option in warranty returns (see section 8.3.1.1). The participants (representing retailers and 3PRL providers) interviewed in this study were not involved in car sales (except car parts), which explains the omission of warranty claims for vehicles. Nevertheless, the participants expanded on the QCA findings by adding televisions as a product type, indicating that any electronic type of product can associate with warranty returns. Additionally, the participants identified ship to the supplier (vendor) and return to the consumer as exit options for warranty returns. Like B2C returns, defective warranty returns are pushed to the suppliers, indicating that South African online retailers prefer to send warranty claims to suppliers. In fact, apart from new/unused B2C returns, participants indicated that warranty returns are preferred by online retailers due to the ability to transfer RL costs and disposition to the suppliers.

Regarding the false-failure warranty claims, online retailers may inspect a product or assist a consumer telephonically to determine if the product is faulty as claimed by the consumer. If the warranty claim is invalid, the online retailer can return the product to the original consumer or avoid warranty return pickup if the consumer was assisted telephonically.

In section 4.3.3, a description for warranty returns was proposed based on the QCA of RL literature findings. Based on the interview findings for the descriptive analysis, warranty returns in online retailing can be redescribed as follows:

> Warranty returns in online retailing refer to consumers returning used or defective products (e.g. electronics, computers and televisions) under manufacturer warranty. Warranty returns can include various reasons, including product failures, quality failures, warranty claims, defects or false failures. Based on the reasons for warranty returns and the condition of the product, warranty returns can involve repair, ship to the supplier or return to the consumer as disposition/exit options.

8.3.1.3 Descriptive analysis for service returns

Only two participants mentioned *service returns* (product returns for service), which means that limited findings from the interviews *corresponded* with the QCA findings. In fact, Table 8.1 shows that the only corresponding findings between the interviews and QCA included the return reason/cause of service return request and the disposition option of repair. While the product types of computers, phones and cameras were not explicitly mentioned in the interviews, participants mentioned consumer electronics and devices, implying that any type of electronics and devices (e.g. computers, cameras, televisions, and tablets/mobile phones) can form part of service returns in online retailing.

Regarding the *differences*, the QCA findings identified "relatively good" and "used" as the product conditions of service returns, while the interviews identified "damaged" as the product condition of service returns. However, it can be argued that a repair request from a consumer means that the product was used and must still be in a relatively good reparable condition. For example, a consumer might request a service repair for a cracked screen of a cell phone, which can be still in a relatively good and used condition. In terms of the reasons for service returns, the QCA findings identified product failure and false failure, while the participants suggested damages as reasons/causes for service returns. This interview finding implies that service returns in online retailing exclude repairs for products in defective condition, which might be more appropriate for warranty returns. Nevertheless, the interview findings related to service returns are too limited for a definite conclusion about the product condition and return reasons/causes for service returns in online retailing. Finally, the interviews excluded vehicles as a product type in service returns because manufacturers or independent service centres for the manufacturers are mostly responsible for vehicle services.

In section 4.3.4, a description, based on the QCA of RL literature findings, for service returns was proposed. Based on the interview findings of the descriptive analysis, service returns in online retailing will be redescribed as follows:

> Service returns in online retailing involve consumers returning relatively good, used and damaged products (e.g. computers, cameras, cell phones or any electronic and device products) due to a repair service request and product damages, involving repair as a disposition option.

8.3.1.4 Descriptive analysis for recalls

Like service returns, Table 8.1 shows that a few participants discussed product *recalls* as a consumer return type in online retailing. However, the participants *confirmed* that recalls involve products in defective condition that are returned because of quality failures, defects and safety issues. Additionally, food was confirmed as a product type associated with product recalls in online retailing. For the *differences* between the QCA and interview findings, notifications and announcements were not mentioned by the participants during the interviews. However, plenty of examples of product recalls in South Africa, demonstrate that notifications and announcements can occur in online retailing. For example, South African grocery retailers, such as SPAR announced on their website that customers can return cold meat products for a full refund (SPAR, 2019).

Furthermore, the QCA findings contained various products that were not mentioned by the participants, including vehicles, pharmaceuticals, toys, baby products, household items, sport equipment and outdoor products. However, one participant added that online retailers selling electronic products might engage with the manufacturers about recalling specific electronic products associated with high volumes of defective returns. Although limited product types were mentioned in the interviews, recalls in South Africa can involve any product type that poses a risk of harm to the public. Therefore, online

retailers that stock pharmaceuticals, toys, baby products, home, sports and outdoor equipment might be involved in the recall of these products. Finally, the QCA findings included repair as a disposition option, while the interview findings included return to the supplier as an exit option. Therefore, like warranty returns, online retailers push the disposition of recalled products to the suppliers/manufacturers.

In section 4.3.5, a description for product recalls was provided based on the QCA of RL literature findings. Based on the findings of the descriptive analysis, product recalls in online retailing will be redescribed as follows:

> Product recalls in online retailing are consumer returns, initiated by online retailers or their suppliers (pull returns), which involve announcements/notifications to consumers about potential defects, quality failures and safety issues related to the consumption of certain products (e.g. electronics, toys, medicine, food, household goods or sports equipment). Online retailers issue refunds to the consumers and ship the recalled products to the manufacturer or supplier for disposition.

In the next section, the descriptive analysis for consumer returns in online retailing concludes with a descriptive analysis summary.

8.3.1.5 Descriptive analysis summary for consumer returns in online retailing

Clearly, several of the findings related to consumer returns corresponded between the QCA of RL literature and the interviews with industry experts. However, the biggest difference between the interview and QCA findings associated with EoU returns. As explained in section 4.3.2, EoU returns involve product upgrades, product exchange programmes and incentives for consumers to return used products (e.g. cell phones and computers) for an upgrade or refund. Some organisations operating in South Africa are implementing these programmes to reduce damages to the environment and raw material consumption. For example, Apple iStore in South Africa sells products online to consumers and offer trade-ins for used devices. Therefore, consumers are incentivised to request a trade-in return for a sales discount of a new product or store credit (Fox, 2023:22).

Ultimately, online retailers must be mindful of these environmentally and socially responsible practices from online sellers, paying attention to the possibility of EoU returns becoming the norm in the online retailing industry of South Africa. Accordingly, the description of EoU returns provided in section 4.3.2, must be considered by online retailers for socially and environmentally responsible RLM practices.

Based on the reformulated descriptions provided in section 8.3.1, Table 8.2 provides a data matrix, comparing the overlapping subcategories of the consumer return types in online retailing.

Table 8.2 Descriptive analysis matrix for common elements of consumer return types

Category	Subcategory	B2C	Warranty	Service	Recalls
Product condition	**Used**		**X**	**X**	
	Damaged	**X**		**X**	
	Defective	**X**	**X**		**X**
Reasons/causes	**False failures**	**X**	**X**		
	Product damage	**X**		**X**	
	Product defects	**X**	**X**		**X**
	Quality failures		**X**		**X**
Product type	**Electronics**		**X**	**X**	**X**
	Computers		**X**	**X**	
	Assorted	**X**			**X**
Disposition	**Repair**	**X**	**X**	**X**	**X**
	Ship to the supplier	**X**	**X**		**X**

Source: Compiled by the researcher

From Table 8.2, several observations can be made for each category. In terms of *product condition*, warranty and service returns can involve products in *used condition*, meaning that online retailers must focus on product protection for warranty and service returns. Additionally, B2C and service returns can involve products in *damaged condition*, indicating that online retailers must distinguish between the return of new/unused products in damaged condition and used products in damaged condition to identify the appropriate consumer return type. All product return types, except service returns, can include products in *defective condition*, indicating that online retailers must develop strategies to effectively handle products in defective condition.

For common *return reasons/causes*, both B2C and warranty returns can include *false failures*. Evidently, online retailers can consider improving product descriptions and collaborating with suppliers to improve product instructions to avoid false failure returns. Linking with the product condition, B2C and service returns entail *product damages* as return reasons, indicating that online retailers can reduce B2C and service returns through improved packaging and product care instructions. Similarly, *defects* can be a common return reason for B2C, warranty and product recalls, which means that online retailers must focus on effective procurement practices to reduce consumer returns. Likewise, improved quality control can help reduce warranty returns and recalls related to *quality failures.*

Regarding *product type*, all consumer returns, except B2C returns (if only warranty electronics are sold), can include *electronic products*. Therefore, online retailers that sell electronics must prepare for all types of consumer returns. Additionally, online retailers that sell *computers* must prepare for warranty and service returns and online retailers that sell *assorted products* must prepare for B2C returns and recalls for effective RLM. Finally, for the *disposition/exit options*, all consumer return types, except recalls, associate with *repair*, which demonstrates that online retailers must develop a product repair strategy for the effective disposition of consumer returns. Likewise, all consumer return types, except service returns, associate with the exit option of *ship to the supplier*, emphasising that online retailers must focus on supplier agreements, integration and relationships to effectively manage consumer returns.

In the next section, the descriptive analysis for the pre-receipt RL processes in online retailing will be provided.

8.3.2 Descriptive analysis for pre-receipt RL processes in online retailing

Pre-receipt RL processes in online retailing start when a consumer notifies the online retailer of a return and ends before the online retailer receives the product at a facility. The pre-receipt RL processes identified in the QCA findings were discussed in section 4.4, including customer return request (CRR), gatekeeping, collection and transportation. All the pre-receipt processes identified in the QCA findings aligned with the interview findings, indicating that pre-receipt RL processes in online retailing involve CRR, gatekeeping, collection and transportation. The descriptive analysis for each pre-receipt RL process will be provided in the subsequent sections.

8.3.2.1 Descriptive analysis for the customer return request (CRR) process in online retailing

In section 4.4.1, the QCA findings for the CRR process (i.e. consumer requesting a return from the online retailer) was presented and discussed. The findings between the QCA and interviews mostly corresponded for the CRR process. However, the participants provided more detailed information on the CRR process, which supplemented the QCA findings. Table 8.3 provides an overview of the findings related to the CRR process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.3 Comparison between the QCA and interview findings for the CRR process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Starts with the consumer**	X	X	•"Well, the processes that take place, look, it starts right at the beginning, obviously, from the from the interaction point of view […]." (P7, owner, 3PRL provider firm) •"Ok, so obviously, the customer gets it, they don't like it […] our customer service will log that return." (P13, supply chain manager, multichannel retailer) •"We've got different reasons that the customers can select for returns. So one of them might be product defective or damaged." (P3, returns manager, online retailer) •"And it's the administrative cost of supporting the logging of the return on some system or the call taking off that system." (P2, owner, supply chain consultancy firm) •"[…] the customer gets it, they don't like it. They will kind of log a return and that kind of goes through our CRM system." (P13, supply chain manager, multichannel retailer) •"So, when a customer logs a return, they obviously need to take a photo of an item, a picture of something as like that person can see that item has been used. It obviously it gets declined right away […] But I also think that's a great, just generally speaking, you must have a very clear returns policy on it." (P3, returns manager, online retailer) •"If a customer wanted to return and they would click onto a link […] It would trigger the collection […]." (P1, operations manager, 3PRL provider firm) •"So mostly with this type of situation, the credit or the refund is processed at the time the consumer logs the return and the online sales system." (P2, owner, supply chain consultancy firm) •"This is what the customer said it was, but on inspection, this is actually what it looked like." (P1, operations manager, 3PRL provider firm)
	Initial RL process	X	X	
	Recognition of a product return	X	X	
	Important	X		
	Involves costs		X	
	Involves technology		X	
	Relates to return reasons	X	X	
	Relates to return policy		X

	Retailers	**X**	**X**	

Source: Compiled by the researcher

Table 8.3 shows that almost all subcategories of the CRR process identified from the QCA corresponded to the interview findings. In the subsequent paragraphs the similarities and differences between the QCA and interview findings for the characteristics, activities, methods and parties of the CRR process will be provided.

- *Characteristics of the CRR process in online retailing*

Most of the characteristics identified in the QCA findings were *confirmed* by the interview findings. Specifically, the participants confirmed that the CRR process is the *first RL process* in online retailing, *starting with the consumer* and *recognition of a product returns*. Furthermore, participants confirmed that the CRR process relates to *return reasons*. Consumers provide the reason for the return at the time of the request, which means that online retailers can provisionally determine the product condition and return type. Like the QCA findings, the CRR process in online retailing can link with other RL processes, including processing and inspection. Particularly, the participants indicated that online retailers could *process a refund or credit* at the time of the CRR, implying that some online retailers trust consumers and perform early processing before return receipt. Additionally, like the QCA findings, participants indicated that the return reasons provided by consumers at the time of the request is verified during *inspection*, linking the CRR and inspection process.

While the interview findings confirmed most of the QCA findings, the *characteristics* included several *differences.* Specifically, the QCA findings indicated that CRR can be characterised as an *important process*, which was not mentioned in the interview findings. Nevertheless, it can be argued that the CRR process can be a significant RL process because the consumers provide online retailers with important information about the product condition and return reasons, which may enhance product return visibility. The participants added several new characteristics to the CRR process, extending the QCA findings. Particularly, the CRR process can *involve costs*, including communication costs (e.g. telephonic costs) and administration costs for supporting the CRR process. Furthermore, participants added that the CRR process can *involve technology*, like a CRM (customer relationship management)

system. Therefore, online retailers can integrate their web-based system with other IT systems to support the CRR process. Additionally, participants mentioned that the CRR process relates to the *return policy*. For example, the return policy might state that defective/damaged return reasons must be accompanied by photos as proof, which means that the CRR process must be adapted for uploading pictures.

Finally, the participants extended the links between CRR and other RL processes by including gatekeeping and collection. The link between CRR and *gatekeeping* relates to the provision of proof of the condition of a product during return logging. Subsequently, the online retailer can gatekeep the return based on the evidence or lack thereof provided by the consumer during the CRR. The involvement of technology demonstrates the linkage between CRR and *collection* since the system use by the online retailer can automatically trigger the collection process. For example, automatically sending the collection instruction to the driver or courier partner as soon as the return request is accepted.

- *Activities, methods and parties of the CRR process in online retailing*

All the activities identified in the QCA findings *correspond* to the interview findings. Therefore, the CRR process in online retailing involves communication, capturing of return reasons, reviewing the return request, early assessment of product condition and pre-return authorisation or rejection. Additionally, the participants *added activities* that can occur in the CRR process, including acknowledging the request and requesting evidence. While *acknowledging the request* can be part of the communication activity, the QCA findings mostly indicated that the communication comes from the consumer. Contrastingly, participants indicated that acknowledging the request can be an important activity from the online retailer since it can reduce consumer uncertainty. Relating to the return policy and gatekeeping characteristics of CRR, the participants added the *request and provision of evidence* activity to the CRR process.

The interviews findings produced a *new category* for the CRR process, which was not identified in the QCA findings. Several participants discussed *methods* of CRR, including online CRR, call centre CRR and email CRR. Therefore, online retailers can offer consumers with several options of CRR logging, either through an online return portal on the website, telephonically with a call centre agent or electronically via an email. Finally, both the QCA and interview findings *corresponded* with the *parties* involved in the CRR process, including consumers and online retailers. While the roles of consumers and online retailers corresponded with the QCA findings, the additional activities identified by participants extended the roles of consumers and online retailers. Apart from logging the return, communicating with the online retailer and providing return reasons, consumers can also be responsible

for providing evidence. Additionally, the online retailer can be responsible for acknowledging the request and requesting for supporting evidence in conjunction with assessing the request, communicating the outcome of the assessment and accepting or rejecting the return request.

Essentially, the interviews produced valuable new findings to a RL process that was understudied in the QCA of RL literature (see section 4.4). Based on the interview findings from the descriptive analysis, the description provided for the CRR process from the QCA findings (in section 4.4.1.3), can be reformulated as follows:

> The CRR process of consumer returns in online retailing can be described as the first pre-receipt RL process, starting with a consumer and the recognition of a product return. The CRR process involves costs and technology, relates to the return reasons and the return policy, and links with the gatekeeping, collection, processing and inspection processes. The CRR process involves methods and activities related to information flows, including online, telephonic or electronic communication, acknowledging of the return request, recording of return reasons, requesting and providing evidence, reviewing the request, initial assessment of product condition and pre-return authorisation or rejection, which can be performed by the consumer and online retailer.

In the next section, the descriptive analysis for the gatekeeping process in online retailing will be provided.

8.3.2.2 Descriptive analysis for the gatekeeping process in online retailing

In section 4.4.2, the gatekeeping process (i.e. determining if the product return is valid) was discussed based on the QCA findings. Several findings between the QCA and interviews corresponded for the gatekeeping process. Table 8.4 provides an overview of the findings related to the gatekeeping process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.4 Comparison between QCA and interview findings of the gatekeeping process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Entry point of RL**	X	X	•"[…] so, it's better obviously to have the gatekeeping function at the start of it. […] And the person will log a return and say, look, it's defective or damaged. So then you have that gatekeeping function at the point where the person logs their return to say, look, we're not accepting it. It's out of our policy." (P3, returns manager, online retailer) •"So, you could implement a verification process, which is the gatekeeper. […] So there you would need verification at collection point […]." (P4, owner/CEO, 3PRL provider firm) •"And then when it proceeds through the authorization, you then into now have to arrange for collection." (P1, operations manager, 3PRL provider firm) •"So, your returns policy is translated into online functionality. So if I wanted to add something your system knows when I bought it, it knows what the rules are for the particular reason I'm returning it as. And that you said that that authorisation piece doesn't need human interaction." (P1, operations manager, 3PRL provider firm) •"They will then take the reason for the return and match it up with the actual product to see whether or not it is right or wrong or whether it meets the criteria. It will log it then and then that information will be fed back to the customer care department to validate that, that is the original reason for return. The customer care department will then make contact with the client to see whether or not there is a credit eligible […]." (P12, Head of logistics, online retailer) •"So that's why the evaluators they can look at an item, and for instance, if you return the cell phone with a cracked screen and you say, I've changed my mind, like the evaluators should know that you're not allowed to do that. Or if you return a gaming disk that has already been opened according to our policy, you're not allowed to do it. So, it's important because that obviously keeps the fact that people will return anything down to saying like okay cool, they are actually checking what the people are returning and making sure that they are returning it for valid reasons." (P3, returns manager, online retailer)
	Identify if a product is allowed	X	X

Source: Compiled by the researcher

Table 8.4 shows that most subcategories of the gatekeeping process identified from the QCA corresponded to the interview findings. In the subsequent paragraphs the similarities and differences between the QCA and interview findings for the characteristics, activities, facilities/locations and parties of the gatekeeping process will be provided.

- *Characteristics of the gatekeeping process in online retailing*

Several characteristics identified in the QCA findings were *confirmed* by the participants. The participants agreed that gatekeeping can be the *entry point for RL*, which relates to the acceptance or rejection of a product return. While gatekeeping can be conducted in conjunction with the CRR process, the gatekeeping process ultimately decides if the *return can be allowed* in terms of authorising the return for collection and authorising the refund. Furthermore, the participants confirmed that the gatekeeping process is *based on the return policy*, meaning that the legitimacy of the return can be determined from the product return conditions stipulated in the return policy. In terms of the *links between gatekeeping* and other *RL processes*, the participants verified that the gatekeeping process can link with the collection, processing, inspection and sorting processes. The link between gatekeeping and *collection* relates to the verification process at the point of collection, the link between gatekeeping

and *inspection* refers to the inspectors validating the return, and the link between gatekeeping and *processing* relates to the acceptance/rejection of a refund or credit. As suggested in the QCA findings, gatekeeping can take place before or after a return arrives at the facility. Accordingly, early gatekeeping before the return arrives establishes a link with collection, while post-return gatekeeping establishes links between the gatekeeping and processing and inspection processes. Similarly, the link between gatekeeping and *sorting* associates with the sequence of RL processes in the facility, for example, once the legitimacy of the return is verified and gatekeeping is completed, the sorting process commences.

Regarding the *dissimilarities*, the participants added to the QCA findings by including *technology* as a part of the gatekeeping process. Specifically, the online retailer's web-based system can perform early gatekeeping by determining the basic legitimacy of the return (e.g. the return is within the return time window based on the order date). Additionally, online retailers or third parties might use other IT systems to facilitate the gatekeeping process. Regarding the *links between the gatekeeping* and other processes, the participants *added* the *CRR process* since gatekeeping can take place during the CRR processes. In contrast, the participants *excluded* the link between gatekeeping and *disposition process*. The disposition process takes place after sorting, which separates gatekeeping and the disposition process.

- *Activities of the gatekeeping process*

All the activities identified in the QCA findings were *corroborated* by participants. Evidently, participants agreed that gatekeeping entails the screening of product returns, decision making, return authorisation and communication. As discussed in section 4.4.2, *screening of product returns* involves the identification of the legitimacy of a product return. The participants indicated that screening can be conducted either manually by call centre staff or through a system, linking with the CRR methods of telephonic return logging and online (self-service) return logging. Based on the screening activity, the staff member or system *makes the decision* to *authorise* (or reject) the product return, which can be telephonically or digitally *communicated* to the consumer. However, the participants *extended* the activities of the gatekeeping process by including *verification* and *return rejection*. The gatekeeper can verify the product return against the purchase order to determine the validity of the product return. Consequently, if the product return is illegitimate, *return rejection* will take place instead of return authorisation.

- *Facilities and parties in the gatekeeping process*

The most significant differences between the QCA findings and the interview findings relate to the *facilities/locations* used for gatekeeping. While the QCA findings included centralised return centres (CRCs) as facilities to perform gatekeeping, the participants indicated that gatekeeping can be performed at a centralised facility. Subsequently, the specific type of facility (either a combined central warehouse or CRC) used for gatekeeping was unclear in the interview findings. Regardless, both the QCA and interview findings suggested that gatekeeping could be performed at a central location. Regarding *differences*, the QCA findings included *retail stores* for gatekeeping, while the participants mentioned *collection points* for gatekeeping. Although this study focusses on the online channel, multi/omnichannel retailers that sell products online might use stores as collection points and subsequent gatekeeping activities. However, online-only retailers can establish gatekeeping virtually, perform it at the collection point (i.e. consumer residence) or in a centralised or decentralised facility. Consequently, the participants added that gatekeeping can take place at *decentralised locations* in smaller facilities/hubs. Lastly, the interviews excluded processing facilities as a facility type used by online retailers for RL processes. Resultingly, processing facilities as a subcategory is excluded from the gatekeeping process in online retailing.

Finally, the participants *reinforced* that the parties in the gatekeeping process can include *consumers*, *retailers* and *third parties*. Like the QCA findings, the interview findings indicated that the consumer plays a secondary role in the gatekeeping process by waiting for the outcome of return acceptance or rejection. Oppositely, online retailers can perform all gatekeeping activities, including screening, decision making, authorisation or rejection and communication. Alternatively, a third party, like a 3PRL provider, can play a primary role in gatekeeping if the online retailer outsourced the RL process. The QCA findings included *suppliers* as a potential party involved in the gatekeeping process, which was *excluded* from the interview findings. Consequently, online retailers perform gatekeeping regardless of the potential involvement of the supplier in the disposition process.

Essentially, most characteristics, activities and parties of the gatekeeping process aligned between the QCA findings and interview findings. Based on the interview findings from the descriptive analysis, the description provided for the gatekeeping process from the QCA findings (in section 4.4.2.4), can be reformulated as follows:

> The gatekeeping process of consumer returns in online retailing can be described as the entry point of the RL process to determine if a product return is allowed based on the return policy. The gatekeeping process involves technology and links with other RL processes, including CRR, collection, processing, inspection and sorting processes. Gatekeeping can be performed virtually before returns are received and/or physically at the collection point, centralised facility or decentralised facility. The online retailer (or its outsourced 3PRL provider) performs the gatekeeping activities of screening, verification, decision making, return authorisation or rejection and communicating the outcomes to the consumers.

In the next section, the descriptive analysis for the collection process in online retailing will be provided.

8.3.2.3 Descriptive analysis for the collection process in online retailing

In section 4.4.3, the collection process was presented and discussed based on the QCA findings. While the interviews mostly confirmed various subcategories from the QCA findings, the interview findings produced several additional subcategories. Table 8.5 provides an overview of the findings related to the collection process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Source: Compiled by the researcher

Table 8.5 shows that several subcategories identified for the collection process corresponded between the QCA and interview findings. In the subsequent paragraphs the similarities and differences between the QCA and interview findings of the characteristics, activities, methods, facilities/locations and parties of the collection process will be provided.

- *Characteristics of the collection process*

Various characteristics of the collection process identified from the QCA findings were corroborated by the interview participants. Specifically, the participants agreed that the collection process in online retailing entails the *availability*, *possession* and *retrieval* of product returns. Since products must be collected from consumers in online retailing, availability can be important for the collection process. The driver can only take possession and retrieve the product if the consumer is available during collection. Furthermore, the participants confirmed that the collection process *involves costs*, which can associate with the *product condition* and *return reason.* For example, if the product was delivered damaged and the return reason is damaged on arrival, the online retailer can be responsible for the collection costs.

Participants supported the QCA findings in terms of the *links between the collection process* and gatekeeping, transportation, processing and inspection processes. Particularly, collection links with gatekeeping if the collection party performs gatekeeping. Additionally, the participants reaffirmed the strong link, identified in the QCA findings, between the collection and transportation process with both processes sharing several characteristics, activities, parties and facilities (see section 8.3.2.5). Some participants indicated that a refund or credit can be issued at the time of collection, which links the collection and processing process. Similarly, inspection can be performed by the collection party, which establishes a link between collection and the inspection process.

Despite the similarities, a few *differences* existed between the QCA and interview findings related to the collection process. The participants *added* that the collection process involves *time* and *technology*.

Collection time can be important in online retailing since the collection party must collect the product from the consumer at a scheduled time. Additionally, the collection process can involve the use of technology, for example, using devices and systems for electronic signing of the waybill. Moreover, the participants added the link between collection and the CRR process, relating to the return logging system triggering the collection process (section 8.3.2.1). Nevertheless, the participants omitted a few characteristics, including the characteristics labelled as the start of RL, depends on product type, linked with sorting and linked with the disposition process. In general, scholars adopt a narrow view of the RL process by regarding collection as the *first RL process* (see section 4.4.1), which was contradicted by all participants in the study, describing CRR as the initial process in online retailing. However, collection can accurately be considered as the first RL process that involves product flows since the CRR and gatekeeping processing mostly involve information flows.

The participants excluded the *product type* from the collection process since the type of product might play a bigger role in the transportation process in terms of vehicle size and transportation costs. The *sorting* process was mentioned less often during the interviews and like the disposition process was mentioned as part of later RL processes, taking place in the facility. From the QCA findings the link between the collection and *disposition process* relates to an early disposition decision making at the collection point. However, in the collection process for online retailers, the participants excluded any reference to disposition decisions and subsequently the disposition process.

- *Activities and methods in the collection process*

Almost all the *activities* identified in the QCA findings *corresponded* with the interview findings. The participants confirmed that the collection process in online retailing involves *loading of vehicles*, *handling*, *shipment* and *movement*. Therefore, the consumer hands the parcel to the driver, who moves the product, loads it onto the vehicle, ships it and delivers it to the next destination. However, the participants *excluded* the *storage* activity from the collection process because collection takes place at the consumer location without the need for storage.

Instead, the participants *added* several *activities* to the collection process in online retailing, including arranging, booking, notification, verification, signing and documentation. Arranging and booking activities take place before collection, which were excluded from the QCA findings since RL literature mostly focused on activities during or after collection. In terms of *arranging collection*, participants described the activity as giving an instruction to a courier and/or assigning a driver. *Booking a collection* can involve contacting the consumer to book a date for the collection. Additionally, on the day of the collection the driver can *notify* (or remind) the consumer about the scheduled collection time planned for that day. Once the driver arrives at the consumer's residence, *verification* can take place,

which involves matching the waybill against the request. If the waybill matches, *signing* and *documentation* can take place. However, signing can be done electronically through tablets or cell phones, which reduces paperwork and documentation. Consequently, the participants added new insights into the activities that can take place in the collection process.

Regarding the collection *methods,* the participants *confirmed pick-up* and *drop-off collection* as options in online retailing. Online retailers can provide consumers with two options, including home pick-up collection or drop-off collection at a collection/drop-off point (e.g. convenience store). Multichannel retailers can offer online shoppers an in-store drop-off collection option. In contrast to the QCA findings, the use of *post collection* was *omitted* from the interview findings. Unlike more developed countries, South Africa's postal system is unreliable and slow, which makes it an unviable collection method for online returns. Additionally, the high availability of good couriers in South Africa makes postal collection for online returns almost obsolete. Therefore, from a South African perspective, online retailing involves two collection methods.

- *Facilities/locations and parties in the collection process*

Several *facilities/locations* identified in the QCA findings *corresponded* to the interview findings. For instance, the participants confirmed that *retail stores, collection points, warehouses* and *distribution centres (DCs)* can be associated with the collection process. For multi/omnichannel retailers drop-off collection can occur in retailer stores, while online-only retailers can use collection/drop-off points for the drop-off collection. However, consumer locations can also be classified as collection points for pick-up collection. Warehouses and DCs are first-tier facilities that receive the collected products from the collection points to conduct post-receipt RL processes.

Regarding the *differences* in the findings, participants *added RL facilities* and *fulfilment centres* to the collection process. RL facilities might represent a specific return centre established by the online retailer for the purpose of handling returns separately from forward operations. Fulfilment centres can be the facilities of 3PL providers or couriers, tasked at collecting product returns before shipment to the online retailer's location. However, several facilities identified in the QCA were *excluded* from the interview findings, namely *collection, inspection* and *disassembly facilities*. While the QCA findings included various facilities for RL processes, dedicated facilities like collection, inspection and disassembly facilities are not used by online retailers (in South Africa), explaining the omission of these facilities from the interviews. Accordingly, these facilities will be excluded from the description of the collection process.

Finally, *all the parties* identified in the QCA findings *corresponded* with the interview findings. Evidently, the participants agreed that *consumers*, *retailers* and *third parties* are involved in the collection process. Based on the activities, the consumers can be responsible for drop-off collection, product handling and signing of the waybill (for pick-up collection). Retailers (both online-only and multi/omnichannel retailers) can be responsible for arranging and booking collection if third parties are used for product return collection. If online retailers use in-house transportation, their responsibilities will be extended to notifying, loading, handling, shipping, moving, delivering, verifying and documenting. Alternatively, third parties will perform these collection activities on behalf of online retailers.

Essentially, the interviews produced several new findings, especially for the activities in the collection process. Based on the interview findings from the descriptive analysis, the description provided for the collection process from the QCA findings (in section 4.4.3.5), can be reformulated as follows:

> The collection process of consumer returns in online retailing can be described as the start of product flows in the RL process, involving costs, time, technology, availability, retrieval and possession of products. Collection can be based on the product condition and return reasons and linked with various pre- and post-receipt RL processes. The collection process can include pick-up and drop-off collection methods and involve various activities, including the information flow activities of arranging, booking, notifying, verifying, signing and documenting, and product flow activities of handling, moving, loading, shipping and delivery. The collection activities can be performed by consumers, retailers and/or outsourced third parties at retail stores, collection points, warehouses, DCs, fulfilment centres or RL facilities.

In the next section, the descriptive analysis for the final pre-receipt RL process of return transportation in online retailing will be provided.

8.3.2.4 Descriptive analysis for the return transportation process in online retailing

In section 4.4.4, the return transportation process was presented and discussed based on the QCA findings. In the QCA findings the return transportation process represented pre-receipt (i.e. transportation from the consumer to the facility) and post-receipt transportation (i.e. transportation from one facility to another). The focus of the interview findings was mostly on pre-receipt transportation or at least initial transportation in the return process. Post-receipt transportation that relates to the exit of returned products (e.g. shipment of returned products to third-party buyers) was included in the redistribution process due to a lack of findings (section 8.3.3.6). Despite the focus shift, several subcategories identified in the QCA findings corresponded with the interview findings.

Table 8.6 provides an overview of the findings related to the return transportation process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.6 Comparison between QCA and interview findings of the return transportation process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Important**	X	X	•"Well, the typical reverse logistics obviously transports number one […]." (P11, Demand and sales manager, FMCG distributor) •"I think when it comes to like transporting your goods to and from the warehouse and you know getting a courier to go and collect your parcels from the customers and making sure it gets delivered and all of that." (P3, returns manager, online retailer) •"[…] some of the bigger retailers might use their own fleet for picking up returns […]. But I think a lot of the other retailers obviously use third parties." (P13, supply chain manager, multichannel retailer) •"[…] transport costs per parcel, per cube, per route. What is our expensive routes versus the non-expensive routes?" (P6, logistics manager, multichannel retailer) •"[…] then it's the cost of the actual transportation, then it's the cost of offloading that vehicle at the site, it's being returned to." (P2, owner, supply chain consultancy firm) •"[…] a return would work the same as a delivery, really, because if you've got a job to take something from Cape Town to Port Elizabeth and drop it there, it really is the same as picking it up there in Port Elizabeth and sending it back to Cape Town you would use the same network." (P13, supply chain manager, multichannel retailer) •"[…] the first one is the turnaround time from collection. The second one is the time it takes from when the driver delivered it to the DC […]." (P5, general manager, online retailer) •"We have outsourced because to own our own fleet of transport will result in us underutilising some transport." (P8, logistics manager, multichannel retailer) •"I don't have scale in returns […] Therefore, [return transportation] it's outsourced […] it becomes part of the courier's greater scale." (P6, logistics manager, multichannel retailer) •"And often when the product is returned, there could be a quality defect that arises in the returns process, not necessarily in the delivery process." (P2, owner, supply chain consultancy firm) •"[…] your Jimmy Choo stilettos, saying that as an unwanted item. […]. But when they arrive, they've come through the courier network and head over heels, snapped off." (P1, operations manager, 3PRL provider firm) •"[…] the driver that currently collects your parcel, […] drop it in the van, and they go back to the DC. They give it to the returns clerk." (P5, general manager, online retailer) •"[…] collecting and transferring and processing." (P5, general manager, online retailer) •"[…] is defective. We need to send it back for credit. And then […] they send the courier to come and collect it or we send a courier to go and deliver the parcel with the defective items in it." (P3, returns manager, online retailer) •"[…] once they've delivered it to the to the distribution centre for evaluation." (P5, general manager, online retailer) •"E retailer […] send a courier, a reverse logistics company to fetch it, to deliver and bring it back? Redeliver it." (P7, owner, 3PRL provider firm)

Source: Compiled by the researcher

Table 8.6 shows that several subcategories assigned to the return transportation process corresponded between the QCA cand interview findings. In the subsequent paragraphs the similarities and differences between the QCA and interview findings for the characteristics, activities, facilities/locations and parties of the return transportation process will be provided.

- *Characteristics of the return transportation process*

The participants *supported* several characteristics of the return transportation process identified in the QCA findings, including that transportation (1) is important, (2) involves product return flows between locations options, decisions and costs, (3) lacks economies of scale, (4) requires efficient handling, and (5) links with other RL processes. Subsequently, the participants indicated that return transportation is an *important process* that involves *product return flows between locations*. Furthermore, transportation can involve *options* and *decisions,* which relates to private-fleet or contract-fleet transportation. Therefore, online retailers must choose between in-house and outsourced transportation for the movement of product returns. Additionally, transportation *involves costs* that associate with the physical movement of the products between locations, for example, vehicle costs, fuel costs, labour costs. service costs and courier fees. The costs of transportation can be attributed to the *lack of economies of scale* due to lower product return volumes. The participants suggested that the transportation options/decisions can be influenced by economies of scale. For instance, a multichannel retailer with lower online sales and subsequent lower return volume can choose to outsource the transportation process for greater scale.

Like the QCA findings, the participants indicated that return transportation *requires efficient handling* since returned products can be damaged or become defective while being transported to the facility. In terms of the RL processes, both the QCA findings and interview findings included the *links between transportation* and the *collection*, *receiving*, *processing*, *inspection*, *disposition* and *redistribution* processes. Since collection takes place at the consumer's location or at a drop-off location, transportation to the facility is required. The receiving process involves the arrival and acceptance of the returned product from the driver, which links the transportation process with the receiving process. Additionally, the transportation process can sequentially link with the processing of credits/refunds, inspection and disposition processes. The link between the return transportation and the redistribution process relates to the collection and transportation of a returned product to the online retailer's facility and the redelivery of a new or recovered product to the original consumer.

Despite the similarities between the QCA and interview findings, the characteristics of the return transportation process involved several *differences.* For instance, the QCA findings describe the transportation as c*omplex, lacking economies of distance, requiring equipment* and *linking with the*

sorting process, which were excluded from the interview findings. The exclusion from complexity and requirement of equipment can associate with the use of couriers or 3PLs for return transportation. Therefore, online retailers might be less concerned about the complexity and equipment requirements in return transportation. Likewise, economies of distance might be less important if third parties are tasked with return transportation. As indicated in the gatekeeping and collection processes (sections 8.3.2.2 and 8.3.2.3), few participants discussed sorting as a RL process, which impacted the links between sorting and other RL processes.

Nevertheless, *several new characteristics* of the return transportation process were identified in the interview findings, including involvement of time, routes and networks, and influenced by organisation size, return volume and product condition. Participants indicated that the transportation process forms part of the return lead time, which can be used to measure RL process efficiency. The transportation process can also *involve time* if longer distances must be travelled between locations. Additionally, the transportation process *involves routes* and *network*s, which can associate with calculating the best route to reduce transport costs and using the forward distribution network (i.e. facilities/locations and infrastructure) for the transportation of returned products.

Several participants mentioned *factors that can influence the transportation process*, including the size of the retailers, product return volume and product condition. For instance, *larger online retailers* might perform transportation using a private fleet, while *smaller online retailers* might outsource return transportation. Likewise, *product return volume* can influence the decision to outsource transportation to third parties. Particularly, retailers with lower return volumes might find it more cost effective to outsource transportation for scale advantages. The *product condition* can influence the destination of return transportation, for example, defective products might be transported to recovery facilities instead of the warehouse for restocking. Subsequently, the participants added several new findings, which can extend the description of the transportation process in online retailing.

- *Activities, facilities and parties in the transportation process*

Most transportation *activities corresponded* between the QCA and interview findings, including *movement, shipping, transfer, delivery, handling, unloading* and *consolidation*. Therefore, the participants reemphasised that transportation involves the physical flows of returned products to a from locations. However, the participants *excluded loading* and *storage activities* from the transportation process. The participants added loading to the collection process and mentioned the storage activity as part of the post-receipt RL processes, taking place in the facilities. Therefore, in-transit storage was excluded as an activity in the transport process for consumer returns in online retailing.

Limited facilities corresponded between the QCA and interview findings, mainly because fewer types of facilities were mentioned in the interview findings. However, participants agreed that *retail stores, CRCs, warehouses, DCs* and *recovery centres* can be included as facilities/locations in the transportation process. Retail stores can be used for drop-off collection (section 8.3.2.3), which might involve the transportation of returned products from the store to a central facility (i.e. CRCs). Additionally, online retailers can use basic facilities, like warehouses and DCs as destination facilities for pre-receipt transportation. Alternatively, the destination facility can be a recovery facility for the treatment of defective/damaged products, emphasising the influence of product condition and link between the transportation and disposition process.

The QCA findings included various origin and destination facilities in the description of the transportation process, including *collection facilities, processing, inspection, disassembly, repair facilities* and *service centres,* which were *excluded* from the interview findings. While these facilities might be associated with the transportation process of consumer returns in online retailing, the participants mentioned these facilities to a limited extent. However, the participants *added RL facilities* and *fulfilment centres* as facilities in the transportation process. Despite the differences between the facility types, both QCA findings and interview findings included first- and second-tier facilities and centralised and decentralised locations as part of the transportation process for consumer returns.

Finally, the interview findings confirmed the QCA findings in terms of the parties involved in the transportation process. Participants agreed that *consumers* play secondary roles by representing the point-of-origin in the RL process or possibly perform initial transportation to the collection points/retailer stores. Additionally, the participants confirmed that *retailers* or *third parties* can perform return transportation activities, depending on the use of private or contract fleets. While the use of a private fleet might exclude third parties from the RL process, online retailers that outsource RL can still be involved in the transportation process in terms of paying transportation costs, contracting third parties, measuring third-party performance and receiving the returned products from the 3PL/courier at the facility.

Essentially, the descriptive analysis for the transportation process highlighted several similarities and differences between the QCA findings and interview findings. Consequently, the description created for the transportation process from the QCA findings in section 4.4.4.5 can be reformulated as follows:

> The transportation process of consumer returns in online retailing can be described as important, involving product flows between locations, options, decisions, cost, time, routes and networks, lacking economies of scale and requiring efficient handling. The transportation process can be influenced by organisation size, return volume and product condition and can link with various pre-and post-receipt RL processes. Transportation includes several product flow activities, including the movement, shipment, transfer, unloading, handling, delivery and consolidation of returned products from the point-of-origin (consumer) to the point-of-recovery (online retailer/third parties, first-tier and second-tier facilities).

In the next section, the descriptive analysis summary for the pre-receipt RL processes will be provided.

8.3.2.5 Descriptive analysis summary of the pre-receipt RL processes in online retailing

Based on the reformulated descriptions provided in section 8.3.2, Table 8.7 provides a data matrix, comparing the overlapping characteristics, activities, facilities/locations and parties of the pre-receipt RL processes in online retailing.

Table 8.7 Descriptive analysis matrix for common elements of pre-receipt RL processes

Source: Compiled by the researcher

From Table 8.7, several observations can be made for each category. For the *characteristics*, *costs* are associated with all pre-receipt processes, except gatekeeping. Therefore, online retailers must identify strategies to control and reduce RL costs in the pre-receipt RL processes. Likewise, all pre-receipt RL processes, except gatekeeping, involve *technology*. Therefore, online retailers can benefit from using technology and systems in the pre-receipt RL processes of consumer returns. CRR and gatekeeping processes relate to the *return policy*, which means that return conditions from the return policy must guide CRR and gatekeeping activities. Furthermore, the CRR and collection processes associate with *product return reasons*. Evidently, online retailers must focus on the consumer return types and reasons for effective execution of the CRR and collection processes. Similarly, the collection and transportation processes relate to *product condition*, meaning that online retailers can consider the condition of the returned product for appropriate return collection and transportation processes. Moreover, both

collection and transportation involve *time*, which means that online retailers need to focus on speed and efficiency for the effective execution of return collection and transportation processes.

Regarding the *links between the RL processes*, the *CRR, gatekeeping* and *collection* processes are all *linked,* which implies that online retailers must integrate the CRR, gatekeeping and collection processes to effectively manage consumer returns. Likewise, the *link* between the *collection* and *transportation* process indicates that these processes require effective coordination and integration for an effective RL process. *All pre-receipt RL processes links* with the *inspection process,* which means that online retailers can perform inspection activities before or just after product returns arrive at the warehouse. Moreover, online retailers can consider integrating the inspection process with pre-receipt RL processes for the management of consumer returns. Similarly, *all pre-receipt RL processes link* with the *processing process*, which means that online retailers must consider the best stage in the RL process for issuing credits/refunds or shipping exchanges. Additionally, online retailers might benefit from integrating processing activities with pre-receipt RL processes for processing speed and efficiency.

The pre-receipt RL processes in online retailing share several common *activities*. Specifically, the CRR, gatekeeping and collection processes involve some form of *communication*, which means online retailers must focus on information flow efficiency for effective communication in these processes. Furthermore, *return authorisation* and *rejection* can take place during the CRR and gatekeeping process, indicating that online retailers must use appropriate systems and skilled staff in the CRR and gatekeeping processes for accurate return authorisation and rejection. Additionally, gatekeeping and collection involve *verification,* which means that online retailers must implement verification mechanisms for effective gatekeeping and collection. Both collection and transportation processes involve the product flow activities of *handling, moving, shipping* and *delivery*, demonstrating that proper packaging and effective handling practices can be important for return collection and transportation. While different, both the CRR and collection process involve *methods,* indicating that online retailers can benefit from using various CRR and collection methods for a consumer-centric pre-receipt RL process.

Regarding the *facilities/locations*, both gatekeeping and collection involve *collection points,* indicating that using collection points for both gatekeeping and collection can increase the efficiency of RL processes. Furthermore, collection and transportation can include *retail stores,* indicating that multi/omnichannel retailers can use stores as a collection point to reduce return collection and transportation costs. *Centralised return centres (CRCs)* can associate with gatekeeping and transportation processes, implying that CRCs can be used for gatekeeping activities and used as destination facilities in the pre-receipt RL process. Additionally, gatekeeping and collection processes can associate with *decentralised facilities*, demonstrating that online retailers can consider

decentralisation and centralisation location strategies for gatekeeping and a decentralisation location strategy for collection. Both collection and transportation processes associate with *warehouses*, *DCs*, *RL facilities* and *fulfilment centres*, emphasising that online retailers can focus on facility/location strategies for the effective collection and transportation of consumer returns. Finally, for the *parties*, *all pre-receipt RL processes* involve *consumers*, *retailers* and *third parties*, which emphasises that online retailers must focus on internal and external integration for the establishment of effective pre-receipt RL processes.

In the next section, the descriptive analysis concludes with the post-receipt RL processes in online retailing.

8.3.3 Descriptive analysis of the post-receipt RL processes in online retailing

The post-receipt RL process starts once a consumer product return arrives at the facility and ends at the redistribution of returned/recovered products to various locations. The post-receipt RL processes identified in the QCA findings were discussed in Chapter 5, including receiving, processing, inspection and sorting, disposition process and redistribution processes. The interview findings confirmed that all the post-receipt RL processes identified in the QCA findings can apply to consumer returns in online retailing. The subsequent sections provide the descriptive analysis of the respective post-receipt RL process, including receiving, processing, inspection, sorting, disposition and redistribution.

8.3.3.1 Descriptive analysis of the receiving process in online retailing

In section 5.3, the QCA findings for the receiving process was presented and discussed. Most findings between the QCA and interviews corresponded for the receiving process. Table 8.8 provides an overview of the findings related to the receiving process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.8 Comparison between QCA and interview findings for the receiving process

Source: Compiled by the researcher

Table 8.8 shows that several subcategories assigned to the receiving process in the QCA corresponded to the interview findings. In the subsequent paragraphs, the similarities and differences between the QCA and interview findings on the characteristics, activities, facilities/areas and parties of the receiving process will be provided.

- *Characteristics of the receiving process*

Most categories of the receiving process identified in the QCA findings were *confirmed* in the interview findings. Evidently, participants confirmed that receiving represents the *arrival* and *inbound flow* of product returns at the facility. Moreover, the participants agreed that the receiving process can be *labour-intensive,* mostly because receiving is a manual process. The participants also indicated that the receiving process involves *technology* and *documentation,* which relates to product return scanning, updating the inventory system and verification of delivery documentation (e.g. the waybill or delivery

note). Furthermore, the participants supported several *links between the receiving* process and *other RL processes*, including transportation, inspection, sorting, disposition and redistribution. The link between receiving and *transportation* relates to the delivery of returned products to the facility for receiving activities. Furthermore, the participants indicated that receiving sequentially links with *inspection, sorting* and *disposition*. Therefore, once the returned product enters the facility, inspection, sorting and disposition decision making can take place. Additionally, receiving links with *redistribution* in terms of inbound and outbound flows at the facility with arrival and departure of returned products.

In contrast, the participants *excluded* the *links* between receiving and the *gatekeeping* and *processing* processes. The QCA findings indicated that receiving operations can include the verification of the legitimacy of return information provided by consumers during the gatekeeping processes. In the interview findings, verification of the legitimacy of the return claim is only performed during inspection. Additionally, in the QCA findings *collection* parties can be responsible for collecting and receiving returned products at collection facilities, which was omitted in the interview findings. Nevertheless, the interview findings produced several *new characteristics* for the receiving process. Specifically, the participants indicated that receiving involves *possession* (ownership) of the returned product. In the collection process the courier takes possession of the product and at the facility the online retailer takes possession of the product, demonstrating that transfer of ownership takes place throughout the RL process of consumer returns. Furthermore, the labour-intensive characteristic of receiving emphasises the involvement of *costs* since receiving operations involve labour costs. Moreover, the participants claimed that return receiving can be a *time-consuming process* due to the uncertainties related to returned product condition and volume. Consequently, the receiving process can be *influenced by return volume*, meaning the higher the return volume the more labour-intensive and time-consuming receiving will be.

- *Activities of the receiving process*

Most receiving *activities* identified in the QCA findings *correspond* to the interview findings. Participants corroborated that receiving involves the information flow activities of the *identification, administration, registration* and *verification of information*. However, as mentioned in the previous section, the QCA findings indicated that the verification of information relates to the legitimacy of the return, while the interview findings focused on the verification of documentation. Furthermore, participants supported several product flow activities from the QCA findings, including *unloading, scanning, movement* and *handling*, which reemphasise the labour-intensive and technology characteristics of receiving. The participants *added additional activities* to the receiving process, including acknowledging receipt of the return, item counting and unpacking. *Acknowledgement of receipt* can relate to the transfer of ownership, with the signing of documentation and updating the

system. The acknowledgement can also form part of the status updates given to the consumers to confirm that the returned product arrived at the facility. Furthermore, participants indicated that manual receiving operations, without scanning, may involve *item counting* before products enter the facility. Additionally, *unpacking* can take place, which means that the receiving staff removes product returns from the parcels before inspection.

Nevertheless, the participants *excluded* the dispatch/distribution, organising/staging and arranging of returned products or pallets. The QCA findings indicated that receiving involves returned product *dispatch* or *distribution* into the facility, implying that the receiving area is separate from the facility. The interview findings excluded any reference to a specific receiving area located separately from the facility, which can explain the omission of dispatch/distribution into the facility. Furthermore, *organising/staging* and *arranging returned products or pallets* implies larger return volumes, which might associate with the receiving operations of 3PRL providers working with larger return volume. While larger scale receiving operations might include these activities in online retailing, this study focuses on providing online retailers with a framework for the RLM of consumer returns, not 3PRL providers that specialise in RL. Consequently, *organising/staging* and *arranging returned products or pallets* can be excluded from the receiving process of online retailers.

- *Facilities/areas and parties in the receiving process*

A few *facilities corresponded* between the QCA and interview findings, including warehouses, DCs and returns (RL) facilities. The participants confirmed that online retailers can either use standard FL facilities, like *warehouse* and *DCs*, or dedicated *RL facilities* for product return receiving. However, the interview findings *excluded* collection facilities, processing facilities and receiving docks/areas as facilities/areas that can be used for receiving. As discussed in the pre-receipt RL processes, RL process facilities, like *collection* and *processing facilities*, were excluded from the interview findings, explaining the omission of these facilities in the receiving process. Additionally, the participants excluded reference to a special *receiving area/dock* at the facility, implying that no separate receiving area/dock is used for product return receiving operations.

Finally, all *parties* involved in the receiving process *corresponded* between the QCA findings and interview findings. The participants agreed that *consumers* play a secondary role by acting as suppliers of returned products received at the facility. *Retailers* and *receiving staff* can play primary roles in the receiving processes. For example, the retailer can be responsible for providing the infrastructure for receiving operations and paying receiving costs, and *receiving staff* can be responsible for the receiving activities. Additionally, the participants confirmed that *third parties*, like 3PLs and couriers, can play a secondary role in delivering consumer returns to the facility and providing the parcel and

documentation for receiving operations. Alternatively, if the online retailer outsourced the RL process, a 3PRL provider can perform all the receiving activities on behalf of the online retailer.

Essentially, the descriptive analysis for the receiving process highlighted some similarities and differences between the QCA findings and interview findings. Based on the interview findings from the descriptive analysis, the description provided for the receiving process from the QCA findings (in section 5.3.3), can be adjusted as follows:

> The receiving process of consumer returns in online retailing can be described as the arrival and inbound flow of returned products, which can be labour intensive, time-consuming and influenced by product return volume. Receiving involves technology, documentation and costs and links with other pre- and post-receipt RL processes. The receiving process involves the (1) information flow activities of identification, acknowledgement of receipt, administration, registration, verification and scanning, and (2) product flow activities of unloading, handling, movement, unpacking and counting, which can be performed by the staff of online retailers or 3PRL providers at FL facilities (such as warehouses and DCs) or RL facilities (such as return facilities).

In the next section, the descriptive analysis of the processing process in online retailing will be provided.

8.3.3.2 Descriptive analysis of the processing process in online retailing

In section 5.4, the QCA findings on the processing process (i.e. issuing refunds/credits and shipping exchanges) were presented and discussed. Most QCA findings for the processing process aligned with the interview findings. Table 8.9 provides an overview of the findings related to the processing process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.9 Comparison between QCA and interview findings of the processing process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Internal process**	X	X	•"[…] processing it on the system up until a point of put away or disposal that would be done by the online retailer themselves." (P2, owner, supply chain consultancy firm) •"Without resources then how are you going to do […] processing all of that […]." (P8, logistics manager, multichannel retailer) •"[…] within the warehouse […] you still need the storage location, you know, because you may not process all returns on the same day." (P1, operations manager, 3PRL provider firm) •"[…] reverse logistics, it's all about the time it's taken and the speed at which you've been able to process your requests." (P5, general manager, online retailer) •"[…]to credit your consumer. So now, without a doubt, you need to use the same accounting software." (P5, general manager, online retailer) •"[…] the most important thing because your customer needs to be up to date with what is going on. There's nothing worse than a customer that doesn't know what. What's going on, how far in the process the return is, when are they getting their money? […] from the customer's point of view. So timing and accurate management of the process is critical." (P5, general manager, online retailer) •"[…] in terms of online retailing, the refund process needs to be quite slick and quite fast […]." (P8, logistics manager, multichannel retailer) •"[…] what sort of cost that processing of that reverse logistics has taken […]." (P12, Head of logistics, online retailer) •"Remember, there is still the refund process because that's the most critical part, because I want to see as a customer, I want to see my money in my account right now […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"What are you seeing coming now is more like particularly in fashion, is exchanges." (P1, operations manager, 3PRL provider firm) •"[…] return a product or send it in for repairs if it happens that her unit is damaged and it's irreparable, there will be a service exchange […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"See if they're drop it off at stores then they can get a credit immediately. […]. If they don't and they

Source: Compiled by the researcher

Table 8.9 shows that several subcategories assigned to the processing process in the QCA corresponded to the interview findings. In the subsequent paragraphs the similarities and differences between the

QCA and interview findings for the characteristics, activities, facilities/areas and parties of the processing process will be provided.

- *Characteristics of the processing process*

Most characteristics of the processing process identified in the QCA findings were *supported* by the interview findings. The participants confirmed that processing is an *internal process* that can be *time-consuming.* Most participants indicated that online retailers are responsible for the processing of credits/refunds even if 3PRL providers are involved in the RL process. Additionally, processing can be time-consuming because banks can take time to clear refunds and suppliers, if responsible for processing, can take time to issue a replacement or credit. Participants also agreed about the *requirements* of the processing process, including *financial* and *infrastructure resources*, *IT, accuracy* and *speed.* Therefore, online retailers must focus on resource commitment, systems and efficiency for effective processing of consumer returns.

The participants affirmed that processing involves *costs*, *consumer service* and *accounts*, relating to processing activities, parties and systems. For example, processing costs may include bank charges for refunds, consumer service can be responsible for communicating with consumers regarding the refund and accounting software can be used for accounts reconciliation. Additionally, the interview findings aligned with the QCA findings regarding the *influence of product type, product condition, channel type, service levels* and *return policy* on the processing process. For instance, clothing items and damaged products often associate with exchanges/replacements. Additionally, the channel type can influence the location and speed of processing, for example, multi/omnichannel retailers can use stores for fast processing of consumer returns. In contrast, processing through the online channel can take longer, if conducted at facilities. Consequently, the service levels of the 3PLs in terms of the time to collect and transport returns to the online retailer's facility can impact the processing speed. Moreover, the terms and conditions in the return policy can dictate processing outcomes, for example, opened defective products can be replaced but not refunded.

The interview findings *corroborated* all the *link*s *between processing* and other RL processes that were identified in the QCA findings. Evidently, the participants confirmed that *processing* can *link* with the CRR, gatekeeping, collection, transportation, receiving, inspection, disposition and redistribution processes. Processing can link with the *CRR* and *collection processes* if a credit or refund is issued once the return is logged or collected (e.g. drop-off in store for instant refund). Additionally, credits and refunds can only be issued if the gatekeeping function confirmed the legitimacy of the return, linking processing and *gatekeeping*. Furthermore, the link between processing and *transportation* relates to the use of the same courier for product return collection and replacement/exchange drop-off.

The links between processing and other post-receipt processes mostly relate to the sequence of the return process of the online retailer. Therefore, processing can take place after *receiving* before *inspection* and *sorting*, or after inspection and sorting before *disposition.* Finally, processing can link with *redistribution* if a refund is denied and the returned product must be redistributed back to the original consumer. Essentially, processing can take place at any stage of the RL process, indicating that online retailers must determine time in the RL process to issue credits/refunds or an exchange.

Regarding the *differences*, the interview findings *excluded* the processing characteristics labelled as challenging, complex, uncertainty/variability, requires skilled/trained staff, requires economies of scale and influenced by quantity. The QCA findings indicated that the *challenging* and *complexity* of processing relates to product return *uncertainty* and requirement of *skilled/trained staff*, which were all characteristics omitted from the interview findings. Furthermore, the QCA findings indicated that trained staff can be important for accurate and speedy processing. While speed and accuracy were identified as characteristics in the interview findings, the participants indicated that appropriate information systems can be important for accurate and speedy processing. Lastly, the interview findings excluded reference to *economies of scale* and the influence of *return quantity* on the processing process, implying the return volume might be less important in the processing of consumer returns in online retailing. Nevertheless, the participants *added* that processing can be *influenced by the return reason,* which links with the influence of product type and condition. For example, if the return reason for a clothing item is "wrong size", the processing outcome will be an exchange, or if the return reason is a defect the processing outcome can be a replacement or service exchange.

- *Activities of the processing process*

Like the characteristics, most processing activities identified in the QCA findings *corresponded* with the interview findings. Particularly, the participants agreed that the information flow activities of processing can include credit and refund authorisation, cross-verification of return authorisation, information sharing and communication, tracking, recordkeeping and data entry/capturing. The *credit* and *refund authorisation* and *cross-verification of return authorisation* activity associate with the link between the processing and gatekeeping. Therefore, before the consumer can be credited the validity of the product return must first be established. Additionally, *information sharing* and *communication* can involve telephonic communication to inform the consumer about the acceptance of a credit/refund. Similarly, the *tracking* activity allows for sharing refund or product exchange status updates with consumers. Moreover, *recordkeeping* and *data entry/capturing* involve updating of accounts after credit processing. Lastly, the participants confirmed some of the *cash flow activities* of processing, including *issuing refunds/credits* and *settling of claims,* and the *product flow activities* of *product*

exchanges (or replacements) and *restocking*. Evidently, the interview findings confirmed that the processing process involves information flows, cash flows and product flows in the RL process.

Nevertheless, the interviews *excluded* the *cash flow activity* of *verifying the accuracy of fund transfers*, indicating that the online retailers expect consumers to verify the accuracy of refunds. Furthermore, the participants *excluded handling* and *pre-disposition decisions* as product flow activities but *added delivery*, which relates to the processing of an exchange or replacement. Although handling can be possible due to restocking and delivery of replacement products, pre-disposition decisions mostly associate with inspection activities. Ultimately, the interview findings closely resembled the QCA findings, indicating that most processing activities identified from the QCA can be applicable to the processing of consumer returns in online retailing.

- *Facilities/areas and parties in the processing process*

Like other RL processes, the findings that fewer facilities/areas can be used for processing corresponded between the QCA and interviews. Regarding the *corresponding facilities*, the participants confirmed that retail stores, warehouses, DCs and service centres can be used for the processing process. The *retail stores* relate to the multichannel retailers that can issue refunds in store for drop-off online returns, while *warehouses* and *DCs* can be used for the processing of online channel returns. *Service centres* relate to the repair disposition option and the subsequent processing of a service exchange for irreparable products.

The QCA findings related to the processing of returns included *CRCs*, *collection facilities*, *processing facilities*, *repair facilities* and *processing stations*, which were *excluded* from the interview findings. While CRCs can be a possibility in online retailing, collection facilities and processing facilities was omitted from the interview findings. Since service centres associate with repair activities, a repair facility might be a possibility for the processing of exchanges and replacements. Like the receiving process, the interview findings excluded reference to a dedicated processing station the facility. Ultimately, less attention was paid to allocated spaces within facilities for RL processes and activities. Nevertheless, the participants *added fulfilment centres* as facilities and *decentralised points* as locations that can be used for the processing of consumer returns. Using decentralised points for return processing contradicts the QCA findings related to using centrally located return facilities (i.e. CRCs) for processing. The participants indicated that decentralised points could facilitate speedy processing of consumer returns, which can be important for consumer satisfaction.

Lastly, most *parties* identified in the QCA findings on processing were *confirmed* in the interview findings, including consumers, retailers, staff/departments and third parties. The participants agreed

that *consumers* play a passive role in the processing process by receiving communication and waiting for refund/credit or an exchange. Additionally, the participants confirmed that *retailers* can play significant roles in return processing, including providing the resources and infrastructure for processing, paying processing costs and allocating staff to perform processing activities. Both the QCA and interview findings emphasised the importance of *staff/departments* in the processing process. For example, customer service can be responsible for communication and information sharing, finance can be responsible for issuing credits/refunds and logistics/operations can be responsible for exchanges/replacements.

Moreover, the participants identified *third parties* that can be involved in the processing process, for example, a credit processing site (e.g. credit payment gateways), couriers and 3PRL providers can be involved in return processing. Since processing was identified as an internal process, third parties mostly play secondary roles. For instance, couriers can be responsible for delivering the exchange or replacement product and 3PRL providers can be responsible credit/refund authorisation, enabling online retailers to only issue credits/refunds or replacements for legitimate returns. In terms of the *dissimilarities*, the QCA findings included wholesalers as parties involved in processing. While the study defines an online retailer as any party that sell products directly to consumers through an online channel, *wholesalers* as parties in the RL processes of consumer returns were *excluded* from the interview findings. However, the participants *added suppliers* as parties that can be involved in the processing process of consumer returns, especially for warranty returns. Therefore, the suppliers might be responsible for shipping a replacement or issuing a credit/refund for warranty returns.

Essentially, the descriptive analysis of the processing process emphasised various similarities and a few differences between the QCA findings and interview findings. Based on the interview findings from the descriptive analysis, the description provided for the processing process from the QCA findings (in section 5.4.5), can be adjusted as follows:

> The processing process of consumer returns in online retailing can be described as an internal and time-consuming RL process, which (1) requires financial and infrastructural resources, technology, accuracy and speed, (2) involves costs, consumer service and accounts, (3) can be influenced by product type, product condition, return reasons, service levels, channel type and return policies, and (4) links with other pre- and post-receipt RL processes. The activities of the processing process involve (1) information flow activities, including credit/refund authorisation, recordkeeping, cross-verification of return authorisation, information sharing and communication, tracking and data entry/capturing, (2) cash flow activities, including issuing credits/refunds and settling claims, and (3) product flow activities, including product exchanges, handling, restocking and delivery, which can be performed by the staff/departments of the online retailer, other third parties (credit processing sites, couriers or 3PRL providers) or suppliers in various facilities/locations (stores, warehouses, DCs, fulfilment centres, decentralised points or service centres) for the benefit of the consumer.

In the next section, the descriptive analysis of the inspection process in online retailing will be provided.

8.3.3.3 Descriptive analysis of the inspection process in online retailing

In section 5.5.1, the QCA findings on the inspection process were presented and discussed. Most QCA findings for the inspection process aligned with the interview findings. Table 8.10 provides an overview of the findings related to the inspection process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.10 Comparison between QCA and interview findings of the inspection process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Important**	X	X	•"[…] you know, the physical inspection of the product, […] the training goes without question because […] every facet that we operate with has to be checked and the person doing it has to be suitably qualified to do so." (P7, owner, 3PRL provider firm) •"[…] you've got people that work in home wear, you've got people that work with clothing and uniforms and sporting goods. You've got people with work with electronics, […] So you employ a number of experts in that field." (P5, general manager, online retailer) •"[…] if you return the cell phone with a cracked screen and you say, I've changed my mind, like the evaluators should know that you're not allowed to do that. Or if you return a gaming disk that has already been opened, according to our policy, you're not allowed to do it. […] when a customer return something, for instance, a laptop and we get this very often, the customer returns the laptop and says it's not working. And then when we test it and we see it, it's actually working. And then it turns out that the customer actually just doesn't like the laptop, or the specs are not enough for them. And then we have to obviously reject that return." (P3, returns manager, online retailer) •"Quality is critical. And that's what follows the processes of being evaluated and graded […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"[…] you need sort of sufficient testing capacity if you really want to validate and assess these things. […] you need to build these mechanisms that you can validate every single across a vast array of products." (P1, operations manager, 3PRL provider firm) •"It's the cost of inspecting those goods […]." (P2, owner, supply chain consultancy firm) •"So, are you going to do basic assessment, visual assessment, or are you going to do a full technical assessment?" (P1, operations manager, 3PRL provider firm) •"[…] timeframes are very important […] it has to be inspected within a certain time frame." (P9, regional & online DC manager, online retailer •"Or you have to say my product is low value enough that I can forfeit the inspection and I'll take it at face value, whatever is being collected and returned […] So check it just basically at face value." (P2, owner, supply chain consultancy firm) •"So, when a customer logged their return, they will give a reason as to why they are returning it, whether it is too small, whether it's malfunctioning or whether it's an item that they purchased and it's not as what was on the site. They will then take the reason for the return and match it up with the actual product to see whether or not it is right or wrong or whether it meets the criteria." (P12, Head of logistics, online retailer) •"[…]do the inspection at the time of the collection […]." (P2, owner, supply chain consultancy firm) •"[…] the process is collection, transportation, it is grading or evaluation […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"[…] when the cargo arrives in the warehouse, you have a grading process that comes into play. Where they assess and evaluate the product." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"And then once it's been inspected, you tell them it's been inspected and you're going to get a refund." (P8, logistics manager, multichannel retailer) •"And then mostly the stock is […] sorted. And there would be a quality check to see is it still usable." (P2, owner, supply chain consultancy firm) •"[…] product that needs to be kept separately before it can be inspected and disposed of […]." (P2, owner, supply chain consultancy firm) •"[…] follows the processes of being evaluated and graded for a resell to salver […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Source: Compiled by the researcher

Table 8.10 shows that various subcategories assigned to the inspection process in the QCA findings corresponded with the interview findings. In the subsequent paragraphs, the similarities and differences between the QCA and interview findings regarding the characteristics, activities, facilities/locations and parties of the inspection process will be provided.

- *Characteristics of the inspection process*

Various characteristics assigned to the inspection process *corresponded* between the QCA and interview findings. Particularly, the participants affirmed the *importance* and *complexity* of the inspection process. Inspection can be considered as one of the most important RL processes because inspection enables online retailers to confirm the condition of the returned product and determine the most appropriate disposition option for the returned product. Additionally, inspection can be complex due to the technical knowledge required for effective product inspection. Consequently, the participants confirmed that the inspection process is *labour-intensive* and *requires skilled staff.* Additionally, both the QCA and interview findings indicated that inspection *involves costs*, which can associate with the inspection activities and skilled labour.

Moreover, the participants agreed that the inspection process can be *influenced* by the product and return type, the product quality and the return policy. Specifically, the *product type* can influence the inspection division or product experts responsible for the inspection of specific items, for example, electronic products are usually inspected by electronic specialists. Additionally, the *return type* or reason associates with the inspection outcome. For example, if the consumer claims that a product is defective and the inspector (or evaluator) finds the product in working order, the return might be

rejected. Additionally, the *quality of the product* can associate with the inspection activities of grading. Therefore, high-quality products can be graded as high quality and low-quality products can be graded as low quality. The *return policy* can be an important part of the inspection process since inspectors can use the return policy as a guide to determine the legitimacy of the product return. For example, the return policy stipulates that DVDs must be returned unopened and if the inspector finds an opened DVD, the return can be rejected based on the return policy requirement.

All the *links between the inspection process* and *other RL processes* corresponded between the QCA findings and interview findings. Therefore, the participants verified that inspection could link with the CRR, gatekeeping, collection, transportation, receiving, processing, sorting and disposition processes. The link between inspection and the *CRR process* relates to the matching of the return reason and product condition provided by consumers during the CRR process with the actual condition of the returned product. Similarly, inspection links with *gatekeeping* since inspectors can act as final gatekeepers by accepting or rejecting returns based on the inspection outcomes. Some participants mentioned that early inspection might take place during collection, which links the inspection and *collection* processes. The links between the inspection and *transportation, receiving, processing, sorting* and *disposition* processes relate to the sequence of the RL processes, for example, inspection can take place after transportation, receiving and sorting and before processing and disposition. Lastly, inspection can also link with the disposition process in terms of identifying the appropriate disposition option for the returned product during inspection.

Although most characteristics assigned to inspection corresponded between the interview and QCA findings, a few *differences* were identified. While the participants *excluded* the *time-consuming* characteristic, they *added* that inspection *involves time* that must be measured for efficiency. Furthermore, the *influence of the channel type* on the inspection process was *excluded* but the *influence of product value* on the inspection process was *added*. The participants indicated that a quick visual inspection can be conducted for lower value products but that a more extensive inspection can be conducted for higher value products. Consequently, the inspection process can *involve options*, including basic inspection, visual inspection and full inspection. Evidently, the inspection options can relate to the characteristics of product type, quality and value. Finally, the participants indicated that the inspection process *requires infrastructure* to support inspection activities, for example, appropriate testing mechanisms must be installed for effective product testing during inspection.

- *Activities of the inspection process*

Like the characteristics, most inspection activities identified in the QCA findings *corresponded* with the interview findings. Specifically, the participants supported the information flow inspection activity

of *verification of information,* which associates with the link between inspection and the CRR process. Therefore, the inspector verifies if the product condition and return reason information provided by the consumer during the CRR process matches the physical condition of the returned product. Additionally, most product flow activities corresponded between the QCA and interview findings, including product evaluation and assessment, testing, grading, product classification, determining the disposition/exit option, and storage. *Product evaluation, assessment* and *testing* relates to the identification of the product condition to confirm the legitimacy of return. Similarly, *grading* relates to the identification of the product quality, which enables effective *product classification.* Based on the evaluation, assessment, testing and grading activities, the most appropriate *disposition/exit option* can be *determined.* Lastly, the products can be *stored* before disposition, for example, storing all the defective items for shipment to the supplier.

The QCA findings identified *disassembly* as an activity in the inspection process, which was *excluded* from the interview findings. The disassembly activity might be more appropriate during product recovery, like repairs, where additional inspection can be conducted to identify faulty parts in a product. However, the participants *added handling* as a product flow inspection activity, which emphasises the product evaluation, assessment and testing activities. Additionally, the interview findings *included communication/notification* as an information flow inspection activity. The participants indicated that inspection could involve contacting the consumer for follow-up information regarding the return reason and product condition and communicating the inspection outcomes with the consumer. Additionally, an inspection status notification can be sent to consumers as part of the product return status updates in the return process.

- *Facilities/locations and parties in the inspection process*

Like other RL processes, limited facilities/locations used for inspection matched between the QCA and interview findings. In fact, only *warehouses* and *CRCs corresponded* between the QCA and interview findings. Therefore, the participants indicated that inspection can either be conducted in traditional FL facilities or in dedicated RL facilities, depending on facility/locations strategies of the online retailer. The QCA findings identified various facilities/locations in the inspection process, including *retail stores/collection points, collection facilities, processing facilities, disassembly facilities, inspection centres* and *repair facilities,* which were *excluded* from the interview findings. The interview findings mostly included basic facilities for RL processes with limited specialised facilities for different RL processes, explaining the disparities between the QCA and interview findings. Resultingly, the interview findings *added DCs* and *fulfilment centres* as basic FL facility types that can be used for the inspection of consumer returns.

Lastly, all *parties* identified in the QCA findings were *confirmed* in the interview findings, including consumers, retailers, staff/departments and third parties. *Consumers* play secondary roles in the inspection process by providing information for the verification of information and receiving inspection communication/notifications. Additionally, *retailers* play primary roles by paying inspection costs, providing an appropriate inspection infrastructure and appointing skilled staff for inspection. The participants also confirmed that *staff/departments* play significant roles in the inspection process, including inspection staff (inspectors or evaluators), managers, quality assurance and customer service. Alternatively, *third parties*, like 3PRL providers, perform inspection activities on behalf of online retailers that outsourced inspection. The interview findings *added manufacturers* as parties in the inspection process, which relates to the influence of product type and value on inspection. For instance, a manufacturer of high valued designer product might perform inspection in the facility of the online retailer to identify counterfeit returns.

Essentially, the descriptive analysis for the inspection process demonstrated various similarities and a few differences between the QCA findings and interview findings. Based on the interview findings from the descriptive analysis, the description provided for the inspection process from the QCA findings (in section 5.5.1.5), can be adjusted as follows:

> The inspection process of consumer returns in online retailing can be described as an important, complex and labour-intensive RL process, which (1) requires skilled/trained staff and an infrastructure, (2) involves costs, time and options, (3) can be influenced by product and return type, product quality, product value and the return policy, and (4) links with other pre- and post-receipt RL processes. The activities of the inspection process involve the (1) information flow activities of verifying information and consumer communication/notifications, and (2) product flow activities of product evaluation, assessment, testing, grading and classification, determining disposition/exit options, storage and handling, which can be performed by the staff/departments of the online retailer, 3PRL providers or manufacturers in traditional FL facilities (such as warehouses, DCs and fulfilment centres) or RL processes facilities (CRCs or dedicated RL facilities).

In the next section, the descriptive analysis of the sorting process in online retailing will be provided.

8.3.3.4 Descriptive analysis of the sorting process in online retailing

In section 5.5.2, the QCA findings of the sorting process were presented and discussed. In contrast to the QCA findings, only few participants mentioned the sorting process, which impacts the alignment between the QCA and interview findings. Table 8.11 provides an overview of the findings related to the sorting process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.11 Comparison between QCA and interview findings of the sorting process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Important and complex process**	X		•"And then mostly the stock is kept somewhere until a later stage, until there's enough of it to be sorted." (P2, owner, supply chain consultancy firm)
	Labour intensive	X		•"[…] staff are doing the sorting process […] They need to be trained by brand. So, we've got a cosmetics brand. They need to understand the cosmetics product. If you've got an electronics brand,
	Time-consuming	X	X	

	Requires skilled/trained staff	X	X	they need to understand that because the electronics products and what can go wrong and identify what bucket to put it into." Source: Compiled by the researcher

Table 8.11 shows that a few subcategories assigned to the sorting process in the QCA findings corresponded with the interview findings. In the subsequent paragraphs, the similarities and differences between the QCA and interview findings of the characteristics, activities, facilities/locations and parties of the sorting process will be provided.

- *Characteristics of the sorting process*

Several characteristics of the sorting process *corresponded* between the QCA and interview findings. The participants indicated that the sorting process can be *time consuming* because returned products might be stored before sorting can be conducted. Additionally, the participants confirmed that the sorting process *involves costs* and *requires skilled/trained staff* because effective disposition depends on accurate sorting. Both the QCA and interview findings identified *product type/characteristic, product condition* and *return type* as factors that can *influence* the sorting process. Linking with the skilled/trained staff requirement, the product type can influence the types of skills needed for the sorting process. Furthermore, product condition and return type can influence the grouping of products, for example, B2C unwanted returns and products in new/unused condition can be sorted into a resale category, and service returns or products in defective condition can be sorted into a repair category. The *links* between the *sorting process* and other RL processes mostly corresponded between the QCA and interview findings. The participants confirmed that sorting can link with *gatekeeping, receiving, processing, inspection, disposition* and *redistribution* processes. These links are mostly sequential, for example, sorting can take place after gatekeeping, receiving or inspection and before disposition and redistribution. However, sorting also links with the disposition and redistribution processes in terms of grouping product returns, for example, sorting products into the repair category and redistribution category.

Regarding the *differences*, the interview findings *excluded* the sorting characteristics labelled as important, complex, labour intensive, influenced by product quality and linked to collection and transportation processes. Although the participants omitted clear reference to the *importance*, *complexity* and *labour-intensive* characteristics, it was implied in their discussions that sorting can be important, complex and labour-intensive. Specifically, their mentioning of the need for skilled staff to accurately sort products for disposition emphasises the importance and complexity of sorting. Furthermore, the physical involvement of staff in the sorting process points to the labour-intensive characteristic of sorting. Similarly, like the product condition, the *product quality* can influence the sorting process, for example, good-quality products can be sorted into a resale category. Subsequently, these characteristics can be appropriate for the sorting process of consumer returns in online retailing and will subsequently be added to the interview findings. However, the *links* between *sorting* and the *collection* and *transportation* processes can be *excluded* since sorting mostly takes place after receiving, processing and inspection. Finally, the interview findings *added product volume* as a factor that can *influence* the sorting process. The participants indicated that sorting requires larger return volumes, which implies that sorting of a few return products might be unnecessary.

- *Activities, facilities/locations and parties of the sorting process*

Most sorting *activities corresponded* between the QCA and interview findings. Particularly, the participants confirmed that the sorting process can involve the information flow activity of *verification of information.* Therefore, depending on the RL operations of the online retailers or 3PRL provider, verification of product return information provided by the consumer can take place during the sorting process. This finding links with the product flow activity of *product evaluation,* which enables sorting staff to not only confirm the legitimacy of the return but also to *determine* the best *disposition/exit option*. Furthermore, the participants corroborated the product flow sorting activities of *product classification and grouping, separation* and *storage,* which emphasises the influence of product type, product condition, return type and return volume on the sorting process. While the participants *omitted* the *movement* activity, they *added handling* as a sorting activity. Since returned products are classified, grouped and stored, both movement and handling can be important activities in the sorting process.

In contrast to the other categories of sorting, the findings on *facilities/locations* used for sorting largely differ between the QCA and interviews. In fact, the *only corresponding* facility between the QCA and interview findings was a returns *warehouse.* Evidently, the interview findings *excluded* stores/collection points, collection facilities, inspection centres, CRCs, processing facilities, disassembly facilities, refurbishment facilities and redistribution facilities. Since sorting requires higher return volumes and online returns to store can be limited, *stores/collection points* can be excluded as locations from the sorting process. Moreover, the interview findings omitted any mention of *collection, inspection, processing, disassembly* and *redistribution facilities* in the RL processes of consumer returns in online retailing. While *CRCs* can be a possibility for sorting operations in online retailing, the limited interview findings for sorting can explain the exclusion of CRCs. As mentioned in the descriptive analysis of consumer return types (section 8.3.1), refurbishment was excluded from the findings as a disposition option, which explains the omission of *refurbishment facilities.* Nevertheless, the participants *added DCs, repair centres* and *sorting facilities*, indicating that traditional FL facilities, recovery facilities and RL process facilities can form part of the sorting process in online retailing.

Lastly, *all parties* identified in the QCA findings for the sorting process were *confirmed* in the interview findings, including consumers, retailers, third parties and staff. Specifically, both the QCA and interview findings indicated that *consumers* play secondary roles in the sorting process in terms of providing information for verification in the sorting process. While the interview findings excluded specific reference to *retailers* and *third parties,* two participants, including a multichannel retailer and a 3PRL provider, explained their sorting processes, confirming the QCA findings. Lastly, *sorting staff* can be involved in the sorting process, linking with the sorting characteristic of skilled/trained staff for the sorting process.

Essentially, the descriptive analysis for the sorting process demonstrated various similarities and a few differences between the QCA findings and interview findings. Based on the findings from the descriptive analysis, the description provided for the sorting process from the QCA findings (in section 5.5.2.5), can be adjusted as follows:

> The sorting process of consumer returns in online retailing can be described as an important, complex, labour-intensive and time-consuming RL process, which (1) requires skilled/trained staff, (2) involves costs, (3) can be influenced by product type, characteristics, condition, return type and return volume, and (4) can be linked with other pre- and post-receipt RL processes. The activities of the sorting process involve the (1) information flow activity of verifying product return information provided by consumers, and (2) product flow activities of product evaluation, determining disposition/exit options, product classification and grouping, separation, storage, handling and movement, which can be performed by staff of the retailer or 3PRL providers in traditional FL facilities (warehouses and DCs), RL processes facilities (sorting facilities) and recovery facilities (repair facilities).

In the next section, the descriptive analysis of the disposition process in online retailing will be provided.

8.3.3.5 Descriptive analysis of the disposition process in online retailing

In section 5.6, the QCA findings of the disposition process was presented and discussed. The disposition process consisted of general disposition processes and disposition/exit options. This section mostly focusses on a general overview of the disposition process in online retailing, excluding details for each disposition and exit option. Additionally, the QCA findings included the outcomes (benefits) of the disposition process, which were excluded from the descriptive analysis since the outcomes form part of the reflexive TA (from section 8.4). Consequently, the descriptive analysis for the disposition process only focuses on the standard RL process categories of characteristics, activities, facilities and parties.

The description created for the disposition process from the QCA findings, in section 5.6.6, included combined characteristics, activities, facilities/locations and parties for the general disposition process and disposition/exit options, which were used as a basis for the descriptive analysis. Therefore, the description of the disposition process holistically represented the QCA findings for the disposition process, which can enable a holistic comparison with the interview findings. Resultingly, the descriptive analysis will be based on the description of the disposition process (excluding the outcomes), and not the QCA quotation tables created for the general disposition process in section 5.6.1. Table 8.12 provides an overview of the findings related to the disposition process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.12 Comparison between QCA and interview findings of the disposition process

CATEGORIES	SUBCATEGORIES	QCA	INT	SUPPORTING INTERVIEW QUOTATIONS
Characteristics	**Important process**	**X**	**X**	•"So, I think it's very important […] what do you do with that product when it's coming back and it's not resalable? You know, do you just try and mark it down and send it to outlets stores, sell it to third parties,
	Complex process	**X**	**X**	

	Time-consuming	X	X	can you maybe do something with it, do you fix it? So, I think it's because there is resources, cost and time." (P13, supply chain manager, multichannel retailer) •"[…] you need a level of expertise to repair those items […]." (P1, operations manager, 3PRL provider firm) •"[…] own in-house [IT] platforms […] [for] understanding the state of repair of the products and where their product is going to." (P4, owner/CEO, 3PRL provider firm) •"And your technical product, consumer electronics. How do you know that customer's data isn't on their product? […] you've got staff that are competent to clear a hard drive." (P1, operations manager, 3PRL provider firm) •"[…] it needs to get onto the shelf ASAP within a specific timeframe and be put up for sale within a specific timeframe." (P9, regional & online DC manager, online retailer) •"And you've got to make sure that it's de-branded because you don't want it going back into a secondary market with your brand." (P1, operations manager, 3PRL provider firm) •"Is it good for resale, is not good for resale we return it to the supplier? Is it damaged? No, it all takes a different route depending on what the condition is." (P9, regional & online DC manager, online retailer) •"[…] a repackaging element where it needs to be repackaged […] they want to put that back into the into a sales pipeline […]." (P4, owner/CEO, 3PRL provider firm) •"Salvage companies will buy the products at a B-grade […]. And then those guys will obviously resell again to end users at 40 percent or 50 percent less." (P10, Head of Sales and Logistics, OEM/multichannel retailer) •"[…] you have got an agreement with a firm whereby any item that's delivered that's malfunctioning, you can have it directly exchanged with that supplier or manufacturer, then that will be the action." (P12, Head of logistics, online retailer) •"You need one or two partners at most that are willing to take the entire consignment of stock for a set price […] and they can then decide to sell it through various used platforms […]." (P5, general manager, online retailer) •"So, from there on, we decide whether the packaging is damaged. If the packaging is damaged, then we will contact our supplier and explain to the supplier […] and let them know that this item has come back." (P9, regional & online DC manager, online retailer) •"[…] in the food industry, it's sell-off as reworks for animal feed production as well as farming activities […]." (P11, Demand and sales manager, FMCG distributor) •"[…] if you've got a large organisation, you can try and sell off inhouse […] three or four times a year." (P1, operations manager, 3PRL provider firm) •"And like the example of technology […] it becomes obsolete very quickly and […] you just made the decision to move it." (P1, operations manager, 3PRL provider firm) •"[…] white goods, there's no expiry on it. So, we can put it back in stock […]." (P9, regional & online DC manager, online retailer) •"[…] if the item is in good condition and the customer wants a refund, then it will just be placed back into stock […]." (P3, returns manager, online retailer) •[…] this item is defective […] they will book into the stock as a supplier warranty claim where it will then follow the route of lodging the call with the supplier." (P5, general manager, online retailer) •"[…] the odd sort of customer returns that come back in. And those were largely […] handled as donations such a small volume that the brand doesn't really worry about it […]." (P1, operations manager, 3PRL provider firm) •"[…] policies […] give you clear indication what needs to be done with return stock." (P11, Demand and sales manager, FMCG distributor) •"[…] a product of that particular manufacturer, whether it's a nick on the corner of the box or whether it's expired, it gets incinerated." (P7, owner, 3PRL provider firm) •"[…] because the CPA […] if there's a scratch or a nick or a cosmetic damage, that kind of stuff, you've got to be able to specify it. And that in itself, if you got high volumes of product. Are you going to really be able to do it and are you cannibalising your sales? So, moving it through secondary and tertiary channels is really your only option." (P1, operations manager, 3PRL provider firm) •"We need to send it back for credit […] we send a courier to go and deliver the parcel with the defective items in it." (P3, returns manager, online retailer) •"There it's a basic [receiving] process of acknowledgement of parcel […] and that then there's a decision based on can I reuse the stock or can't I reuse the stock." (P6, logistics manager, multichannel retailer) •"[…] of lodging the call with the supplier. The customers in turn receive credit or they've received a replacement item […] the defective item is then made the problem of the supplier to come and collect and replace or credit the business." (P5, general manager, online retailer) •"[…] product that needs to be kept separately before it can be inspected and disposed of […]." (P2, owner, supply chain consultancy firm) •"[…] it goes through a whole sorting process […] So it will be a […] repair buckets […] the product needs to be repaired." (P4, owner/CEO, 3PRL provider firm) •"[…] for repair, it comes back. You send it back up to the customer […]." (P1, operations manager, 3PRL provider firm)

Source: Compiled by the researcher

From Table 8.12 it is evident that both the QCA of RL literature and the interviews with industry experts produced comprehensive findings with various subcategories for the disposition process. In the subsequent paragraphs the similarities and differences between the QCA and interview findings for the characteristics, activities, facilities/locations and parties of the disposition process will be provided.

- *Characteristics of the disposition process*

Most characteristics of the disposition process *corresponded* between the QCA and interview findings. The participants confirmed that the disposition process can be *important*, *complicated* and *time-consuming* because of the various options and parties involved in disposition. Additionally, the

participants agreed that *skilled/trained staff* with the necessary expertise can be pivotal for effective dispositioning, reemphasising the complexity of the disposition process. Moreover, the participants verified that the disposition process *requires resources* and *technology*, which can explain the *costs* associated with disposition activities. Evidently, for an effective disposition process, online retailers must recognise the importance and complexity of the disposition process and provide the necessary financial, human and IT resources.

Both the QCA and interview findings indicated that the disposition process *involves various options/alternatives.* Generally, the participants confirmed that direct reuse, repair, selling on secondary markets, selling to third-party buyers and ship to the vendor can be disposition/exit options for consumer returns in online retailing. However, the biggest difference between the QCA and interview findings was the refurbishment option, which was omitted from all interview findings. Consequently, from a South African perspective, the refurbishment option was excluded as a disposition option. However, the interview findings produced several other options that were excluded from the QCA (because of a lack of findings or being outside the scope of the study). For example, the participants mentioned selling product returns as scrap and donations as disposition options, which were excluded from the QCA because of limited findings. Moreover, recycling, destroy and disposal were excluded from the QCA findings because these options were beyond the scope of the study. However, the participants identified these options as viable for online retailing, especially for specific product types (such as books and food). Lastly, participants added internal staff sales as a disposition option that can be appropriate for online retailing.

For other corresponding "involvement characteristics", the participants indicated that various disposition options *involve* different *routes,* which directs returned products to *different channels, destinations* and *markets.* Furthermore, the participants confirmed that the disposition process *involves risks,* like sales cannibalisation, which can occur if new products at higher prices in the primary market must compete with returned products at *discounted prices* in the secondary markets. Moreover, both the interview and QCA findings mentioned that the disposition process involves *negotiations, contracts/agreements* and *partnerships.* Specifically, through negotiations, online retailers can establish contracts/agreements with suppliers and partnerships with third-party buyers. Additionally, the participants agreed that *information sharing* can be an important part of the disposition process because of contracts and partnership relationships.

All the *"influenced by characteristics"* of the disposition process *aligned* between the QCA and interview findings, including industry, product and organisation type, product characteristics, condition and quality, return type/reason, volume and policy, manufacturer specifications and legislation. For example, the food *industry* can include the disposition/exit options of destroy, composting and disposal,

while the fashion industry can include the exit options of secondary markets and donations. Likewise, *product types* can influence the disposition options, for instance, books can be recycled, clothes can be donated and electronics can be repaired. Additionally, larger *organisations* can consider internal staff sales for effective disposition of returned products. *Product characteristics* can influence the disposition process, for example, technology products require speedy disposition to avoid obsolete stock. Furthermore, the *product condition* can influence the disposition choice and supplier agreement, for instance, based on the supplier agreement products in defective condition can be shipped to the supplier. The *quality* of the product can influence the market/destination, for example, lower quality products can be more appropriate for secondary or tertiary markets.

The *return type* can associate with the disposition option (also see section 8.3.1), like warranty returns of defective products can be directed to suppliers for repair. Similarly, *return volume* can influence the choice of disposition options, for instance, lower return volumes can be more appropriate for donations and larger volumes for selling to third-party buyers (e.g. auctioneers and jobbers). The *return policy* can also play a role in the disposition process, for example, the return policy might stipulate that defective products can only be repaired and not replaced. Similarly, if a *manufacturer specified* that returned products are to be destroyed for brand protection, the only disposition option available can be incineration. Lastly, *legislation,* like the Consumer Protection Act (CPA), can stipulate that slightly damaged products can be resold on the primary channel only at a discount and with a clear description of the products' condition.

Most of the *links between the disposition process* and other RL processes corresponded between the QCA and interview findings. Specifically, disposition can link with *transportation* through the disposition activities related to shipment and delivery. The link between disposition and the *receiving* process can be sequential, meaning that after arrival a decision can be made regarding the best disposition options. The link between disposition and *processing* relates to warranty returns, for example, consumers can only receive a replacement or credit once the supplier confirmed the validity of the return. Additionally, *inspection* and *sorting* activities include disposition decisions, which establishes a link with the disposition processes. Finally, the link between disposition and *redistribution* relates to the transportation of returned/recovered products to the supplier, back to the consumer or to the markets.

While most of the disposition characteristics aligned between the QCA and interview findings, a few *differences* were identified. The interview findings *omitted equipment* as a disposition process requirement. Only the repair and refurbishment options associated with equipment in the QCA findings, indicating that the disposition process in general can exclude equipment as a requirement. Additionally, the interviews *excluded links* between the disposition and *gatekeeping* and *collection*

processes because these processes take place early in the RL process. Nevertheless, the interviews produced *new characteristics*, including the requirement of speed and involvement of time. Particularly, the disposition process *requires speed* for the disposition of certain product categories (e.g. clothing, food and technology) that can quickly go out of fashion, expire or outdated. Subsequently, the participants indicated that the disposition process *involve time* that must be measured for optimum economic recovery of consumer returns in online retailing.

- *Activities of the disposition process*

Various disposition activities *corresponded* between the QCA and interview findings, including information flow, product flow and cash flow activities. Particularly, the participants affirmed that the disposition process include the information flow activities of *administration* and *communication.* Since returned products can be sent for repairs, sold to third-party buyers or shipped to the supplier both administration and communication are needed. Additionally, communication with the consumer can occur, especially for warranty or service returns of products that can be returned to the consumer or replaced with another item. Furthermore, most product flow activities corresponded between the QCA and interview findings, including product examination/evaluation, disposition decisions, repackaging, restocking/returned to inventory, disassembly, fixing, cleaning, treatment, handling, packing, storage, shipment and delivery. *Product examination/evaluation* can be important to *determine* the best *disposition option* and identify recovery activities. For example, if the packaging is damaged the product can be *repackaged* and *restoked/returned to inventory* or if the product is faulty or beyond repair the product can be *disassembled* and/or *fixed.* Similarly, returned clothing with possible makeup and deodorant marks can be *cleaned* and *treated*. Additionally, returned products destinated for other locations can be *packed, stored, shipped* and *delivered.* The *handling* activity takes place throughout the disposition process as part of the other product flow activities from product examination to delivery. Lastly, the participants reemphasised the significance of *reselling* as a cash flow activity in disposition, which enables cost recovery from returned products.

The QCA findings included other information flow, product flow and cash flow *activities* that were *omitted* from the interviews. Specifically, the interview findings excluded scanning and remarketing as information flow activities. While scanning was excluded from the interviews, online retailers that use scanning at their facilities might scan returned products at arrival (see section 8.3.3.1) and departure for disposition. Evidently, scanning can form part of the disposition process in online retailing. Contrastingly, the interview findings omitted any reference to *remarketing,* implying that remarketing activities might be unnecessary in online retailing. For example, if the online retailer partners with a third-party buyer, only communication is needed for the reselling transaction. Likewise, if online

retailers resell returned products on the website or ship returned products to the supplier, no remarketing is needed.

In terms of the product flow activities, the interviews excluded *loading, replacement, upgrade* and *(re)testing.* While loading can be a possibility for the shipment of returned products to other locations in the disposition process, replacement and upgrade largely associate with refurbishment and other product recovery activities. Since refurbishment was omitted from the interview findings, the replacement and upgrade activities can be excluded. Furthermore, the participants indicated that retailers are rarely involved in specialised recovery activities, implying that further testing beyond inspection might be unnecessary. For the cash flow activities, the participants omitted *trading* and *charging* as disposition activities in online retailing. The trading activity might be more appropriate for parties operating in the secondary markets and reverse SC, which associates with the buying and selling of used/recovered products. Additionally, the participants excluded charging as a potential disposition activity, which mostly associate with product recovery. While consumers might be charged for the repair of service returns, returns under warranty excludes charging. Consequently, charging for product recovery might occur less often in the disposition process of consumer returns in online retailing. Nevertheless, the participants *added* the information flow activity of *booking,* which relates to the repair option. Since online retailers use third parties for product repair, booking a repair can occur in the disposition process of consumer returns.

- *Facilities/areas and parties in the disposition process*

Few *facilities/locations* used for the disposition process *corresponded* between the QCA and interview findings. The participants agreed that retail *stores* can be used for the direct reuse of online product returns. Moreover, the participants confirmed that traditional FL facilities, like *warehouses* and *DCs* can be used for the disposition of consumer returns in online retailing. Additionally, RL facilities, like *CRCs,* can be used for disposition decisions and activities, and recovery facilities, like *repair facilities* and *recovery/service centres,* can be used for the repair disposition option. In terms of the locations, both the QCA and interview findings identified *primary markets* and *secondary markets* as destinations in the disposition process, emphasising the shipping, delivery and reselling activities. Like other RL processes, the interview findings *excluded collection, processing, disassembly* and *refurbishment facilities* in the disposition process of consumer returns. However, the participants *added fulfilment centres* as facilities that can be used for disposition decisions and activities.

Finally, the interview findings *corroborated all* the disposition process *parties* identified in the QCA findings. Specifically, the participants confirmed that *consumers* can represent either the (1) original consumers that act as the suppliers of returned products for disposition and receivers of repaired

products, and or (2) the second consumers responsible for buying returned/recovered products in the secondary or primary markets. Additionally, *online retailers* play significant roles in terms of providing resources, skilled staff and funds for disposition, establishing departments, contracts and partnerships, returning repaired products to original consumers and reselling returned products to second consumers and other parties through primary or secondary channels. Moreover, various *staff/departments* of online retailers can be involved in the disposition activities, including (1) RL or general managers, making disposition decisions, (2) recovery or RL departments, performing various information and product flow disposition activities, and (3) other functional departments, responsible for the transportation, redistribution and allocation of returned products in the disposition process.

However, like the QCA findings, the participants indicated retailers in the disposition process can include *second retailers*, acting as buyers and resellers of consumer returns. Furthermore, *suppliers* are responsible for honouring agreements, accepting consumer returns from online retailers, and repairing or replacing returned products under warranty. Lastly, several *third parties* aligned between the QCA and interview findings, including (1) 3PRL providers, responsible for disposition activities on behalf of online retailers, (2) third-party buyers, like salvagers, dealers and brokers, responsible for the buying and selling of returned products, and (3) third-party recovery specialists, like repairers, responsible for product repairs. Evidently, the disposition process in online retailing involves various parties with diverse roles needed for effective disposition and value recovery from consumer returns.

Essentially, the descriptive analysis for the disposition process emphasised various similarities and a few differences between the QCA findings and interview findings. Based on the discussion of findings for the descriptive analysis, the description created for the disposition process from the QCA findings (in section 5.6.6), can be reformulated as follows:

> The disposition process of consumer returns in online retailing can be described as an important, complex and time-consuming RL process, which (1) requires skilled/trained staff, resources, technology and speed, (2) involves costs, time, options/alternatives, routes, channels, destinations, markets, risks, discounted/lower prices, negotiations, contracts/agreements, partnerships and information sharing, (3) can be influenced by industry and organisation type, product type, characteristics, condition and quality, return type/reasons, volume and policies, manufacturer specifications and legislation, and (4) links with other pre- and post-receipt RL processes. The disposition process can include the (1) information flow activities of administration, scanning, booking and communication, (2) product flow activities of product examination/evaluation, disposition decisions, repackaging, restocking/return to inventory, disassembly, fixing, cleaning, treatment, packing, storage, loading, shipment, delivery and handling, and (3) cash flow activity of reselling, which can be performed by the staff/departments of online retailers or 3PRL providers in traditional FL facilities/locations (such as stores, warehouses, DCs and fulfilment centres), RL process facilities (such as CRCs) and recovery facilities (such as repair facilities and recovery/service centres). The aims of the disposition process can include (1) recovery of returned products through direct reuse and repair, (2) shipment of returned/recovered products to the suppliers or original consumers, (3) reselling of returned products in primary markets, and (4) selling of returned/recovered/used products to staff or second consumers, second retailers or third-party buyers in secondary markets.

In the next section, the descriptive analysis of the redistribution process in online retailing will be provided.

8.3.3.6 Descriptive analysis of the redistribution process in online retailing

Limited participants mentioned the term redistribution or the final transportation of returned/recovered products after disposition. In the QCA findings, the redistribution process, discussed in section 5.7, included any form of exit transportation, including redelivery of products to original consumers, shipment of consumer returns to suppliers and transporting returned products to other locations and markets. Therefore, any reference to transportation after disposition decision-making in the interview findings were included in the descriptive analysis. Furthermore, like the disposition process, the QCA findings included outcomes of redistribution, which were excluded from the descriptive analysis.

Table 8.13 provides an overview of the findings related to the redistribution process in online retailing, including detail on the combined categories and subcategories from the QCA and interview findings, a basic data matrix to compare the QCA and interview findings and supporting quotations from the interviews.

Table 8.13 Comparison between QCA and interview findings of the redistribution process

Source: Compiled by the researcher

Table 8.13 shows that a few subcategories assigned to the redistribution process in the QCA findings corresponded with the interview findings. In the subsequent paragraphs, the similarities and differences between the QCA and interview findings of the characteristics, activities, facilities/locations and parties of the redistribution process will be provided.

- *Characteristics of the redistribution process*

While the interview findings related to redistribution were limited, several redistribution characteristics *aligned* between the QCA and interview findings. Specifically, the participants confirmed that the redistribution process is *costly* and *requires speed.* Since redistribution involves transportation of returned/recovered products to various locations, general shipment/dispatch, transportation and redelivery expenses can be incurred in the redistribution process. Furthermore, like the disposition process, redistribution requires speed since the longer the returned products are stored before redistribution to the markets the greater the value loss. Furthermore, the participants agreed that redistribution *involves networks* since returned/recovered products must be transported to various locations through a network structure. Additionally, redistribution associates with *product reuse,* which can include the redelivery of returned products to the original consumer for re-consumption or to another location for reuse.

Both the QCA and interview findings showed that the redistribution process can be *influenced by product condition, return type* and *demand.* For instance, a false failure return of a product in a non-defective condition can be redistributed back to the original consumers. Additionally, participants indicated that product demand can determine the appropriate destination of the returned product. Most *links between redistribution* and *other RL processes coincided* between the QCA and interview findings. Specifically, the link between redistribution and the *collection* and *transportation processes* relates to the same network of parties used to collect, transport and redeliver product returns. Furthermore, the link between redistribution and *receiving* relates to the inbound and outbound flows of returned/recovered to and from the facility. The link between redistribution and *processing* relates to the denial of a refund and delivery of the returned product back to the original consumer. Additionally, the link between redistribution and *sorting* relates to the grouping of returned products in a

"redistribution for resale" category. Lastly, the links between redistribution and *disposition* relate to the shipment, transportation and delivery of returned/recovered products during or after disposition.

Few disposition characteristics from the QCA findings were *excluded* from the interview findings, namely that the process is an exit process, is time-consuming, requires resources, involves technology and influenced by product type, product quality and legislation. Although the interview findings excluded the term exit or final, no other processes after redistribution (or final transportation) were discussed by the participants. Consequently, redistribution can be viewed as an exit RL process. Apart from the reference to speed, participants omitted any other reference to time in the redistribution process, which explains the omission of the *time-consuming* characteristic. Furthermore, redistribution can use the same resources and/or parties as other RL and FL processes, which eliminate the need for specialised *resources*. Similarly, participants excluded reference to *technology* in the redistribution process, indicating that redistribution can be a more manual RL process. While the disposition process can be *influenced by product type* (e.g. food must be destroyed) and *legislation* (e.g. specify the condition of products), these factors may be less important in redistribution. However, like product condition, *product quality might influence* the redistribution process since it impacts the sales channel in the disposition process (e.g. selling low quality products to third-party buyers or in secondary markets). Therefore, if online retailers resell lower quality products in the secondary market, the product quality can impact the market destination in the redistribution process.

- *Activities of the redistribution process*

Fewer redistribution activities *corresponded* between the QCA and interview findings. However, the participants confirmed that the product flow activities of redistribution can include *packing, shipping/dispatching, delivery* and *storage.* Therefore, the product flow activities in redistribution associate with the outbound flows of returned/recovered products from the facility. Additionally, the participants agreed that the redistribution process involves the cash flow activity of *reselling*, relating to the delivery of returned/recovered products for resale in the primary or secondary channels.

Several activities identified in the QCA findings for the redistribution process were *excluded* from the interview findings. Particularly, the participants omitted the information flow activity of *remarketing.* As mentioned in section 8.3.3.5 (the disposition process activities), remarketing was excluded from the interview findings as an activity that can occur in the RLM of consumer returns. Nevertheless, the participants *added* the information flow activity of *communication* to the redistribution process, relating to product return shipment arrangements with suppliers. In terms of the product flow activities, the interviews *excluded loading, retesting, cleaning, repackaging and relabelling.* Since redistribution involves packing and shipment, the *loading* activity can be *included* in the redistribution process.

However, retesting, cleaning, repackaging and relabelling can be excluded since these activities in the QCA findings associated with specialised redistributor parties that perform value-added activities on returned products before redistribution. From the interview findings, the redistribution is a basic process with activities mostly relating to the transportation of returned/recovered products to various locations, excluding product recovery activities.

- *Facilities/locations and parties of the redistribution process*

Like other RL processes, limited *facilities/locations* associated with the redistribution process *corresponded* between the QCA and interview findings. However, the participants agreed that *stores* can be used for the redistribution of online product returns based on demand. Additionally, traditional FL facilities can be used for the redistribution of returned products, including *warehouses and DCs.* Lastly, the interview findings confirmed that *markets* can be locations in the redistribution process, relating to the reselling activity. The *facilities excluded* from the redistribution process were *CRCs*, *processing facilities*, *disassembly facilities* and *redistribution facilities*. Since CRCs can be used in the disposition process, online retailers might use CRCs for the redistribution process. The other facilities were omitted from the interview findings, explaining the exclusion of processing, disassembly and redistribution facilities from the redistribution process.

Most *parties* involved in the redistribution process *aligned* between the QCA and interview findings. *Consumers* play secondary roles by representing the original consumer that receives the returned/recovered back or second consumers in the markets that purchase returned/recovered products. *Online retailers* can be involved in the redistribution activities of communication, shipment/dispatch and redelivery activities. Alternatively, online retailers can use *3PLs/couriers* or *3PRL providers* for the redistribution of consumer returns, limiting the redistribution activities to communication, packing and storage. Furthermore, *suppliers* can be involved in the arrangement of transportation and receipt of consumer product returns from online retailers. Finally, *distributors* can be involved in the transportation of returned products to the suppliers. However, the QCA findings included redistributors as specialised parties in the redistribution process, which was omitted from the interview findings. Subsequently, redistributors are excluded as parties from the RL process of consumer returns in online retailing.

Essentially, the descriptive analysis for the redistribution process demonstrated various similarities and differences between the QCA and interview findings. Based on the discussion of findings for the descriptive analysis, the description created for the redistribution process from the QCA findings (in section 5.7.6), can be reformulated as follows:

> The redistribution process of consumer returns in online retailing can be described as a costly and exit process in RL, which (1) requires speed, (2) involves networks and product reuse, (3) can be influenced by product condition

and quality, return type and demand, and (4) links with other pre- and post-receipt RL processes. The redistribution process can include the (1) information flow activity of communication, (2) product flow activities of storage, packing, loading, shipping/dispatch and delivery, and (3) cash flow activity of reselling, which can be performed by online retailers, distributors and/or 3PL/3PRL providers in traditional FL facilities/locations (such as stores, warehouses and DCs), RL process facilities (such as CRCs) and market locations. The aims of the redistribution process include preparing of returned/recovered products for transportation to suppliers, original consumers, third-party buyers or second consumers in primary or secondary markets.

In the next section, the descriptive analysis summary of the post-receipt RL processes in online retailing is provided.

8.3.3.7 Descriptive analysis summary of the post-receipt RL processes in online retailing

Based on the reformulated descriptions provided in section 8.3.3, Table 8.14 provides a data matrix, comparing the overlapping characteristics, activities, facilities/locations and parties (occurring in two or more) of the post-receipt RL processes in online retailing.

Table 8.14 Descriptive analysis data matrix for post-receipt RL processes

Source: Compiled by the researcher

Table 8.14 shows that several subcategories were assigned to three or more post-receipt RL processes, with only few overlapping subcategories assigned to two post-receipt RL processes. From the table, several important observations can be made from the most significant subcategories (assigned to three or more processes) in the post-receipt RL process.

For the *characteristics*, inspection, sorting and disposition processes can be *important* and *complex* and *require skilled/trained staff*, indicating the need for online retailers to allocate sufficient and appropriate human resources for effective inspection, sorting and disposition of consumer returns. Furthermore, the receiving, inspection and disposition processes can be *time consuming*, implying that online retailers must consider developing strategies to reduce and monitor receiving, inspection and disposition lead time. Processing, inspection and disposition *require resources/infrastructure*, which means that online retailers might need to allocate various resources for successful processing, inspection and disposition processes. Furthermore, *speed* can be an important requirement in processing, disposition and redistribution, suggesting that online retailers establish speedy and efficient processing, disposition and redistribution processes. *Costs* associate with *all post-receipt processes*, indicating that online retailers need to identify cost strategies to control and reduce the costs of post-receipt RL processes.

All post-receipt RL processes, except receiving, can be *influenced by product condition* and *return/type reasons*, which means that online retailers can enhance visibility in the RL process for efficient post-receipt RL processes in the facility. Similarly, most post-receipt RL processes, except receiving and redistribution, can be *influenced by product type*, suggesting that online retailers with assorted product categories can establish flexible return procedures for the effective processing, inspection, sorting and disposition of consumer returns. Furthermore, receiving, sorting and disposition can be *influenced by*

return volume, indicating that online retailers can benefit from developing return forecasting strategies for receiving and consider return volume for effective sorting and disposition processes. *Product quality* can *influence* inspection, disposition and redistribution processes, which means that online retailers can implement mechanisms to determine returned product quality for effective inspection, disposition and redistribution processes. Additionally, the *return policy* can influence processing, inspection and disposition, suggesting that online retailers should align the terms and conditions of the return policy with the decision-making activities in processing, inspection and disposition.

Regarding the *links between the RL processes*, processing, inspection and disposition processes *link* with the *collection process*, which suggests that online retailers can consider integrating these processes. Similarly, processing, inspection and sorting *link with the gatekeeping process*, indicating that online retailers can benefit from integrating gatekeeping with the processing, inspection and sorting processes. All post-receipt RL processes, except sorting, *link with the transportation process*, implying that online retailers should integrate pre-receipt transportation with post-receipt RL processes. Furthermore, *all post-receipt RL processes* are *linked* (except inspection and redistribution), which indicates that online retailers must coordinate and integrate post-receipt RL processes for the effective management of consumer returns.

The post-receipt RL processes in online retailing share several common *activities*. Specifically, most RL processes, except disposition and redistribution, can include *verification of information*, which means that online retailers can implement verification mechanisms for effective receiving, processing, inspection and sorting processes. Similarly, most RL processes, except receiving and sorting, involve some form of *information sharing* and *communication*, which suggests that online retailers can benefit from establishing effective communication platforms and encouraging internal and external integration for effective processing, inspection, disposition and redistribution processes. All RL processes, except redistribution, involve *handling* as a product flow activity, emphasising that effective product return handling practices must be implemented for efficient receiving, processing, inspection, sorting and disposition processes.

The inspection, sorting and disposition processes involve some form of *product evaluation/examination* and *disposition decision making*, indicating that staff involved in inspection, sorting and disposition requires product knowledge and skill to effectively identify the best disposition option for maximum value recovery. Most RL processes, except receiving and processing, involve *storage*, suggesting that online retailers must allocate sufficient storage space for effective inspection, sorting, disposition and redistribution activities. Lastly, processing, disposition and redistribution can involve *delivery*, which means that online retailers must consider transportation options and arrangements for effective processing, disposition and redistribution processes.

Regarding the *facilities/locations*, *stores* can be used for processing, disposition and redistribution processes, implying that multi/omnichannel retailers can consider using their stores as locations for processing, disposition and redistribution activities. All post-receipt RL processes can be conducted in *warehouses* and *DCs*, indicating that online retailers can use their traditional FL facilities for the receiving, processing, inspection, sorting, disposition and redistribution of consumer returns. *Centralised return centres (CRCs)* can associate with most post-receipt RL processes, except processing and sorting, suggesting that online retailers can use dedicated and centrally located RL facilities for product return receiving, inspection, disposition and redistribution.

For the *parties*, all post-receipt RL processes involve *consumers*, *retailers* and *third parties*, which emphasises that online retailers need to focus on external integration for the establishment of effective post-receipt RL processes. Additionally, all post-receipt RL processes, except redistribution, involve *staff/departments*, suggesting that online retailers need to focus on human resource development and management for effective post-receipt RL processes. Finally, most RL processes, except receiving and sorting, involve *suppliers/manufacturers*, indicating that online retailers can benefit from focusing on strengthening supplier relationships, coordination and integration for effective processing, inspection, disposition and redistribution processes.

Essentially, the descriptive analysis confirmed, removed from and added to the QCA findings for an in-depth understanding and description of consumer return types and RL processes in online retailing. While several differences were identified between the QCA and interview findings in the descriptive analysis, the interviews with industry experts confirmed most categories/subcategories assigned to consumer return types and RL processes in the QCA of RL literature. These descriptive analysis findings will form part of the final framework for the effective RLM of consumer returns in online retailing, presented in Chapter 9. In the next section, the first theme from the reflexive TA of the interviews with industry experts will be presented, analysed and discussed

8.4 THEME 1: PREVENTION AND CONTROL FOR THE EFFECTIVE RLM OF CONSUMER RETURNS

Theme 1 involves return prevention and control initiatives for the effective RLM of consumer returns in online retailing. According to Lamba *et al.* (2020:381), high consumer returns make RL inevitable for online retailers. In fact, the influx of product returns in online retailing is so high that many retailers find it increasingly challenging to control (Bozzi *et al.* 2022:27). While online retailers can reduce consumer returns, they can never eliminate it; hence, they need to implement prevention and control measures to manage consumer returns effectively and efficiently. All participants mentioned throughout their interview discussions the importance of product return prevention and control in

online retailing. Therefore, "prevention and control" was identified as RLM factors, which means that online retailers must pay attention to return prevention and control for the effective RLM of consumer returns. The following quotations convey this importance:

> […] if you do it right, the first time, as I always mentioned [to] you, it reduces or mitigates the reverse logistics to a certain extent, [but] because reverse logistics is inevitable, you are going to have returns. […] the question is, how do you reduce the volume?" (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] you are always going to have an element of returns. But you can reduce, I believe you can reduce the percentage of returns. (P12, Head of logistics, online retailer)

> "[…] returns are always kind of like an afterthought for a lot of companies. So, if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly." (P3, returns manager, online retailer)

> "[…] you don't want to resell bad stuff. You don't want to be known in the trade as the guy that takes back rubbish [by accepting damaged/used product returns] and sends you [the new consumer] back rubbish [by reselling damaged/used returned products]." (P5, general manager, online retailer)

Figure 8.3, in section 8.2.2, provides an overview of theme 1, including the subthemes and related categories. Figure 8.5 provides a snapshot derived from Figure 8.3, highlighting Theme 1 – *Prevention and control for the effective RLM of consumer returns*.

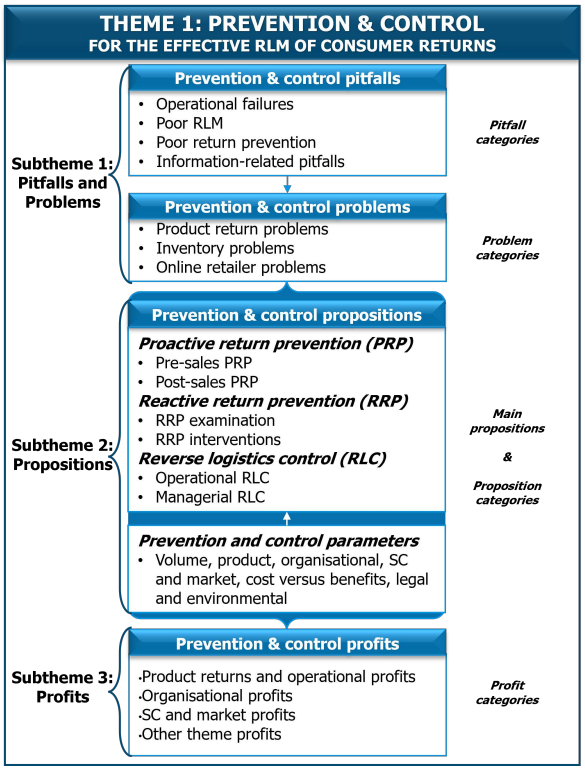

Figure 8.5 Overview of Theme 1 – Prevention and control for the effective RLM of consumer returns
Source: Compiled by the researcher

In the subsequent sections, a detailed overview, analysis and discussion of the interview findings for each subtheme, including prevention and control pitfalls and problems (subtheme 1), prevention and control propositions (subtheme 2) and prevention and control profits (subtheme 3) will be given. The section concludes with a framework, summary and overall analysis of the prevention and control findings for the effective RLM of consumer returns in online retailing.

8.4.1 Prevention and control pitfalls and problems – Subtheme 1

As illustrated in Figure 8.5, and discussed in section 8.2.2., the prevention and control pitfall categories include operational failure, poor RLM, poor return prevention and information-related pitfalls, and the prevention and control problem categories include product return, inventory and online retailer problems. Based on the interview findings, Figure 8.6 provides a detailed overview of the prevention and control pitfalls and problems in RL that will be discussed in this section.

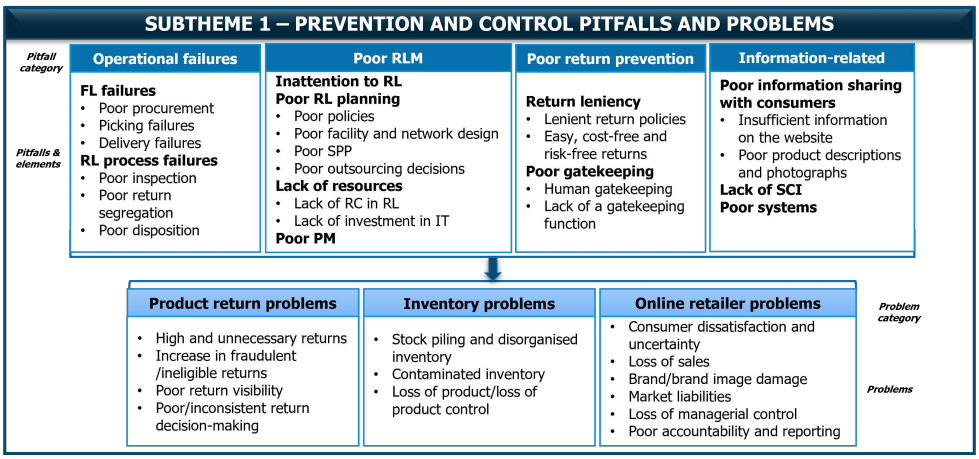

Figure 8.6 Detailed overview of prevention and control pitfalls and problems
Source: Compiled by the researcher

Based on the interview findings, Figure 8.6 shows the *prevention and control pitfall* categories with related pitfalls and pitfall elements (if applicable), and the *prevention and control problem* categories with related problems, which can hamper the effective RLM of consumer returns in online retailing. Section 8.2.2 provides details regarding the presentation and format of the pitfalls and problems applicable to each theme. In the subsequent sections, the prevention and control pitfall categories of operational failure, poor RLM, poor return prevention and information-related and associated pitfalls, pitfall elements and product return, inventory and online retailer problems will be discussed. The section concludes with a framework and summary of findings to demonstrate the relationship between specific prevention and control pitfalls and problems.

8.4.1.1 Operational failure pitfalls and related prevention and control problems

As shown in Figure 8.20, operational failures as a prevention and control pitfall category involves the prevention and control pitfall subcategories of FL failures and RL process failures, which can result in various product return, inventory and online retailer problems. FL failures and RL process failures as operational failure pitfalls with related prevention and control problems will be discussed in the subsequent sections.

8.4.1.1.1 FL failure pitfalls and related prevention and control problems

The FL failure pitfalls involve the elements of poor procurement practices, picking failures and delivery failures, which can contribute to various prevention and control problems, including product return, inventory and online retailer problems. Particularly, participants indicated that *poor procurement practices* can involve purchasing poor- or low-quality products, which can lead to unnecessary product returns (product return problem) and contaminated inventory (inventory problem). Additionally, poor procurement practices can result in consumer dissatisfaction and a loss of sales (online retailer problems) since consumers may share their bad experiences about the quality of the products. The following quotations illustrate the impact of poor procurement practices:

> "And, you know, obviously, if you're getting too many failures there's a procurement issue." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] if you've sold 30 items and 20 has been returned, then there's a problem with that product. […] It might be a default [defect] […]." (P12, Head of logistics, online retailer)
>
> "So, people return stock to us for a variety of reasons. One is that the merchandise quality doesn't perform to their expectations. So, it could be a manufacturing fault. […] And so, they [the consumers] buy it [a garment], […] then they find that there's a thread pulled or something's wrong or they wash the garment, and they find that it's shrunk. From a quality point of view that isn't good." (P8, logistics manager, multichannel retailer)
>
> "But people, the consumers talk amongst each other about the product quality, and you start losing sales because of a bad experience that one consumer had with the product that was bought online that had a defect […]." (P2, owner, supply chain consultancy firm)

Picking failures as a FL failure pitfall involves picking errors and poor product handling practices, which can contribute to product return problems and online retailer problems. Picking errors may be errors of selecting (1) a wrong item, (2) a correct item but in the wrong size, colour or other variation, or (3) near dated or expired stock, which can lead to high and unnecessary returns (product return problems). Additionally, poor product handling practices may involve using dirty hands or inappropriate handling of products during picking and packing, which can lead to consumer dissatisfaction (online retailer problem) and unnecessary returns. The following quotations demonstrate the prevention and control problems related to the picking failures:

> "[…] pick accuracy is a big driver of returns for obvious reasons." (P5, general manager, online retailer)
>
> "[…] if you think about a large distribution centre […] the errors that come in from a picking team, […] with a business that sells millions of items every month, you're bound to find somewhere that there was a miss pick whether they picked the yellow one instead of a blue one […]." (P5, general manager, online retailer)
>
> "[…] you do get problematic areas of stock returns, obviously the expiry date." (P11, Demand and sales manager, FMCG distributor)
>
> "Now you are putting it somewhere where a picker that handled 6000 items today takes their dusty hands and they touch the top of that lampshade and it's got two big thumbprints on it. And books, I mean, people that love reading, they are particular about books. If you got dirty hands and you pick a book without a plastic sleeve that would be soiled, they'll [the consumers will] send it back […] [and say] I didn't buy a book with somebody else's thumbprints on the front cover. So, the packaging and picking integrity outside of the accuracy, that's really important because a lot of comebacks are because of customers saying […]. Take it back. I want another one." (P5, general manager, online retailer)

Delivery failures as the final FL failure pitfall involves wrong, delayed and late deliveries and poor parcel handling in the delivery process, which can result in product return problems and online retailer

problems. Particularly, participants indicated that wrong deliveries and delays in or late deliveries can result in dissatisfied consumers (online retailer problem) that may decide to purchase the item from another online or multi/omnichannel retailer and return the product or cancel the order, resulting in unnecessary returns (product return problem) and a loss of sales (online retailer problem).

Moreover, a poor delivery experience may increase fraudulent returns (product return problem) since consumers might purposively damage the product and return it out of spite. Additionally, poor delivery experiences can result in brand image damage (online retailer problem) through consumer complaints on social media. Lastly, poor handling of the parcel in the delivery process involves outer package (e.g. delivery box) damages, which can increase consumer uncertainty (online retailer problem) about the condition of the product, resulting in unnecessary returns (product return problem). These findings can be demonstrated by the following quotations:

> "I picked up that due to delays in the service level, that the customer no longer requires the item. So, I would say I put that at about 15 percent. And it's more the customer's requirement of an item at a specific time. And if it doesn't reach them at a specific time they go onto the website, they cancel and they return. They purchase it elsewhere." (P9, regional & online DC manager, online retailer)

> "[…] you can have the best website in place or online system in place, but if the customer does not receive his product on time, I can tell you now that customer will be so angry or frustrated, you'll definitely return that product there is no doubt about it." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "Some customers will end up deciding, you know what, I'm going to be vindictive and say, because you provided me with such below par service, substandard service mediocrity, I'm going to show you something and I'm going to show you that I will damage this product […] [and] you do not want the noise levels […] the customer goes to social media badmouthing your company." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "It's the outer box sometimes. So, the customer sees that the outer box is damage and all of a sudden, he says, no way, geez, I'm not going to take this unit. And I'm afraid that probably the unit inside could be damaged." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

A few studies in the reviewed literature indicated that high consumer returns in online retailing can be attributed to quality problems, late or wrong deliveries (Ashan & Rahman 2022:138; De Araújo *et al.* 2018:348), delivery damages (Lamba *et al.*2020:381) and packaging damages (Hjort *et al.* 2019:779). Therefore, FL failures can be problematic for online retailers causing various product return problems, inventory problems and online retailer problems, which can hamper the effective RLM of consumer returns.

8.4.1.1.2 RL process failure pitfalls and related prevention and control problems

Although RL can be the result of problematic forward practices, *RL process failures* can exacerbate prevention and control problems. Associating with both poor prevention and poor control practices, the RL process failure pitfalls involve poor return inspection, poor return segregation and poor return disposition.

Particularly, *poor return inspection* can involve uneducated and untrained RL staff that either accept ineligible product returns (e.g. accepting an opened DVD classified as non-returnable in the return

policy) or place damaged/defective/used products back in stock, resulting in (1) high and unnecessary returns, an increase in fraudulent/ineligible returns and poor return decision-making (product return problems), (2) contaminated inventory due to mixing new and returned products (inventory problem), and (3) potential brand image damage (online retailer problem). The following quotations illustrate the impact of poor return inspection:

> "So, we have seen that with a lot of untrained people, they will accept the return that the customer has misused and in which case they should have actually declined it and send it back to the customer." (P3, returns manager, online retailer)

> "If your evaluators are stupid, they'll put [new/unused returned] products into bad stock, which are not supposed to be there, or they'll put [damaged/used returned] products into good stock that are not supposed to be there either. And you create a perpetual problem of returns because these guys are not doing the job correctly […] you don't want to resell bad stuff. You don't want to be known in the trade as the guy that takes back rubbish [by accepting damaged/used product returns] and sends you [the new consumer] back rubbish [by reselling damaged/used returned products]." (P5, general manager, online retailer)

Similarly, *poor return segregation* involves mixing returned products with new products by using the same area in the facility for returned products and new products. Subsequently, the online retailer may contaminate their inventory (inventory problem) through poor return segregation, which may involve reselling defective/damaged/used products or even counterfeit products, leading to high and unnecessary returns (product returns problems) and potential brand/brand image damage (online retailer problem). The following quotation supports this finding:

> "[…] keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items and possibilities of counterfeit goods, for example, entering your supply chain through a back door or having defective merchandise entering your supply chain again." (P2, owner, supply chain consultancy firm)

The RL process failure pitfall of *poor return disposition* involves poor or no disposition activities, which can result in inventory and online retailer problems. Particularly, poor disposition activities involve incompetent/untrained disposition staff, failing to de-brand returned products or clear personal information from returned computers and devices before resale on the secondary market, resulting in potential brand damage and market liabilities (online retailer problems). Additionally, no disposition activities means that online retailers ignore returned products after processing (i.e. refunds or replacements), causing stock pileups, a loss of products (inventory problems) and a loss of sales (online retailer problem). For example, storing and disposing resalable returned products instead of returning it to inventory for resale. The following quotations demonstrate poor disposition as a RL failure pitfall:

> "And you've got to make sure that it's de-branded because you don't want it going back into a secondary market with your brand. Or with your warranty slips. And your technical product, consumer electronics, how do you know that the customer's data isn't on their product? […] You as [the online retailer] must make sure that you've got staff that are competent to clear a hard drive. But if the power supply is gone, you can't access the hard drive, [and] now somebody comes along, fixes the power supply and then they are able to access the hard drive you've got a potential liability in your hand." (P1, operations manager, 3PRL provider firm)

> "[…] [the returned products] get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here, and that gets thrown in the back of a skip waste bin […]." (P7, owner, 3PRL provider firm)

Limited studies in the reviewed literature identified RL process failures as a pitfall that can lead to unnecessary returns, contaminated inventory, brand damage and a loss of sales. However, Ermes and Niemann (2023:7) noted that the risk of poor inspection in the RL process can cause an increase in damaged product returns. Furthermore, Senthil *et al.* (2018:718) indicated that poor storage of returned products can cause damage, which further increases future damaged product returns. Lastly, Ahsan and Rahman (2021:21) and Bozzi *et al.* (2022:12) identified that mishandling of product returns can cause brand damage and a loss of market share. Evidently, the impact of poor return segregation and return disposition practices extend the literature, highlighting practices that online retailers could avoid.

8.4.1.2 Poor RLM pitfalls and related prevention and control problems

Poor RLM as a prevention and control pitfall category involves the pitfalls of inattention to RL, poor RL planning, lack of resources and poor performance measurement (PM) in RL (see Figure 8.20), which will be discussed in subsequent sections with related prevention and control problems.

8.4.1.2.1 Inattention to RL pitfall and related prevention and control problems

Inattention to RL as a prevention and control pitfall means that online retailers treat RL as an "afterthought" and consider it as unimportant, resulting in loss of managerial control (online retailer problem). Furthermore, linking with the RL process failure pitfalls (section 8.4.1.1.2), participants indicated that failure to pay attention to RL means that online retailers often ignore product returns, contributing to inventory problems, like contaminating inventory through poor return segregation practices and a loss of product/product control. Additionally, contaminating inventory means that online retailers can resell damaged/defective products, leading to high and unnecessary returns (product return problems). The consequences of inattention to RL as a poor RLM pitfall can be demonstrated by the following quotations:

> "[…] returns are always like an afterthought for a lot of companies. So, if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly." (P3, returns manager, online retailer)

> "So, warehouses and processes are geared for the perfect delivery. You hardly find any organisations that open up and start with new facilities, with reverse logistics in mind […]. They'll put it [the returned products] in a little corner in the south wing and say, well, if something comes back, let's just bring it to that door. And then soon they find out that it's a completely different set of events to what you normally do [in forward logistics]. You have to segregate the [forward logistics and reverse logistics] processes completely, otherwise you sit with problems of mixing good and bad stock." (P5, general manager, online retailer)

> "[…] reverse logistics […] doesn't receive focus. It doesn't receive attention […] [returned products] eventually gets swept out and thrown away, it is pilfered, etc." (P7, owner, 3PRL provider firm)

While various studies in the reviewed literature indicated the negative impact of inattention to RL on the management of consumer returns (Bozzi *et al.* 2022:11; Davidavičienė & Al Majzoub, 2021:6), no research was found that identifies the product return and inventory problems associated with inattention to RLM. Therefore, this study adds to the literature by suggesting other problems associated with

inattention to RLM, which must be noted and avoided by online retailers for the effective RLM of consumer returns.

8.4.1.2.2 Poor RL planning pitfalls and related prevention and control problems

Poor RL planning involves the pitfall elements of poor policies, poor facility and network design, poor strategic planning and procedures (SPP), and poor outsourcing decisions, which can lead to product return, inventory and online retailer problems. Particularly, online retailers that implement *poor return policies* without the required specifications of clear product return conditions can receive high and unnecessary returns (product return problems) and a loss of sales (online retailer problem), as implied in the following quotation:

> "[…] your policy needs to be sound […] You're talking to somebody that bought two million rands worth of electronics with you, and they don't want to pay you. Or they are saying that your product is substandard, and they want to send it back. So, if you don't have a robust returns policy, you're going to get a hiding [with high product returns]." (P5, general manager, online retailer)

Additionally, linking with the pitfalls of RL process failures (section 8.4.1.1.2) and inattention to RL (section 8.4.1.2.1), online retailers often *design* their *facilities* and *networks* to be conducive for FL operations, which might not be suitable for RL processes. For example, not allocating a separate receiving gate and separate area in the facility for product returns can result in the inventory problems of disorganised inventory and contaminated inventory (e.g. mixing products by using the same receiving gate for new and returned product). Additionally, using a decentralised network design for product return gatekeeping and inspection activities can lead to inconsistent product return decision-making (product return problem) and consumer uncertainty (online retailer problem). The following quotations support these findings:

> "[…] because the facilities are not designed for reverse logistics, everything comes through one door. So, you're sitting with large things [like new products] on top of small things [like returned products] and it's a complete mess […] I think the one thing that gets neglected the most is the actual practical layout of the facility that needs to be conducive to a good return logistics process." (P5, general manager, online retailer)

> "[…] you do not want six or seven reclaim centres where the six or seven people that handled electronics all have a different view of what is used. Because that creates uncertainty with the consumer." (P5, general manager, online retailer)

Poor SPP involves a lack of strategic planning for RL, a lack of adding disposition decisions in strategic planning and poor standardisation/formalisation of RL processes and procedures, which can contribute to inventory, online retailer and product return problems. Particularly, online retailers that fail to strategically plan for RL and include disposition decisions in their strategic plans can risk product return stockpiling in the warehouse (inventory problem), potential brand damage and market liabilities (online retailer problems). For example, lacking a strategic plan for RL and disposition can lead to improper disposition activities, like not preparing products for resale on the secondary markets, which can result in market liabilities. Subsequently, a lack of strategic planning for RL and disposition

contributes to the RL process failure pitfall element of poor disposition of returns (see section 8.4.1.1.2).

Similarly, a lack of a strategic plan for handling product returns can lead to pilferages (a loss of product through theft), and the possibility of returned products ending up in black or informal markets (loss of product control) (inventory problems), which can damage the brand/brand image of the online retailer. Additionally, failure to standardise/formalise RL procedures and processes can result in poor/inconsistent product return decision making (product return problems), a loss of product/product control (inventory problem) and a loss of managerial control (online retailer problem). The following quotations expand on these findings:

> "You need to have a [strategic] plan for [reverse logistics]. […] [product returns] can't be building up in your warehouse. That's often the starting point. What are we going to do with the stuff in the warehouse? […] And how do we make sure we get it [the returned products] out of there in a way that we're not going to incur any potential liability […]." (P1, operations manager, 3PRL provider firm)

> "[…] your biggest damages of your brand could be the product finding its way into illegal or illegitimate markets. […] That's one example of justification of why it [reverse logistics] should be in your strategic plan." (P7, owner, 3PRL provider firm)

> "[…] I think they would be delinquent in any way to not including that disposal in their strategic planning […] you [will] find that product at every […] spaza store. It can only destroy the brand." (P7, owner, 3PRL provider firm)

> "[…] your [reverse logistics] activity of your teams, it has to be standardised. There cannot be any room for debate. The moment, there's debate people have different opinions, they make different decisions." (P5, general manager, online retailer)

> "Well, if you do not have the standard processes and regulations in place and policies, you do get the people selling off or taking stock or hand it out to staff and then [the] just say, but we weren't aware that it's not allowed. Where your policy and guidelines give you clear indication what needs to be done with return stock." (P11, Demand and sales manager, FMCG distributor)

Finally, *poor outsourcing decisions* involve online retailers that either (1) outsource the entire RL function to third parties without ensuring that the 3PL/3PRL provider can be trusted with product returns or capable in managing product returns or (2) partially outsource RL to capable 3PRL providers due to distrust. On the one hand, online retailers that outsource the entire RL function to 3P(R)L providers that lack product return inspection capabilities and standardised policies and procedures for RL may experience an increase in fraudulent/ineligible returns (product return problem), a loss of products/product control (inventory problems), brand/brand image damage and market liabilities (online retailer problems). On the other hand, online retailers that partially outsource RL to capable 3PRL providers can contribute to the prevention and control problems of a loss of managerial control, poor accountability and poor reporting (online retailer problems). The following quotations demonstrate the impact of poor outsourcing decisions as a poor RL planning pitfall element:

> "[…] if you outsource it [your reverse logistics] and the outsource company is selling it [the returned products] off to the man on the street […] you […] [are] liable for that." (P11, Demand and sales manager, FMCG distributor)

> "And I think our supply chains are too immature to successfully outsource the entire reverse logistics portion. And again, in South Africa, there's too much opportunity to open up yourself for fraud and other types of interactions. And it could devalue your brand when you allow that to be completely outsourced without inspection." (P2, owner, supply chain consultancy firm)

> "[…] someone needs to be in control of the whole circle. So, we've dealt with one or two brands where they just want us [the 3PRL provider] to do an element of the returns or the reverse logistics process, which is very bitty. You know, if anybody needs to take accountability, where do you point the accountability finger to if you've got different people doing different elements of the process? Whereas if it's fully outsourced, […] you just speak to the company who is managing the entire reverse logistics process […]. So, the reporting is much easier […]." (P4, owner/CEO, 3PRL provider firm)

Some of these findings aligned with a few studies in the reviewed literature, including the impact of (1) poorly designed return policies on the performance and sales of the online retailer (Davidavičienė & Al Majzoub, 2021:19), (2) poor strategic planning on the control of product returns (Badenhorst, 2022:229; Chen *et al.* 2017:26; Karlsson *et al.* 2023:8) and (3) outsourcing to 3P(R)L providers that lack skills and expertise on inventory control in RL (Tavana *et al.* 2016:554).

However, this study extends the literature by identifying the impact of poor facility and network design, poor standardisation/formalisation of RL processes and procedures and partial outsourcing to capable 3PRL providers on return prevention and control. Additionally, this study discovered various product return, inventory and online retailer problems that can be the results of poor RL planning. Subsequently, this study emphasises that online retailers can experience additional problems with poor return policies, facility and network design, SPP and outsourcing decisions that hampers the effective RLM of consumer returns.

8.4.1.2.3 Lack of resources pitfalls and related prevention and control problems

A lack of resources as part of the poor RLM prevention and control pitfall category involves a lack of resource commitment (RC) in RL and a lack of investment in IT resources, which can result in various product return, inventory and online retailer problems

A *lack of RC* in RL involves failure to allocate sufficient resources for RL, which can contribute to inventory and online retailer problems. Particularly, failing to commit resources for RL can contribute to poor RLM, resulting in the online retailer problem of a loss of managerial control. Additionally, a lack of RC in RL can include the failure to allocate financial resources to establish or design a facility to manage product returns, linking with the pitfalls of RL process failures (i.e. poor return segregation) and poor RL planning (i.e. poor facility design) (sections 8.4.1.1.2 and 8.4.1.2.2). Subsequently, failure to commit resources for product return segregation can result in disorganised inventory, contaminated inventory (i.e. mixing new and returned stock), a loss of product/product control (inventory problems), unnecessary returns (product return problem), potential brand/brand image damage and market liabilities (online retailer problems). The following quotations demonstrate these findings:

> "Without resources [for RL] then how are you going to do [and manage] it? […] If you don't invest in resources, you're not going to be able to do [and manage] any of it." (P8, logistics manager, multichannel retailer)

> "[…] everything comes through one door. So, you're sitting with large things [like new products] on top of small things [like returned products] and it's a complete mess […] And I think that's where a lot of businesses missed the mark […] I mean, you can speak to anybody that opens up a new business. They're not going to build a fancy

> design and layout the fancy warehouse for returns. They're going to say, no, of course not. We're going to spend our money on the good stuff [not returns]." (P5, general manager, online retailer)
>
> "I think it is because the online retailer that doesn't [commit resources to RL] […] will be behind in the marketplace […]. You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items and possibilities of counterfeit goods, for example, entering your supply chain through a back door or having defective merchandise entering your supply chain again." (P2, owner, supply chain consultancy firm)

A *lack of investment* in *IT resources* means that online retailers lack the capability to track the movement of product returns, which can lead to an increase in unnecessary and fraudulent returns, poor return visibility (product return problems), a loss of product/product control (inventory problems), potential market liabilities and poor accountability (online retailer problems). The following quotations depict the impact of a lack of investment in IT resources for RL:

> "You want to make sure that your parcels return to you […], you want to be able to see that stuff, and if you don't invest in systems and information technology […] it's very difficult to manage that and actually proactively get the visibility [of product returns]." (P13, supply chain manager, multichannel retailer)
>
> "[Investment in IT for RL is important] […] because it's a stock that's been returned, it's not stock going out of the system. So, it's basically stock that is nowhere or it's not been accounted since it left the customer till it's been returned to our depot. So, if there's no […] systems in place, you run the risk of potential fraud and potential risk that products may end up being [back] in the [forward logistics] system, which can be problematic." (P11, Demand and sales manager, FMCG distributor)

Various studies in the reviewed literature concur with the interview findings on the impact of inadequate financial resources, lack of facility infrastructure resources and a lack of investment in IT resources on the prevention and control of product returns. For example, a lack of financial resources can hamper the implementation of appropriate product tracking and tracing systems (Jović *et al.* 2020:160; Frei, *et al.* 2020:1619) needed for managing product return uncertainties in terms of volume, frequency and source (Mathu & Khunou, 2021:443). Furthermore, inadequate facility infrastructure causes uncertainties and operational inefficiencies, which can hamper planning, management and control of RL processes (Badenhorst, 2022:330; Meyer *et al*. 2017:12, 13). Similarly, a lack IT resources can hamper product return visibility and the ability to track fraudulent returns (Zhang *et al.* 2023:2, 10). Subsequently, the findings of this study reemphasise the harmful impact of a lack of resources on the management of consumer returns.

8.4.1.2.4 Poor performance measurement (PM) pitfall and related prevention and control problems

The final poor RLM pitfall entails poor PM in RL, which can result in prevention and control problems associated with product returns, inventory and the online retailer. Participants indicated that poor PM in RL can hamper RLM, leading to the online retailer problem of a loss of managerial control. Subsequently, a lack PM in RL can reduce an online retailer's capability to control the flow of product returns, which, like a lack of investment in IT resources (section 8.4.1.2.3), can result in a loss of product/product control (inventory problems), unnecessary or fraudulent returns (product return problems) and potential market liabilities (online retailer problem).

Additionally, failure to measure the performance of staff responsible for handling returned products can lead to stockpiling in the facility (inventory problem), which links to the poor RLM pitfall of inattention to RL. Furthermore, online retailers that fail to centralise and apply PM for RL across functional departments can contribute to accountability and reporting problems (online retailer problems). The following quotations support these findings:

> "And if you don't measure [RL], you can't manage it. So, whether it's reverse or not reverse, if you don't have a measurement process in place, you will not be able to manage something. It's impossible." (P6, logistics manager, multichannel retailer)

> "So, if there's no control measurements […] in place, you run the risk of potential fraud and potential risk that [returned] products may end up being [back] in the [forward logistics] system, which can be problematic." (P11, demand and sales manager, FMCG distributor)

> "[Performance measurement is important for RL] or else we're going to have a second warehouse full of goods and nothing is happening." (P9, regional & online DC manager, online retailer)

> "[…] the company needs to be looked at a centralised bit of information so that all the reporting [for RL] is on the same bit of information. So, the worst thing that can happen is that different departments get measured on different things and they are reporting on different aspects […]." (P8, logistics manager, multichannel retailer)

Poor PM in RL was identified by various studies in the reviewed literature as detrimental to the management and control of product returns and the RL function (Badenhorst, 2022:229; Lamba *et al.* 2020:385; Solati *et al.* 2023:14). In fact, Solati *et al.* (2023:14) found that a lack of a proper performance measurement system is the most significant barrier to effective RLM, emphasising the significance of effective PM practices in RLM. However, this study added further insight into the specific prevention and control problems that can be the result of poor PM, contributing to the motivation of implementing appropriate PM practices for the effective RLM of consumer returns.

Essentially, poor RLM involves the prevention and control pitfalls of inattention to RL, poor RL planning, lack of resources and poor PM, which can lead to various product return, inventory and online retailer problems. Subsequently, the impact of poor RLM on the ability of online retailers to prevent and control product returns, emphasises the importance of implementing efficient and effective RLM practices for the effective RLM of consumer returns.

8.4.1.3 Poor return prevention pitfalls and related prevention and control problems

As illustrated in **Figure 8.20**, poor return prevention as a prevention and control pitfall category involves return leniency and poor gatekeeping, which can lead to product return, inventory and online retailer problems.

Return leniency as a pitfall involves the pitfall elements of lenient return policies, and easy, cost-free and risk-free returns, which can lead to problems related to product returns, inventory and the online retailer. Particularly, a *lenient return policy* can entail a no-questions-asked return policy (e.g. allowing any product returns), which can increase fraudulent or ineligible returns (product return problem). Additionally, online retailers with *easy, cost-free* and *risk-free* returns can create a return culture, which

can lead to the (1) product return problems of high and unnecessary returns and an increase in fraudulent/ineligible returns, (2) inventory problem of contaminated inventory through potential counterfeit product returns, and (3) online retailer problem of a loss of sales (e.g. a consumer buying a dress in two sizes, keeping the correct-sized dress and returning the wrong-sized dress). The following quotations expand on these findings:

> "[…] a no-questions-asked return policy […] it's difficult to say no to those customers, but your customers take chances. So, you do need a [robust] policy." (P8, logistics manager, multichannel retailer)

> "It's very easy to return. And mostly there's no cost involved in returning. So, there's no risk for the purchaser in buying any of the product […] that may perhaps not be suitable when it comes […]." (P2, owner, supply chain consultancy firm)

> "You know, I think [online retailers are] just […] [creating a] culture of returns, […] whilst it is a very nice sales tool to say, well, if you don't like it, bring it back, I'm not sure how sustainable that's going to be […]." (P7, owner, 3PRL provider firm)

> "I've seen in the marketplace and people that shared this with me and because it is so easy [to return] and there are such a variety of online retailers […] it's very easy to buy something at one online retailer and return it to another online retailer where you basically duplicate the transaction and then claim a return from it. And some of the online retailers are also selling counterfeit goods or goods that are not in the right format." (P2, owner, supply chain consultancy firm)

> "I think with clothing, specifically people just buy, and they know there's no risk, so they over purchase […] And that's what a lot of people are telling me […]. I'll buy three pairs of shoes, […] the same model, different colours, and I'll decide at home which one is the one that I like [and return the rest]." (P2, owner, supply chain consultancy firm)

Closely related to return leniency, *poor gatekeeping* as a poor return prevention pitfall involves the pitfall elements of human gatekeeping and a lack of a gatekeeping function, which can result in several product return problems. Participants indicated that *human gatekeeping* can be problematic for online retailers since consumers might convince staff to accept ineligible product returns that fall outside the return policy parameters (e.g. accepting returns outside the return time limit of 30 days), which increases fraudulent and ineligible returns (product return problem). Additionally, using untrained or less skilled operational staff for product return gatekeeping can lead to poor and inconsistent return decision-making and an increase in unnecessary returns (product return problems). Human gatekeeping as a pitfall element can be demonstrated by the following quotations:

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [the consumer] phone the contact centre and I spin them a whole story about how I'm very poor and I bought this to talk to my grandchildren who are all overseas. […] now there is this whole story behind this return, and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter, this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable. Once you've agreed to pick it up, there's an expectation in the customer's mind that there's going to be an outcome [of accepting the return]." (P1, operations manager, 3PRL provider firm)

> "[…] an operational person with trying to decide at their level, I'm going to give [or allow] this [return], I'm going to give [or allow] that [return]. It's going to go haywire. Hence you need [a] gatekeeping process and [managers as gatekeeping] people." (P6, logistics manager, multichannel retailer)

Similarly, a *lack of a gatekeeping function* can lead to high and unnecessary returns and an increase in fraudulent returns (product return problems) since consumers might abuse a lenient return system. Additionally, failure to implement a gatekeeping function before the returns arrive at the facilities can result in a loss of products (inventory problem) and poor accountability (online retailer problem). For

example, the consumer claimed the return reason as unwanted, but a damaged item arrives at the warehouse, resulting in blame shifting between the consumer and courier. The following quotations substantiate these findings:

> "[…] gatekeeping is the correct word because if people simply return things because Retailer C will just take it back, don't worry […] [and] those floodgates will open, and people will abuse the system. People will buy the dinner jacket because they want to look suave with a date tonight and tomorrow, they are sitting back and saying that it's too small. And so, consumers are much more 'skelm' [untrustworthy] than we give them credit for. So, there are people that absolutely abuse the system." (P5, general manager, online retailer)

> "[…] a product that comes back and is broken, that's a very difficult one from an online point of view, because where was it broken when consumers are not going to take responsibility for it and the transporter is going to tell you it is broken when they collected it. So, there you would need verification at [the] collection point […]." (P4, owner/CEO, 3PRL provider firm)

These observations about to poor return prevention pitfalls and related problems fall in line with the reviewed literature. Specifically, various studies identified that return leniency associated with lenient and no-questions-asked return policies and cost/risk-free returns contribute to (1) higher returns (Andresen & Istad, 2019:57; Ashan & Raham, 2021:24), (2) opportunistic buying and return behaviour of dishonest consumers (Nel & Badenhorst, 2020:121; Zhang *et al.* 2023:10), (3) fraudulent returns, like returning counterfeit or lower-quality products (Shi *et al.* 2021:2172; Nel & Badenhorst, 2020:119; Zhang *et al.* 2023:6), and (4) brand image damage, a loss of consumers and a loss of sales (Ashan & Raham, 2021:24). While Hjort *et al.* (2019:775) agreed that gatekeeping in the warehouse associate with higher unnecessary returns in online retailing, no research was found that identified the impact of human gatekeeping on return prevention and control. Evidently, this study provides new insight into the problems that can arise from poor gatekeeping practices in online retailing. Essentially, online retailers need to implement return prevention practices that addresses return leniency and poor gatekeeping for the effective RLM of consumer returns in online retailing.

8.4.1.4 Information-related pitfalls and related prevention and control problems

The final prevention and control pitfall category involves information-related pitfalls, including poor information sharing with consumers, a lack of supply chain integration (SCI) and poor systems (see **Figure 8.20**), which can result in product return, inventory and online retailer problems.

Poor information sharing with consumers involves the pitfall elements of insufficient information on the website and poor product descriptions and photographs, which can result in product return and online retailer problems. Particularly, the participants mentioned that *inadequate information on the website* can lead to high and unnecessary returns (product return problems), consumer uncertainty and a loss of sales (online retailer problems). For example, only providing delivery information after the payment was made can be problematic if the consumer needs the product earlier than the estimated delivery date. In this case the consumer might decide to visit a bricks-and-mortar retailer to buy the

product and return the online purchased product once received, resulting in an unnecessary return and a loss of sale.

Furthermore, the participants indicated that *poor product descriptions* and *photographs* can increase false failure returns (e.g. the consumer thinks a non-defective product is defective because of unclear instructions) and unwanted returns (e.g. the consumer returns a product because the website photo is different from the actual product), resulting in high and unnecessary returns (product return problem) and consumer dissatisfaction and uncertainty (online retailer problems). The consequences of poor information sharing with consumers can be illustrated in the following quotations:

> "One of the things that I see systems lacking is the ability for the consumer or the purchaser to know when the delivery will take place. You have to go through the whole process of making the purchase. And at the very last step, you only get confirmation of when the delivery will take place. And often that is in such a way that you can't backtrack out of the transaction, meaning you now order a product, but on the final confirmation, it tells you it's only going to get to you in 10 days' time where the consumer then actually needs the product sooner. They then go to the nearest brick and mortar shop, purchase the same product, and again, knowing they can return the online purchase basically for free at a later stage." (P2, owner, supply chain consultancy firm)

> "[…] [the product] might be unwanted […] because the product description didn't tie to the customer's expectation […]. You might say something is defective […] but when you drill down, you might actually find that there's a degree of user ignorance [due to inadequate product descriptions]. So, particularly consumer electronics, this thing doesn't do what I expected it to do, but you need some technical knowledge to be able to operate it." (P1, operations manager, 3PRL provider firm)

> "[…] the dumbest thing you can do is to use old or dated or incorrect photography." (P5, general manager, online retailer)

> "[…] often the returns are [received] […] [because] the consumer didn't quite get the product that they were hoping for […], the product was very different to what was shown in the pictures […]." (P2, owner, supply chain consultancy firm)

While poor information sharing with consumers associates with problems related to product return prevention, a *lack of SCI* associates with problems related to product return control. For instance, a lack of integration between online retailers and couriers/3PLs can result in poor return visibility (product return problem) and the potential loss of the product/product control (inventory problem) due to the inability to track the product from the consumer's location to the facility. The following quotation supports this finding:

> "Look, I think couriers is the other leg that you want to integrate [with] […] for the majority of online retailers, that's a major challenge, trying to figure out where is my parcel between the customer and the DC. Because it's not my own employee, it's a courier [employee] that may have done one of ten things with that parcel." (P5, general manager, online retailer)

Finally, *poor systems* associate with the lack of investment in IT resources as a lack of resources pitfall element. Subsequently, poor systems represent manual operations, which makes return prevention and control problematic. Particularly, online retailers with poor systems may experience an increase in fraudulent product returns, poor return visibility, poor/inconsistent return decision-making (product return problems), a loss of product/product control (inventory problem), market liabilities and a loss of managerial control (online retailer problems). The following quotations illustrate the impact of poor systems on product return prevention and control:

> "[…] reverse logistics is simply not possible without a solid technology platform, because what you'll end up doing is you'll sit in a position where you manually logging things in, but you've got no idea of who's doing what, [and] how to track it." (P5, general manager, online retailer)
>
> "[…] the [online] system leads you through each step of the way with photographs and processes. But if it's a very basic system, you won't have that consistency [in accepting or rejecting product returns] across." (P8, logistics manager, multichannel retailer)
>
> "So, if there's no […] systems in place, you run the risk of potential fraud and potential risk that [returned] products may end up being [back] in the [forward logistics] system, which can be problematic." (P11, demand and sales manager, FMCG distributor)

The interview findings related to poor information sharing with consumers, lack of SCI and poor systems resonate with several studies in the reviewed literature. Specifically, poor information sharing with consumers on the website can increase product returns (Bozzi *et al.* 2022:28; Zhang *et al.* 2022:3188) and enhance consumer uncertainty and dissatisfaction (Bozzi *et al.* 2022:28). Additionally, a lack of SCI and poor systems can hamper product return visibility (Badenhorst, 2022:330; Zhang *et al.* 2023:7) and the ability to track and control returned products (Bozzi *et al.* 2022:19) as well as increase fraudulent returns (Zhang *et al.* 2023:7). Consequently, for the effective RLM of consumer returns, online retailers need to address the respective information-related prevention and control pitfalls to eliminate the resulting problems associated with product returns, inventory and the online retailer.

Essentially, a few studies from the reviewed literature align with the interview findings related to prevention and control pitfalls and problems. However, this study discovered several new prevention and control pitfalls and problems, which online retailers can identify and mitigate for the effective RLM of consumer returns. The next section summarises the interview findings for the prevention and control pitfalls and problems that can hamper the effective RLM of consumer returns.

8.4.1.5 Framework and summary of findings of prevention and control pitfalls and problems in RLM

The interview findings presented in section 8.4.1 shows that various prevention and control pitfalls and problems can hamper the effective RLM of consumer returns in online retailing. Online retailers need to identify the prevention and control pitfalls and problems and understand the cause-and-effect relationship between the prevention and control pitfalls and problems, which can guide them with the implementation of appropriate practices to mitigate specific pitfalls and problems. Figure 8.**7** provides an overview demonstrating the links between the prevention and control pitfalls and problems in RLM.

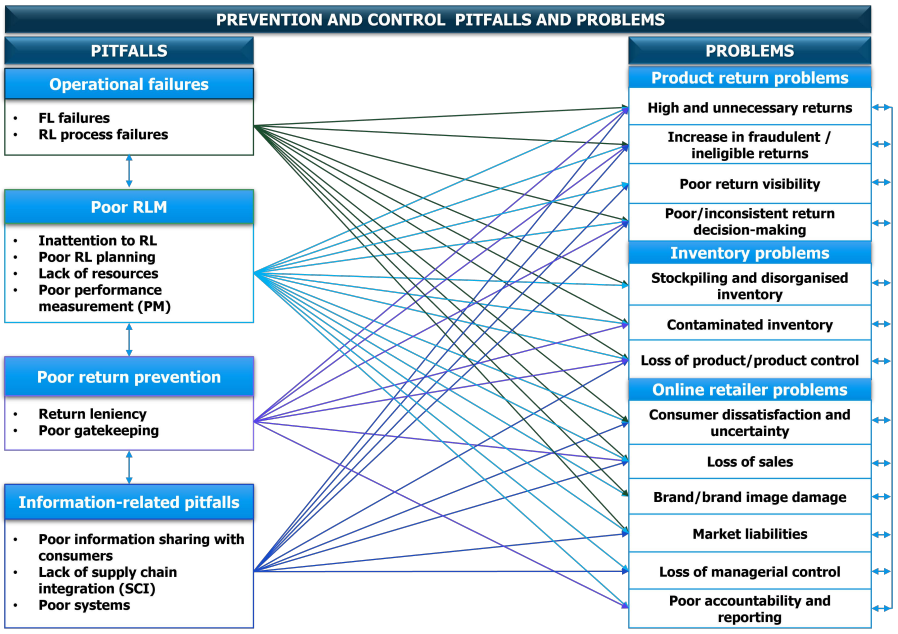

Figure 8.7 Relationship between prevention and control pitfalls and problems in RLM
Source: Compiled by the researcher

Figure 8.**7** provides an overview of the relationship between prevention and control pitfalls and specific prevention and control problems that can hamper the effective RLM of consumer returns. The links between the prevention and control pitfalls and problems in RL can demonstrate the most problematic factors in RL, which must be first addressed by online retailers that experience problems related to prevention and control in RL. Additionally, the framework illustrates links between the prevention and control pitfalls (the arrows on the left reaching more than one subcategory on the right), as well as the links between the prevention and control problems (short blue arrows on the right), which can be important considerations in identifying the most significant pitfalls and problems.

Specifically, the framework demonstrates that poor RLM can be the most significant prevention and control pitfall category, resulting in various product return, inventory and online retailer problems. Consequently, online retailers that experience prevention and control pitfalls related to poor RLM, including inattention to RL, poor RL planning, a lack of resources and poor PM, can expect all the product return, inventory and online retailer problems. Therefore, online retailers must address poor RLM pitfalls first for effective prevention and control in RL.

Additionally, the framework shows that the biggest consequences of the prevention and control pitfall categories can be the product return problems of high and unnecessary returns, increase in fraudulent/ineligible returns and poor/inconsistent return decision-making, the inventory problem of loss of product/product control and the online retailer problem of a loss of sales. Subsequently, online retailers with operational failures, poor RLM, poor return prevention and information-related pitfalls can expect high and unnecessary returns, increase in fraudulent/ineligible returns, poor/inconsistent

return decision-making, a loss product/product control and a loss of sales, which can hamper the effective RLM of consumer returns.

From the findings presented in section 8.4.1, examples of links between the prevention and control pitfalls include the links between (1) inattention to RL (poor RLM pitfall) and RL process failures (operational failures pitfall), (2) poor RL planning (poor RLM pitfall) and return leniency (poor return prevention pitfall) and (3) a lack of resources (poor RLM pitfall) and poor systems (information-related pitfall). Subsequently, addressing inattention to RL can help address RL process failures, addressing poor RL planning can help address return leniency and addressing a lack of resources can help address poor systems. Therefore, online retailers must identify and address the prevention and control pitfalls that contribute to other prevention and control pitfalls first.

Similarly, examples of links between prevention and control problems include the links between (1) high and unnecessary returns (product return problem) and a loss of sales (online retailer problem), (2) increase in fraudulent returns (product return problem) and contaminated inventory (inventory problem), (3) poor return visibility (product return problem) and poor accountability (online retailer problem), (4) inconsistent return decision-making (inventory problem) and consumer uncertainty (online retailer problem), (5) contaminated inventory (inventory problem) and brand/brand image damage (online retailer problem), and (6) a loss of product/product control and market liabilities (online retailer problem). Consequently, addressing high and unnecessary returns can help address a loss of sales, addressing fraudulent returns can help address contaminated inventory, addressing poor return visibility can help address poor accountability, inconsistent return decision-making can help address consumer uncertainty, addressing contaminated inventory can help address brand/brand image damage, and addressing a loss of product/product control can help address market liabilities. Evidently, online retailers must identify and address the prevention and control problems that contribute to other prevention and control problems first.

Nevertheless, online retailers may experience specific prevention and control pitfalls and related prevention and control problems that requires identification for the effective RLM of consumer returns. Subsequently, Table 8.15 provides a detailed summary of the interview findings, demonstrating links between the prevention and control pitfalls, pitfall elements (if applicable), and the specific prevention and control problems that online retailers can encounter.

Table 8.15 Prevention and control pitfalls and related problems

Pitfall category	Pitfalls	Pitfall elements	Product return problems	Inventory problems	Online retailer problems
Operational failures	***FL failures***	Poor procurement	•Unnecessary returns	•Contaminated inventory	•Consumer dissatisfaction •Loss of sales
		Picking failures	•High and unnecessary returns	-	•Consumer dissatisfaction

Pitfall category	Pitfalls	Pitfall elements	Product return problems	Inventory problems	Online retailer problems
		Delivery failures	•Unnecessary returns •Increase in fraudulent returns	-	•Consumer dissatisfaction and uncertainty •Loss of sales •Brand image damage
	RL process failures	Poor inspection	•High and unnecessary returns •Increase in fraudulent/ ineligible returns •Poor/inconsistent return decision-making	•Contaminated inventory	•Brand/brand image damage •
		Poor return segregation	•High and unnecessary returns	•Contaminated inventory	•Brand/brand image damage
		Poor disposition	-	•Stockpiling •Loss of product	•Loss of sales •Brand damage •Market liabilities
Poor RLM	***Inattention to RL***	-	•High and unnecessary returns	•Contaminated inventory •Loss of product/product control	•Loss of managerial control
	Poor RL planning	Poor return policies	•High and unnecessary returns	-	•Loss of sales
		Poor facility & network design	•Poor/inconsistent return decision-making	•Disorganised inventory •Contaminated inventory	•Consumer uncertainty
		Poor SPP	•Poor/inconsistent return decision-making	•Stockpiling •Loss of product/product control	•Brand/brand image damage •Market liabilities •Loss of managerial control
		Poor outsourcing decision-making	•Increase in fraudulent/ineligible returns	•Loss of product/product control	•Brand/brand image damage •Market liabilities •Loss of managerial control •Poor accountability and reporting
	Lack of resources	Lack of RC in RL	•Unnecessary returns	•Disorganised inventory •Contaminated inventory •Loss of product /product control	•Brand / brand image damage •Market liabilities •Loss of managerial control •Poor accountability and reporting
		Lack of investment in IT resources	•Unnecessary returns •Increase in fraudulent returns •Poor return visibility	•Loss of product/product control	•Market liabilities •Poor accountability
	Poor PM	-	•Unnecessary returns •Increase in fraudulent returns	•Stockpiling •Loss of product/product control	•Market liabilities •Loss of managerial control •Poor accountability and reporting
Poor return prevention	***Return leniency***	Lenient return policies	•Increase in fraudulent/ ineligible returns	-	-
		Easy, cost-free and risk-free returns	•High and unnecessary returns •Increase in fraudulent/ ineligible returns	•Contaminated inventory	•Loss of sales
	Poor gatekeeping	Human gatekeeping	•Unnecessary returns •Increase in fraudulent/ ineligible returns •Poor/inconsistent return decision-making	-	-
		Lack of a gatekeeping function	•High and unnecessary returns •Increase in fraudulent/ ineligible returns	-	•Poor accountability
Information-related pitfalls	***Poor information sharing with consumers***	Insufficient information on the website	•High and unnecessary returns	-	•Consumer uncertainty •Loss of sales
		Poor product descriptions & photos	•High and unnecessary returns	-	•Consumer dissatisfaction
	Lack of SCI	-	•Poor return visibility	•Loss of product/product control	-
	Poor systems	-	•Increase in fraudulent returns •Poor return visibility •Poor/inconsistent return	•Loss of product/product control	•Market liabilities •Loss of managerial control

Pitfall category	Pitfalls	Pitfall elements	Product return problems	Inventory problems	Online retailer problems
			decision-making		

Source: Compiled by the researcher

Table 8.15 summarises the findings for subtheme 1, linking the prevention and control pitfalls, pitfall elements and resulting problems. Online retailers can use the table to identify prevention and control pitfalls and related elements with corresponding prevention and control problems, which can help them to address specific prevention and control pitfalls and problems in RL.

For example, online retailers that use staff for gatekeeping (human gatekeeping pitfall element of a poor gatekeeping) in RL can identify the resulting product return problems of unnecessary returns, increase in fraudulent/ineligible returns and poor/inconsistent return decision-making, which might motivate them to implement an online gatekeeping function. Additionally, online retailers that experience, for example, stockpiling as a prevention and control inventory problem can investigate the possible causes that may include the RL process failure pitfall element of poor disposition, and the poor RL planning pitfall elements of poor SPP and poor PM. Subsequently, online retailers that experience product return stockpiling can identify that they must prioritise addressing RL process failure and poor RL planning pitfalls.

Moreover, online retailers can use the table to identify the most problematic prevention and control pitfalls and/or pitfall elements and the most significant prevention and control problems in RL that they must address or avoid for effective RLM. For instance, the most problematic prevention and control pitfall includes poor PM in RL, associating with eight prevention and control problems, which means that online retailers must avoid or address poor PM in RL for effective prevention and control of consumer returns. This finding corresponds with Solati *et al.* (2023:14) who identified poor PM in RL as the most significant barrier in RLM. Similarly, other problematic prevention and control pitfalls/pitfall elements, associating with seven prevention and control problems, that online retailers need to address include poor outsourcing decisions (poor RL planning pitfall) and lack of RC in RL (lack of resources pitfall). Subsequently, poor RLM can be detrimental to effective prevention and control in RL, emphasising the importance of implementing practices to improve RLM.

Finally, online retailers can identify that the problem of unnecessary returns (linked to 14 pitfall elements), followed by high returns and a loss of product/product control (linked to nine pitfall elements), can be the most significant prevention and control problems in RL, which may motivate them to implement various RL practices for improved return prevention and control.

Although online retailers can focus on addressing specific prevention and control pitfalls and related problems to improve return prevention and control in RL, they can gain even more advantages by

identifying and implementing appropriate prevention and control propositions in RL. Subsequently, the next section focuses on the prevention and control propositions for the effective RLM of consumer returns.

8.4.2 Prevention and control propositions – Subtheme 2

As illustrated in Figure 8.5, and discussed in section 8.2.2., the main prevention and control propositions, including *proactive return prevention* (PRP) (section 8.4.2.1), *reactive return prevention* (RRP) (section 8.4.2.2), *reverse logistics control* (RLC) (section 8.4.2.3) and *prevention and control parameters* (section 8.4.2.4), consist of proposition categories, key practices/parameters and support RL practices, which can be implemented and considered for the effective RLM of consumer returns. Based on the interview findings, Figure 8.8 provides a detailed overview of the prevention and control propositions in RL.

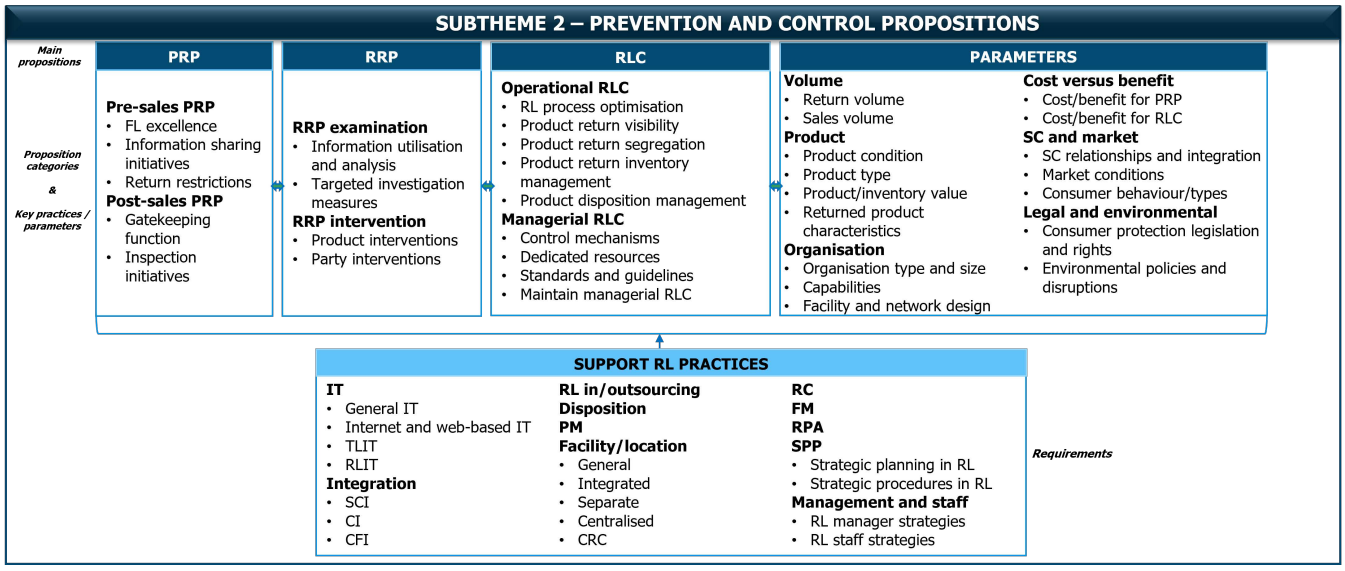

Figure 8.8 Detailed overview of prevention and control propositions in RL
Source: Compiled by the researcher

Figure 8.8 shows the main prevention and control propositions (headings), proposition categories (subheadings in bold) and key practices/parameters (bulleted), and the support RL practices (bottom of Figure 8.8). In section 8.2.2, details regarding the presentation and format of the propositions applicable to each theme were provided, including key practice/parameter elements (not listed in **Figure 8.15** but included in the discussion of the key practices/parameters). Based on **Figure 8.15**, the main prevention and control propositions, including proposition categories, key practices/parameters, key practice/parameter elements (if applicable) and support RL practices, will be discussed in the subsequent sections. This section concludes with a prevention and control proposition framework and a summary of the findings, demonstrating the links between the prevention and control propositions.

8.4.2.1 Proactive return prevention (PRP) propositions

According to Dobson (2023:10), online retailers must implement any method thinkable to proactively prevent products returns. PRP as a main prevention and control proposition involves the proposition categories of *pre-sales PRP* and *post-sales PRP*, which can be implemented to address various prevention and control pitfalls and problems. The PRP proposition categories of pre-sales PRP and post-sales PRP will be described and analysed.

8.4.2.1.1 Pre-sales PRP

Pre-sale PRP as a proposition category involves the key practices of *FL excellence*, *information sharing initiatives* and *return restrictions* (see **Figure 8.15**), which can address several prevention and control pitfalls and problems. These key practices will be described in the subsequent paragraphs.

- *FL excellence for pre-sales PRP*

FL excellence as a key pre-sales PRP practice involves several key practice elements, which include the 6 Rs of logistics, effective procurement and inbound inspection, and FL staff education.

Specifically, the *6 Rs of logistics* for FL excellence involves delivering the *right product*, in the *right quantity*, in the *right condition*, at the *right place*, at the *right time*, to the *right customer*. The 7th R of logistics include the "right price", which might entice the consumer to purchase the product in the first place. However, the right price never surfaced in the interview findings as a RL factor, justifying the 6 Rs of logistics to proactively prevent consumer returns. The following quotations illustrate the importance of the 6 Rs of logistics for pre-sales PRP:

> "[…] if you can provide an exceptional forward logistics, your reverse logistics will reduce. No doubt about it." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "Firstly, you have to ensure [that] the right goods get to the right customer at the right time. So, that is basically what it is and in the right condition […] if you get that right from an outgoing perspective, you will see your returns being minimised." (P9, regional & online DC manager, online retailer)

> "So, it's about ensuring that the right product was sent to the right customer […]." (P2, owner, supply chain consultancy firm)

Furthermore, the participants suggested that online retailers can focus on pick accuracy, control and integrity to ensure that the *right product* in the *right quantity* and in the *right condition* is delivered to the consumer. Similarly, online retailers can use effective packaging and reduce handling activities to ensure that products are delivered in the *right condition*. Moreover, online retailer can implement consumer identification measures (such as a pin number) to ensure that the *right customer* receives the *right product*. Some of these examples can be demonstrated by the following quotations:

> "[…] the way that you reduce returns is accuracy. You triple check on your accuracy of your picking." (P7, owner, 3PRL provider firm)

> "[…] the right product must be the right item, it must be the right size, it must be the right colour variant, etc. […] because often […] the consumer will say, well, I have ordered green and you've sent me blue […] there's not enough checking on what's being sent to the consumer." (P2, owner, supply chain consultancy firm)

> "So, the packaging and picking integrity outside of the accuracy, that's really important, because a lot of comebacks are because of customers saying […]. It looks like it went through war before it got to my door. Take it back. I want another one." (P5, general manager, online retailer)

> "And ensure that the product is adequately packaged so that when it does go to the consumers [it is] not broken or torn or doesn't look shabby. I think that way would minimise it." (P4, owner/CEO, 3PRL provider firm)

> "Anything that has been handled quite a few times has a risk or exposure of being damaged. So, we try and reduce the amount of times that an item is handled, meaning that to reduce the probability of damages." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] the consumer often […] [is] not physically present to sign for and open the parcel […]. So, it's very much checking on the outside [of the parcel] […] [to] see that you've given the right thing [the product] to the right person [the consumer]. (P2, owner, supply chain consultancy firm)

Additionally, participants indicated that online retailers could benefit by focusing on the perfect order ratio to ensure that the *right product* in the *right condition* and in the *right quantity* is delivered to the *right consumer* at the *right time*, which can prevent unnecessary and fraudulent product returns. Evidently, online retailers must focus on providing consumers with exceptional FL delivery service for effective pre-sales PRP, as emphasised in the following quotations:

> "And the most important thing is to ensure that we achieve a perfect order ratio […] making sure that there's no errors in the delivery, making sure that there's no damages, [so that] there's no returns. [We are] making sure that we deliver on the correct delivery dates, making sure that the correct quantities […] matches the order […]. So, we believe that quality is critical." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] we try to reduce the amount of times […] the customer goes to social media badmouthing your company […]. And the way you do it again is by providing the best customer service […] because if you providing this customer with the most exceptional service from the get go and he receives his product, I can tell you now already he'll embrace it. Some customers will end up deciding, you know what, I'm going to be vindictive and say, because you provided me with such below par service, substandard service mediocrity, I'm going to show you something and I'm going to show you that I will damage this product [and return it fraudulently]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Subsequently, *implementing the 6 Rs of logistics* can help online retailers address the FL inefficiency pitfall elements of picking failures and delivery failures, which involves the (1) product return problems of high and unnecessary returns and an increase in fraudulent returns, and (2) online retailer problems of consumer dissatisfaction (e.g. receiving a damaged product), consumer uncertainty (e.g. receiving products with damaged outer packaging), a loss of sales (e.g. late deliveries causing consumers to shop elsewhere) and brand image damage (see section 8.4.1.1.1).

Online retailers can perform *effective procurement* and *inbound inspection* to address poor procurement as a FL failure pitfall element, which can reduce unnecessary product returns, contaminated inventory, consumer dissatisfaction and a loss of sales (see section 8.4.1.1.1). For instance, online retailers can find suppliers with higher quality products and perform more effective inbound receiving inspection to ensure that any visible defects and dead-on-arrival products can be identified before damaged/defective products are placed in inventory and sold to online consumers. This finding can be demonstrated by the following quotation:

> "[To avoid or reduce consumer returns] improve the quality of your merchandise, […] make sure that the inbound inspection of all your products is high […] and embedded into your buying practices […]." (P8, logistics manager, multichannel retailer)

Finally, participants indicated that online retailers could *educate FL staff* for FL excellence to proactively prevent consumer returns. Particularly, the participants suggested that online retailers train FL staff to understand RL and the implications of FL failures as drivers of consumer product returns. Therefore, understanding RL may motivate FL staff to be more attentive during product picking, packing and handling. The following quotation support this finding:

> "[…] just as well as you understand the forward logistics, you have to understand, it's a must, that you understand reverse logistics. […] if you've got a team being responsible for forward logistics and they do not understand […] [that] forward logistics can contribute to reverse logistics, then you shouldn't have them there. And that's the reason why it's important that you train your individuals." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Since the establishment of FL excellence focuses on FL efficiencies, limited RL support practices can be used for the effective implementation of FL excellence as pre-sales PRP. Nevertheless, online retailers can implement (as supported by literature) return prevention and avoidance (RPA) practices (section 6.9.3) and the RL staff strategies of developing and implementing RL training and education programmes (section 6.9.5).

The interview findings in this section are in line with the pre-sales return avoidance and prevention practices identified from the reviewed literature, including (1) quality management and control (Davidavičienė & Al Majzoub, 2021:19; Euchi *et al. 2*019:49), (2) reduction of picking and delivery errors (Bozzi *et al.* 2022:20; Hjort *et al.* 2019:779) to deliver products in the right condition and quantity (Heyns & Kilbourn, 2022:11), (3) appropriate packaging, (4) the right product to the right consumer (Hjort *et al.* 2019:776, 779) and (5) effective procurement (Zhang *et al.* 2017:156). While Bozzi *et al.* (2022:30) found that managers involved in logistics are aware of the impact of consumer returns, no study identified training of FL staff as a pre-sales PRP measure. Therefore, this study provides a new avenue for online retailers to proactively reduce unnecessary returns.

Essentially, FL excellence can help online retailers address the prevention and control pitfall of FL failures (operational failure pitfall) as well as the prevention and control problems of high and unnecessary returns, an increase in fraudulent returns (product return problems), contaminated inventory (inventory problem), consumer dissatisfaction and uncertainty, a loss of sales and brand image damage (online retailer problems).

- *Information sharing initiatives for pre-sales PRP*

Information sharing initiatives as a key pre-sales PRP practice involves initiatives, including product descriptions, photography and consumer education (key practice elements), which can help consumers make better purchasing decisions.

For *product descriptions,* the participants suggested that accurate metadata on the website (e.g. correct specifications and size guides) and detailed and informative product descriptions can reduce returns. Regarding *photography,* the participants indicated that the online images must accurately reflect the actual product through in-house photography. Lastly, participants mentioned several *consumer education* initiatives for pre-sales PRP, including (1) videos/video links (e.g. YouTube links) to educate consumers on the correct use of the product, (2) product reviews, using verified shoppers (consumers) to educate or inform potential buyers on product quality, performance, usage and other characteristics, and (3) showrooming, providing consumers the opportunity to physically view products at a physical location before buying it online. These suggestions can be demonstrated by the following quotations:

> "[…] make sure that your online image reflects exactly what the customer's going to get, so that it doesn't confuse them with colour or quality. And make sure that the metadata on your website […] is 100 percent accurate so that the sizes and weights and dimensions are all 100 percent right." (P8, logistics manager, multichannel retailer)

> "[…] we had four in-house photography rooms. We would make sure that the visual that you get is actually the same as when you get the real item in your hands. It should look the same and it must be in detail. And where possible, you must have a YouTube link. Show a little video, show what it can do. So, it's all about visibility and information, give them the specifications, drill down into the specs. It's a lot of people that understand all this [product] information. Let them review it, make sure the [potential] customer understands, if it's cotton, you're going to have a shrinkage issue. You might have a three to 10 percent shrinkage. […] So, the more information […] the better, because that will entice the customer to make a better choice at the end of the day." (P12, Head of logistics, online retailer)

> "[…] the best way to minimise it […] [is to] educate the consumer as to what they're getting […]." (P4, owner/CEO, 3PRL provider firm)

> "I think if you can get it over to the customer […] in terms of what they're buying, […] like I said, showrooming or videos […]." (P13, supply chain manager, multichannel retailer)

As support RL practices online retailers can implement (as supported by literature) the consumer integration (CI) strategy of consumer education initiatives (section 6.4.2) and the RPA strategy of consumer support initiatives (section 6.9.3). The interview findings related to information sharing initiatives for pre-sales PRP correspond to various studies in the reviewed literature, including (1) accurate size guides and fit information (Bozzi *et al.* 2022:15; Hjort *et al.* 2019:778), (2) detailed and informative product descriptions (Gustafsson *et al.* 2021:877; Hjort *et al.* 2019:777; Nel & Badenhorst, 2020:127; Zhang *et al.* 2017:156), (3) appropriate and realistic photography (Bozzi *et al.* 2022:15; Hjort *et al.* 2019:778), and (4) consumer education initiatives (Mostert *et al.* 2017:10), including online videos (Bozzi *et al.* 2022:15; Nel & Badenhorst, 2020:127), product reviews (Li *et al.* 2021:1824) and showrooming (Bozzi *et al.* 2022:14).

Subsequently, this study reaffirms the importance of various consumer information sharing initiatives for pre-sales PRP, which can help online retailers address the prevention and control pitfall of poor information sharing with consumers (information-related pitfall) and related problems of high and unnecessary returns (product return problem), and consumer dissatisfaction and uncertainty (online retailer problems).

- *Return restrictions for pre-sales PRP*

Return restrictions for pre-sales PRP involves the key practice elements of developing and implementing robust policies and clearly communicating return conditions and policies to consumers. Particularly, participants suggested that online retailers *develop* and *implement robust return policies* with stricter return conditions, like a shorter return period (e.g. 14 days instead of 30 days) or charging return costs (e.g. administrative or transportation fees). Developing and implementing robust return policies can help online retailers avoid potential situations of receiving an influx of returns for large orders and reduce the possibility of fraudulent returns, as suggested in the following quotations:

> "[…] your policy needs to be sound […] You're talking to somebody that bought two million rands worth of electronics with you, and they don't want to pay you. Or they are saying that your product is substandard, and they want to send it back. So, if you don't have a robust returns policy, you're going to get a hiding [with high product returns]." (P5, general manager, online retailer)

> "Probably what you can do is reduce the amount of days or clemency that a customer has available to return […] have certain clauses in place so, […] within that two weeks that customer could damage a product. He could damage the product himself and say that he wants to return it. So, have some sort of a [restrictive return] policy […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] they will reduce the number of returns if they do attach a cost to the return." (P2, owner, supply chain consultancy firm)

Additionally, participants suggested that online retailers clearly *communicate return conditions* and *return policies* to consumers on their websites for pre-sales PRP. For example, warning consumers that no returns will be accepted for used, worn or opened products, which can reduce fraudulent product returns. Furthermore, online retailers can reduce unnecessary and ineligible product returns by clearly indicating non-returnable products. The following quotations convey these findings:

> "You need to be very clear. Your website needs to be clear from the get-go. You need to say to your consumer in the fine print that if you buy this jacket and you wear it, no matter what […] we're not going to take it back […] to minimise that risk [of fraudulent returns]." (P5, general manager, online retailer)

> "[…] you must have a very clear returns policy on [the website] […] I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

> "[…] you have to be clear with your customer. You have to standardise that […] You have to be clear about what's acceptable and what's not accepted and what product can be returned and what product is likely to get refunded. So, if somebody buys underwear and they send it back, you're not going to get a refund for it, or you don't take it back […]." (P13, supply chain manager, multichannel retailer)

Evidently, as support RL practices for the creation of effective return restrictions, online retailers can implement (as supported by literature) the CI strategies of consumer communication and information (section 6.4.2), and RPA strategies of clear return policies and return restrictions (section 6.9.3). The

interview findings related to return restrictions for pre-sales PRP align with the findings of Zhang *et al.* (2023:10), who indicated that stricter return policies and clearly communicated return policies and procedures can reduce unnecessary and fraudulent consumer returns. Additionally, Andresen and Istad (2019:8) agree that a clear return policy can be important for decreasing the number of consumer returns in online retailing.

Consequently, return restrictions for pre-sales PRP can help address the prevention and control (1) pitfalls of poor RL planning (poor RLM), return leniency (poor return prevention) and poor information sharing with consumers (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns (product return problems) and consumer uncertainty (online retailer problem).

8.4.2.1.2 Post-sales PRP

As illustrated in **Figure 8.15**, post-sales PRP as a proposition category involves the key practices of gatekeeping and inspection initiatives, which can address several prevention and control pitfalls and problems. These key practices will be described in the subsequent paragraphs.

- *Gatekeeping initiatives for post-sales PRP*

Gatekeeping initiatives as a key post-sales PRP practice involve the prevention of unnecessary and fraudulent returns through online authorisation and an appropriate gatekeeping function (key practice elements). Specifically, some participants indicated that online retailers must digitise their return policies and use non-human *online authorisation* procedures to automatically reject invalid product returns, which can avoid unnecessary, fraudulent and ineligible returns (product return problems). The following quotations show the value of online authorisation as a gatekeeping practice for post-sales PRP:

> "I think being able to validate returns on the front end is critical. So, your returns policy is translated into your online functionality. So, if I wanted to add something your system knows when I bought it, it knows what the rules are for the particular reason I'm returning it […] that authorisation piece doesn't need human interaction." (P1, operations manager, 3PRL provider firm)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter [is], this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable […]. So, avoiding that on the front end by digitising your returns policy […]. Your computer system understands what the product is and when they [the consumer] bought it, what the return parameters are for that item, what the policy is for that item and allows that customer to return it or rejects the return with treatable messaging. That avoids those sorts of fraudulent returns right at the outset." (P1, operations manager, 3PRL provider firm)

Other participants indicated that human involvement in gatekeeping can still prevent unnecessary and fraudulent returns, provided that online retailer establish an *appropriate gatekeeping function*. For instance, online retailers can request photos of products to assess the condition of the product before

accepting the return or restrict call centre agents in using the online authorisation system and order/invoice numbers to determine the validity of the product return request. Additionally, online retailers can use managers as gatekeepers, avoiding acceptance of ineligible product returns and poor/inconsistent return decision-making (product return problem). The following quotations illustrate the importance of establishing an appropriate gatekeeping function for post-sales PRP:

> "So, when it comes to Retailer D, there is certain criteria that needs to be done right. So, when a customer logs a return, they obviously need to take a photo of an item, a picture of something so that the person [gatekeeper] can see that item has been used. It obviously gets declined right away […]. I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

> "I think you should have the algorithms in place in the system […] the system will say. All right, Mr. X, you would like to return your product […] just click on this website or on this link and you will go through the whole [return authorisation] process […]. So, the gatekeeping mechanism should be there on the website. Or if it happens that he [Mr. X] decides to contact the call centre because he does not have access to the website […] the call centre enters his order number, and you [the call centre agent] can say, all right, Mr. X, based on this, you bought this product probably three months ago and unfortunately, we cannot entertain your return." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] some things [like return authorisation] need decisions at a higher [managerial] level. You never want to confuse an operational person with trying to decide at their level [where they might decide], I'm going to give [or accept] this [return], I'm going to give [or accept] that [return]. It's going to go haywire. Hence you need [a] gatekeeping process and [managers as gatekeeping] people." (P6, logistics manager, multichannel retailer)

As support RL practices for the effective implementation of gatekeeping, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities and using the Internet and website for RL (section 6.3.2), (2) CI strategies of consumer communication, information sharing and interaction (section 6.4.2), (3) RPA strategy of implementing gatekeeping practices (section 6.9.3), and (4) RL manager strategy of assigning experienced managers to RL (section 6.9.5). Nevertheless, implementing gatekeeping for post-sales PRP can be dependent on the effective implementation of return restrictions (key pre-sales PRP practice) to proactively prevent unnecessary and fraudulent returns.

The interview findings related to gatekeeping for post-sales PRP correspond with the findings of Hjort *et al.* (2019:774, 778), who identified that early gatekeeping at the point of the consumer return request, asking for photos and verifying order numbers can help post-sales avoidance of unwanted consumer returns. However, this study uniquely identifies that digitising return policies and online authorisation can automatically reject fraudulent returns, implying that online retailers must integrate their return policy parameters into their online functionality for effective post-sales PRP. Additionally, using managers for gatekeeping to avoid ineligible product returns and poor/inconsistent return decision-making extends return prevention and avoidance literature.

Essentially, gatekeeping initiatives as a key post-sales PRP practice can address the prevention and control (1) pitfalls of a lack of resources (poor RLM), return leniency, poor gatekeeping (poor return prevention) and poor systems (information-related pitfall) and (2) problems of high and unnecessary

returns, increase in fraudulent/ineligible returns and poor/inconsistent return decision-making (product return problems).

- *Return inspection initiatives for post-sales PRP*

Closely related to gatekeeping, participants suggested the implementation of return inspection initiatives as a key practice for post-sales PRP. Return inspection initiatives include the key practice elements of preventative inspection at consumer locations and preventative inspection at online retailer locations.

While inspection mostly takes place after the receiving process in the warehouse (see section 5.4), some participants suggested that online retailers could use dedicated staff to perform *preventative inspection at consumer locations* before collection, ensuring that the return reasons given by consumers are valid. For example, due to user error a consumer might believe that a product is faulty, resulting in logging a return and claiming that the product is defective. Subsequently, by inspecting "defective" products at consumer locations, dedicated staff might facilitate consumers with operating the product, complementing information sharing initiatives (e.g. providing detailed product instructions) as a key pre-sales PRP practice (section 8.4.2.1.1) to prevent "false failure" returns. Apart from preventing unnecessary product returns, preventative inspection at consumer locations can address problems related to a loss of products (inventory problem) and poor accountability (online retailer problem). The following quotations highlight the importance of preventative inspection at consumer locations:

> "[…] let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve it right there." (P5, general manager, online retailer)

> "But if a product comes back and it's broken, that's a very difficult one from an online point of view. Because where was it broken when consumers are not going to take responsibility for it and the transporter is going to tell you it is broken when they collected it. So, there you would need verification at [the] collection point […]." (P4, owner/CEO, 3PRL provider firm)

Nevertheless, most participants described *preventative inspection* at *online retailer locations*. Particularly, the participants indicated that online retailers could implement proper verification processes, allow supplier/manufacturer inspection and/or use dedicated RL disposition staff to prevent unnecessary and fraudulent product returns (e.g. counterfeit and used products). Likewise, participants indicated that online retailers must train inspection staff to make correct decisions about the condition of the product and on consumer behaviour to prevent unnecessary false failure returns. Additionally, online retailers can use their return policies to train inspection staff to detect potential fraudulent product returns, emphasising the importance of return restrictions (such as a robust return policy) for PRP. These findings can be illustrated by the following quotations:

> "And the only way you're going to really minimise [a fraudulent return] is that when it arrives, make sure the verification is correct […]. I don't think you can stop the fraudulent intent, but you can stop fraud from happening through a proper verification process." (P4, owner/CEO, 3PRL provider firm)

> "And they [the inspectors] might be external parties […]. They might be physical inspectors from the manufacturer at the online retailer's premises to verify that the return goods are in fact the original goods and not counterfeit goods." (P2, owner, supply chain consultancy firm)

> "But the value-add team, they would have to take that garment out of the bag […] to see whether there are any makeup marks or any dirt marks […] to see whether it's actually been worn. If so, they'll return it to the customer, and say, you know what, you wore it, we've got lipstick, mascara or deodorant or perfume on the jacket, we can't resell it. Sorry you take it [back], you keep it." (P5, general manager, online retailer)

> "Rather educate the staff to filter the decision properly. So, train the inspectors on how to manage your actual product. And that would reduce the number of comebacks you get […]. Train them on consumer behaviour, saying before you tell me that the product is broken, you know, just try one, two and three and [the consumers], they'll say, oh, OK, now that works perfectly." (P5, general manager, online retailer)

> "[…] we have a returns policy and whenever we train the people, we obviously use the policy as kind of a guideline to evaluate your return. […] a lot of untrained people, they will accept the return that the customer has misused and in which case they should have actually declined it and send it back to the customer. Training is of the utmost importance." (P3, returns manager, online retailer)

As support RL practices for the implementation of return inspection initiatives, online retailers can implement (as supported by literature) the (1) supply chain integration (SCI) strategies of SC collaboration, cooperation and strategic sharing of responsibilities (section 6.4.1), (2) CI strategies of consumer support initiatives, communication, information sharing and interaction (section 6.4.2), (3) resource commitment (RC) strategy of human RC (section 6.9.1), (4) RPA strategy of consumer support initiatives (section 6.9.3), and (5) RL staff strategies of establishing a RL function, developing RL skills/knowledge and implementing RL training and education (section 6.9.5).

While home inspection as a preventative initiative corresponds with the findings of Hjort *et al.* (2019:775), this study added inspection at online retailer locations as an initiative to proactively prevent consumer returns. Therefore, multiple inspection initiatives, including home inspections, dedicated and trained RL staff and manufacturer inspections, can be considered by online retailers for post-sales PRP. Additionally, this study shows that return inspection initiatives as a key post-sales PRP practice can address the prevention and control (1) pitfalls of RL process failures (operational failure), lack of resources (poor RLM), return leniency, poor gatekeeping (poor return prevention), poor information sharing with consumers and a lack of SCI (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns, poor return decision-making (product return problems), contaminated inventory, a loss of product (inventory problems), consumer dissatisfaction and uncertainty, loss of sales, brand image damage, market liabilities (e.g. reselling counterfeit or defective stock) and poor accountability (online retailer problems).

Essentially, the findings presented in section 8.4.2.1 shows that the PRP propositions of pre-sales PRP and post-sales PRP can help address various prevention and control pitfalls and problems, which can help online retailers with the effective RLM of consumer returns.

8.4.2.2 Reactive return prevention (RRP) propositions

RRP as a main prevention and control proposition involves the proposition categories of *RRP examination* and *RRP intervention* to prevent future product returns, which can be regarded as the opposite of PRP (proactive return prevention) practices. Nevertheless, RRP propositions can complement the PRP propositions to holistically prevent and avoid product returns and address prevention and control pitfalls and problems. In the subsequent sections, RRP examination and RRP intervention as RRP proposition categories will be described and analysed.

8.4.2.2.1 RRP examination

RRP examination as a RRP proposition category involve the key practices of *information usage and analysis* and *targeted investigation measures* (see **Figure 8.15**) to examine the causes of consumer returns, which will be discussed in the subsequent sections.

- *Information usage and analysis for RRP examination*

Participants identified several sources of information that online retailers can use and analyse for RRP examination. Particularly, participants suggested that online retailers use and analyse consumer feedback and complaints data, product return data and KPI data (key practice elements) as sources of information to examine product return reasons. For instance, establishing robust consumer feedback loops to analyse *consumer feedback* and *complaints data* can help online retailers identify problems in the FL process and procurement, complementing the key pre-sale PRP practice of FL excellence (section 8.4.2.1.1). Additionally, online retailers can encourage information sharing between departments and in the SC to analyse consumer feedback and complaints data to prevent future returns. Using consumer feedback and complaints data for RRP examination can be demonstrated by the following quotations:

> "[…] you have robust feedback loops. So, when returns do happen, you're able to understand why. Look, you will always get a certain level of returns. But when they're driven by either operational process or [the] product itself, unless you're getting that feedback [from consumers], you're not going to fix these processes, you just exacerbate the problem. So, I think that those are probably key." (P1, operations manager, 3PRL provider firm)

> "[…] the customer wasn't happy and complained, you know, the customer always complained due to something that was an error in their order or there was a missed delivery or delay and 90 percent [are] related to returns. So, it just becomes so important for us because this is where we improve our business. You know, we pull from the complaints [data] to iron out the creases […]." (P9, regional & online DC manager, online retailer)

> "Our supply chain will interact with our sales department or the sales executives and, [an] investigation and communication between various functions will be done with the customer to see where the problem is." (P11, demand and sales manager, FMCG distributor**)**

Moreover, online retailers can obtain *product return data* from appropriate IT systems, like AI and predictive analytics software, to identify problems with products or brands associated with high returns. Additionally, a dedicated RL manager can be used to analyse product return data and perform a root

cause analysis for return reasons. Alternatively, 3PRL providers with specialised return data capabilities can be used to explore return reasons related to defects. Subsequently, using and analysing product return data can help online retailers identify and mitigate the FL failure pitfall elements of poor procurement and delivery efficiencies (section 8.4.1.1.1). The following quotations support these findings:

> "I think [using IT to manage RL] helps you understand product behaviour, too. So, we are able to identify which brands have more issues, which brands need more robust packaging, which brands are more reliable versus unreliable brands […]." (P4, owner/CEO, 3PRL provider firm)

> "If you have that manager […] I think it would be good for someone to watch over it and to see if it can be used through AI and predictive analytics. You could start collecting information to see now three bags of cat food [was] returned. There seems to be a problem with a specific product line with a specific batch, or I'm finding that all of these brands of computers are being returned […]." (P2, owner, supply chain consultancy firm)

> "[…] looking at a root cause analysis as to what are the causes of the returns. I mean, it could be a myriad of things. It could be damages, it could be product issues, it could be actual products or dead-on-arrival products being latent damages, et cetera." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "I would definitely outsource reverse logistics and I would use a company that is specialised with it, because your [product return] data then becomes more relevant […]. So, [for] example, you can then pick out [and identify] if you've sold 30 items and 20 has been returned, then there's a problem with that product. […] It might be a default, it might be malfunctioning, it might be wrongly manufactured." (P12, Head of Logistics, online retailer)

Finally, participants suggested that online retailers use and analyse *KPI data*, like product return metrics and SC metrics, for RRP examination. Particularly, online retailers can use returns versus sales percentage as a product return metric to identify and examine causes of high product returns. Additionally, the product return metric of return reasons and SC metrics of supplier performance (e.g. percentage of defects) and 3PL performance (e.g. percentage of damages) can be used to examine FL failures that cause high and unnecessary returns. These findings can be demonstrated by the following quotations:

> "I think one of the most important things that we use is the percentage of returns versus sales. So, we measure […] every unit or every order that goes out, two percent or four percent or six percent of it comes back. And obviously, if you have an influx on that, if it [your returns] goes above a certain percentage, you need to start looking internally and find out why it is happening and what you can do to mitigate it." (P3, returns manager, online retailer)

> "So, it's important to measure why things are coming back, you need to understand if, for instance, 20 percent of your returns has a reason of damaged, then you know you've got an investigation to do within your picking and your delivery teams. Why are the things being damaged in-transit or is it a bad supplier? Is it a supplier problem?" (P5, general manager, online retailer)

> "So, we obviously check the fraction of how many items that goes out for delivery gets damaged by the courier." (P3, returns manager, online retailer)

As support RL practices for effective information usage and analysis, online retailers can implement (as supported by literature) the (1) general IT strategy of developing and using IT with information management capabilities (section 6.3.1), (2) SCI strategy of SC knowledge and information sharing (section 6.4.1), (3) CI strategy of consumer input (section 6.4.2), (4) cross-functional integration (CFI) strategies of communication, knowledge sharing and information sharing between functions (section 6.4.3), (5) RL outsourcing strategies of selecting 3P partners and developing PM (performance measurement) for 3P partners (section 6.5.1), (6) PM strategies of developing appropriate KPIs and

evaluating and analysing performance results (section 6.7.1), (7) RPA strategies of identifying product return drivers and using return analytics (section 6.9.3) and (8) the RL manager strategy of assigning a RL expert manager (section 6.9.5).

Various studies in the reviewed literature aligns with the interview findings on the use and analysis of information for RRP examination, including the use of (1) consumer feedback and product return analytics (Hjort *et al.* 2019:779), (2) AI and technologies for return rate and reason tracking (Bozzi *et al.* 2022:15; Zhang *et al.* 2023:11), (3) internal and external information sharing and integration (Mostert *et al.* 2017:1, 13), and (4) metrics for product return reasons, types and tracking (De Araújo *et al.* 2018:354; Sajjanit & Rompho, 2019:790). However, this study uniquely identified SC metrics and 3PRL providers with product return data capabilities as information usage and analysis initiatives for RRP examination.

Essentially, using and analysing information for RRP examination can help address the prevention and control (1) pitfalls of FL failures (operational failure), poor RL planning, a lack of resources, poor PM (poor RLM), poor information sharing with consumers and poor SCI (information-related pitfalls), and (2) problems of high and unnecessary returns, increase in fraudulent returns (product return problems), contaminated inventory, a loss of product (inventory problems), consumer dissatisfaction, a loss of sales and poor accountability (online retailer problems).

- *Targeted investigation measures for RRP examination*

While the interview findings mostly focused on information usage and analysis for RPP examination, some participants provided targeted investigation, including the use of product experts and investigation of return abusers (key practice elements), as effective measures for RRP examination.

Specifically, a few participants suggested that online retailers *use product experts* in their RL department to investigate return causes related to problematic products, linking with the pre-sales PRP practice of FL excellence through effective procurement (section 8.4.2.1.1) and post-sales PRP practice of return inspection initiatives (section 8.4.2.1.2). For instance, a technology expert can identify that the voltage of an imported electronic device is incompatible with voltage requirements in South Africa, or a fashion designer can identify a design flaw in an evening gown, which can help online retailers to prevent high and unnecessary returns. The following quotation shows the value of product experts as a targeted investigation measure for RRP examination:

> "[…] if you as an online commodity is running tech items, then get one person in that reverse logistics department that is savvy enough that knows something about tech that can say, right, this is not equipped for South Africa, or the resistors will never work in South Africa. So, there's a reason for that return. Like a junior fashion designer that receives all these clothing and say, hang on, guys, this is wrongly stitched, this is your problem." (P12, Head of logistics, online retailer)

Other participants suggested that online retailers *investigate individual return abusers* to address the fraudulent returns (a product return) problem. One participant further indicated that online retailers must focus on identifying consumers that abuse the system instead of punishing the entire consumer population with strict returns. Subsequently, implementing investigation measures to identify return abusers can reduce the need to create 'overly strict return restrictions' as a key pre-sales PRP practice (section 8.4.2.1.1). The following quotation denotes the targeted investigation measure of investigating individual return abusers:

> "One of the provisos around doing it was that we would instead of trying to penalise 98 percent of our customers […] to avoid them defrauding us, we would focus our efforts on identifying the two percent of customers that would actually try to defraud us. So, it's the serial returner and make individual decisions about those customers instead of penalising your entire customer body to try and protect yourself." (P1, operations manager, 3PRL provider firm)

As support RL practices for targeted investigation measures, online retailers can implement (as supported by literature) the (1) RC strategies of human resources and RL process resources (section 6.9.1), (2) RPA strategies of classifying consumers, developing a consumer database and implementing return avoidance strategies (section 6.9.3), and (3) RL staff strategy of establishing a RL function (section 6.9.5). While several studies in the literature supported the investigation of individual return abusers as reactive prevention measures (Ermes & Niemann, 2023:9; Hjort *et al.* 2019:779; Zhang *et al.* 2023: 11, 17), no studies identified the use of product experts for RRP examination. Therefore, this study adds to the literature and opens new avenues for online retailers to perform targeted investigations for RRP examination.

Additionally, this study shows that targeted investigation measures can help address the prevention and control (1) pitfalls of FL failures, RL process failures (operational failures) and a lack of resources (poor RLM), and (2) problems of high and unnecessary returns, increase in fraudulent returns (product return problems), contaminated inventory (inventory problem), consumer dissatisfaction and a loss of sales (online retailer problems).

8.4.2.2.2 RRP intervention

Based on the outcomes of RRP examination, online retailers can implement RRP intervention practices. Subsequently, both RRP examination and RRP intervention must be implemented as RRP proposition categories to effectively address prevention and control pitfalls and problems. As illustrated in **Figure 8.15**, the key practices of RRP intervention include *product interventions* and *party interventions*, which will be discussed and analysed in subsequent paragraphs.

- *Product interventions for RRP*

The implementation of product interventions for RRP intervention involves the key practice elements of redesigning/reengineering products and/or packaging, motivating product recalls and discontinuing products. The participants indicated that online retailers could use RRP examination practices, including information usage and analysis and targeted investigation measures, to share information and knowledge internally (between departments) and externally (with SC partners) for the implementation of product interventions.

For example, if consumers complain about packaging damages, the logistics department can share information with the procurement department, which in turn can share information with suppliers to redesign product packaging. Similarly, if product return data shows a high defective return rate for a specific product, internal and external feedback loops can be used to redesign products or motivate manufacturer product recalls. Furthermore, if a product expert identified a design flaw in a product, knowledge about the design flaw can be shared with the procurement department to discontinue purchasing the product and the sales and logistics departments to discontinue selling the product. Evidently, the implementation of product interventions can facilitate FL excellence as a key pre-sales PRP practice (section 8.4.2.1.1). The following quotations support these findings:

> "I think knowledge sharing would be good between the distribution team and the procurement team […], where they can feed [information] back further up the supply chain on potential changes to the packaging […] to reduce [product return] claims." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] what we would do is reengineering [the packaging]. Maybe it's just shoddy packaging." (P6, logistics manager, multichannel retailer)
>
> "[…] for instance, Samsung, [if] we get 95 percent product returns on a product of theirs […] [the] question gets raised to Samsung about maybe recalling the product […]." (P3, returns manager, online retailer)
>
> "[…] there needs to be the feedback loops into the business as well. If the same five-inch board-shorts keeps generating returns every summer, it's time to stop selling the five-inch board shorts or change its design." (P1, operations manager, 3PRL provider firm)

As support RL practices for product interventions, online retailers can implement (as supported by literature) the (1) SCI strategies of SC collaboration and knowledge and information sharing (section 6.4.1), (2) CFI strategies of functional collaboration and knowledge and information sharing (section 6.4.3), and (3) RPA strategy of implementing product initiatives for return avoidance (section 6.9.3).

Aligning with the interview findings, Andresen and Istad (2019:7), Bozzi *et al.* (2022:30) and Hjort *et al.* (2019:779) found that product and packaging improvements can be valuable ways to reactively prevent and avoid unnecessary product returns. However, this study uniquely identified discontinuation of products and manufacturer recalls as product interventions for RRP. Subsequently, online retailers can implement various product interventions for RRP, which can help them mitigate the prevention and control (1) pitfalls of FL failures (operational failure) and a lack of SCI (information-related pitfall), and (2) problems of high and unnecessary returns (product return problems), contaminated inventory

(inventory problem), consumer dissatisfaction and uncertainty and a loss of sales (online retailer problems).

- *Party interventions for RRP*

While product interventions can potentially improve external relationships, implementing party interventions as a key RRP intervention practice may hamper external relationships. Subsequently, participants suggested that party interventions, including the key practice elements of issuing penalties, cancelling supplier contracts, and consumer account suspensions, must be implemented with caution or as a last resort to address prevention and control pitfalls and problems.

Like product interventions, party interventions can be implemented based on RRP examination (section 8.4.2.2.1). For example, online retailers can use KPI data, like SC metrics, to (1) *issue penalties* (i.e. charging product costs) based on percentage of damages caused by couriers, and (2) *cancel supplier contracts* based on percentages of defects by suppliers. Additionally, online retailers can use the targeted investigation measure of investigating return abusers as a basis to *suspend the consumer accounts*. The following quotations illustrate party interventions as a key RRP intervention practice:

> "And to ensure that you engage with carriers or couriers that will deliver products to your customers, […] [to] take care of your product, and they are measured against any of their own damages. If our carrier loses a parcel or damages a good, they pay for it, which encourages good behaviour." (P8, logistics manager, multichannel retailer)
>
> "For us to cancel a contract with the supplier is a severe issue […] but eventually you could end up giving the supplier, a red card." (P6, logistics manager, multichannel retailer)
>
> "[…] you would exit the supplier if they've got more comebacks than what is normal. And that's an obvious red flag. You simply exit that supplier and say, you know what, we've got too many comebacks [of your products]. You are tarnishing our brand, so cheers." (P5, general manager, online retailer)
>
> "[…] what we found with Retailer E was that the same consumer would keep trying to commit the fraud and they eventually just block their accounts." (P4, owner/CEO, 3PRL provider firm)

Therefore, issuing penalties and cancelling supplier contracts can facilitate the effective establishment of FL excellence as a key pre-sales PRP practice (section 8.4.2.1.1). Additionally, suspending consumer accounts can complement the return restrictions as a key pre-sales PRP practice, clearly communicating return conditions and policies to consumers on the website. For example, warning consumers that fraudulent return behaviour can lead to account suspensions, which might discourage fraudulent returns (see section 8.4.2.1.2). Furthermore, as supporting RL practices for party interventions, online retailers can implement (as supported by literature) the (1) SCI strategies of developing PM for SCI, SC agreements and arrangements, and cost/risk sharing (section 6.4.1), (2) PM strategies of establishing appropriate KPIs and performance monitoring and review (section 6.7.1), and (3) RPA strategy of account suspensions (see section 6.9.3).

While a few recent studies, like Hjort *et al.* (2019:778), Robertson *et al.* (2020:172) and Zhang *et al.* (2023:11), identified account suspensions of return abusers as a measure of curbing fraudulent returns,

this study added partner penalties and supplier exit as party interventions for RRP. The explanation for this can be the SC power relationships in South Africa. In contrast to many regions around the globe, South African retailers carry the most power in the SCs, which enable them to dictate terms to suppliers. This finding is substantiated by the following quotation:

> "[…] the retail environment here [in South Africa] is a very powerful environment. So, you'll find the retailer really dictates to the supplier, which is extraordinary." (P4, owner/CEO, 3PRL provider firm)

Subsequently, supplier penalties and cancelling of contracts might only be viable party interventions in retailer-dominant markets. Nevertheless, as emphasised by the participants, party interventions must be implemented as a last resort to reactively prevent consumer returns. Essentially, party interventions can help online retailers address the prevention and control (1) pitfalls of FL failures (operational failure), poor PM (poor RLM) and lack of SCI (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent returns (product return problems), contaminated inventory, loss of products (inventory problems), consumer dissatisfaction and uncertainty, a loss of sales, brand image damage and poor accountability (online retailer problems).

In conclusion, RRP propositions, including RRP examination and RRP intervention, can help online retailers to reactively prevent future product returns as well as address various prevention and control pitfalls and problems. Therefore, online retailers can implement RRP propositions for the effective RLM of consumer returns. In the next section, reverse logistics control (RLC) propositions will be described and analysed.

8.4.2.3 Reverse logistics control (RLC) propositions

RLC as a main prevention and control proposition involve the proposition categories of *operational RLC* and *managerial RLC*, which can be implemented to control and manage return processes, returned products and the RL function. In the subsequent sections, operational RLC and managerial RLC as RLC proposition categories will be described and analysed.

8.4.2.3.1 Operational RLC

Operational RLC as a proposition category entails the control of return processes and returned products to effectively address prevention and control pitfalls. As illustrated in **Figure 8.15**, several key practices can be implemented to achieve operational RLC, including (1) RL process optimisation, (2) product return visibility, (3) product return segregation, (4) product return inventory management, and (5) product disposition management, which will be explored in the subsequent paragraphs.

- *RL process optimisation for operational RLC*

As a key operational RLC practice, online retailers can optimise the RL process to control and manage return processes. Online retailers can optimise the RL process by implementing several key practice elements, including the use of (1) strategic planning, (2) appropriate facilities and resources, (3) appropriate staff practices, and (4) third parties.

Regarding *strategic planning*, the participants mentioned that online retailers must include RL in their strategic plans to optimise the RL process for effective return prevention and control. Additionally, for *appropriate facilities* and *resources*, the participants suggested the use of centralised facilities to establish a dedicated RL department and allocate sufficient human resources, which can enhance RL process speed, efficiency and consistency. Other resources that online retailers can use for RL process optimisation include managerial resources (i.e. dedicated RL manager), IT resources (i.e. integrated IT systems) and financial resources. The following quotations illustrate the importance of using strategic planning and appropriate facilities and resources for RL process optimisation as a key operational RLC practice:

> "[…] you can have [RL] as part of a strategic plan to reduce [returns and] optimise, building efficiencies [in return processes]." (P6, logistics manager, multichannel retailer)

> "I would have a [returns] department within that centralised warehouse […] it relates directly then to the existing or current stock that you may carry or may not carry [such as counterfeit stock], and you've got immediate control. […] you want to immediately go and inspect [product returns] […] That's quick. […] It's in your own warehouse. You can control it quickly." (P12, Head of logistics, online retailer)

> "I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up [return] processes […]." (P5, general manager, online retailer)

> "[…] if you want to run your reverse logistics process accurately, you definitely need someone [a RL manager] to account for it. You need someone to manage the flow of it […]." (P4, owner/CEO, 3PRL provider firm)

> "[…] you would have to definitely invest in some sort of resources, whether it be IT integration, investing money, putting heads, where it counts towards that [return] process and managing it." (P13, supply chain manager, multichannel retailer)

In terms of *using appropriate staff practi*ces for RL process optimisation, participants suggested that online retailers train RL staff, measure staff performance and utilise dedicated RL staff for operational RLC. Particularly, online retailers must *train RL staff* to (1) perform RL processes correctly, (2) handle product returns correctly and efficiently and (3) understand RL systems and procedures. Furthermore, participants indicated that online retailers can *measure RL staff performance*, ensuring that RL processes in facilities (e.g. inspection, sorting, processing and disposition) are performed effectively and efficiently, avoiding prevention and control problems like stockpiling, a loss of product/product control over the product, a loss of sales and potential market liabilities (see sections 8.4.1.1.2 and 8.4.1.2.4). The following quotations denote the use of staff training and staff PM for RL process optimisation:

> "[…] the staff needs to be trained […] on the [return] process […] in order to function efficiently." (P4, owner/CEO, 3PRL provider firm)

> "And then obviously in a warehouse that does reverse logistics is not a square racked palletised environment, which is simple cubic measurement. Everything's a different size. Everything doesn't come back in a box. So, the people that are working in that warehouse need to be very skilled […]." (P7, owner, 3PRL provider firm)

> "[…] people need training because they need to know the process and the systems […] you're going to have to train and educate people on how you do your reverse logistics […] or just maybe get a firmer understanding of how your reverse logistics works." (P13, supply chain manager, multichannel retailer)

> "[The performance measurement of staff is important for] […] ensuring that our fulfilment centres and the returns process is carried out efficiently. It's an internal issue as well, because, if it has to go to the supplier, it must get to the supplier, if it is to be resold, it needs to get resold […] it needs to get onto the shelf ASAP within a specific timeframe and be put up for sale within a specific timeframe. Or else we're going to have a second warehouse full of goods and nothing is happening." (P9, regional & online DC manager, online retailer)

Moreover, linking to the post-sales PRP key practice of return inspection initiatives (section 8.4.2.1.2), online retailers can use *dedicated RL staff* to perform pre-return inspection at consumer locations, which can optimise the RL process. Particularly, participants indicated that dedicated RL staff may facilitate consumers with operating products correctly, which can avoid unnecessary false failure returns as well as unnecessary return collection, transportation, receiving, processing, sorting and disposition processes. Similarly, if the product is defective or incompatible, inspection at consumer locations saves inspection and processing time (i.e. quickly ordering a replacement) and reduce product return traffic at the facilities, enhancing RL process efficiency. The following quotation support this finding:

> "If you were able to put a dedicated returns team, […] our first line evaluators, […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell […] just to give them a better service [and] save some time and traffic at the DC." (P5, general manager, online retailer)

Alternatively, online retailers can *use third parties* for RL process optimisation. Particularly, online retailers can outsource RL processes to 3PRL providers with the capabilities to optimise RL processes, which can mitigate the prevention and control inventory problems of stockpiling and a loss of product/product control. The following quotation verifies this finding:

> "[RL outsourcing can be important] in the […] turnaround of the [returned] stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here and [then] that gets thrown in the back of a skip waste bin […]." (P7, owner, 3PRL provider firm)

As support RL practices for RL process optimisation, online retailers can implement (as supported by literature) the (1) CI strategies of consumer service and support initiatives and consumer interaction (section 6.4.2), (2) RL outsourcing strategies of deciding on the degree and type of 3Ps for RL outsourcing and selecting a 3PRL provider (section 6.5.1), (3) PM strategies of implementing PM for RL and performance monitoring and review (section 6.7.1), (4) centralised facility/location strategy of using a centralised facility for RL (section 6.8.4), (5) RC (resource commitment) strategies of financial, IT and infrastructure, RL process and human RC (section 6.9.1), (6) strategic planning strategy of integrating strategic plans for RL with organisational strategic plans (section 6.9.4), (7) RL manager

strategy of creating a full-time RL manager portfolio, and (8) RL staff strategies of establishing a RL function, implementing RL staff training and education and producing skilled and well-trained staff (section 6.9.5).

Several interview findings related to RL process optimisation for operational control correlate with the reviewed literature. Specifically, using (1) centralised return facilities (CRCs) was supported by Dapiran and Kam (2017:830), (2) dedicated staff, appropriate IT resources, integrated IT systems and staff training was supported by Bozzi *et al.* (2022:19, 21), and (3) third parties for RL process optimisation was supported by Wang, Dang *et al.* (2021:2) as practices to optimise the RL process for operational RLC. Additionally, Prajapati *et al.* (2021:6) confirmed that 3PRL providers can help with the necessary resources, including qualified human resources and appropriate IT resources, which can be important for RL process optimisation.

Essentially, RL process optimisation as a key operational RLC practice can address the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning, lack of resources, poor PM (poor RLM), poor gatekeeping (poor return prevention) and poor systems (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns, poor product return visibility, poor product return decision-making (product return problems), stockpiling, disorganised and contaminated inventory, a loss of product/product control (inventory problems), consumer dissatisfaction and uncertainty, a loss of sales, brand/brand image damage, market liabilities, a loss of managerial control and poor accountability (online retailer problems).

- *Product return visibility for operational RLC*

Linking with RL process optimisation, participants suggested that online retailers can effectively control RL operations through product return visibility, which can be achieved through the key practice elements of using IT and third parties.

In terms of *using IT*, the participants indicated that online retailers could enhance product return visibility by using their online web-based systems in the return request process, prompting the consumer to select the correct product for the return and book a return collection timeslot. Moreover, online retailers can integrate their online web-based systems with their WMS to receive information on the specific product (indicated by consumers on the system during the return request process) that will arrive for additional product return visibility and control in the receiving process. Subsequently, online retailers must invest in appropriate IT systems to enhance product return visibility. The following quotations illustrate these findings:

> "[…] you need some kind of inbound visibility. You can imagine if you've got a warehouse that has limited receiving space and you've got fresh product being flown into a distribution centre, you need to know what your volumes are going to be for returns […]." (P1, operations manager, 3PRL provider firm)

> "[…] to build from your WMS […] you can then request that the customer book their own return time slot. They can book their time; you give it a two-hour time slot […]. Then out of that you can build into that same customer portal, you can build your criteria for the return. And that you can also integrate into your WMS. The nice thing is if you build it into your WMS and you ask the customer to either use their email or their cell phone, you can then immediately pull that into the latest delivery that was made. So, you can ask the customer to pinpoint what that specific product is and if the customer selects the correct product, it will then work backwards into your supply chain for the warehouse management solution, so that once you receive it, it's actually waiting for you to tick it off and say, yes, it's now been returned. So, that's much better control." (P12, Head of logistics, online retailer)

> "[Investment in IT is important for RL] […] because it's a stock that's been returned, it's not stock going out of the system, so it's basically stock that is nowhere or it's not been accounted since it left the customer till it's been returned to our depot. So, if there's no control […] systems in place, you run the risk of potential fraud and potential risk that products may end up being [back] in the [forward logistics] system […]." (P11, Demand and sales manager, FMCG distributor)

Alternatively, online retailers can *use third parties* for product return visibility as a key operational RLC practice. Linking with the use of IT, participants indicated that online retailers could utilise the delivery software of SC partners, like couriers and 3PL providers, to enhance product return visibility in collection, transportation and receiving processes for operational RLC. Additionally, online retailers can use 3PRL providers with the necessary IT systems (such as special return software) and integration capabilities, which not only enhances product return visibility but also address the online retailer problem of poor reporting. The following quotations show the value of using third parties for product return visibility:

> "I use the courier's delivery online platform […] for reverse logistics control and management, because they've got all the steps in there that you would need, which is I've received your item, I'm in transit, and I'm back in the hub, I've confirmed it back in the hub, and I've taken ownership of there is the receipt of it." (P12, Head of logistics, online retailer)

> "And I developed an App that actually does all those [RL] processes in the form of physical inspection, photographs of the goods, routing, capturing of the information […] to know what's coming back for stock control and all that is controlled on an App […]." (P7, owner, 3PRL provider firm)

> "So, we've got a reporting system that goes over to the clients [or online retailers] where they can see what product it is, in what state of repair, which consumer it has come back from, how many credits are being granted, etc." (P4, owner/CEO, 3PRL provider firm)

Evidently, several support RL practices can be implemented for product return visibility as a key operational RLC practice. Specifically, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities and integrating Internet/web-based IT with other IT (section 6.3.2), (2) TLIT (traditional logistics IT) strategy of customising and using WMS for RL (section 6.3.3), (3) RLIT strategy of using product return IT and software (section 6.3.5), (4) SCI strategies of RSC collaboration, cooperation and coordination, and information and IT integration and sharing (section 6.4.1), (5) CI strategy of consumer input and participation (section 6.4.2), (6) RL outsourcing strategies of deciding on the type of RL processes, services and 3Ps for RL outsourcing, selecting a 3PRL partner and developing outsourcing terms (section 6.5.1), and (7) RC strategy of committing IT resources (section 6.9.1).

The interview findings related to the use of IT for product return visibility correspond to the findings of Jović *et al*. (2020:164), Zhang *et al.* (2017:157) and Zhang *et al.* (2023:7). Additionally, Prajapati *et al.* (2021:6) found that 3PRL providers can provide valuable IT solutions, which can ultimately enhance product return visibility. However, this study extends the literature by adding the use courier systems as an option for online retailers to enhance product return visibility for operational RLC. Essentially, product return visibility as a key operational RLC practice can address the prevention and control (1) pitfalls of RL process failures (operational failure), poor RL planning, lack of resources (poor RLM), a lack of SCI and poor systems (information-related pitfalls), and (2) problems of fraudulent returns, poor product return visibility (product return problems), disorganised and contaminated inventory, a loss of product/product control (inventory problems), market liabilities, loss of managerial control, and poor accountability and reporting (online retailer problems).

- *Product return segregation for operational RLC*

Product return segregation as a key operational RLC practice involves the physical separation of returned products and RL processes from new products and FL operations, which can be attained by allocating space and designing facility layout for RL processes, establishing a RL department and establishing a separate returns facility (key practice elements).

Based on the network design of the online retailers, participants indicated that online retailers could perform product return segregation in a standard facility (e.g. using a warehouse for RL and FL) by allocating *sufficient space* and *designing facility layout* for RL processes. Therefore, a standard FL facility must be designed to keep product returns separate from new products. Additionally, online retailers can enable product return segregation through the establishment of a RL department in their standard facilities, avoiding the use of staff with dual RL and FL responsibilities. Alternatively, online retailers with limited space for product return segregation can establish a *separate returns facility*, which naturally separate RL processes and returned products from FL and new products. The following quotations expand on these findings, showing the importance of product return segregation for operational RLC:

> "You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items […]." (P2, owner, supply chain consultancy firm)

> "So, warehouses and processes are geared for the perfect delivery. You hardly find any organisations that start new facilities, with reverse logistics in mind […]. And then soon they find out that it's a completely different set of events to what you normally do. You have to segregate the practices completely, otherwise you sit with problems of mixing good and bad stock. So, the industrial engineering layout, the floor layout and the floor plans and all of these SOPs [standard operating procedures] that drive reverse logistics needs to be top of mind when designing facilities. […] a lot more emphasis and a lot more money needs to be spent on initial layout planning [and] for reverse logistics departments, even if it's within a specific DC. They need to put sufficient planning into designing that layout so that it's practical for reverse logistics. I mean, Retailer K put up an entire reclamation centre, which is a standalone […]. They found that you can't do this [RL] in a normal DC. It's just too complicated. So, they had to build a separate facility." (P5, general manager, online retailer)

> "[…] a lot of the major online retailers have their returns handling completely separate from the outbound operation. Because instead of you contaminating your outbound operations to accommodate returns, it makes it a lot easier to handle [and control]." (P1, operations manager, 3PRL provider firm)

Subsequently, as support RL practices for product return segregation, online retailers can implement (as supported by literature) the (1) separate facility/location strategies of establishing and using separate facilities, separating a single facility and separating RL and FL processes (section 6.3.8), (2) RC strategies of financial and infrastructure RC (section 6.9.1), (3) strategic procedures strategy of formally developing SOPs for RL (section 6.9.4), and (4) RL staff strategy of establishing a RL function (section 6.9.5).

While Misni and Lee (2017:92) indicated that integrated facilities for RL and FL operations require sufficient space allocation for returns, no study in the reviewed literature identified the importance of product return segregation in facilities. Therefore, this study adds valuable insight and provides additional initiatives to address the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning and a lack of resources (poor RLM), and (2) problems of high and unnecessary returns (product return problem), stockpiling and disorganised inventory, contaminated inventory, a loss of product/product control (inventory problems), brand/brand image damage, market liabilities and a loss of managerial control (online retailer problems).

- *Product return inventory management for operational RLC*

Product return inventory management for operational RLC involves the use of systems, staff or third parties (key practice elements) to effectively control RL processes and returned products.

Regarding the *use of systems* for product return inventory management, participants suggested that online retailers invest in order management systems (OMS) to transfer returned products to various facilities/locations of the organisation based on the demand for the returned product. Additionally, online retailers can use end-to-end inventory management systems that track product returns in the return process and reinstate returned products back into inventory for resale, linking with the key operational RLC practice of product return visibility. The following quotations demonstrate the use of systems for product return inventory management:

> "I've got inventory floating around in the business […] I've got consumer stock coming back as returns […] we would have to look at some level of distributed order management [system] to take all this [returned] inventory and see how best we can use it. That's probably our biggest investment that we would do to try and manage [returned] inventory in motion […] so that you're not always dependent just on inventory from [the] central [warehouse], but you can use the return that comes back […], you can say, hey but there's a demand for this item there, I can fulfil from here to there […]." (P6, logistics manager, multichannel retailer)

> "[…] you need an end-to-end inventory management system. So, you need to be able to create a reverse order, and systematically track and update the status of that order as it goes back into the DC […] So, you need to […] make sure that you don't lose that product and that you don't miss it somewhere in the system […]." (P5, general manager, online retailer)

In terms of *using staff*, participants suggested that online retailers appoint a dedicated RL manager to effectively manage returned product inventory for improved operational RLC. Similarly, online retailers can create a dedicated RL inventory team to be responsible for managing and controlling returned stock inventory, mitigating inventory problems related to stockpiling, disorganised inventory, contaminated inventory and a loss of product/product control. The following quotations expand on these findings:

> "[…] the reverse logistics manager is actually managing the inventory component. What are we going to do with the stock? How are we going to handle it? How are we going to disposition [or dispose of] it? And maybe on the reporting side […] you can let the inventory go through the internal components […]." (P1, operations manager, 3PRL provider firm)

> "And then you've got your inventory team that works within that returns area. […] So, until it's gone through the entire [RL] process, that inventory team is responsible for ensuring that the bad stock goes either to a reseller, or [resalable returned stock] goes back into the good stock warehouse, so they maintain [returned] stock accuracy and security." (P5, general manager, online retailer)

Finally, online retailers can *use third parties* for product return inventory management as a key operational RLC practice. Specifically, online retailers can outsource product returns to 3PRL providers with the necessary expertise, resources and facilities for effective inventory management, as suggested in the following quotation:

> "[…] a dedicated, outsourced reverse logistics business. And the reason why I believe it is advantageous is because, if you got a warehouse that's running out a billion rands worth of goods every year, a million rands worth of reverse logistics is not warranted for them to take their focus of the ball. It [the returned products] inevitably lands up in a corner of the warehouse. It doesn't receive focus. It doesn't receive attention. It eventually gets swept out and thrown away, it is pilfered, etc. […] Our facilities are adopted for [the] management of reverse logistics. We've got the correct technology. We've got the correct type of vehicles and receptacles to put [the] product in […] [so] that it's stored correctly." (P7, owner, 3PRL provider firm)

As support RL practices for product return inventory management, online retailers can implement (as established by literature) the (1) TLIT strategies of using existing ERPs and ordering systems for RL (section 6.3.3), (2) RL outsourcing strategies of deciding on the types of RL processes, services and 3Ps for RL outsourcing and selecting a 3PRL provider (section 6.5.1), (3) RC strategies of IT and human RC (section 6.9.1), (4) RL manager strategy of creating a full-time RL manager portfolio, and (5) RL staff strategy of establishing a RL function (section 6.9.5). The studies by Bozzi *et al.* (2022:19), Frei *et al.* (2020:1616) and Starostka-Patryk (2021:2591) confirm the value of using of appropriate systems for the inventory management of product returns. Furthermore, Wang, Dang *et al.* (2021:2) supported the use of 3PRL providers to manage returned product inventory. Nevertheless, the study uniquely identified the use of dedicated staff, including a RL manager and a dedicated product return inventory team, as avenues for product return inventory management.

Therefore, online retailers can consider various measures for the inventory management of returned product, which can help them mitigate the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning, a lack of resources (poor RLM) and poor systems (information-related pitfall), and (2) problems of high and unnecessary returns, poor product

return visibility, poor/inconsistent return decision-making (product return problems), stockpiling, disorganised and contaminated inventory, a loss of product/product control (inventory problems), loss of sales, brand/brand image damage, market liabilities, a loss of managerial control and poor accountability and reporting (online retailer problems).

- *Product disposition management for operational RLC*

Closely related to product return inventory management, the key operational RLC practice of product disposition management involves the management and control of returned products in the disposition process to avoid inventory and online retailer problems. Participants suggested that online retailers engage with suppliers, train disposition staff, maintain internal disposition control or use third parties for effective disposition management.

For the disposition option of return to the supplier, participants indicated that online retailers could *engage with suppliers* to avoid stockpiling of returned products in the facility. Furthermore, online retailers can *train disposition staff* to remove serial numbers and personal information from returned products (e.g. removing the consumer's user profile from a laptop) to avoid possible brand damages and market liabilities when reselling returned products in secondary markets. The following quotations illustrate the use of supplier engagement and disposition staff training as key elements in product disposition management:

> "The problem about returns, it's not ever flowing, like you don't get product in, product out. So, it's a big request from our side to the supplier to actually get the [returned] products out […] in this [Covid] lockdown period, the stock on hand that we have for returns and bad stock that we have on returns have piled up greatly due to suppliers not being able to operate in that time." (P3, returns manager, online retailer)

> "[…] things like personal information and things like products that might cause potential harm once they are disposed of […] being able to de-brand that [returned product], does require a level of training." **(**P1, operations manager, 3PRL provider firm)

The participants provided opposing views in terms of maintaining internal disposition control and using third parties for returned product disposition management. On the one hand, some participants indicated that outsourcing disposition to third parties can be risky in terms of brand damage and market liabilities (see section 8.4.1.2.2), suggesting that online retailers *maintain internal disposition control* over returned products. On the other hand, some participants indicated that online retailers could benefit from *third parties* with disposition management capabilities, ensuring that returned products are dispositioned safely and effectively. The following quotations expand on these findings:

> "Well, we have experienced a trial outsourcing company receiving the returns or the reverse logistics material. And you as a business needs to be hands-on. That is the quickest way where irregularly is happening […] it's a risky business to outsource your return food products […]. There are [returned] products that can be, if you outsource it, and the outsource company is selling it off to the man on the street and it end up [back] in the [forward supply] chain […], [you are] liable for that." (P11, Demand and sales manager, FMCG distributor)

> "[RL outsourcing is important for] the recoverability of the product, the control […] of the stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says,

> we've got to get this nonsense out of here and [then] that gets thrown in the back of a skip waste bin […]." (P7, owner, 3PRL provider firm)
>
> "[…] [we are] a dedicated outsourced reverse logistics business […] Our facilities are adopted for [the] management of reverse logistics. […] our disposal mechanisms are all in terms of […] the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the [returned] products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)

Subsequently, as supporting RL practices for product disposition management, online retailers can implement (as supported by literature) the (1) SCI strategies of SC cooperation and sharing responsibilities and risks (section 6.4.1), (2) RL in/outsourcing strategies of RL in/outsourcing decisions, deciding on the type of RL processes, services and 3Ps for RL outsourcing, and selecting a 3PRL provider as a 3P partner (section 6.5.1), (3) disposition strategies of developing a disposition system, establishing disposition rules and policies and developing secondary market strategies (section 6.6.1), and (4) RL staff strategy of implementing RL staff training and education (section 6.9.5).

While the use of staff training for product disposition management correlates with the findings of Zailani *et al.* (2017:35), no studies in the reviewed literature for RLM in online retailing suggested supplier engagement, internal disposition controls or third parties (i.e. 3PRL providers) as product disposition management initiatives for operational RLC. Therefore, this study brings new insight into the value of product disposition management as a key operational RLC practice, which can help online retailers mitigate the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning (poor RLM) and a lack of SCI (information-related pitfall), and (2) problems of stockpiling, disorganised inventory, a loss of product/product control (inventory problems), loss of sales, brand damage, market liabilities, a loss of managerial control and poor accountability (online retailer problems).

8.4.2.3.2 Managerial RLC

Managerial RLC as a proposition category entails the management and control of the RL function, forming the foundation for the effective implementation and maintenance of prevention and control practices. Managerial RLC involves several key practices, including (1) control mechanisms, (2) dedicated resources, (3) standards and guidelines, and (4) maintaining managerial RLC (see **Figure 8.15**), which will be discussed in subsequent paragraphs.

- *Control mechanisms for managerial RLC*

The participants indicated that online retailers can either establish internal control mechanisms or select external control mechanisms (as key practice elements) for managerial RLC. For *internal control mechanisms*, participants suggested that online retailers keep the RL function inhouse and use centralisation (i.e. centralised facilities and PM systems) for managerial RLC. Additionally,

participants indicated that internal control mechanisms can help online retailers mitigate the prevention and control problems of inconsistent return decision-making (product return problem), consumer uncertainty, loss of managerial control, and poor accountability and reporting (online retailer problems), emphasising the value of internal control mechanisms. These findings can be illustrated by the following quotations:

> "But with regards to the entire reverse logistics process […] I do not believe it should be outsourced. I believe that the back office should control the administration side [of RL]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] that's all about how you set up your internal controls […] is it easier in one place when everything comes back, [and] one [RL] team dealing with it […] to keep an eye on that." (P13, supply chain manager, multichannel retailer)

> "[…] we've centralised [RL] because the decision-making criteria is more consistent in one depot in the country […]. So, it's a managerial control decision […]." (P8, logistics manager, multichannel retailer)

> "[…] the company needs to be looked at a centralised bit of information so that all the reporting [for RL] is on the same bit of information. So, the worst thing that can happen is that different departments get measured on different things and they are reporting on different aspects […]. So, I think the most important thing is that the metrics and benchmarks in an organisation need to be centralised and the data visibility must be available to all those parties easily." (P8, logistics manager, multichannel retailer)

Contrastingly, online retailers may select an *external control mechanism* by using appropriate third parties for managerial RLC. Specifically, participants indicated that online retailers must select a full RL outsourcing strategy, ensuring that one 3PRL provider party is accountable for the management and control of the RL function, as emphasised in the following quotation:

> "I would say outsource the whole thing […] Because someone needs to be in control of the whole circle. […] if anybody needs to take accountability, where do you point the accountability finger to? […] if it's fully outsourced there is one call to make. If something goes wrong or something goes right, you just speak to the company who is managing the entire reverse logistics process […] So, the reporting is much easier now […]. (P4, owner/CEO, 3PRL provider firm)

Subsequently, control mechanisms links with the operational RLC practice of product disposition management, involving either internal disposition control or external disposition control for disposition management (section 8.4.2.3.1). Therefore, online retailers must consider operational RLC practices for the effective implementation of managerial RLC practices. As support RL practices for control mechanisms, online retailers can implement (as supported by literature) the (1) RL in/outsourcing strategies of RL in/outsourcing decisions, deciding on the degree of outsourcing and selecting a 3PRL provider (section 6.5.1), (2) PM strategies of standardising PM, implementing PM and creating feedback mechanisms (section 6.7.1), (3) centralised facility/location strategies of a centralised return system and using a centralised facility for RL (section 6.8.4), and (4) RL staff strategy of establishing a RL function (section 6.9.5).

The interview findings related to internal control mechanism for managerial RLC correspond to the findings of several studies from the reviewed literature. Specifically, Prajapati *et al.* (2021:5) identified that keeping RLM inhouse can help with internal managerial control. Additionally, Dapiran and Kam (2017:830) found that centralised facilities can be a valuable internal control mechanism in RL. While

the studies of Prajapati *et al.* (2021), Tombido *et al.* (2018:236) and Wang, Dang *et al.* (2021:2) identified the value of 3PRL providers in RLM, no studies identified the use of a 3PRL provider as an external control mechanism for managerial RLC. In fact, the loss of organisational control was identified as an external outsourcing risk by Panjehfouladgaran and Lim (2020:1462), implying that online retailers must carefully consider the potential risks associated with the use of a 3PRL provider as an external control mechanism for managerial RLC.

Essentially, the interview findings emphasised that control mechanisms for managerial RLC can help online retailers to address the prevention and control (1) pitfalls of RL process failures (operational failure pitfall), inattention to RL, poor RL planning and poor PM (poor RLM pitfalls), and (2) problems of poor/inconsistent return decision-making (product return problems), a loss of product/product control (inventory problem), consumer uncertainty, a loss of managerial control, and poor accountability and reporting (online retailer problems).

- *Dedicated resources for managerial RLC*

Dedicated resources as a key managerial RLC practice follows the selection of control mechanisms for managerial RLC. The participants indicated that both internal and external control mechanisms require the allocation of dedicated resources, including a dedicated manager and staff/department for RL. Evidently, internal control mechanisms for managerial RLC requires allocation of dedicated human resources, while external control mechanisms for managerial RLC requires the selection of a 3PRL provider based on dedicated human resources. Furthermore, the participants suggested that online retailers use a separate RL facility, which facilitate effective dedication of resources for managerial RLC. The following quotations support these findings:

> "[…] because they are completely different processes […] you definitely need a dedicated person or a resource dedicated to [manage and control] the entire reverse logistics process, whether that's managing a 3PL who does the whole thing or whether you are managing it in-house." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] you'd have to have a [dedicated] manager to make sure that things are kept in control." (P8, logistics manager, multichannel retailer)
>
> "[…] appoint additional resources to make reverse logistics a division that manages the returns […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "I would think for just returns […] If you have a separate facility just for that […] you can have great controls and only focus [your resources] on returns and managing that." (P13, supply chain manager, multichannel retailer)

Accordingly, as support RL practices, online retailers can implement (as supported by literature) the (1) separate facility/location strategy of separate facilities for RL (section 6.3.8), (2) RC strategies of sufficient and appropriate resources for RL and human RC (section 6.9.1), (3) RL manager strategies of creating a full-time RL manager portfolio and assigning a RL manager, and (4) RL staff strategy of establishing a RL function (section 6.9.5).

Dedicated resources for managerial RLC links with various operational RLC practices (section 8.4.2.3.1), including (1) RL process optimisation using a dedicated RL manager and staff, (2) product return segregation using a dedicated RL function and separate return facilities, (3) inventory management using a dedicated RL manager and staff, and (4) product disposition management using dedicated RL staff. Therefore, without dedicated resources effective RLC would be impossible, hampering the effective RLM of consumer returns in online retailing. While the reviewed literature stresses the importance of committing resources for RLM in online retailing (see section 2.5.4), no recent study focussing on RLM in online retailing was identified that aligns with the interview findings.

Therefore, this study provides additional insight into the use of a RL manager, dedicated RL function and separate RL facility for managerial RLC and mitigation of the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning and lack of resources (poor RLM), and (2) problems of high/unnecessary returns (product return problem), disorganised and contaminated inventory, loss of product/product control (inventory problems), loss of managerial control and poor accountability and reporting (online retailer problems).

- *Standards and guidelines for managerial RLC*

In conjunction with control mechanisms and dedicated resources, participants indicated that managerial RLC requires standards and guidelines, which involves the key practice elements of standardising return processes, using return policies as guidelines and centralising the RL function.

Specifically, *standardising return processes* and *using return policies as guidelines* ensure that RL staff follow the same standards, rules and procedures, which can improve managerial RLC and enable measurement of RL staff performance. Similarly, participants indicated that online retailers could *centralise the RL function* by using centralised return facilities, ensuring that the same standards and guidelines are followed by staff in a single facility. Subsequently, implementing standards and guidelines not only improves managerial RLC, but also improves staff performance and product return decision-making. The following quotations convey the importance of standards and guidelines as a key managerial RLC practice:

> "[…] if you do not have standard processes and regulations in place [for RL] […] you do get the people selling off or taking stock or hand it out to staff, and then just say, but we weren't aware that it's not allowed […] your [return] policy and guidelines give you clear indication what needs to be done with return stock." (P11, Demand and sales manager, FMCG distributor)

> "We have a reverse logistics policy here and we call it a returns policy […] that is absolutely important to us. […] all employees [must] follow the same guidelines, it's standardised. […] it also affects our KPIs our measures, because if you don't have a standardised formula of the process, you will never be able to measure it." (P9, regional & online DC manager, online retailer)

> "[…] [for the] return processes […] the centralised functions are definitely standardised and that's to improve productivity." (P8, logistics manager, multichannel retailer)

> "I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense […] you have got the same method of thinking in one facility […]. So, I would go towards having a centralised reclaimed centre so that you've got that uniform approach in your [RL] activity." (P5, general manager, online retailer)

Evidently, standards and guidelines for managerial RLC links with the key (1) pre-sales PRP practice of return restrictions (section 8.4.2.1.1), (2) post-sales PRP practice of inspection initiatives (i.e. using return policies to train inspectors) (section 8.4.2.1.2), (3) operational RLC practice of RL process optimisation (section 8.4.2.3.1) and (3) managerial RLC practice of internal control mechanisms.

As support RL practices for the establishment of standards and guidelines, online retailers can implement (as support by literature) the (1) PM strategy of establishing standardised PM (section 6.7.1), (2) centralised facility/location strategy of a centralised facility for RL (section 6.8.4), (3) centralised return centre (CRC) strategy of establishing and utilising CRCs (section 6.8.5), and (4) strategic procedure strategies of defining formal rules and controls for RL, formally developing standard operating procedures (SOPs) and manuals, standardising RL processes, publishing RL standards and formally implementing strategic procedures (section 6.9.4). Additionally, the interview findings on the use of formalisation and standards for managerial RLC resonate with the findings of Davidavičienė and Al Majzoub (2021:6) and Dapiran and Kam (2017:830, 831), emphasising the importance of standardisation and formalisation in RL.

Essentially, standards and guidelines for managerial RLC can address the prevention and control (1) pitfalls of RL process failures (operational failure), poor RL planning and poor PM (poor RLM), and (2) problems of poor/inconsistent return decision-making (product return), loss of product/product control (inventory), consumer uncertainty, brand/brand image damage, market liabilities, loss of managerial control and poor accountability (online retailer problems).

- *Maintain managerial RLC*

Maintaining managerial RLC enables effective monitoring of the return function, which can help online retailers control return volume and trends, processes and products. Subsequently, maintaining managerial RLC can be important for maintaining various key prevention and control practices. The participants indicated that online retailers must measure RL performance and use appropriate facilities and functions (as key practice elements).

Specifically, online retailers can *measure RL performance* to maintain managerial RLC and manage and control return volume, processes and products. The participants suggested that online retailers develop and use appropriate KPIs to measure return percentages, ensuring that the RL function and return volumes are monitored and controlled. Additionally, online retailers can measure RL performance to minimise the impact of a potential influx of product returns, ensuring adequate control

of the return function, processes and products. The following quotations emphasise the importance of measuring RL performance to maintain managerial RLC:

> "And if you don't measure it [RL], you can't manage it [the RL function]. So, whether it's reverse or not reverse, if you don't have a measurement process in place, you will not be able to manage something. It's impossible." (P6, logistics manager, multichannel retailer)

> "I still have to measure that ultimate [return] percentage level […] to make sure that it doesn't creep up on me […]. I still need to make sure that returns as a department doesn't grow." (P6, logistics manager, multichannel retailer)

> "[Performance measurement in RL is important] because […] what if […] you [are] hit with high volumes of returns, perhaps […] your initial disposal channels won't be sufficient to take it anymore, then you would be able to make those decisions, things like being able to plan your inbound receiving to accommodate your returns […]." (P1, operations manager, 3PRL provider firm)

> "So, if there's no control measurements […] in place, you run the risk of potential fraud and potential risk that products may end up being [back] in the [forward logistics] system […]." (P11, Demand and sales manager, FMCG distributor)

Regarding the *use* of *appropriate facilities* and *functions* to maintain managerial RLC, participants indicated that online retailers could use a standard centralised facility and a dedicated RL function to monitor return trends. For instance, online retailers can quickly identify fraudulent return trends using a dedicated RL department to identify potential counterfeit stock in the centralised warehouse that carries new and original stock, enabling improved control over fraudulent product returns, RL processes and the RL function, as suggested in the following quotation:

> "I would have a [returns] department within that centralised warehouse. I would definitely have it all together. Because it relates directly then to the existing or current stock that you may carry or may not carry [such as counterfeit stock], and you've got immediate control […] [to] see if it's a [fraudulent return] trend and when it comes through, you want to immediately go and inspect, review and measure." (P12, Head of logistics, online retailer)

Subsequently, maintaining managerial RLC complements RRP propositions (section 8.4.2.2.1), and facilitates operational RLC and managerial RLC propositions. As support RL practices to maintain managerial RLC, online retailers can implement (as supported by literature) the (1) PM strategies of appropriate KPIs and metrics for RL, implementing PM and performance monitoring and review (section 6.7.1), (2) integrated facility/location strategy of using a standard facility for RL (section 6.8.3), (3) centralised facility/location strategy of using a centralised facility for RL (section 6.8.4), and (4) management and staff strategies of maintaining management and staff initiatives and establishing a RL function (section 6.9.5).

The findings of Lamba *et al.* (2020:384) and Karlsson *et al.* (2023:9) support the use of PM to effectively maintain and control RL practices and product returns. However, using a standard centralised warehouse with a dedicated returns department to identify return trends and maintain managerial RLC extends the literature. Therefore, managerial RLC can be maintained through various initiatives, which can help online retailer address the prevention and control (1) pitfalls of RL process failures (operational failure), poor RL planning, lack of resources and poor PM (poor RLM), and (2) problems of high and unnecessary returns, an increase in fraudulent returns, poor return decision-

making (product return problems), stockpiling, disorganised and contaminated inventory, loss of product/product control (inventory problems), market liabilities, a loss of managerial control and poor accountability and reporting (online retailer problems).

Essentially, the RLC propositions of operational RLC and managerial RLC can help online retailers effectively control return processes, returned products and the RL function as well as address various prevention and control pitfalls and problems. Accordingly, online retailers can implement RLC propositions for the effective RLM of consumer returns. In the next section, the final proposition category, namely prevention and control parameters, will be analysed and discussed.

8.4.2.4 Prevention and control parameters

Prevention and control parameters as the final main prevention and control proposition, involve various proposition (parameter) categories, including volume, product, organisational, cost versus benefit, SC and market, and legal and environmental parameters (see **Figure 8.15**). No studies in the reviewed literature focused on the factors (parameters) that can impact the implementation of prevention and control propositions, meaning that this study adds new insights into important considerations for the effective implementation of proactive return prevention (PRP), reactive return prevention (RRP) and reverse logistics control (RLC) propositions. Nevertheless, a few studies (unintentionally) identified parameters that align with the interview findings, which will be referenced in the discussion. The various prevention and control parameters will be discussed in the subsequent sections.

8.4.2.4.1 Volume prevention and control parameters

As illustrated in **Figure 8.15**, volume prevention and control parameters involve the key parameters of return volume and sales volume that can be important for implementing various prevention and control propositions.

Participants indicated that *return volume* can be an important parameter for implementing PRP, RRP and RLC propositions. Specifically, a higher return volume must be considered for the post-sales PRP practice of implementing inspection initiatives and operational RLC practice of RL process optimisation, relating to pre-return inspection at consumer locations, as illustrated in the following quotation:

> "[…] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. So, I think that's possibly another avenue that one can explore just to […] save some time and traffic at the DC." (P5, general manager, online retailer)

Additionally, return volume can be important for the key RRP examination practice of information usage and analysis, using KPI data to measure return percentage volume. Similarly, online retailers can use return volume to implement party interventions for RRP. For example, cancelling supplier contracts based on a high return rate of the supplier. The following quotations conveys the impact of return volume on RRP practices:

> "I think one of the most important things that we use is the percentage of returns versus sales. So, we measure like two per cent of every unit or every order that goes out, but two percent or four percent or six percent of it comes back. And obviously, if you have an influx on that, if it goes above a certain percentage, you need to start looking internally and find out why it is happening and what you can do to mitigate it." (P3, returns manager, online retailer)

> "[…] you would exit the supplier if they've got more comebacks than what is normal. And that's an obvious red flag. You simply exit that supplier and say, you know what, we've got too many comebacks. You are tarnishing our brand, so cheers." (P5, general manager, online retailer)

In terms of operational RLC propositions, online retailers that experience erratic return volumes can prioritise the implementation of product return visibility for improved operational control. Furthermore, higher return volumes can be important for the product return segregation practice of using separate return facilities for operational RLC. Additionally, online retailers must consider return volume to identify the role and functionality of the RL manager for the key operational RLC practice of product return inventory management. The association between return volume and operational RLC can be demonstrated by the following quotations:

> "[…] you need some kind of inbound visibility. You can imagine if you've got a warehouse that has limited receiving space and you've got fresh product being flown into a distribution centre, you need to know what your volumes are going to be for returns […]." (P1, operations manager, 3PRL provider firm)

> "[…] if the volumes are justified […] a lot of the major online retailers have their returns handling completely separate from the outbound [forward logistics] operation. Because instead of you contaminating your outbound operations to accommodate returns, it makes it a lot easier to handle [and control]." (P1, operations manager, 3PRL provider firm)

> "[…] depending on scale […] all the reverse logistics manager is actually [responsible for is] managing the [return] inventory component […]. And maybe on the reporting side […] you can let the inventory go through the internal components […]." (P1, operations manager, 3PRL provider firm)

Lastly, return volume can be important for the key managerial RLC practices of dedicated resources and maintaining managerial RLC. For dedicated resources, return volume can impact the choice between a dedicated RL manager or a dedicated manager with dual RL and FL responsibilities (e.g. e-commerce manager). Consequently, the participants indicated that online retailers with (1) high return volumes must appoint a dedicated RL manager for managerial RLC, and (2) low return volumes can allocate a dedicated manager with dual functions for managerial RLC. Additionally, return volume can be an important consideration for measuring RL performance (as a key practice element) to maintain managerial RLC. The subsequent quotations illustrate the importance of considering return volume for managerial RLC:

> "So, if you're volume is of such magnitude that your returns are a massive thing, having somebody [like a dedicated RL manager] that looks after that [RL function] for sure. If it's not of such magnitude, then I think having somebody looking at online logistics [like an ecommerce manager] is a good idea." (P13, supply chain manager, multichannel retailer)

> "[Performance measurement in RL is important] because […] what if […] you [are] hit with high volumes of returns, perhaps […] your initial disposal channels won't be sufficient to take it anymore, then you would be able to make those decisions, things like being able to plan your inbound receiving to accommodate your returns […]." (P1, operations manager, 3PRL provider firm)

Sales volume as a key volume parameter can be important for the key pre-sales PRP practice of return restrictions by implementing a robust return policy. As one participant explained that small businesses can also be consumers in online retailing, ordering large quantities of office and computer equipment. Subsequently, a weak return policy can be detrimental to the online retailer if a small business returns all the equipment, as demonstrated by the following quotation:

> "[…] your policy needs to be sound […] You're talking to somebody [like a small business] that bought two million rands worth of electronics with you, and they don't want to pay you. Or they are saying that your product is substandard, and they want to send it back. So, if you don't have a robust returns policy, you're going to get a hiding [with high returns]." (P5, general manager, online retailer)

As support RL practices to consider volume parameters for prevention and control, online retailers can implement (as supported by literature) the (1) PM strategy of strategic considerations for PM (section 6.7.1), (2) general facility/location strategy of considering operational factors in facility/location decisions (section 6.8.1), (3) RC strategy of strategic considerations for RC (section 6.9.1), (4) RPA strategy of strategic considerations for return avoidance (section 6.9.3), and (5) RL manager strategy of establishing appropriate and sufficient leadership for RL (section 6.9.5). No studies in the reviewed literature identified the significance of considering return volume and sale volume for the effective implementation of prevention and control propositions. Subsequently, this study identifies new factors that online retailers can consider for the effective implementation of PRP, RRP and RLC propositions.

Essentially, considering volume as a prevention and control parameter can help online retailers effectively address the prevention and control (1) pitfalls of RL process failures (operational failure), inattention to RL, poor RL planning, a lack of resources, poor PM (poor RLM), return leniency, poor gatekeeping (poor return prevention) and poor systems (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns, poor product return visibility, poor/inconsistent return decision-making (product return problems), stockpiling, disorganised and contaminated inventory, loss of product/product control (inventory problems), consumer dissatisfaction and uncertainty, a loss of sales, brand/brand image damage, a loss of managerial control and poor accountability and reporting (online retailer problems).

8.4.2.4.2 Product prevention and control parameters

Figure 8.15 shows the product prevention and control parameters involve the key parameters of product condition, product type, product/inventory value and product characteristics, which associate with several prevention and control propositions.

Product condition can be important for the implementation of PRP, RRP and operational RLC propositions. Particularly, online retailers must consider the condition of a returned product for the key post-sales PRP practice of gatekeeping, for example, rejecting products in a damaged or used condition. Additionally, online retailers must consider product condition for information usage and analysis (key RRP examination practice) and party interventions (key RRP intervention practice), using KPIs, like courier damage percentages, to reactively prevent unnecessary damaged product returns. Moreover, product condition can be important for the implementation of the key operational RLC practices of product return segregation (i.e. segregating new products from damaged products) and inventory management (i.e. inventory staff to manage inventory based on product condition). The following quotations demonstrate these findings:

> "So, when a customer logs a return, they obviously need to take a photo of an item, a picture of something so that the person [staff member] can see that item has been used […]. I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

> "So, it's important to measure why things are coming back, you need to understand if, for instance, 20 percent of your returns has a reason of damaged, then you know you've got an investigation to do within your picking and your delivery teams. Why are the things being damaged in-transit or is it a bad supplier? Is it a supplier problem?" (P5, general manager, online retailer)

> "And to ensure that you engage with carriers or couriers that will deliver products to your customers, […] [to] take care of your product, and they are measured against any of their own damages. If our carrier loses a parcel or damages a good, they pay for it, which encourages good behaviour." (P8, logistics manager, multichannel retailer)

> "You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination […] having defective merchandise entering your supply chain again." (P2, owner, supply chain consultancy firm)

> "And then you've got your inventory team that works within that returns area. […] So, until it's gone through the entire [RL] process, that inventory team is responsible for ensuring that the bad stock goes either to a reseller, or [resalable returned stock] goes back into the good stock warehouse […]." (P5, general manager, online retailer)

Additionally, both *product condition* and *product type* can play a role in the key post-sales PRP practice of inspection initiatives. For example, using qualified disposition staff for the inspection of returned clothing to identify signs of usage, as illustrated by the following quotation:

> "But the value-add team, they would have to take that garment out of the bag […] to see whether there are any makeup marks or any dirt marks […] to see whether it's actually been worn. If so, they'll return it to the customer, and say, you know what, you wore it, we've got lipstick, mascara or deodorant or perfume on the jacket, we can't resell it. Sorry you take it [back], you keep it." (P5, general manager, online retailer)

Product type as a key product prevention and control parameter associates with PRP, RRP and RLC propositions. Specifically, online retailers must consider the product type for the key pre-sales PRP practice of information sharing initiatives, for example, specifying device compatibility for electronic devices and providing accurate size charts for clothing. Additionally, product type can impact gatekeeping as a key post-sales PRP practice, for example, online retailers that sell computers and electronic products may benefit from online authorisation. Similarly, online retailer can consider product type for the key post-sales PRP practice of inspection initiatives and the key operational RLC practice of RL process optimisation. For example, the online retailer can use dedicated staff to perform pre-return inspection at consumer locations for electronics, appliances and computers to identify

potential compatibility or user-error problems, linking with the return volume parameter (section 8.4.2.4.1). The links between product type and PRP propositions can be illustrated by the subsequent quotations:

> "[…] making sure that the customer can see that this is compatible to an iPhone and not an Android and that this is not supported by Windows […]." (P5, general manager, online retailer)

> "In clothing […] it's like a size chart. I think the people of Retailer J, they do it well. They give you a lot of information." (P12, Head of logistics, online retailer)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter [is], this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable […]. So, avoiding that on the front end by digitising your returns policy […]. Your computer system understands what the product is and when they [the consumer] bought it, what the return parameters are for that item, what the policy is for that item and allows that customer to return it or rejects the return with treatable messaging. That avoids those sorts of fraudulent returns right at the outset." (P1, operations manager, 3PRL provider firm)

> "But if you had if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell. So, they can sell them the correct device." (P5, general manager, online retailer)

For the RRP propositions, online retailers can consider product type for the key (1) RRP examination practices of information usage and analysis and targeted investigations, and (2) RRP intervention practice of product interventions. Additionally, product types can be an important consideration for the key operational RLC practice of product disposition management, for example, training disposition staff to remove serial numbers and personal information from a returned laptop or using internal disposition control measures for food products. The following quotations expand on these observations:

> "If you have that manager […] I think it would be good for someone to watch over it and to see if it can be used through AI and predictive analytics. You could start collecting information to see now three bags of cat food [was] returned. There seems to be a problem with a specific product line […]." (P2, owner, supply chain consultancy firm)

> "[…] if you as an online commodity is running tech items, then get one person in that reverse logistics department that is savvy enough that knows something about tech that can say, right, this is not equipped for South Africa, or the resistors will never work in South Africa. So, there's a reason for that return." (P12, Head of logistics, online retailer)

> "[…] there needs to be the feedback loops into the business as well. If the same five-inch board-shorts keeps generating returns every summer, it's time to stop selling the five-inch board shorts or change its design." (P1, operations manager, 3PRL provider firm)

> "[…] things like personal information and things like products that might cause potential harm once they are disposed of […] being able to de-brand that does require a level of training." (P1, operations manager, 3PRL provider firm)

> "Well, we have experienced a trial outsourcing company receiving the returns or the reverse logistics material. And you as a business needs to be hands-on. That is the quickest way where irregularly is happening […] it's a risky business to outsource your return food products […]. There are [returned] products that can be, if you outsource it, and the outsource company is selling it off to the man on the street and it end up [back] in the [forward supply] chain […], [you are] liable for that." (P11, Demand and sales manager, FMCG distributor)

Product/inventory value and *product characteristics* can be important considerations for the implementation of the key post-sales PRP practice of inspection initiatives and key operational RLC practices of inventory management and disposition management. Particularly, online retailers must

consider product value and returned product characteristics, like luxury consumer goods, for using manufacturer inspection staff as an inspection initiative. Additionally, online retailers must consider inventory value and returned product characteristics for selecting third parties to effectively manage returned product inventory and disposition. The following quotations demonstrate these findings:

> "And they might be external parties for luxury consumer goods. They might be physical inspectors from the manufacturer at the online retailer's premises to verify that the return goods are in fact the original goods and not counterfeit goods." (P2, owner, supply chain consultancy firm)

> "[…] a dedicated, outsourced reverse logistics business. And the reason why I believe it is advantageous is because, if you got a warehouse that's running out a billion rands worth of goods every year, a million rands worth of reverse logistics is not warranted for them to take their focus of the ball. It [the returned products] inevitably lands up in a corner of the warehouse. It doesn't receive attention. It eventually gets swept out and thrown away, it is pilfered, etc […]. Our facilities are adopted for [the] management of reverse logistics. We've got the correct […] receptacles to put [the] product in, whether it be leaking, whether it be messy, whether it have a stench or something like that, it's stored correctly. And obviously our disposal mechanisms are all in terms of [environmental] policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)

Finally, *product characteristics* must also be considered for the key operational RLC practice of RL process optimisation by training staff to effectively handle returned products in various sizes and quality. The following quotation proves this finding:

> "And then obviously in a warehouse that does reverse logistics is not a square racked palletised environment, which is simple cubic measurement. Everything's a different size. Everything doesn't come back in a box. So, the people that are working in that warehouse need to be very skilled as to the quality of the product." (P7, owner, 3PRL provider firm)

As support RL practices to consider product parameters for prevention and control, online retailers can implement (as supported by literature) the (1) general IT strategy of using IT with information management capabilities (section 6.3.1), (2) SCI strategies of developing PM for SCI, cooperating with SC partners and sharing responsibilities, risks and costs (section 6.4.1), (3) CI strategies of considerations for CI and consumer support initiatives (section 6.4.2), (4) CFI strategies of knowledge and information sharing between functions, (5) RL in/outsourcing strategies of considerations and analysis of RL in/outsourcing decisions (section 6.4.1), (6) disposition practices of disposition decision factors (section 6.6.2), (7) PM strategies performance monitoring and review (section 6.7.1), (8) RC strategy of considerations for RC (section 6.9.1), (9) RPA strategy of considerations for gatekeeping and return avoidance (section 6.9.3), (10) RL manager strategy of assigning a RL expert manager, and (11) RL staff strategies of establishing a RL function and producing skilled and well-trained staff (section 6.9.5).

Like the volume parameters, this study uniquely identified the value of considering product prevention and control parameters for the effective implementation of prevention and control practices. Subsequently, this study identifies new factors that online retailers can consider for the effective implementation of PRP, RRP and RLC propositions, which can help them to address the prevention and control (1) pitfalls of FL failures, RL process failures (operational failures), inattention to RL, poor

RL planning, a lack of resources, poor PM (poor RLM), poor return prevention, poor information sharing with consumers, a lack of SCI and poor systems (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns, poor return visibility, poor/inconsistent return decision-making (product return problems), stockpiling, disorganised and contaminated inventory, loss of product/product control (inventory problems), consumer dissatisfaction and uncertainty, a loss of sales, brand/brand image damage, market liabilities, a loss of managerial control and poor accountability (online retailer problems).

8.4.2.4.3 Organisational prevention and control parameters

The organisational prevention and control parameters involve the key parameters of organisation type and size, organisational capabilities and facility and network design (see **Figure 8.15**), which can be important for the implementation of various prevention and control propositions.

Organisation type and *size* as key parameters associate RLC propositions, including the key operational RLC practice of product return segregation and managerial RLC practice of dedicated resources. Particularly, organisation type and size can influence product return segregation since larger online retailers might benefit more from separate return facilities due to larger return volumes. Subsequently, smaller online retailers or multichannel retailers can consider other strategies for return segregation, like allocating sufficient space in the facility (see section **Error! Reference source not found.**). Furthermore, organisation size can influence the allocation of dedicated managers for managerial RLC, for example, larger online retailers can allocate senior RL managers and smaller online retailers can allocate operational RL managers. Evidently, organisation size and type as key parameters links with the return volume parameter (section 8.4.2.4.1). The following quotations show the importance of considering organisation type and size for RLC:

> "[…] a lot of the major online retailers have their returns handling completely separate from the outbound operation. Because instead of you contaminating your outbound operations to accommodate returns, it makes it a lot easier to handle [and control]." (P1, operations manager, 3PRL provider firm)

> "[…] if you look at some of those bigger businesses in the US, guys that speak on those webinars are reverse logistics managers [...] that sort of gives an indication […], you have to you have a dedicated person. And some of those [RL managers] are dedicated directors. But even for smaller size [businesses], you need […] a dedicated manager to manage the [RL] process." (P7, owner, 3PRL provider firm)

Organisational capabilities involve RL process capabilities and information management and IT capabilities (key parameter elements), which associate with the implementation of PRP, RRP and RLC propositions. *RL process capabilities* involve return inspection and disposition processes. Online retailers must consider inspection capabilities for the key post-sales PRP practice of implementing inspection initiatives. For example, online retailers must consider their capabilities in acquiring sufficient testing and inspection equipment before implementing preventative inspection initiatives in their facilities. Additionally, online retailers must consider their disposition capabilities for the key

operational RLC practice of product disposition management, ensuring that returned products are dispositioned safely, efficiently and effectively. Subsequently, lacking product disposition capability means that the online retailer must select and use third parties for disposition management, which links with product type and returned product characteristics as product parameters (section 8.4.2.4.2). The following quotations illustrate the importance of considering RL process capabilities/resources in the implementation of post-sales PRP and operational RLC practices:

> "So, you need sort of sufficient testing capacity if you're really going to validate and assess these [returned products […] if you're going to approach it from a 'we want to protect ourselves from fraud', then you need to build these [inspection] mechanisms, [so] that you can validate every single [product return] […]." (P1, operations manager, 3PRL provider firm)

> "[…] [we are] a dedicated outsourced reverse logistics business […] Our facilities are adopted for [the] management of reverse logistics. […] our disposal mechanisms are all in terms of [environmental] policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the [returned] products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)

Moreover, online retailers must consider their *information management* and *IT capabilities* to implement RRP and operational RLC propositions. Particularly, online retailers must consider their information management and IT capabilities for the key (1) RRP examination practice of information usage and analysis, (2) operational RLC practice of for product return visibility, and (3) operational RLC practice of inventory management. Subsequently, if online retailers lack (1) information management capabilities for effective information usage and analysis of product return data, (2) IT capabilities to enhance product return visibility, and (3) IT capabilities for inventory management, they must consider using 3PRL providers with the necessary information management and IT capabilities. The following quotations support these findings:

> "I would definitely outsource reverse logistics and I would use a company that is specialised with it, because your [product return] data then becomes more relevant […]. So, [for] example, you can then pick out [and identify] if you've sold 30 items and 20 has been returned, then there's a problem with that product. […] It might be a default […]." (P12, Head of logistics, online retailer)

> "And I developed an App that actually does all those [RL] processes in the form of physical inspection, photographs of the goods, routing, capturing of the information […] to know what's coming back for stock control and all that is controlled on an App and that's what we do." (P7, owner, 3PRL provider firm)

> "[…] you need an end-to-end inventory management system. So, you need to be able to create a reverse order, and systematically track and update the status of that order as it goes back into the DC […] So, you need to […] make sure that you don't lose that product and that you don't miss it somewhere in the system […]." (P5, general manager, online retailer)

Finally, *facility and network design* can be an important key organisational parameter for RLC propositions. Particularly, online retailers must consider facility capacity and design for effective product return segregation. Subsequently, if online retailers lack facility capacity to segregate returned products from new products, they must consider establishing a separate returns facility, linking to return volume (section 8.4.2.4.1), product condition (section 8.4.2.4.2) and organisational type and size as key parameters. Similarly, online retailers must consider their network design for the implementation of the key managerial RLC practice of control mechanisms. For instance, online retailers that select internal control mechanisms (key practice element) must consider a centralised network design, using a

centralised facility for effective managerial RLC. The following quotations demonstrate the association between facility and network design parameters and RLC propositions:

> "You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items […]." (P2, owner, supply chain consultancy firm)

> "They'll put it in a little corner in the south wing and say, if something comes back, let's just bring it to that door. And then soon they find out that it's a completely different set of events to what you normally do. You have to segregate the practices completely, otherwise you sit with problems of mixing good and bad stock. So, the industrial engineering layout, the floor layout and the floor plans and all of these SOPs [standard operating procedures] that drive reverse logistics needs to be top of mind when designing facilities […]. They need to put sufficient planning into designing that layout so that it's practical for reverse logistics. I mean, Retailer K put up an entire reclamation centre, which is a standalone […]. They found that you can't do this [RL] in a normal DC. It's just too complicated. So, they had to build a separate [returns] facility." (P5, general manager, online retailer)

> "It all depends on your network design. And what we've done is we've centralised it because the decision-making criteria is more consistent in one depot in the country […]. So, it's a managerial control decision […]." **(**P8, logistics manager, multichannel retailer)

As support RL practices to consider organisational parameters for prevention and control, online retailers can implement (as supported by literature) the (1) general IT strategy of using IT with information management capabilities (section 6.3.1), (2) TLIT (traditional logistics IT) strategy of using existing ERPs for RL (section 6.3.3), (3) RLIT (RL information technology) strategy of considerations for RLIT (section 6.3.5), (4) RL in/outsourcing strategy of considerations and analysis of RL in/outsourcing decisions (section 6.4.1), (5) disposition strategy of developing a disposition system (section 6.6.1), (6) general facility/location strategy of facility/location decision factors (section 6.8.1), (7) RC strategy of considerations for RC (section 6.9.1), and (8) RL manager strategies of appropriate and sufficient leadership for RL and a full-time RL manager portfolio (section 6.9.5).

While no studies in the reviewed literature directly focused on considering organisational parameters for the implementation of PRP, RRP and RLC propositions, a few studies implied that online retailers could consider factors for outsourcing and facility and network design in RL. For example, Wang, Dang *et al.* (2021:2) indicated that outsourcing can help online retailers that lack the capabilities and resources to manage consumer returns effectively. Furthermore, Misni and Lee (2017:92) indicated that online retailers using facilities for both RL and FL must note the complexity and space requirements for successful RL operations. Evidently, online retailers must carefully consider both their capabilities and facility/network design for effective return prevention and control.

Essentially, considering organisational prevention and control parameters can help online retailer to effectively implement PRP, RRP and RLC propositions, and address the prevention and control (1) pitfalls of RL process failures (operational failures), inattention to RL, poor RL planning, a lack of resources (poor RLM), poor gatekeeping (poor return prevention) and poor systems (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent returns, poor return visibility, poor/inconsistent return decision-making (product return problems), stockpiling,

disorganised and contaminated inventory, a loss of product/product control (inventory problems), consumer uncertainty, brand/brand image damage, market liabilities, a loss of managerial control and poor accountability and reporting (online retailer problems).

8.4.2.4.4 Cost versus benefit parameters

Cost versus benefit parameters (see **Figure 8.15**) involve important considerations for the implementation of pre-sales PRP propositions and RLC propositions, ensuring that the benefits of implementing PRP and RLC propositions outweigh the potential costs.

In terms of *pre-sales PRP propositions*, online retailers must consider the costs versus the benefits of FL excellence, information sharing initiatives and return restrictions (key practices). Specifically, participants suggested that online retailers consider the costs of implementing effective procurement and inbound inspection (FL excellence practice element) against the benefits of preventing consumer returns. Similarly, participants indicated that uploading photographs and providing detailed description of products as information sharing initiatives involve costs, which online retailers must consider, ensuring that the benefits outweigh the costs. Therefore, the cost versus benefit parameter for information sharing initiatives associate with product type parameters (e.g. clothing requires accurate size charts).

For return restrictions online retailers must consider the costs of implementing a robust return policy since adjusting a return policy can be costly. Therefore, the prevention benefits must outweigh the costs of using a robust return policy, linking with sales volume as a key volume parameter (section 8.4.2.4.1). For example, if small businesses are consumers for online retailers the cost of implementing a robust return policy might be justified to prevent the possibility of large financial losses for large order returns. Similarly, online retailers must consider the costs of return conditions in stricter return policies versus the benefits of preventing high and unnecessary returns. For example, considering the benefits of charging return fees (as a preventative measure) and the potential costs of losing consumers due to strict return conditions. The following quotations demonstrate the importance of considering the costs versus the benefits for pre-sales PRP propositions:

> "[To avoid or reduce consumer returns] improve the quality of your merchandise, […] make sure that the inbound inspection of all your products is high. Although to do one hundred percent [inbound] inspection there is a lot more cost [involved] […]." (P8, logistics manager, multichannel retailer)

> "There's a cost involved in uploading photographs, […] because all of those photographs have to be hosted and stored and someone needs to take it and upload it." (P2, owner, supply chain consultancy firm)

> "In clothing, […] it's like a size chart. I think the people of Retailer J they do it well. They give you a lot of information. I think that it stems down to, they need to spend money on it." (P12, Head of logistics, online retailer)

> "So, that's now a good policy. That's great. But how do we go and implement that now without all the wiring at the back or incur huge amounts of expense […]? And I think that's why they take a long time to change [the return policy], because the investment is huge […]." **(**P1, operations manager, 3PRL provider firm)

> "[…] they will reduce the number of returns if they do attach a cost to the return. Having said that, they might also lose a customer if they attach a cost to the return." (P2, owner, supply chain consultancy firm)

Regarding RLC propositions, online retailers must consider the costs versus the benefits for implementing operational RLC and managerial RLC practices. Specifically, online retailers must consider the costs of redesigning facilities or establishing new separate facilities for the implementation of return segregation for operational RLC. Similarly, online retailers must consider the costs versus benefits of control mechanisms for managerial RLC. For instance, online retailers must compare the benefits of using a centralised facilities for managerial control versus the costs of losing cost efficiency. Consequently, the cost versus benefit parameter for implementing RLC propositions link with the organisational parameters of facility and network design (section 8.4.2.4.3). The following quotations support these findings:

> "You have to segregate the practices completely, otherwise you sit with problems of mixing good and bad stock […] a lot more money needs to be spent on initial layout planning for reverse logistics departments, even if it's within a specific DC. They need to put sufficient planning into designing that layout so that it's practical for reverse logistics. I mean, Retailer K put up an entire reclamation centre, which is a standalone […]. They found that you can't do this [RL] in a normal DC. It's just too complicated. So, they had to build a [returns] separate facility." (P5, general manager, online retailer)

> "It all depends on your network design. And what we've done is we've centralised it because the decision-making criteria is more consistent in one depot in the country, but then you lose the efficiency of transport. […]. So, it's a managerial control decision versus a cost optimised decision." (P8, logistics manager, multichannel retailer)

As support RL practices to consider cost versus benefit parameters for prevention and control, online retailers can implement (as supported by literature) the (1) general facility/location strategy of cost/benefit or trade-off analysis for facilities/locations (section 6.8.1), (2) RC strategies of considerations for RC and financial RC (section 6.9.1), (3) Financial management (FM) strategy of performing a costs/benefit analysis (section 6.9.2), and (4) RPA (return prevention and avoidance) strategy of performing a cost/benefit analysis for RPA (section 6.9.3).

Some of the reviewed literature identified the costs and benefits of strict and lenient return policies. For example, lenient return policies can increase returns and RL costs (Andresen & Istad, 2019:57), while strict return policies can result in a loss of sales (Biswas & Abdul-Kader, 2018:1016; Zhang *et al.* 2023:10). Nevertheless, no studies in the reviewed literature discussed the costs versus benefits related to the key pre-sale PRP practices of FL excellence and information sharing initiatives and operational and managerial RLC propositions. Evidently, this study contributes to the literature by emphasising the importance of consider the costs versus benefits for effective return prevention and control.

Essentially, considering cost versus benefit parameters can help online retailers to effectively implement pre-sales PRP practices and RLC propositions, and mitigate the prevention and control (1) pitfalls of RL process failures (operational failures), inattention to RL, poor RL planning (poor RLM), return leniency (poor return prevention) and poor information sharing with consumers (information-related pitfall), and (2) problems of high and unnecessary returns, poor/inconsistent return decision-

making (product return problems), contaminated inventory (inventory problems), consumer dissatisfaction and uncertainty, a loss of managerial control and poor accountability (online retailer problems).

8.4.2.4.5 Supply chain (SC) and market prevention and control parameters

As emphasised in **Figure 8.15**, SC and market prevention and control parameters involve key parameters related to SC relationships and integration, market conditions and consumer behaviour and types, which can influence the implementation of PRP, RRP and RLC propositions.

For *SC relationship* and *integration parameters*, online retailers must consider manufacturer relationships (key parameter element) and 3PL/3PRL provider integration (key parameter element) for the implementation of PRP, RRP and RLC propositions. Particularly, online retailers that seek to implement inspection initiatives (key post-sales PRP practice), involving manufacturer staff inspections on the online retailer's premises, must consider their relationships with these manufacturers. However, online retailers must still consider the product type and value (i.e. luxury consumer goods) for manufacturer inspections, linking with product parameters, as indicated in the following quotation:

> "And they might be external parties for luxury consumer goods. They might be physical inspectors from the manufacturer at the online retailer's premises to verify that the return goods are in fact the original goods and not counterfeit goods." (P2, owner, supply chain consultancy firm)

Moreover, online retailers must consider the willingness of 3P(R)L providers to integrate and share information before implementing the key (1) RRP examination practice information usage and analysis (section 8.4.2.2.1), (2) operational RLC practices of RL process optimisation, product return visibility and product return inventory and disposition management (section 8.4.2.3.1), and (3) managerial RLC practice of control mechanisms (section 8.4.2.3.2). Evidently, in absence of effective SCI, online retailers must utilise internal (i.e. RL insourcing) practices for the effective implementation of RRP and RLC propositions. The following quotations show the importance of considering SCI before using third parties for RRP and RLC propositions:

> "[…] integration with a stock management system […], which can be both internal and external, so internal your own, warehouse and external with a third party, that's if they would like to integrate, that is first prize, it's easier to control […] on the reverse logistic side […]." (P12, Head of logistics, online retailer)

> "[…] you can outsource all of that and somebody else does all that for you, but you still going to need the reporting on that or the visibility from their system." (P13, supply chain manager, multichannel retailer)

> "So, we've got a reporting system that goes over to the clients [or online retailers] where they can see what product is, in what state of repair, which consumer it has come back from, how many credits are being granted, etc." (P4, owner/CEO, 3PRL provider firm)

Regarding *market conditions*, online retailers must consider market share and market demand as key parameter elements for PRP and RLC propositions. Specifically, participants indicated that online retailers must consider their *market share* before implementing the key pre-sales PRP practice of return restrictions. For instance, online retailers with low market penetration must limit the degree of return

restrictions to avoid losing market share, but as their market share increases, online retailers can increase the degree of return restrictions to proactively prevent returns. Furthermore, online retailers must consider *market demand* for the implementation of the key operational RLC practice of inventory management. For example, online retailers must consider market demand for directing returned inventory to locations/markets, demanding the returned inventory. The following quotations expand on these finding:

> "I remember distinctly back in the day that with Retailer C, you couldn't really dictate to the customer because you've got such a small penetration into the market, you literally have everything to lose. So, they were a lot more accommodating than what they were supposed to be. Honestly, they would take back things and smile and say, oh, it's OK, we'll just do it because we were going for market share […] So, as that improves, as Retailer C becomes a more established business with a credible market share and good online penetration, then they'll start tightening all of these belts and saying, you know what, sorry, Mr. Customer, we're not just going to take back whatever you give us […] So, I think that's the next level of innovation in South Africa is where the [market] penetration increases, the online retailers will become a lot more sticky and saying, you know what? Sorry, pal, I'm not going to take that back, you broke it, or you didn't use it properly." (P5, general manager, online retailer)

> "I've got inventory floating around in the business […] I've got consumer stock coming back as returns […] we would have to look at some level of distributed order management [system] to take all this inventory and see how best we can use it. That's probably our biggest investment that we would do to try and manage inventory in motion […], you can say, hey but there's a demand for this item there, I can fulfil from here to there […]." (P6, logistics manager, multichannel retailer)

Finally, online retailers must consider *consumer behaviour* and *types* for the implementation of RRP and operational RLC propositions. For instance, online retailers must consider consumer behaviour and type for the implementation of the key (1) RRP examination practice of targeted investigations to identify return abusers and (2) RRP intervention practices of party intervention to suspend consumer accounts. Subsequently, before suspending consumer accounts, online retailers must determine if high returners are engaging in fraudulent behaviour or if they are uncertain about their purchases, experiencing buyer's remorse. Additionally, online retailers must consider consumer behaviour and types for the key operational RLC practice of product return visibility, which requires accurate input from consumers during the return request process. If online retailers determine that consumers are less likely to select the correct products and return options, they must consider other initiatives to enhance product return visibility. These findings can be illustrated by the following quotations:

> "And you can start looking at the trends or the behaviour or the activities of these customers transactions […], unfortunately, certain customers become the heat maps or become classified as a category C or B customers, because based on the [number of] returns that they have […]. But [ensure that] you are fully made aware of, this is the type of customer we're dealing with here, he's not really sure what he wants when he purchased the product the first time, and hence the reason why [his] returns are so high." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "As long as the customers got [and willing to give] all the information, it can actually go quite well […]. So, you can ask the customer to pinpoint what that specific product is and if the customer selects the correct product, it will then work backwards into your supply chain for the warehouse management solution, so that once you receive it, it's actually waiting for you to tick it off and say, yes, it's now been returned. So, that's a much better control." (P12, Head of logistics, online retailer)

> "[…] it's more difficult to track and trace on what's being returned […] the moment you have tick box [for return reasons], the consumer will choose the top line. Does not matter what it is." (P2, owner, supply chain consultancy firm)

As support RL practices to consider SC and market parameters for prevention and control, online retailers can implement (as supported by literature) the (1) general IT strategy of strategic considerations for IT (section 6.3.1), (2) TLIT strategies of integrating TLIT with other IT and using WMS and ordering systems (section 6.3.3), (4) SCI strategy of considerations for SCI (section 6.4.1), (5) CI strategy of considerations for CI (section 6.4.2), (6) RL in/outsourcing strategies of considerations and analysis for RL in/outsourcing decisions and selecting 3P partners (section 6.4.1), and (7) RPA strategy of considerations for gatekeeping and return avoidance (section 6.9.3).

While no studies from the reviewed literature identified the impact of SC relationships and integration on return prevention and control, Frei *et al.* (2020:1618) indicated that integrated IT can be important for successful SCI and Meyer *et al*. (2017:13) emphasised that information system accessibility by SC partners can be important for effective SC information sharing. In terms of the market conditions and demand, no studies from the reviewed literature aligned with the interview findings, which means this study provides additional factors that online retailers can consider for the effective implementation of pre-sales PRP and operational RLC practices. Although the studies of Hjort *et al.* (2019:778) and Zhang *et al.* (2023:11) suggested the use of product return trends to identify serial returners for account suspensions, no studies indicated that online retailers must consider the type of consumer before suspending consumer accounts. Therefore, this study adds new insight to mistakenly prevent account suspensions of honest but uncertain consumers. Lastly, Frei *et al.* (2020:1615) found that 70% of return reasons are inaccurately attributed to a "change of mind" because many consumers conveniently select the first return option (i.e. a change of mind) from the drop-down menu on the website during return request. This confirms the importance of considering consumer behaviour for the successful implementation of product return visibility for operational RLC.

Essentially, considering SC and market parameters can help online retailers to effectively implement PRP, RRP and RLC propositions, and address the prevention and control (1) pitfalls of RL process failures (operational failures), poor RL planning, a lack of resources, return leniency, poor gatekeeping (poor return prevention), lack of SCI and poor systems (information-related pitfalls), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns, poor return visibility (product return problems), stockpiling, disorganised and contaminated inventory, loss of product/product control (inventory problems), consumer dissatisfaction and uncertainty, a loss of sales, brand/brand image damage, market liabilities, a loss of managerial control, and poor accountability and reporting (online retailer problems).

8.4.2.4.6 Legal and environmental prevention and control parameters

Legal and environmental prevention and control parameters involve key parameters related to consumer protection laws and rights and environmental policy and disruptions (see **Figure 8.15**), which can influence the implementation of various prevention and control propositions.

Consumer protection laws and *rights* as key parameters associate with PRP and RRP propositions. For the PRP propositions, participants indicated that laws, like the Consumer Protection Act (CPA), must be considered for return restrictions (key pre-sales PRP practice), gatekeeping and inspection initiatives (key post-sales PRP practices). Subsequently, online retailers must use the CPA to determine if they can establish certain return restrictions (e.g. charging return costs) and implement gatekeeping practices before return collection (e.g. using online authorisation to reject returns). If the CPA protects consumers and stipulate that returns must be accepted, online retailers can implement preventative inspection at their facilities (section 8.4.2.3.1). The impact of consumer protection laws on the implementation of PRP propositions can be demonstrated by the following quotations:

> "So, have some sort of a policy in place […] But unfortunately, with the Consumer Protection Act, I mean, there's certain things that you can do, [and] certain things you can't. So, the essence is that you follow the Consumer Protection Act and you've got to make sure that you're in line with that, but somehow use it to help you navigate the process and help you to reduce certain returns." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] the product is going to come back to you anyway […] because […] the Consumer Protection Act works against you. So, you could implement a verification process [in the facility], which is the gatekeeper." (P4, owner/CEO, 3PRL provider firm)

Furthermore, participants indicated that *consumer rights* must be considered for the implementation of the key (1) RRP examination practice of targeted investigations to identify return abusers and (2) RRP intervention practice of party intervention to suspend consumer accounts. Subsequently, consumer protection and rights as legal parameters link with consumer behaviour and types as market parameters (section 8.4.2.4.5), emphasising that online retailers can benefit from implementing RRP practices related to return abusers as a last resort (see section 8.4.2.2.2). The following quotation supports this finding:

> "[…] this is the type of customer we're dealing with here, he's not really sure what he wants when he purchased the product the first time, and hence the reason why [his] returns are so high. But can you discriminate? No, you can't. Because he's a customer, and […] he has the right to return something that he does not want, whether he does it hundred times, as long as it meets the [return condition] criteria, he's able to do so." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Environmental policy and *disruptions* as key parameters can be important for the implementation of RLC propositions. Particularly, participants indicated that online retailers should consider *environmental policies* for the implementation of product return inventory and disposition management as key operational RLC practices. For instance, if online retailers are unable to comply with environmental policies for effective disposal (i.e. recycling or waste management) of unsalable returned products, they must consider using 3PRL providers with capabilities to comply with

environmental policies. Subsequently, environmental policy links with the organisational parameter related to disposition capabilities (see section 8.4.2.4.3). The following quotation shows the link between environmental policy and operational RLC practices:

> "[…] a dedicated, outsourced reverse logistics business. […] [returned products] inevitably lands up in a corner of the warehouse. It doesn't receive focus. It doesn't receive attention. It eventually gets swept out and thrown away, it is pilfered, etc. […]. Our facilities are adopted for [the] management of reverse logistics. […] And obviously our disposal mechanisms are all in terms of [environmental] policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)

Similarly, online retailers must consider *environmental disruptions* for the implementation of the key operational RLC practice of product disposition management. Particularly, for environmental disruptions, like the Covid pandemic, online retailers should prioritise supplier engagement for the disposition option of "returning to the supplier", to avoid stockpiling of returned products in the facility. Therefore, the environmental disruptions can associate with the key SC parameter of SC relationships and integration (section 8.4.2.4.5). The following quotation support this finding:

> "The problem about returns, it's not ever flowing, like you don't get product in, product out. So, it's a big request from our side to the supplier to actually get the [returned] products out […] in this [Covid] lockdown period, the stock on hand that we have for returns […] piled up greatly […]." (P3, returns manager, online retailer)

As support RL practices to consider legal and environmental parameters for prevention and control, online retailers can implement (as supported by literature) the (1) SCI strategy of considerations for SCI (section 6.4.1), (2) RL in/outsourcing strategy of considerations and analysis for RL in/outsourcing decisions (section 6.4.1), (3) disposition strategy of considerations for disposition decisions (section 6.6.1), and (4) RPA strategy of considerations for gatekeeping and RA (section 6.9.3). In terms of the consumer protection laws, Hjort *et al.* (2019:774) found that early gatekeeping in Europe is mostly practiced for information purposes because EU laws mandate that returns must be accepted for online product returns. Furthermore, Prajapati *et al*. (2021:14) indicated that the legal benefits of compliance with government policies and environmental protection can be factors to consider for effective RL insourcing and outsourcing decisions. Nevertheless, this study extends the literature by suggesting the consideration of consumer rights for reactive return prevention and environmental disruptions for the key operational RLC of product disposition management.

Essentially, considering legal and environmental prevention and control parameters can help online retailers effectively implement PRP, RRP and RLC propositions, and mitigate the prevention and control (1) pitfalls of RL process failures (operational failures), inattention to RL, poor RL planning (poor RLM), return leniency, poor gatekeeping (poor return prevention) and a lack of SCI (information-related pitfall), and (2) problems of high and unnecessary returns, increase in fraudulent/ineligible returns (product return problems), stockpiling, disorganised inventory, loss of product/product control (inventory problems), consumer dissatisfaction and uncertainty, brand/brand

image damage, market liabilities, a loss of managerial control and poor accountability (online retailer problems).

In conclusion, the prevention and control parameters can impact the implementation of PRP, RRP and RLC propositions and help online retailers to address various prevention and control pitfalls and problems. Therefore, online retailers should consider prevention and control parameters for the effective RLM of consumer returns. The next section contains a framework and summary of the findings for prevention and control propositions in RLM.

8.4.2.5 Framework and summary of findings for prevention and control propositions in RLM

Clearly the discussion in section 8.4.2 showed that prevention and control propositions, including proactive return prevention (PRP), reactive return prevention (RRP), RL control (RLC) and prevention and control parameters, can be important for the effective RLM of consumer returns in online retailing. Figure 8.**9** provides a broad overview of the prevention and control propositions for RLM, demonstrating the links between the RL support practices (see bottom of **Figure 8.15**), main propositions and proposition categories (listed below the main propositions in the middle and right columns).

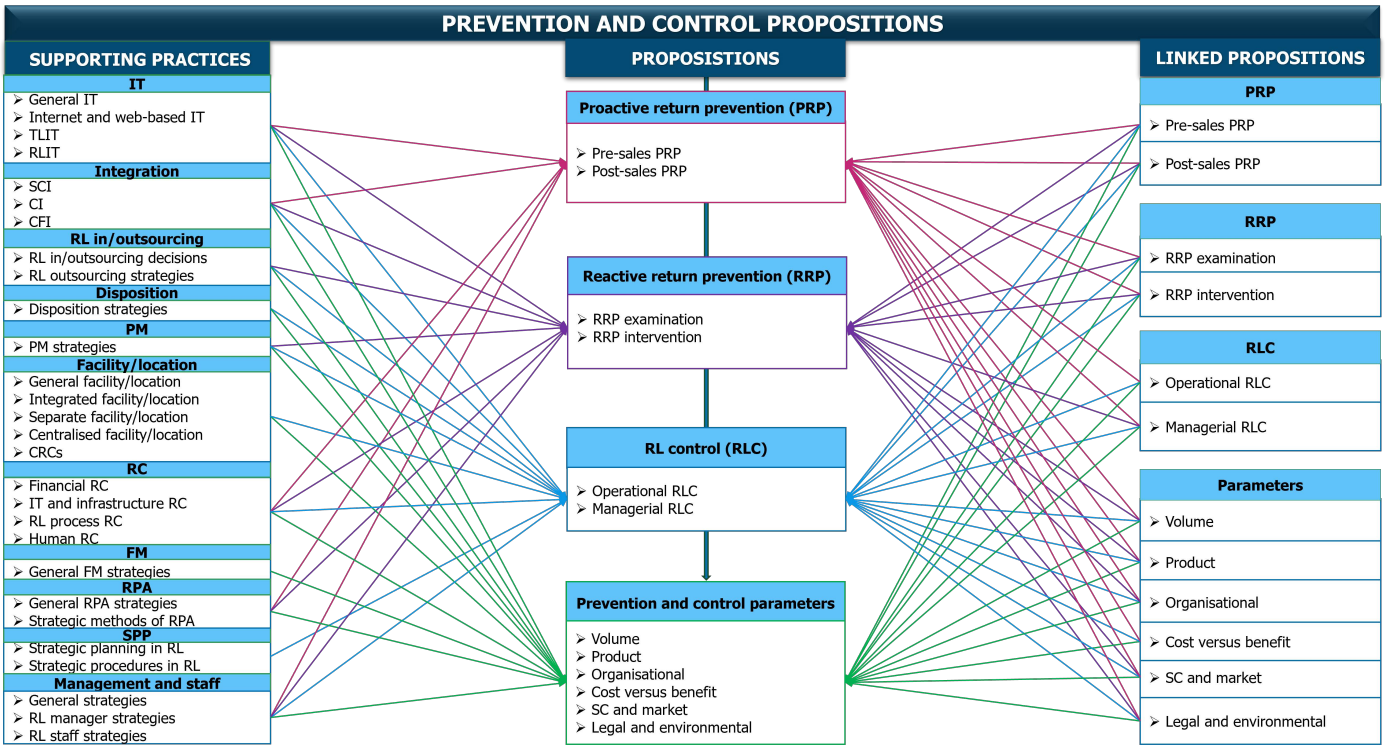

Figure 8.9 Framework for prevention and control propositions
Source: Compiled by the researcher

In terms of the *support RL practices*, the framework shows that prevention and control propositions can be supported by implementing strategies from all RL support practices from the QCA of RL literature findings. The most significant RL support practice categories include IT, integration, RC and

management and staff practices, which means that online retailers can prioritise implementing these RL support practices for the successful implementation of prevention and control propositions. In contrast, the least significant support RL practice categories include FM and SPP, which means online retailers can implement FM and SPP practices as a last priority for the successful implementation of prevention and control propositions.

For the *propositions*, prevention and control parameters, followed by RLC propositions associate with the highest variety of RL support practices. Consequently, online retailers can benefit the most from implementing various RL support practices for the effective consideration of prevention and control parameters and implementation of RLC propositions. However, prevention and control parameters and RLC propositions might be more complicated to consider or implement for effective prevention and control in RL.

Regarding the *links between* the *prevention* and *control propositions*, the framework shows that PRP propositions and prevention and control parameters associate with the most proposition categories, indicating that online retailers must pay attention to prevention and control parameters and PRP propositions for the implementation of various prevention and control proposition categories. Contrastingly, RRP propositions associate with the least proposition categories, indicating that online retailers can pay less attention to RRP propositions for the implementation of prevention and control proposition categories. Finally, the framework shows that the prevention and control proposition categories of pre-sales PRP, post-sales PRP, RRP examination, RRP intervention, managerial RLC and volume, product, organisational, SC, market, legal and environmental parameters equally link with the main prevention and control propositions. Subsequently, online retailers must pay attention to these prevention and control proposition categories in the implementation of various prevention and control propositions.

Table 8.16 provides a detailed proposition framework and summary of the findings, demonstrating the prevention and control proposition categories, key practices/parameters (with elements if applicable), support RL practices, linked proposition categories, and the number of requirements per key practice/parameter and per proposition category. The links between the prevention and control propositions and the pitfalls and problems will be summarised in the final framework and summary of findings for the prevention and control theme (section 8.4.4).

Table 8.16 Summary of findings for prevention and control propositions

Proposition categories	Key practices/parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category

Source: Compiled by the researcher

Table 8.16 provides a detailed summary of the interview findings for prevention and control propositions, which can help online retailers to identify the (1) requirements for specific prevention and control proposition categories, (2) support practices that links with the highest number of prevention

and control propositions, (3) key practices and key parameters that link with the highest number of prevention and control proposition categories, (4) proposition categories that require the most key practices/parameters and key elements, (5) key practice or parameter that requires the most key elements, (6) proposition category that associates with the most support practices, (7) key practice or parameter that associates with the most support practices, and (8) proposition category and key practice/parameter that involves the most requirements for successful implementation/consideration. Some examples of using the framework will be given in the subsequent paragraphs.

In terms of the *requirements for specific prevention and control proposition categories*, an online retailer interested in implementing, for example, pre-sales PRP propositions, can identify (1) FL excellence, information sharing initiatives and return restrictions as the required key practices, (2) CI, RPA and RL staff strategies as required support RL practices, and (3) post-sales PRP, RRP examination and intervention, managerial RLC and volume, product, cost versus benefit, SC, market, legal and environmental parameters as associated proposition categories. Similarly, online retailers that experience, for example, fluctuations in return volume (as a key volume parameter) can focus on return volume for implementing/considering (1) PM, general facility/location, RC, RPA and RL manager strategies as support RL practices, (2) post-sales PRP, RRP examination, RRP intervention, operational RLC and managerial RLC as associated proposition categories, and (3) product and organisational parameters as associated parameter proposition categories.

The most *significant support RL practices* for the implementation of prevention and control propositions include RC and RPA practices. Subsequently, to effectively implement/consider various prevention and control propositions, online retailers must prioritise the implementation of RC and RPA as support RL practices. Furthermore, the *key practice* of return inspection initiatives (post-sales PRP practice) and the *key parameter* of product type (product parameter) *associates with the highest number of proposition categories*, which means that online retailers must pay attention to return inspection initiatives and product type for the successful implementation/consideration of various prevention and control proposition categories.

Regarding the *proposition categories*, operational RLC *require the most key practices/elements*, which means that online retailers must implement several key practices/elements for the effective implementation of operational RLC practices. Subsequently, the *key practices* of RL process optimisation and product disposition management *requires the most key elements*, which means that online retailers must implement several practice elements for successful RL process optimisation and product disposition management. Furthermore, the *proposition category* of operational RLC *associate with the most support RL practices*, which means that support RL practices can be the most beneficial for the implementation of various operational RLC practices. Similarly, the *key parameter* of product

type *associates with the most support RL practices*, which means that support RL practices can be the most beneficial for considering product type as a parameter. However, operational RLC as a proposition category and product type as a key parameter might be more complicated to implement/consider for effective return prevention and control.

Finally, operational RLC as a *proposition category* and RL optimisation as a *key practice* involve the *highest number of requirements*, which means that operational RLC and RL optimisation might be a too challenging to implement successfully for effective prevention and control. Nevertheless, before online retailers choose to implement proposition categories and key practices/parameters based on the number of requirements, they must first identify the linked benefits. The benefits represent the number of prevention and control pitfall and problems addressed and profits realised, which will be identified in the final framework and summary of finding for prevention and control theme (section 8.4.4). In the next section, the prevention and control profits (subtheme 3) that can be realised through the effective implementation of prevention and control propositions, will be analysed and discussed.

8.4.3 Prevention and control profits – Subtheme 3

As illustrated in Figure 8.5, and discussed in section 8.2.2., the prevention and control profits consist of profit categories, including product return and operational, organisational, SC and market and other themes, profit subcategories and related profits, which can be realised through the implementation/consideration of proactive return prevention (PRP), reactive return prevention (RRP) and RL control (RLC) propositions and prevention and control parameters. Figure 8.**10** provides an overview of the prevention and control profit categories, subcategories and related profits that can be realised through the implementation/consideration of prevention and control propositions.

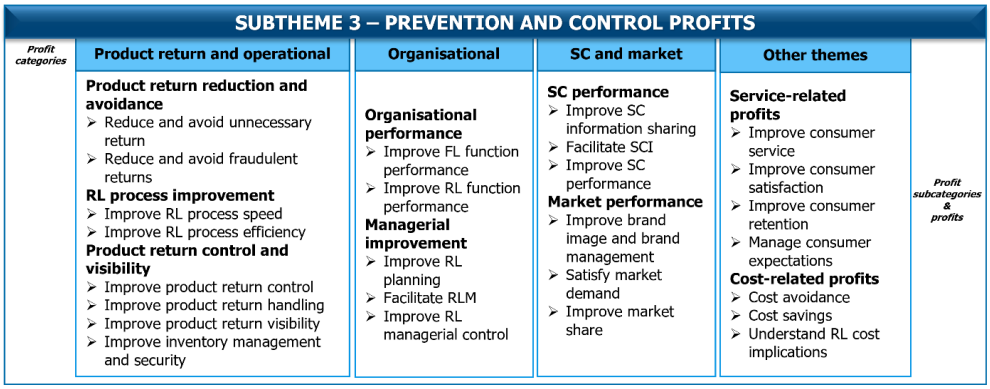

Figure 8.10 Overview of subtheme 3 – Prevention and control profits
Source: Compiled by the researcher

In the subsequent sections the main prevention and control profit categories, including *product return* and *operational, organisational, SC* and *market,* and *other theme profits,* with related profit subcategories and profits will be discussed.

8.4.3.1 Product return and operational prevention and control profits

As illustrated in Figure 8.**10**, product return and operational prevention and control profits can be categorised as (1) product return reduction and avoidance, (2) RL process improvements, and (3) product return control, which will be discussed in the subsequent sections.

8.4.3.1.1 Product return reduction and avoidance profits

Product return reduction and avoidance profits involve reduction and avoidance of unnecessary and fraudulent product returns, which can be realised through PRP, RRP and operational RLC propositions and prevention and control parameters.

Specifically, participants indicated that online retailers could *reduce and avoid unnecessary product returns* through the key (1) pre-sales PRP practices of FL excellence, information sharing initiatives and return restrictions, (2) post-sales PRP practices of gatekeeping and return inspection initiatives, (3) RRP intervention practice of product interventions (i.e. product/package design changes), (4) operational RLC practice of RL process optimisation, (5) cost versus benefit parameter related to pre-sales PRP, and (6) legal parameter of consumer protection laws. The following quotations support these findings:

> "[…] if you can provide an exceptional forward logistics, your reverse logistics will definitely reduce." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "[…] the best way to minimise it […] [is to] educate the consumer as to what they're getting […]." (P4, owner/CEO, 3PRL provider firm)
>
> "So, have some sort of a policy in place […] But unfortunately, with the Consumer Protection Act there's certain things that you can do, [and] certain things you can't […] but [you can] somehow use it to help you navigate the process and help you to reduce certain returns." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "[…] they will reduce the number of returns if they do attach a cost to the return." (P2, owner, supply chain consultancy firm)
>
> "[…] on our website, if you want to log a return for something that you've changed your mind, but you've ordered it outside the [return] period […], it automatically rejects it. I think that's a great way to avoid unnecessary returns." (P3, returns manager, online retailer)
>
> "So, train the inspectors on how to manage your actual product. And that would reduce the number of comebacks you get […]." (P5, general manager, online retailer)
>
> "I think they good for knowledge sharing would be good between the distribution team and the procurement team […] where they can feed back further up the supply chain on potential changes to the packaging or products […] to reduce claims." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] you can have [RL] as part of a strategic plan to reduce [returns and] optimise, building efficiencies [in return processes]." (P6, logistics manager, multichannel retailer)

Moreover, participants indicated that online retailers could reduce, minimise or avoid fraudulent product returns through PRP propositions and product parameters. Specifically, online retailers can *reduce fraudulent product returns* through the key (1) pre-sales PRP practice of return restrictions (e.g. communicating return restrictions to consumers), (2) post-sales PRP practice of inspection initiatives, (3) RRP intervention practice of party interventions, and (4) product parameters of product type and

value. Similarly, online retailers can *avoid fraudulent product returns* by implementing gatekeeping as a key post-sales PRP practice, which involves utilising online authorisation for gatekeeping, and considering the key product parameter of product type. The following quotations expand on these findings:

> "You need to be very clear. Your website needs to be clear from the get-go. You need to say to your consumer in the fine print that if you buy this jacket and you wear it, no matter what […] we're not going to take it back […] to minimise that risk [of fraudulent returns]." (P5, general manager, online retailer)

> "And the only way you're going to really minimise [a fraudulent return] is that when it arrives, make sure the verification is correct […]. But I don't think you can stop the fraudulent intent, but you can stop fraud from happening through a proper verification process." (P4, owner/CEO, 3PRL provider firm)

> "And they might be external parties for luxury consumer goods. They might be physical inspectors from the manufacturer at the online retailer's premises to verify that the return goods are in fact the original goods and not counterfeit goods." (P2, owner, supply chain consultancy firm)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter [is], this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable […]. So, avoiding that on the front end by digitising your returns policy […]. Your computer system understands what the product is and when they [the consumer] bought it, what the return parameters are for that item, what the policy is for that item and allows that customer to return it or rejects the return with treatable messaging. That avoids those sorts of fraudulent returns right at the outset." (P1, operations manager, 3PRL provider firm)

> "[…] what we found with Retailer E was that the same consumer would keep trying to commit the fraud and they eventually just block their accounts." (P4, owner/CEO, 3PRL provider firm)

Several studies from the reviewed literature aligns with the interview findings on the expected product return reduction and avoidance profits from the implementation of various prevention and control propositions. Particularly, unnecessary returns can be reduced and avoided through (1) logistics efficiency (Davidavičienė & Al Majzoub, 2021:19; Euchi *et al.* 2019:49; Hjort *et al.* 2019:779), (2) information sharing initiatives (Ahlén & Johansson, 2023:31; Ahsan & Rahman, 2022:157; Bozzi *et al.* 2022:15; Hjort *et al.* 2019:777; Nel & Badenhorst, 2020:127), (3) return restrictions (Andresen & Istad, 2019:8, 57), (4) gatekeeping (Andresen & Istad, 2019:8; Hjort *et al.* 2019:774), (5) inspection initiatives (Hjort *et al.* 2019:775), (6) product interventions (Andresen & Istad, 2019:7; Bozzi *et al.* 2022:30; Hjort *et al.* 2019:774), and (7) RL process optimisation (Solati *et al.* 2023:2). Similarly, fraudulent returns can be reduced and avoided through clearly communicated return policies (Zhang *et al.* 2023:10) and account suspensions (Hjort *et al.* 2019:778; Zhang *et al.* 2023:11). Nevertheless, this study uniquely identifies that using online authorisation for gatekeeping can avoid fraudulent returns, emphasising the importance of non-human gatekeeping.

Subsequently, reducing and avoiding product returns as prevention and control profits, reemphasise that online retailers can address return leniency, poor gatekeeping (poor RPA) and poor information sharing with consumers (information-related) pitfalls, and high and unnecessary returns and an increase in fraudulent/ineligible returns (product return) problems through the implementation of prevention and control propositions for the effective RLM of consumer returns.

8.4.3.1.2 RL process improvement profits

RL process improvement profits associate with the improvement of the speed and efficiency of the RL process through PRP and RLC propositions and prevention and control parameters.

Participants suggested that online retailers could *improve RL process speed* and *efficiency* through various key practices and parameters. Particularly, online retailers can improve the speed and efficiency of their RL processes through the key (1) post-sales PRP practice of inspection initiatives, (2) operational RLC practices of RL process optimisation (i.e. using strategic plans, facilities and staff practices) and product disposition management (i.e. using 3PRL providers), (3) managerial RLC practices of standards and guidelines, (3) volume parameter of return volume, (4) product parameter of product type, and (4) SC and market parameter of SCI (see section 8.4.2.4.5). These findings can be supported by the subsequent quotations:

> "[…] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. So, I think that's possibly another avenue that one can explore just to […] save some time and traffic at the DC." (P5, general manager, online retailer)

> "[…] you can have [RL] as part of a strategic plan to reduce [returns and] optimise, building efficiencies [in return processes]." (P6, logistics manager, multichannel retailer)

> "[…] the staff needs to be trained […] on the [return] process […] in order to function efficiently." (P4, owner/CEO, 3PRL provider firm)

> "[…] the saving [of RL outsourcing] may not come in direct costs, but it will become in the recoverability of the product, the control […] of the stock […] where your customers are getting that kind of service that you buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently." (P7, owner, 3PRL provider firm)

> "I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up processes […] [and] you have got the same method of thinking in one facility […]." (P5, general manager, online retailer)

> "[Performance measurement is important for] […] ensuring that our fulfilment centres and the returns process is carried out efficiently. […] if it is to be resold, it needs to get resold […] it needs to get onto the shelf ASAP within a specific timeframe and be put up for sale within a specific timeframe." (P9, regional & online DC manager, online retailer)

The interview findings related to the improvement of RL process speed and efficiency as product return and operational profits correspond with a few studies from the reviewed literature. For example, RL process speed and efficiency can be achieved through RL staff training (Ahsan & Rahman, 2022:157), outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2) and performance measuring (Karlsson *et al.* 2023:9). Nevertheless, this study contradicts the findings of Hjort *et al.* (2019:781), who identified that using centralised facilities (i.e. CRCs) can reduce RL process speed because of longer transportation distances. However, this study demonstrates that centralised RL facilities can increase the efficiency and speed of return processes due to improved decision-making, consistency and resources. Therefore, additional benefits can be attributed to the use of CRCs to manage consumer returns effectively.

Essentially, improving RL process speed and efficiency as prevention and control profits, reemphasise that online retailers can address RL process failure (operational failure) pitfalls through the implementation of prevention and control propositions for the effective RLM of consumer returns.

8.4.3.1.3 Product return control and visibility profits

The product return control and visibility profits involve the improvement of product return control, handling and visibility, and inventory management and security through RLC propositions and various prevention and control parameters.

Particularly, online retailers can *improve product return control* through the (1) key operational RLC practices of RL process optimisation (e.g. using centralised facilities and third parties), product return visibility and product disposition management (e.g. using 3PRL providers), (2) key managerial RLC practice of maintaining managerial RLC (e.g. using centralised facilities for monitoring return trends), and (3) SC and market parameters of SC integration and consumer behaviour and type. The following quotations demonstrate the role of RLC propositions and related parameters in improving product return control:

> "I would have a [returns] department within that centralised warehouse. I would definitely have it all together. Because it relates directly then to the existing or current stock that you may carry or may not carry [such as counterfeit stock], and you've got immediate control. It's all about time when you see if it's a [fraudulent return] trend and when it comes through, you want to immediately go and inspect, review and measure. That's quick. That's quick access. It's in your own warehouse. You can control it quickly." (P12, Head of logistics, online retailer)

> "[RL outsourcing is important because of] the recoverability of the product, the control […] of the stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here and [then] that gets thrown in the back of a skip waste bin […]." (P7, owner, 3PRL provider firm)

> "As long as the customers got [and willing to give] all the information, it can actually go quite well […]. So, you can ask the customer to pinpoint what that specific product is and if the customer selects the correct product, it will then work backwards into your supply chain for the warehouse management solution, so that once you receive it, it's actually waiting for you to tick it off and say, yes, it's now been returned. So, that's a much better control." (P12, Head of logistics, online retailer)

Moreover, online retailers can *improve product return handling* by (1) implementing product return segregation as a key operational RLC practice, (2) considering return volume as a key volume parameter and (3) considering organisation type and capabilities as organisational parameters. Additionally, participants suggested that online retailer could *improve product return visibility* through the key (1) operational RLC practices of product return visibility and inventory management, (2) organisational parameter of organisational (IT) capabilities, and (3) SC and market parameter of SC integration. These findings can be illustrated by the following quotations:

> "[…] if the volumes are justified […] a lot of the major online retailers have their returns handling completely separate from the outbound [forward logistics] operation. Because instead of you contaminating your outbound operations to accommodate returns, it makes it a lot easier to handle." (P1, operations manager, 3PRL provider firm)

> "And I developed an App that actually does all those [RL] processes in the form of physical inspection, photographs of the goods, routing, capturing of the information […] to know what's coming back for stock control […]." (P7, owner, 3PRL provider firm)

> "[…] you need an end-to-end inventory management system. So, what I mean by that, you need to be able to create a reverse order. And systematically track and update the status of that order as it goes back into the DC […] So, you need to keep accurate track of where that product is in the system […]." (P5, general manager, online retailer)

Finally, improvements in *inventory management and security* can be attained through the implementation of inventory management (i.e. using systems and dedicated staff) as a key operational RLC practice and considerations of return volume and product condition as volume and product parameters. The subsequent quotations convey these findings:

> "[…] you need an end-to-end inventory management system. So, you need to be able to create a reverse order, and systematically track and update the status of that order as it goes back into the DC […] So, you need to […] make sure that you don't lose that product and that you don't miss it somewhere in the system […]." (P5, general manager, online retailer)

> "[…] depending on scale […] all the reverse logistics manager is actually [responsible for is] managing the [return] inventory component […]. And maybe on the reporting side […] you can let the inventory go through the internal components […]." (P1, operations manager, 3PRL provider firm)

> "And then you've got your inventory team that works within that returns area. […] So, until it's gone through the entire [RL] process, that inventory team is responsible for ensuring that the bad stock goes either to a reseller, or [resalable returned stock] goes back into the good stock warehouse, so they maintain [returned] stock accuracy and security." (P5, general manager, online retailer)

No studies in the reviewed literature identified improved product return control and handling as profits that can be realised through RLC propositions and prevention and control parameters. Therefore, this study identified new profits that online retailers can realised through the implementation of prevention and control propositions. Nevertheless, several studies identified improved product return visibility using IT in the RL process (Biswas & Abdul-Kader, 2018:1021; Frei *et al.* 2020:1619; Jović *et al*. 2020:164). Furthermore, only the use of systems was identified as a practice that can improve inventory management and security (Frei *et al.* 2020:1616; Jović *et al*. 2020:164). Consequently, various product return visibility and inventory management practices can help online retailers realise product return control and visibility profits.

Essentially, product return control and visibility profits, reemphasise that online retailers can address the prevention and control problems of poor product return visibility (product return), stockpiling, disorganised and contaminated inventory and a loss of product/product control (inventory) through the implementation of prevention and control propositions for the effective RLM of consumer returns. In the next section, organisational prevention and control profits will be analysed and discussed.

8.4.3.2 Organisational prevention and control profits

Organisational prevention and control profits can be categorised as *organisational performance* and *managerial improvement profits* (see Figure 8.**10**), which will be discussed and analysed in subsequent sections.

8.4.3.2.1 Organisational performance profits

Organisational performance profits involve improvements of FL function performance and RL function performance through various prevention and control propositions.

Particularly, participants indicated that online retailers could *improve* their *FL function performance* through the implementation of the key RRP examination practice of information usage and analysis. For instance, using consumer complaints data, online retailers can identify FL problems and accordingly improve FL performance. Similarly, online retailers can use IT and 3PRL providers to identify problems with specific products and brands and consider SC integration as a key SC and market parameter, which can improve their negotiation power with suppliers and their procurement practices. The subsequent quotations demonstrate the role of RRP examination practices and SC and market parameters in improving FL function performance:

> "So, the customer wasn't happy and complained, you know, the customer always complained due to something that was an error in their order or there was a missed delivery or delay and 90 percent [are] related to returns. So, it just becomes so important for us because this is where we improve our business. You know, we pull from that complaint's we pull from that to iron out the creases […]." (P9, regional & online DC manager, online retailer)

> "I think [using IT to manage RL] helps you understand product behaviour, too. So, we are able to identify which brands have more issues, which brands need more robust packaging, which brands are more reliable versus unreliable brands […] one of our online customers have […] used our information in buying decisions going forward. So, they would take the information we supplied them through the reverse logistics process and they would negotiate better buying rates with their suppliers." (P4, owner/CEO, 3PRL provider firm)

RL function performance improvement associates with improved RL decision-making, standardisation and productivity, which can be realised through RLC propositions and prevention and control parameters. Specifically, online retailers can improve RL decision-making, standardisation and productivity through RL process optimisation (key operational RLC practice) and standards and guidelines (key managerial RLC practice). Similarly, online retailers can improve RL decision-making through the key (1) managerial RLC practice of control mechanisms, (2) organisational parameter of facility and network design, and (3) cost versus benefit parameter for implementing RLC propositions. These findings can be supported by following quotations:

> "I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up processes, make better decisions, and very importantly, you have got the same method of thinking in one facility […] so that you've got that uniform approach in your activity." (P5, general manager, online retailer)

> "[…] [for the] return processes […] the centralised functions are definitely standardised and that's to improve productivity." (P8, logistics manager, multichannel retailer)

> "It all depends on your network design […] we've centralised [RL] because the decision-making criteria is more consistent in one depot in the country […]. So, it's a managerial control decision versus a cost optimised decision."." (P8, logistics manager, multichannel retailer)

In terms of FL performance, using product return data to negotiate better buying rates matches the findings of Dapiran and Kam (2017:830), which emphasises the value of information usage and analysis as a key RRP examination practice. Similarly, Bozzi *et al.* (2022:15) found that online retailers

analyse product return data to improve FL processes for overall performance improvements. However, no studies from the reviewed literature resonated with the interview findings related to the RL function performance profits. Therefore, this study identified additional benefits related to the implementation of operational and managerial RLC practices and consideration of prevention and control parameters.

Subsequently, improving FL and RL functional performance as prevention and control profits, reemphasise that online retailers can address the prevention and control pitfalls of FL failures (operational failure) and poor RL planning (poor RLM), and product return problem of poor/inconsistent return decision-making through the implementation of prevention and control propositions for the effective RLM of consumer returns.

8.4.3.2.2 Managerial improvement profits

Managerial improvement profits involve RL planning improvements, facilitation of RLM and improvement of RL managerial control, which can be realised through RLC propositions and prevention and control parameters.

Participants indicated that online retailers could *improve RL planning* through the key managerial RLC practice of maintaining managerial RLC and volume parameter of return volume. Moreover, online retailers can *facilitate RLM* through the implementation of the key (1) operational RLC practices of RL process optimisation, product return visibility, inventory management and product disposition management, and (2) managerial RLC practices of control mechanisms (i.e. external control) and dedicated resources. Likewise, online retailers can facilitate RLM through the consideration of the key (1) product parameters of product value and characteristics, (2) organisational parameters of organisation size and organisational capabilities, (3) SC and market parameter of SC relationships and integration, and (4) legal and environmental parameter of environmental policy. The following quotations expand on these findings:

> "[Performance measurement in RL is important] because […] what if […] you [are] hit with high volumes of returns, perhaps […] your initial disposal channels won't be sufficient to take it anymore, then you would be able to make those decisions, things like being able to plan your inbound receiving to accommodate your returns […]." (P1, operations manager, 3PRL provider firm)

> "[…] if you want to run your reverse logistics process accurately, you definitely need someone to […] manage the flow of it […]." (P4, owner/CEO, 3PRL provider firm)

> "I use the courier's delivery online platform, whatever they've got, I use that […] for reverse logistics control and management, because they've got already all the steps in there that you would need, which is I've received your item, I'm in transit, and I'm back in the hub, I've confirmed it back in the hub, and I've taken ownership of it, there is the receipt of it." (P12, Head of logistics, online retailer)

> "[…] a dedicated, outsourced reverse logistics business. And the reason why I believe it is advantageous is because, if you got a warehouse that's running out a billion rands worth of goods every year […] Our facilities are adopted for [the] management of reverse logistics. We've got the correct technology. We've got the correct type of vehicles and receptacles to put [the] product in, whether it be leaking, whether it be messy, whether it have a stench or something like that, it's stored correctly. And obviously our disposal mechanisms are all in terms of [environmental] policy, in terms of the management of brand equity." (P7, owner, 3PRL provider firm)

> "I would say outsource the whole thing […]. If something goes wrong or something goes right, you just speak to the company who is managing the entire reverse logistics process […]. (P4, owner/CEO, 3PRL provider firm)
>
> "[…] appoint additional resources to make reverse logistics a division that manages the returns […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "But even for smaller size [businesses], you need […] a dedicated manager to manage the [RL] process." (P7, owner, 3PRL provider firm)

Finally, the participants indicated that online retailers could *improve RL managerial control* through the key (1) managerial RLC practices of control mechanisms, either internally through centralised facilities or externally through 3PRL providers, and dedicated resources, (2) organisational parameter of facility and network design, (3) cost versus benefit parameter for implementing RLC propositions, and (4) SC and market parameter of SC relationships and integration. These findings can be validated by the subsequent quotations:

> "It all depends on your network design […] we've centralised [RL] because the decision-making criteria is more consistent in one depot in the country […]. So, it's a managerial control decision versus a cost optimised decision." (P8, logistics manager, multichannel retailer)
>
> "I would say outsource the whole thing […] Because someone needs to be in control of the whole circle. […] if anybody needs to take accountability, where do you point the accountability finger to? […] if it's fully outsourced there is one call to make […] So, the reporting is much easier now […]." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] you'd have to have a manager to make sure that things are kept in control." (P8, logistics manager, multichannel retailer)

While no studies identified improvements in RL planning as a profit related to maintaining managerial RLC, a few studies mentioned practices related to the RLC propositions that can facilitate RLM. Specifically, RLM can be facilitated through (1) performance measurement (Lamba *et al.* 2020:384), (2) SC collaboration and integration (Badenhorst, 2022:330), (3) outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2), and (4) commitment of sufficient resources (Govindan & Bouzon, 2018:320). In terms of improving RL managerial control, no studies from the reviewed literature aligned with the interview findings. Therefore, this study uniquely identified that managerial control can be realised through various key managerial RLC practices and related return prevention and control parameters.

Essentially, managerial improvement profits, reemphasise that online retailers can address inattention to RL, poor RL planning, lack of resources and poor PM (poor RLM) pitfalls, and a loss of managerial control and poor accountability and reporting (online retailer) problems through the implementation of prevention and control propositions for the effective RLM of consumer returns. In the next section, the SC and market prevention and control profits will be discussed.

8.4.3.3 SC and market prevention and control profits

SC and market profits can be categorised as *SC performance* and *market performance profits* (see Figure 8.**10**), which will be analysed and discussed in the subsequent sections.

8.4.3.3.1 SC performance profits

SC performance profits involve improvement of SC information sharing, facilitation of SCI and improvement in SC performance, which can be realised through the implementation of RRP and operational RLC propositions and prevention and control parameters.

Specifically, participants suggested that online retailers could *improve SC information sharing* by implementing the key RRP examination practice of information usage and analysis and RPP intervention practice of product interventions. Additionally, online retailers can *facilitate SCI* by enhancing product return visibility as a key operational RLC practice and considering SC relationships and integration as a key SC and market parameter. These findings can be substantiated through the subsequent quotations:

> "I see benefit in the data for any supplier. You can quite easily pick up certain trends on returns that can be valuable for any supplier, whether it's sizes, whether it's malfunctioning of a product, whether it is any reason for the return […] then that highlights certain data issues that you can take on with that […] supplier or manufacturer." (P12, Head of logistics, online retailer)

> "[…] they can feed [information] back further up the supply chain on potential changes to the packaging […] to reduce claims." (P4, owner/CEO, 3PRL provider firm)

> "[…] integration with a stock management system, […] which can be both internal and external, so internal your own, warehouse and external with a third party, that's if they would like to integrate, that is first prize, it's easier to control […] on the reverse logistic side, it's a must […] to externally integrate […]." (P12, Head of logistics, online retailer)

Moreover, online retailers can *improve SC performance* by implementing the key operational RLC practice of product return segregation and considering the product parameter of product condition and organisational parameter of facility and network design. For example, effective return segregation at the online retailer's facility prevents counterfeit or defective products from entering the SC, strengthening SC performance. The following quotations emphasise these findings:

> "You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items and of possibilities of counterfeit goods, for example, entering your supply chain through a back door or having defective merchandise entering your supply chain again. […] physical segregation is important to ensure that products can be returned safely into your supply chain without compromising your products." (P2, owner, supply chain consultancy firm)

Several studies from the reviewed literature aligned with the interview findings in terms of the SC performance profits. Specifically, Dapiran and Kam (2017:830) identified that sharing product return data with suppliers can improve SC information sharing (Dapiran & Kam, 2017:830). Additionally, Ahlén and Johansson (2023:32) indicated that SCI can be realised through SC information sharing. Similarly, Frei *et al.* (2020:1618) found that integration of IT systems between SC partners enhances SC information sharing. Lastly, Wang *et al.* (2020:67) identified that RL information sharing across the SC and sharing of return delivery information can improve visibility and enhance SC performance. However, as indicated in section 8.4.2.3.1, product return segregation as a key operational RLC

practice is a unique finding, which means this study adds to the practices that can improve SC performance.

Essentially, SC performance as a prevention and control profit, reemphasises that online retailers can address a lack of SCI and poor systems (information-related) pitfalls through the implementation of prevention and control propositions for the effective RLM of consumer returns.

8.4.3.3.2 Market performance profits

Market performance profits involve improved brand image and management, market demand satisfaction and increased market share, which can be attained through RRP propositions, operational RLC propositions and prevention and control parameters.

Specifically, online retailers can *improve* their *brand image* by implementing the key RRP intervention practice of party interventions and considering return volume as a key volume parameter, exiting suppliers that supply problematic products associated with high return volumes. Additionally, online retailers can *improve brand management* by implementing the key operational RLC practice of product disposition management and considering the key parameters of organisational capabilities, SC relationships and integration and environmental policies. Subsequently, online retailers that lack the capabilities for effective disposition management can outsource RL to 3PRL providers, which can improve brand management. Brand image and brand management as market profits can be supported by the following quotations:

> "[…] you would exit the supplier if they've got more comebacks than what is normal. And that's an obvious red flag. You simply exit that supplier and say, you know what, we've got too many comebacks. You are tarnishing our brand, so cheers." (P5, general manager, online retailer)

> "[…] [we are] a dedicated outsourced reverse logistics business […] Our facilities are adopted for [the] management of reverse logistics. […] our disposal mechanisms are all in terms of [environmental] policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)

Moreover, online retailers can *satisfy market demand* by implementing the key operational RLC practice of inventory management and considering the key SC and market parameter of market conditions. Additionally, considering market conditions can help online retailers to *improve* their *market share* by implementing fewer return restrictions as a key pre-sales PRP practice. Subsequently, online retailers that seek improved market share may implement other prevention measures, including post-sales PRP and RRP practices. The following quotations expand on these findings:

> "I've got inventory floating around in the business […] I've got consumer stock coming back as returns […] we would have to look at some level of distributed order management to take all this inventory and see how best we can use it. That's probably our biggest investment that we would do to try and manage inventory in motion […] you can say, hey but there's a demand for this item there, I can fulfil from here to there […]." (P6, logistics manager, multichannel retailer)

> "I remember distinctly back in the day that with Retailer C, you couldn't really dictate to the customer because you've got such a small penetration into the market, you literally have everything to lose. So, they were a lot more

accommodating than what they were supposed to be. Honestly, they would take back things and smile and say, oh, it's OK, we'll just do it because we were going for market share […]." (P5, general manager, online retailer)

While no study in the reviewed literature identified supplier exit as a RRP practice, Eriksson and Käck (2023:24-25) found that improvements in product design can enhance the reputation of the online retailer. Consequently, selling better quality products either through exiting the supplier or improving the quality of a product can enhance the brand image of the online retailer. Additionally, no study was found that identified brand management as an outcome of disposition management through 3PRL providers. Nevertheless, Phuong (2019:14) suggested that adhering to government policies and legislation in RL can improve the brand image of organisations. Furthermore, this study uniquely identified demand satisfaction as a profit that can be realised through inventory management, which can further motivate online retailers to implement product return inventory management for operational RLC. Lastly, the interview finding related to the improvement of market share through return leniency echoes the finding of Hjort *et al.* (2019:778), who found that online retailers generally accept all returns regardless of their return policies to attract more consumers.

Essentially, market performance as a prevention and control profit, reemphasises that online retailers can address a loss of sales, brand/brand image damage and market liability (online retailer) problems through the implementation of prevention and control propositions for the effective RLM of consumer returns. In the next section, the prevention and control profits for the other themes will be analysed and discussed.

8.4.3.4 Other themes prevention and control profits

As illustrated in Figure 8.**10**, the other themes prevention and control profits include profits related to service (theme 2) and costs (theme 3). In the subsequent sections, *service-related* and *cost-related* prevention and control profits will be discussed.

8.4.3.4.1 Service-related prevention and control profits

The service-related prevention and control profits involve consumer service, satisfaction, retention and expectations, which online retailers can realise through various prevention and control propositions.

Particularly, the participants indicated that online retailers could *improve consumer service* through the key (1) pre-sales PRP practice of FL excellence, (2) post-sales PRP practice of inspection initiatives, (3) RRP examination practice of information usage and analysis, (4) operational RLC practice of RL process optimisation, (5) volume parameter of return volume, and (6) product parameters of product type and condition. The following quotations expand on these findings:

"[…] we try to reduce the amount of times […] the customer goes to social media badmouthing your company […] And the way you do it again is by providing the best customer service […] because if you provide this

customer with the most exceptional service from the get-go and he receives his product, I can tell you now already he'll embrace it." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

"So, a lot of those factors, the customer wasn't happy and complained, you know, the customer always complained due to something that was an error in their order or there was a missed delivery or delay and 90 percent [are] related to returns. So, […] we pull from that complaint's we pull from that to iron out the creases […] and to improve our business, our offering to the customer." (P9, regional & online DC manager, online retailer)

"[…] a practical way of putting a team of people into the street and saying, you know what, returns is such a big thing in our world […]. So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there? […] So, I think that's possibly another avenue that one can explore just to give them a better service […]." (P5, general manager, online retailer)

Moreover, online retailers can *improve consumer service, satisfaction* and *retention* by (1) implementing the key operational RLC practices of RL process optimisation and product disposition management (i.e. using 3PRL providers), and (2) considering the key SC and market parameter of SC integration. Finally, online retailers can *manage consumer expectations* by implementing the key operational RLC practice of inventory management and considering the key organisational parameter of organisational (IT) capabilities and resources. The following quotations support these findings:

"[RL outsourcing is important because of] the recoverability of the product, the control […] of the stock […] […] and some non-attributable costs in the form of customer service […], where your customers are getting that kind of service that you buy it [the dress] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)

"[…] you need an end-to-end inventory management system. […] that gives you the ability to change status, update status and communicate the new status to the customer […] So, you need to keep accurate track of where that product is in the system to […] manage the customer's expectation in terms of progress, you also need to make sure that you don't lose that product […]." (P5, general manager, online retailer)

Apart from Le (2023:16), who identified that consumer satisfaction can be improved through outsourcing to 3PRL providers, no studies from the reviewed literature identified consumer service and expectations as outcomes of FL excellence (key pre-sales PRP practice), inspection initiatives (key post-sales PRP practice), information usages and analysis (key RRP examination practice), product return inventory management (operational RLC practice). Consequently, this study identified additional service-related profits that can be realised, which can further motivate online retailers to implement and consider various prevention and control propositions.

Essentially, realising service-related prevention and control profits, reemphasise that online retailers can address consumer dissatisfaction and uncertainty and a loss of sales (online retailer) problems through the implementation of prevention and control propositions for the effective RLM of consumer returns.

8.4.3.4.2 Cost-related prevention and control profits

The cost-related prevention and control profits involve cost avoidance, cost savings and understanding of RL cost implications. Specifically, online retailers can *avoid costs* by implementing/considering the

key (1) pre-sales PRP practice of return restrictions (i.e. charging consumers a return fee), (2) post-sales PRP practice of gatekeeping (i.e. online authorisation and establishing a gatekeeping function), and (3) product parameters of product condition and type. The following quotations illustrate the cost-related prevention and control profit of cost avoidance:

> "[…] they will reduce the number of returns if they do attach a cost to the return" (P2, owner, supply chain consultancy firm)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. […] But there is also, what are you going to do with this two-year old computer […] it's only a cost driver. So, avoiding that on the front end by digitising your returns policy […]." (P1, operations manager, 3PRL provider firm)

> "So, when a customer logs a return, they obviously need to take a photo of an item […] that person can see that item has been used. It obviously it gets declined right away. So, you don't have that cost incurred […] to send it back […] I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

Furthermore, online retailers can realise *cost savings* in RL by implementing the key (1) post-sales PRP practice of inspection initiatives (i.e. pre-return inspection and consumer locations), (2) RRP intervention practice of party interventions (i.e. charging couriers for damages), and (3) operational RLC practices of RL process optimisation and product disposition management (using 3PRL providers). Additionally, online retailers can consider return volume (key volume), product condition, product type (key product) and SC relationships and integration (key SC and market) parameters for cost savings in RL. The following quotations demonstrate these findings:

> "And to ensure that you engage with carriers or couriers that will deliver products to your customers, […] [to] take care of your product, and they are measured against any of their own damages. If our carrier loses a parcel or damages a good, they pay for it, which encourages good behaviour." (P8, logistics manager, multichannel retailer)

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time. […] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […]. So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there? And if not, fine, then let's just take your profile of the pc before I leave. Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell." (P5, general manager, online retailer)

> "[…] the saving [of RL outsourcing] may not come in direct costs, but it will become in the recoverability of the product, the control […] of the stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here and [then] that gets thrown in the back of a skip waste bin […] So, yes, I do believe there are significant costs, maybe not directly as a comparison line for line in the income statement, but there are costs that can be saved elsewhere […]." (P7, owner, 3PRL provider firm)

Finally, online retailers can improve their *understanding of RL cost implications* by using IT and 3PRL providers to enhance product return visibility (key operational RLC practice) and consider organisational capabilities (key organisational parameter) and SC relationships and integration (key SC and market parameter), as demonstrated in the following quotation:

> "And I developed an App that actually does all those [RL] processes in the form of physical inspection, photographs of the goods, routing, capturing of the information […] to know what's coming back for stock control and […] the [cost] implications thereof." (P7, owner, 3PRL provider firm)

Although the interview findings related to cost avoidance through PRP propositions and prevention and control parameters are unique, Andresen and Istad (2019:7) indicated that return restrictions can lower RL costs due to fewer returns. Furthermore, no studies in the reviewed literature identified that cost savings can be realised through supplier penalties, home inspections and outsourcing to 3PRL providers. Likewise, no studies identified that enhancing product return visibility through information systems and 3PRL providers can help online retailers understand the cost implications of RL. Subsequently, this study extends the literature by identifying additional cost advantages that can be realised through product return prevention and control initiatives.

Evidently, cost-related profits as prevention and control profits, reemphasise that online retailers can address return leniency, poor gatekeeping (poor RPA) and poor systems (information-related) pitfalls, and high and unnecessary returns, increase in fraudulent/ineligible returns, poor return visibility (product return) and a loss of sales (online retailer) problems through the implementation of prevention and control propositions for the effective RLM of consumer returns.

Essentially, online retailers can realise various product return, operational, organisational, SC, market, service-related and cost-related profits through the implementation of various prevention and control propositions, reemphasising that prevention and control propositions can be important for the effective RLM of consumer returns. In the next section, the prevention and control theme will be concluded with a framework and summary of findings.

8.4.4 Framework, summary and analysis of findings for Theme 1 - Prevention and control for the effective RLM of consumer returns in online retailing

In section 8.2.2, the application of the overall framework, summary and analysis of findings for each theme were described. Accordingly, based on the interview findings presented in section 8.4, Figure 8.**11** shows a broad framework and overview of the links between prevention and control pitfalls/problems, propositions and profits. The most significant prevention and control pitfalls, problems and profits, illustrated in Figure 8.**11**, were emphasised in several ways. Particularly, per prevention and control pitfall, problem and profit category the <u>most significant</u> pitfall, problem and profit (associated with the most prevention and control proposition categories) was emphasised through *italics*, the <u>top three</u> prevention and control pitfalls and problems (associated with ten or more proposition categories) and profits (associated with five or more proposition categories) were emphasised in **bold**, and the <u>highest and most significant</u> prevention and control pitfall/problem and profit was emphasised through an asterisk*.

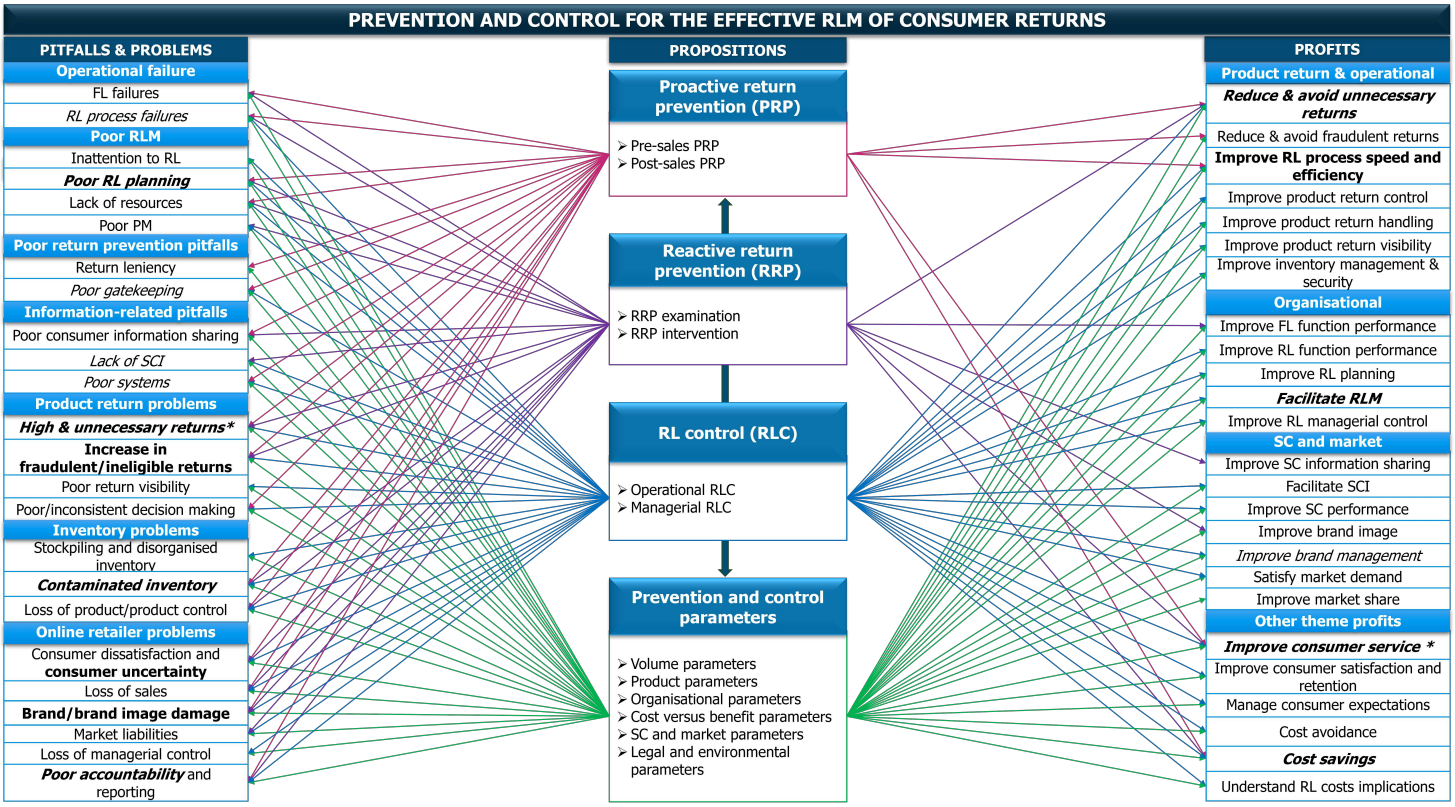

Figure 8.11 Framework for Theme 1 – Prevention and control for the effective RLM of consumer returns
Source: Compiled by the researcher

In terms of the *prevention and control pitfalls/problems*, Figure 8.**11** shows that all main *prevention* and *control pitfall/problem* categories, except poor return prevention pitfalls, associate with all main prevention and control propositions. Subsequently, online retailers can address various pitfalls and problems through various prevention and control propositions. Furthermore, the prevention and control pitfalls/problems that associate with all (four) main prevention and control propositions include (1) RL process failures (operational failure pitfall), (2) poor RL planning and a lack of resources (poor RLM pitfalls), (3) high and unnecessary returns and an increase in fraudulent/ineligible returns (product return problems), (4) contaminated inventory and loss of product/product control (inventory problems), and (5) consumer uncertainty, loss of sales, brand/brand image damage and poor accountability (online retailer problems). Subsequently, online retailers can implement any prevention and control propositions to address these prevention and control pitfalls and problems.

Per prevention and *control pitfall/problem category*, the framework shows that the *most significant* prevention and control *pitfalls/problems* (presented in *italics*) that can be addressed by the prevention and control proposition categories include (1) RL process failures (operational failure pitfall), (2) poor RL planning (poor RLM pitfall), (3) poor gatekeeping (poor RPA pitfall), (4) a lack of SCI and poor systems (information-related pitfalls), (5) high and unnecessary returns (product return problem), (6) contaminated inventory (inventory problem), and (7) poor accountability (online retailer problem).

Additionally, the *top three most significant prevention* and *control pitfalls/problems* (presented in **bold**) that can be addressed through (ten or more out of 12) prevention and control proposition categories include high and unnecessary returns (12), increase in fraudulent/ineligible returns, contaminated inventory and poor accountability (11 each), and poor RL planning, loss of product/product control, consumer uncertainty and brand/brand image damage (ten each). Subsequently, the *highest* and *most significant prevention* and *control problem* (presented with an asterisk*) that can be addressed by prevention and control proposition categories includes the product return problem of high and unnecessary returns. Evidently, online retailers can implement any prevention and control proposition category to address high and unnecessary product returns, followed by various proposition categories for addressing fraudulent/ineligible returns, contaminated inventory, poor accountability, poor RL planning, loss of product/product control, consumer uncertainty and brand/brand image damage.

In terms of the *prevention* and *control propositions*, the framework shows that prevention and control parameters (23 pitfalls/problems and 24 profits), followed by RLC propositions (20 pitfalls/problems and 20 profits), can be the most significant propositions in terms of addressing various prevention and control pitfalls/problems and realising various prevention and control profits. Therefore, online retailers must prioritise the consideration of prevention and control parameters and implementation of RLC propositions to effectively address various prevention and control pitfalls and problems and realise various prevention and control profits.

For the *prevention* and *control profits*, the framework shows that the most significant profit categories (associated with the most propositions) include product return and operational profits and other theme profits, indicating that prevention and control propositions can be the most beneficial for realising product return and operational profits and other theme profits. Furthermore, reduction and avoidance of unnecessary returns, improved consumer service and cost saving profits associate with all main prevention and control propositions, indicating that online retailers can implement any prevention and control propositions to reduce and avoid unnecessary returns, improve consumer service and save costs. Subsequently, prevention and control propositions can be important for profits related to other themes, which emphasises the importance of prevention and control for the effective RLM of consumer returns in online retailing.

Per prevention and *control profit category* the framework shows that the *most significant* prevention and control *profits* (presented in *italics*) that can be realised through the implementation of various prevention and control proposition categories, include (1) reducing and avoiding unnecessary returns (product return and operational profit), (2) facilitating RLM (organisational profit), (3) improving brand management (SC and market profit), and (4) improving consumer service and cost savings (other theme profits). Similarly, the *top three most significant prevention* and *control profits* (presented in

bold) that can be realised through the implementation of (five or more out of 12) prevention and control proposition categories include (1) improving consumer service (seven), (2) reducing and avoiding unnecessary returns, RL process speed and efficiency and facilitating RLM (six each), and (3) cost savings (five). Subsequently, the *highest* and *most significant prevention* and *control profit* (presented with an asterisk*) that can be realised through various prevention and control proposition categories include consumer service improvement. Evidently, online retailers can expect improvements in consumer service through the implementation of various prevention and control proposition categories, reemphasising the significance of prevention and control for the effective RLM of consumer returns in online retailing.

Table 8.**17** provides a summary of the main findings for the prevention and control theme, focussing on the prevention and control proposition categories, key practices/parameters and related prevention and control pitfalls, problems and profits. Additionally, the table provides columns giving an overview of the costs (total requirements as identified in Table 8.16) versus the benefits (total benefits in terms of the number of addressed pitfalls and problems and realised profits) per key practice/parameter and proposition category.

Table 8.17: Summary of findings for theme 1 - Prevention and control for the effective RLM of consumer returns

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
Pre-sales PRP	**FL excellence**	***Operational failure*** • FL failures	***Product return*** • High and unnecessary returns • Increase in fraudulent returns ***Inventory*** • Contaminated inventory ***Online retailer*** • Consumer dissatisfaction and uncertainty • Loss of sales • Brand image damage	***Product return/operational*** • Reduce/avoid unnecessary returns ***Other themes*** • Improve consumer service	• Costs – 5 • Benefits – 12 • +7	• ***Costs – 14*** • ***Benefits – 30*** • ***+16***
	Information sharing initiatives	***Information-related*** • Poor consumer information sharing	***Product return*** • High and unnecessary returns ***Online retailer*** • Consumer dissatisfaction and uncertainty	***Product return/operational*** • Reduce/avoid unnecessary returns	• Costs – 5 • Benefits – 7 • +2	
	Create return restrictions	***Poor RLM*** • Poor RL planning ***Poor prevention*** • Return leniency ***Information-related*** • Poor consumer information sharing	***Product return*** • High and unnecessary returns • Increase in fraudulent returns ***Online retailer*** • Consumer uncertainty	***Product return/operational*** • Reduce/avoid unnecessary returns • Reduce fraudulent returns ***Other themes*** • Cost avoidance	• Costs – 4 • Benefits – 11 • + 7	
Post-sales PRP	**Gatekeeping**	***Poor RLM*** • Lack of resources ***Poor prevention*** • Return leniency • Poor gatekeeping ***Information-related*** • Poor systems	***Product return*** • High and unnecessary returns • Increase in fraudulent/ineligible returns • Poor return decision making	***Product return/operational*** • Reduce/avoid unnecessary returns • Avoid fraudulent returns ***Other themes*** • Cost avoidance	• Costs – 6 • Benefits – 12 • +6	• ***Costs – 13*** • ***Benefits – 37*** • ***+24***
	Inspection initiatives	***Operational failure*** • RL process failures ***Poor RLM*** • Lack of resources ***Poor prevention*** • Return leniency • Poor gatekeeping ***Information-related***	***Product return*** • High and unnecessary returns • Increase in fraudulent/ineligible returns • Poor return decision making ***Inventory*** • Contaminated inventory • Loss of product	***Product return/operational*** • Reduce/avoid unnecessary • Reduce fraudulent returns • Improve RL process speed and efficiency ***Other themes*** • Improve consumer service • Cost savings	• Costs – 7 • Benefits – 25 • +18	

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
		• Poor consumer information sharing • Lack of SCI	***Online retailer*** • Consumer dissatisfaction and uncertainty • Loss of sales • Brand image damage • Market liabilities • Poor accountability			
RRP examination	**Information usage and analysis**	***Operational failure*** • FL failures ***Poor RLM*** • Poor RL planning • Lack of resources • Poor PM ***Information-related*** • Poor consumer information sharing • Lack of SCI	***Product return*** • High and unnecessary returns • Increase in fraudulent returns ***Inventory problem*** • Contaminated inventory • Loss of product ***Online retailer*** • Consumer dissatisfaction • Loss of sales • Poor accountability	***Organisational*** • Improve FL function performance ***SC and market*** • Improve SC information sharing ***Other themes*** • Improve consumer service	• Costs – 11 • Benefits – 17 • + 6	• ***Costs – 16*** • ***Benefits – 26*** • ***+10***
	Targeted investigation measures	***Operational failure*** • FL failures • RL process failures ***Poor RLM*** • Lack of resources	***Product return*** • High and unnecessary returns • Increase in fraudulent returns ***Inventory problem*** • Contaminated inventory ***Online retailer*** • Consumer dissatisfaction • Loss of sales	-	• Costs – 5 • Benefits – 9 • +4	
RRP intervention	**Product interventions**	***Operational failure*** • FL failures ***Information-related*** • Lack of SCI	***Product return*** • High and unnecessary returns ***Inventory problem*** • Contaminated inventory ***Online retailer*** • Consumer dissatisfaction and uncertainty • Loss of sales	***Product return/operational*** • Reduce/avoid unnecessary returns ***SC and market*** • Improve SC information sharing	• Costs – 6 • Benefits – 11 • +5	• ***Costs – 12*** • ***Benefits – 27*** • ***+15***
	Party interventions	***Operational failure*** • FL failures ***Poor RLM*** • Poor PM ***Information-related*** • Lack of SCI	***Product return*** • High and unnecessary returns • Increase in fraudulent returns ***Inventory problem*** • Contaminated inventory • Loss of products ***Online retailer*** • Consumer dissatisfaction and uncertainty • Loss of sales • Brand image damage • Poor accountability	***Product return/operational*** • Reduce fraudulent returns ***SC and market*** • Improve brand image ***Other themes*** • Cost savings	• Costs – 6 • Benefits – 16 • +10	
Operational RLC	**RL process optimisation**	***Operational failure*** • RL process failures ***Poor RLM*** • Inattention to RL • Poor RL planning • Lack of resources • Poor PM ***Poor prevention*** • Poor gatekeeping ***Information-related*** • Poor systems	***Product return*** • High and unnecessary returns • Increase in fraudulent returns • Poor product return visibility • Poor return decision making ***Inventory*** • Stockpiling and disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Consumer dissatisfaction and uncertainty • Loss of sales • Brand image damage • Market liabilities • Loss of managerial control • Poor accountability	***Product return/operational*** • Reduce/avoid unnecessary returns • Improve product return control • Improve RL process speed and efficiency ***Organisational*** • Improve RL function performance • Facilitate RLM ***Other themes*** • Improve consumer service • Improve consumer satisfaction and retention • Cost savings	• Costs – 12 • Benefits – 34 • +22	• ***Costs – 44*** • ***Benefits – 112*** • ***+68***
	Product return visibility	***Operational failure*** • RL process failures ***Poor RLM*** • Poor RL planning • Lack of resources ***Information-related*** • Lack of SCI • Poor systems	***Product return*** • Increase in fraudulent returns • Poor product return visibility ***Inventory*** • Disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Market liabilities • Loss of managerial control • Poor accountability & reporting	***Product return/operational*** • Improve product return control and visibility ***Organisational*** • Facilitate RLM ***SC and market*** • Facilitate SCI ***Other themes*** • Understand RL cost implications	• Costs – 9 • Benefits – 19 • +10	
	Product return segregation	***Operational failure*** • RL process failures ***Poor RLM***	***Product return*** • High and unnecessary returns ***Inventory***	***Product return/operational*** • Improve product return handling	• Costs – 7 • Benefits – 15	

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
		• Inattention to RL • Poor RL planning • Lack of resources	• Stockpiling and disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Brand/brand image damage • Market liabilities • Loss of managerial control	***SC and market*** • Improve SC performance	• +8	
	Product return inventory management	***Operational failure*** • RL process failures ***Poor RLM*** • Inattention to RL • Poor RL planning • Lack of resources ***Information-related*** • Poor systems	***Product return*** • High and unnecessary returns • Poor return visibility • Poor return decision making ***Inventory*** • Stockpiling and disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Brand/brand image damage • Market liabilities • Loss of managerial control • Poor accountability and reporting	***Product return/operational*** • Improve product return visibility • Improve inventory management and security ***Organisational*** • Facilitate RLM ***SC and market*** • Satisfy market demand ***Other themes*** • Manage consumer expectations	• Costs – 8 • Benefits – 24 • +16	
	Product disposition management	***Operational failure*** • RL process failures ***Poor RLM*** • Inattention to RL • Poor RL planning ***Information-related*** • Lack of SCI	***Inventory*** • Stockpiling and disorganised inventory • Loss of product/product control ***Online retailer*** • Brand/brand image damage • Market liabilities • Loss of managerial control • Poor accountability	***Product return/operational*** • Improve product return control • Improve RL process speed and efficiency ***Organisational*** • Facilitate RLM ***SC and market*** • Improve brand management ***Other themes*** • Improve consumer service, satisfaction and retention • Cost savings	• Costs – 8 • Benefits – 20 • +12	
Managerial RLC	**Control mechanisms**	***Operational failure*** • RL process failures ***Poor RLM*** • Inattention to RL • Poor RL planning • Poor PM	***Product return*** • Poor return decision making ***Inventory*** • Loss of product/product control ***Online retailer*** • Consumer uncertainty • Loss of managerial control • Poor accountability and reporting	***Organisational*** • Improve RL function performance • Facilitate RLM • Improve managerial control	• Costs – 6 • Benefits – 13 • +7	• ***Costs – 25*** • ***Benefits – 59*** • ***+34***
	Dedicated resources	***Operational failure*** • RL process failures ***Poor RLM*** • Inattention to RL • Poor RL planning • Lack of resources	***Product return*** • High and unnecessary returns ***Inventory*** • Disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Loss of managerial control • Poor accountability and reporting	***Organisational*** • Facilitate RLM • Improve managerial control	• Costs – 5 • Benefits – 14 • +9	
	Standards and guidelines	***Operational failure*** • RL process failures ***Poor RLM*** • Poor RL planning • Poor PM	***Product return*** • Poor return decision making ***Inventory*** • Loss of product/product control ***Online retailer*** • Consumer uncertainty • Brand/brand image damage • Marker liabilities • Loss of managerial control • Poor accountability	***Product return/operational*** • Improve RL process speed and efficiency ***Organisational*** • Improve RL function performance	• Costs – 7 • Benefits – 13 • +6	
	Maintain managerial RLC	***Operational failure*** • RL process failures ***Poor RLM*** • Poor RL planning • Lack of resources • Poor PM	***Product return*** • High and unnecessary returns • Increase in fraudulent returns • Poor return decision making ***Inventory*** • Stockpiling and disorganised inventory • Contaminated inventory • Loss of product/product control ***Online retailer*** • Marker liabilities • Loss of managerial control • Poor accountability and reporting	***Product return/operational*** • Improve product return control ***Organisational*** • Improve RL function performance • Improve RL planning	• Costs – 7 • Benefits – 19 • +12	
Volume parameters	**Return volume**	***Operational failure*** • RL process failures ***Poor RLM***	***Product return*** • High and unnecessary returns • Increase in fraudulent/ineligible	***Product return/operational*** • Improve product return handling	• Costs – 6 • Benefits – 32	• ***Costs – 8*** • ***Benefits – 38***

Source: Compiled by the researcher

Table 8.**17** provides a detailed summary of the various prevention and control proposition categories and related key practices/parameters, addressed pitfalls and problems, and realised profits as well as the costs versus benefits per key practice/parameter and proposition categories. Online retailers can use this framework in several ways for the effective RLM of consumer returns. Specifically, online retailers can identify the (1) benefits for specific prevention and control proposition categories and key practices/parameters (hereafter propositions), (2) propositions for specific prevention and control pitfalls, (3) propositions for specific prevention and control problems, (4) propositions for specific prevention and control profits, (5) most significant propositions for addressing prevention and control pitfalls, (6) most significant propositions for addressing prevention and control problems, (7) most significant propositions for realising prevention and control profits, and (8) most and least beneficial propositions in terms of costs versus benefits. Examples of applying Table 8.**17** for the effective RLM of consumer returns will be given in the subsequent paragraphs.

For the *benefits associated with specific propositions*, an online retailer interested in implementing, for example, pre-sales PRP propositions, can identify that (1) FL failures, poor RL planning, return leniency and poor consumer information sharing pitfalls can be addressed, (2) high and unnecessary returns, increase in fraudulent returns, contaminated inventory, consumer dissatisfaction and uncertainty, a loss of sales and brand image damage problems can be addressed, and (3) reduction/avoidance of unnecessary returns, reduction in fraudulent returns, improvements in consumer service and cost avoidance can be realised. Additionally, an online retailer interested in implementing, for example, the key pre-sales PRP practice of information sharing initiatives can identify that (1) poor consumer information sharing as an information-related pitfall can be addressed, (2) high and

unnecessary returns and consumer dissatisfaction and uncertainty problems can be addressed, and (3) reduction/avoidance of unnecessary returns can be realised.

In terms of the *propositions for specific prevention and control pitfalls*, an online retailer that identified, for example, poor PM, as a significant prevention and control pitfall can implement/consider the key (1) RRP examination practice of information usage and analysis, (2) RRP intervention practice of party interventions, (3) operational RLC practice of RL process optimisation, (4) managerial RLC practices of control mechanisms, standards and guidelines, and maintaining managerial RLC, (5) volume parameter of return volume, (4) product parameter of product condition, and (5) SC and market parameter of SC relationships and integration as mitigating propositions for the effective RLM of consumer returns.

Regarding the *propositions for specific prevention and control problems*, an online retailer that identified, for example, poor reporting, as a prevention and control problem can implement/consider the key (1) operational RLC practices of product return visibility and inventory management, (2) managerial RLC practices of control mechanisms, dedicated resources and maintaining managerial RLC, (3) volume parameter of return volume, (4) organisational parameters of organisation type and size, and (5) SC and market parameters of SC relationships and integration as mitigating propositions for the effective RLM of consumer returns. In terms of the *propositions for specific prevention and control profits*, an online retailer seeking, for example, to improve product return control can implement/consider the key (1) operational RLC practices of RL process optimisation, product return visibility and product disposition management, (2) managerial RLC practice of maintaining managerial RLC, and (3) SC and market parameter of consumer behaviour and types.

Concerning the *most significant propositions for addressing prevention and control pitfalls*, online retailers that experience various prevention and control pitfalls in RL can prioritise the implementation of operational RLC propositions and consideration of product parameters as the most beneficial prevention and control proposition categories. Likewise, online retailers that experience various prevention and control pitfalls in RL can prioritise the implementation of the key operational RLC practice of RL process optimisation and consideration of the key volume parameter of return volume as the most beneficial key practice and parameter. Pertaining to the *most significant propositions for addressing prevention and control problems*, online retailers that experience various prevention and control problems in RL can prioritise the implementation of operational RLC propositions and consideration of product parameters as the most beneficial prevention and control proposition categories. Additionally, online retailers that experience various prevention and control problems can prioritise the implementation of the key operational RLC practice of RL process optimisation and

considerations of the key volume parameter of return volume and key product parameter of product type as the most beneficial key practice and parameters.

Relating to the *most significant propositions for realising prevention and control profits*, online retailers that seek various prevention and control profits in RL can prioritise the implementation of operational RLC propositions and consideration of SC and market parameters as the most beneficial prevention and control proposition categories. Consequently, online retailers that seek various preventions and control profits can prioritise the implementation of the key operational RLC practice of RL process optimisation and consideration of the key SC and market parameter of SC relationships and integration as the most beneficial key practice and parameter.

Finally, online retailers can use the framework to perform a cost-benefit analysis, identifying the costs (sum of the key practices/parameters and the support practices) versus the benefits (sum of addressed prevention and control pitfalls and problems, and realised profits) to implement/consider the most beneficial prevention and control propositions for RLM. Specifically, Table 8.**17** shows that the *most beneficial proposition categories* include operational RLC in terms of the costs (44) versus benefits (112), and product parameters in terms of costs (23) versus benefits (77). Consequently, despite being the most complicated proposition categories in terms of the requirements/costs (also see section 8.4.2.5), operational RLC and product parameters associate with the highest number of benefits, meaning that online retailers can prioritise the implementation of operational RLC and consideration of product parameters for the effective RLM of consumer returns. Additionally, the *most beneficial key practice* and *parameter* include RL process optimisation (operational RLC) in terms of the costs (12) versus benefits (34) and return volume (volume parameter) in terms of the costs (6) versus benefits (32). Subsequently, online retailers can prioritise the implementation of RL process optimisation as a key practice and consideration of return volume as a key parameter for the effective RLM of consumer returns.

In contrast, the *least beneficial proposition categories* include RRP examination in terms of the costs (16) versus benefits (26), and cost versus benefit parameters in terms of the costs (6) versus benefits (19), which means that online retailers can implement RRP examination and consider cost versus benefit parameters as last priorities. Additionally, the *least beneficial key practice* and *parameter* include information sharing initiatives (pre-sales PRP) in terms of the costs (5) versus benefits (7) and sale volume (volume parameter) in terms of the costs (2) and benefits (6), indicating that online retailers may implement/consider information sharing initiatives and sales volumes as last priorities.

Nevertheless, all prevention and control propositions can be beneficial, and online retailers that experience specific prevention and control pitfalls/problems or seek specific prevention and control

profits can identify the most suitable propositions to implement and consider for the effective RLM of consumer returns. Essentially, "prevention and control for the effective RLM of consumer returns" can be regarded as critical factors for the effective RLM of consumer returns in online retailing. Therefore, online retailers should focus on identifying prevention and control pitfalls and problems in RL for the effective implementation/consideration of mitigating prevention and control propositions (practices/parameters) and realisation of prevention and control profits to manage consumer returns effectively.

8.5 THEME 2: SERVICE FOR THE EFFECTIVE RLM OF CONSUMER RETURNS

Theme 2 involves *consumer service initiatives* for the effective RLM of consumer returns in online retailing. Consumer-centricity should be the heart of an online retailer's business since it can be profitable to place the needs and expectations of consumers first (Bozzi *et al.* 2022:16). In fact, Karlsson *et al.* (2023:8) indicated that online retailers must shift their focus from return prevention and cost savings and adopt a consumer-centric approach, ensuring that they offer a differentiated service.

Likewise, all participants mentioned throughout their discussions the importance of consumer service to manage consumer returns effectively and efficiently. Therefore, "service" was identified as an important factor in RLM, which means that online retailers must pay attention to service for the effective RLM of consumer returns. The following quotations emphasise these sentiments:

> "[…] it's not just about the forward logistics, it's about reverse logistics as well, because your customer's journey does not end at the time that he receives the product […] reverse logistics is an extension of the customer journey and experience." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "The starting point is that the customer is always right, but not malicious. And that changes your whole customers' experience of the reverse logistics process." (P1, operations manager, 3PRL provider firm)
>
> "It's very difficult to view the returns logistics as […] a separate piece of your business, it's often viewed as the dirty cousin, you know. But it has a disproportionate impact on how online customers perceive your business." (P1, operations manager, 3PRL provider firm)

Figure 8.3, in section 8.2.2, provides an overview of theme 2, including the subthemes and related categories. Figure 8.12, provides a snapshot derived from Figure 8.3, showing an overview of Theme 2 – *Service for the effective RLM of consumer returns*.

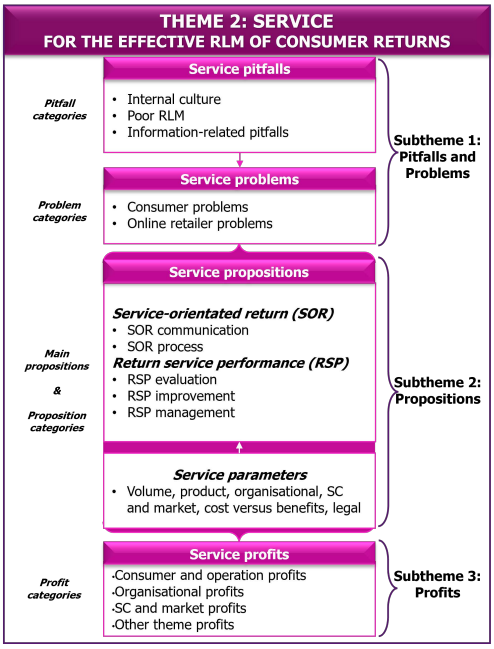

Figure 8.12 Overview of Theme 2 – Service for the effective RLM of consumer returns
Source: Compiled by the researcher

In the subsequent sections, a detailed overview, analysis and discussion of the interview findings for each subtheme, including service pitfalls and problems (subtheme 1), service propositions (subtheme 2) and service profits (subtheme 3) will be given. The section concludes with a framework, summary and overall analysis of the service findings for the effective RLM of consumer returns.

8.5.1 Service pitfalls and problems – Subtheme 1

As illustrated in Figure 8.12, and discussed in section 8.2.2, the service pitfalls include internal culture, poor RLM and information-related pitfalls, and the service problem categories include consumer and online retailer problems. Based on the interview findings, Figure 8.13 provides a detailed overview of the service pitfalls and problems in RL that will be discussed in this section.

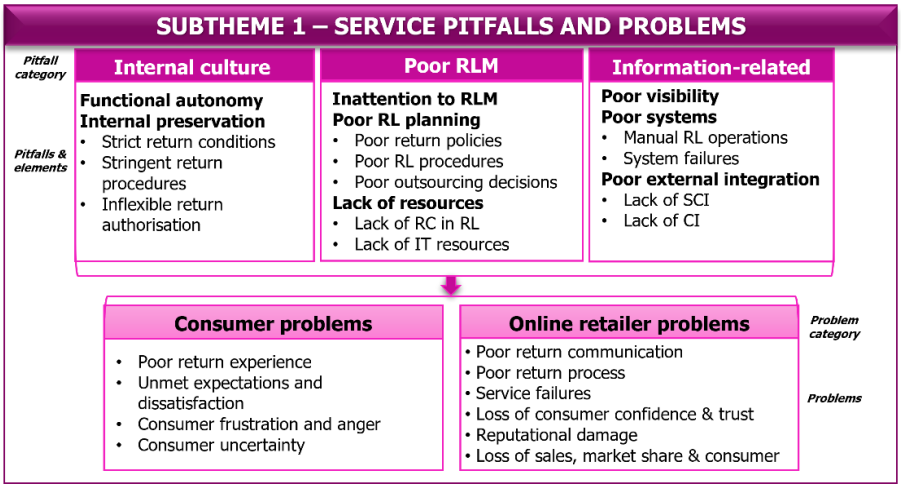

Figure 8.13 Detailed overview of service pitfalls and problems
Source: Compiled by the researcher

Based on the interview findings, Figure 8.13 shows the *service pitfall* categories with related pitfalls and pitfall elements (if applicable), and the *service problem* categories with related problems, which can hamper the effective RLM of consumer returns in online retailing. Section 8.2.2 provides details regarding the presentation and format of the pitfalls and problems applicable to each theme. In the subsequent sections, the service pitfall categories of internal culture, poor RLM and information-related pitfalls, and associated service pitfalls, pitfall elements and consumer and online retailer problems will be discussed. The section concludes with a framework and summary of findings to demonstrate the relationship between specific service pitfalls and problems.

8.5.1.1 Internal culture service pitfalls and related service problems

Internal culture as a service pitfall category involves functional autonomy and internal preservation, which can lead to various consumer and online retailer problems.

Functional autonomy involves a lack of cross-functional integration (CFI), which can be problematic for consumers and online retailers. Particularly, participants indicated that functional departments of online retailers often work in silos, which means that functional departments are unwilling to collaborate due to internal politics. Additionally, online retailers may contribute to the silo mentality through poor cross-functional performance evaluation. For instance, online retailers may implement heterogenous performance measures, meaning that different departments get measured on different areas in RL, which can hamper consumer-centricity. The participants indicated that a silo mentality and a lack of CFI can cause bottlenecks in the return process, which can result in a poor return experience, consumer dissatisfaction and frustration (consumer problems), poor return processes, service failures and reputational damage (online retailer problems). The following quotations confirm the impact of functional autonomy on consumer return experience and RL process efficiency:

> "I think when it comes to inter-departmental [integration], the scary part that we have these days in organisations is that everyone works within silos […] because everyone has an ego. Who suffers in the end, the customer? […] for example, […] if logistics delays on some certain items or certain activities, it'll create an impact or bottleneck on the entire [RL] operation. The same applies for the call centre. If the call centre, do not follow up on a call, I could have a delay on the entire [RL] process. If finance delay on refunding a customer […], and remember, it's not only about collecting a unit and delivering it to the warehouse […] there is still the refund process. That's the most critical part, because I want to see as a customer, I want to see my money in my account right now." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] the worst thing that can happen is that different departments get measured on different things and they are reporting on different aspects [in RL], which may not be customer centric." (P8, logistics manager, multichannel retailer)

> "[…] we have different departments, you have the service division, and you have the logistics division. And you have the reverse logistics division that falls under service. Everyone was not singing from the same hymn sheet, and there was no [cross-functional] alignment. OK, we would believe that it should be done this way. They believe it should be done the other way. Therefore, when the customer calls, the call centre realise, wow, OK, we're looking terrible here [with inconsistent return procedures]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Internal preservation as an internal culture service pitfall involves an online retailer adopting a self-protective stance by implementing stringent return conditions and procedures, demonstrating distrust towards consumers. While poor return prevention pitfalls involved return leniency and poor gatekeeping that cause prevention and control problems (see section 8.4.1.3), stringent return procedures can be regarded as the opposite, involving strict returns, stringent return request procedures and inflexible return authorisation (pitfall elements).

Participants indicated that *strict returns* involve return restrictions, like charging for returns, which can lead to the consumer problem of unmet expectations and the online retailer problem of a loss of market share. Additionally, *stringent return request procedures* can involve asking consumers too many questions and proof of product condition or expecting consumers to physically return products to facilities/locations, which can lead to consumer uncertainty (consumer problem) and a loss of consumer trust and confidence, sales, market share and consumers (online retailer problems). The following quotations support these findings:

> "[…] the online retailer that doesn't do so [by offering lenient returns] will be behind in the marketplace, because within a very short period of time, the consumer has come to expect that everything is a free delivery and is a free return." (P2, owner, supply chain consultancy firm)
>
> "So, you don't want to be sticky with the returns. You don't want to ask them 17 questions before you accept their return because then they will be more apprehensive about repurchase online. You know, they'll happily go back to the type of brick-and-mortar retail stores." (P5, general manager, online retailer)
>
> "[…] it shouldn't be a hassle for any person […] to return an item, because then it will make them skittish to buy from you again." (P3, returns manager, online retailer)

Inflexible return authorisation as an internal preservation pitfall element involves the use of non-human gatekeeping or non-discerning gatekeepers for return request authorisation and gatekeeping. Particularly, participants indicated that inflexible return authorisation can involve using a computer or online authorisation system to automatically reject returns based on return policy parameters (e.g. rejecting a return on day eight of the seven-day return period), without affording consumers, with potential legitimate return reasons, opportunities to return products. Similarly, inflexible return authorisation can involve using non-discerning gatekeeping staff to reject returns based on return policy parameters, without affording consumers, with legitimate return reasons, to explain the reasons for requesting the returns.

A legitimate return reason might involve a consumer expecting the seven-day return period to start from the delivery date, while the online retailer's return policy stipulate that the seven-day return period starts on the date of purchase. Alternatively, a consumer might open the parcel after seven days of the delivery noticing that the incorrect product was delivered or that the product is damaged or defective. Subsequently, online retailers with inflexible return authorisation can contribute to the consumer problems of unmet expectations, dissatisfaction, frustration and anger and online retailer problems of a loss of sales and consumers. The following quotations justify these findings:

> "[…] to stop a customer from returning a product legitimately, the worst thing you can do is to put a computer system in there, that says okay 14 days old, I'm going to reject this [return]. If it was me as a consumer, I would want to speak to a human being and say, hey pal, this is what I want to send back, and these are the reasons why." (P4, owner/CEO, 3PRL provider firm)

> "So, you need to have a discerning employee managing that [gatekeeping], because if the customer's 18 days out [of the return period] and they wanted to return the product [for a legitimate reason] and you say, no, I'll [as a consumer] never go back and buy from those people again […]." (P4, owner/CEO, 3PRL provider firm)

The interview findings related to *internal culture* service pitfalls align with various studies from the reviewed literature. Particularly, Hjort *et al.* (2019:784) found that poor cross-functional coordination means that each function focuses on optimising its performance at the expense of other functions, which can result in poor RL processes and service performance. Furthermore, several studies identified the problems associated with internal preservation pitfalls. Specifically, literature identified that return restrictions can result in a loss of sales (Biswas & Abdul-Kader, 2018:1016; Starostka-Patryk *et al.* 2013:509; Zhang *et al.* 2023:10), increase product return complexity for consumers (Zhang *et al.* 2023:10), and ultimately impact consumer satisfaction (Badenhorst, 2022:230). Additionally, complicated return processes can increase consumer uncertainty (Bozzi *et al.* 2022:12) and a loss of sales and consumers (Lin & Hsu 2017:218). Consequently, internal culture service pitfalls can cause various problems for consumers and online retailers, which mean that online retailers should identify and implement practices to mitigate internal culture pitfalls for the effective RLM of consumer returns.

8.5.1.2 Poor RLM service pitfalls and related service problems

Poor RLM as a service pitfall category involves the service pitfalls of inattention to RLM, poor RL planning and a lack of resources (see **Figure 8.20**), which can lead to various consumer and online retailer problems. These poor RLM service pitfalls and related service problems will be briefly discussed and analysed in the subsequent sections.

8.5.1.2.1 Inattention to RLM pitfall and related service problems

Inattention to RLM involves the failure of online retailers to recognise the impact of poor RLM on consumer experience, service and retention. Online retailers may be unaware that a poor RL function without proper management (e.g. no dedicated manager) can be detrimental to the sustainability and image of the online retailer. Subsequently, inattention to RLM can lead to the online retailer problems of reputational damage and a loss of market share and consumers, as expressed in the following quotations:

> "[…] your biggest risk in terms of customer retention sits in that returns department. So, that's another thing that people neglect is that they don't necessarily understand that when things go wrong in that [returns] department, you are bound to lose thousands of customers by word of mouth." (P5, general manager, online retailer)

> "[A dedicated manager for RLM is important] in ecommerce, because the reputational risks are so high […] to get it wrong is quite rife." (P6, logistics manager, multichannel retailer)

These findings correspond to the reviewed literature in terms of management's failure to understand the importance of RLM (Davidavičienė & Al Majzoub, 2021:21; Chen *et al.* 2017:253; Lin & Hsu, 2017:218), which can result in reputational damage (Ahsan & Rahman, 2021:21; Bozzi *et al.* 2022:12) and a loss of market share (Ahsan & Rahman, 2021:21; Bozzi *et al.* 2022:12; Davidavičienė & Al Majzoub, 2021:2). Evidently, online retailers must pay attention to RLM, ensuring long-term sustainability through a positive public image and consumer retention.

8.5.1.2.2 Poor RL planning pitfalls and related prevention and control problems

Poor RL planning can involve, poor return policies, poor RL procedures, and poor outsourcing decisions (pitfall elements), which can be problematic for consumers and online retailers.

Particularly, participants indicated that *poor return policies* as a service pitfall element can be a poorly planned policy and an open-ended (or open for interpretation) return policy and a complicated return policy, which can lead to consumer problems. Participants indicated that a poorly planned policy often entails focusing on legal compliance, without considering the impact of the return policy on consumer return experience. Similarly, the return policy might involve only legal terms and conditions that can be difficult for consumers to understand, causing consumer uncertainty. Furthermore, from the internal preservation pitfall example (section 8.5.1.1), an open-ended return policy can be failing to indicate the start of the return acceptance period, for example, mentioning a seven-day return window without stipulating that return period starts on the date of purchase. Subsequently, the consumer might expect that the seven-day return period starts on the delivery date, which can result in a rejected return request and a frustrated and angry consumer (problem). The following quotations demonstrate the impact of poor return policies:

> "[…] you first start with legal compliance […] so that you make sure you're legally compliant and then you forget about it, […] and when you get to a place where you actually started to measure customer experience […] you then start looking at your returns policy. And then often you've got, hamstrung by legacy systems." **(**P1, operations manager, 3PRL provider firm)

> "Return policy needs to go through the whole legal department […] [but] must not be difficult for that customer to understand." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] if you leave something open for interpretation from a customer perspective, which we've obviously had quite frequently, you get a lot of upset customers because the [return] policy was a bit open-ended." (P3, returns manager, online retailer)

Similarly, *poor RL procedures* can cause inconsistencies in return decision-making, which can be problematic for consumers and the online retailer. For instance, online retailers with various decentralised facilities without clear SOPs in RL can run the risk of inconsistent decisions regarding the acceptance and rejection of product returns, creating unmet expectations, consumer frustration and uncertainty (consumer problems), and a loss of consumer confidence (online retailer problems). Similarly, online retailers that standardised RL but fail to enforce standards and procedures (e.g. allowing employees to make return decisions without following the SOPs) can contribute to the

consumer problems of unmet expectations and dissatisfaction, leading to a loss of consumer trust. These findings can be supported by the following quotations:

> "Absolutely, I think it [formalisation and standardisation in RL] is imperative because, […] If it doesn't happen within my own reasonable expectation [as a consumer], I get very frustrated." (P7, owner, 3PRL provider firm)

> "[…] you do not want six or seven reclaim centres where the six or seven people that handled electronics all have a different view of what is used. Because that creates uncertainty with the consumer." (P5, general manager, online retailer)

> "[...] there's nothing worse than a consumer having an expectation of X but getting Y because somebody decided that the SOP wasn't the one, they wanted to follow today. There's no debate on those things because there's a commitment you make." (P6, logistics manager, multichannel retailer)

Finally, *poor outsourcing decisions* involve online retailers, deciding to outsource the entire RL function to third parties (i.e. couriers) that may lack RL capabilities or expertise for effective RL service performance and management. Specifically, participants indicated that outsourcing the entire RL function to incapable service providers can run the risk of service failures (online retailer problem), which can lead to a poor return experience (consumer problem) and reputational damage (online retailer problem). The following quotations portray these findings:

> "I am totally against outsourcing, because when you outsource, especially the reverse logistics […] because if your outsource company would fail in any of those [RL] services, it's you [the online retailer] that will have to bear the brunt for it." (P9, regional & online DC manager, online retailer)

> "So, if I had to run a little courier service to manage my returns, the consumer experience would have been a shocker." (P6, logistics manager, multichannel retailer)

A few studies from the reviewed literature focused on the impact of poor RL planning on service performance. Relating to poor return policies, Robertson *et al.* (2020:174) indicated that return policies must reflect the service and marketing strategies of online retailers and should never be turned over to the legal departments, which can negatively impact consumer value. Additionally, Davidavičienė and Al Majzoub (2021:7) mentioned that an unclear return policy can be the same as no return policy, demonstrating the importance of well-developed return policies. Finally, poor outsourcing decisions might lead to the outsourcing risk related to the inability of 3PL providers to develop necessary resources for flexibility and innovation in RL (Panjehfouladgaran & Lim, 2020:1461), which can lead to inefficiencies and impact consumer service (Tavana *et al.* 2016:555). Additionally, Ahsan and Rahman (2021:21) and Bozzi *et al.* (2022:12) emphasised that mismanagement of product returns and subsequent service failures can contribute to consumer dissatisfaction and reputational damage.

Nevertheless, no studies identified the impact of poor RL procedures, including a lack of standardisation, consistency and compliance with SOPs, on consumer satisfaction and the service performance of online retailers. Consequently, this study extends the literature, demonstrating the importance of proper RL procedures for the effective RLM of consumer returns in online retailing. Subsequently, online retailers with poor return policies, poor RL procedures and poor outsourcing decisions as poor RL planning pitfall elements can contribute to various service problems, which can hinder the effective RLM of consumer returns.

8.5.1.2.3 Lack of resources pitfalls and related prevention and control problems

A lack of resources as a service pitfall involves a lack of resource commitment (RC) in RL and a lack of IT resources (pitfall elements), which can result in various consumer and online retailer problems.

Particularly, *lack of RC* in RL involves failure to allocate and invest in sufficient resources in RL, which can be problematic for consumers and online retailers. Participants indicated that online retailers often invest in resources to provide consumers with exceptional shopping and delivery experiences but fail to commit adequate resources in RL, which can reverse the effects of an exceptional forward experience. Consequently, a lack of RC in RL can result in a poor return experience (consumer problem), service failures and a loss of consumers (online retailer problems). These findings can be supported by the subsequent quotations:

> "But I think there's very little investment in the reverse logistics […], which means that you might want to give a customer great experience just on the purchase, but when it comes to return, you might actually lose that customer if you don't deal with it properly." **(**P12, Head of logistics, online retailer)

> "[Resource commitment in RL is] as important, if not equally as important as what you would spend on delivering your outbound experience. […] if you spent a whole lot of money developing a site that ships products, lovely experience on the outbound [delivery], lots of marketing goes into driving those customers. All that money is being spent and they come to return the product and it's a poor experience, you lose that customer." (P1, operations manager, 3PRL provider firm)

Similarly, participants indicated that a *lack of IT resources* involves the unwillingness of online retailers to invest in IT resources needed for efficient RL processes and communication. Subsequently, failure to invest in IT resources for RL can lead to the consumer problem of a poor return experience and the online retailer problems of poor return communication, poor return processes, a loss of consumer trust and confidence, and a loss of market share and consumers. The following quotations illustrate these findings:

> "Now you want a smooth flow, the same technology to be applied […] backwards. That is not happening at the moment. I think companies don't want to […] outlay money with an expense." (P9, regional & online DC manager, online retailer)

> "[Investment in IT for RL is] crucial […] to smoothen the reverse logistics [process]. Because I tell you why, this is where online companies lose business and, in the end, they lose the customer's trust." **(**P9, regional & online DC manager, online retailer)

> "I think investment in technology […] is paramount. Without investment in technology, your customers will not shop with you anymore because they'll get much better experiences elsewhere because they'll know where their stuff is." (P8, logistics manager, multichannel retailer)

While various studies in the reviewed literature indicated that a lack of investment in resources hampers effective RLM (Lamba *et al.* 2020:397; Zailani *et al.* 2017:37), no studies identified the service-related problems of a lack of RC. Additionally, apart from identifying that a lack of IT resources hampers RL process efficiency (Frei *et al.* 2020:1619), no studies from the reviewed literature identified the various service problems associated with inadequate IT resources. Evidently, this study extends literature by demonstrating additional problems, including poor return experiences,

service failures and a loss of consumer confidence, trust, market share and consumers, which can be expected with a lack of RC and IT resources in RL.

Essentially, poor RLM involves the service pitfalls of inattention to RLM, poor RL planning and a lack of resources, which can lead to various consumer and online retailer problems. Subsequently, the impact of ineffective RLM on the service performance of online retailers, emphasises the importance of implementing efficient and effective RLM practices for the effective RLM of consumer returns.

8.5.1.3 Information-related service pitfalls and related service problems

As highlighted in **Figure 8.20**, information-related service pitfalls involve poor visibility, poor systems and poor external integration in RL, which can be problematic for consumers and online retailers.

Poor visibility as an information-related service pitfall entails the inability of online retailers to provide consumers with return updates and notifications throughout the returns process. For example, after the consumer logged a return, the courier collects the product unannounced, and the consumer waits for the outcome of a refund without any updates on return receipt, inspection and processing. Participants indicated that poor visibility in the return process can lead to a poor return experience, consumer uncertainty (consumer problems), poor return communication and a loss of consumer confidence (online retailer problems). The following quotations reveal the significance of poor visibility as an information-related service pitfall in RL:

> "Our visibility is poor, so customers will return something […] things happen in the background. So, the courier will collect it and then they [the consumer] will just have to wait until one day they get a refund. It's not visible as to what step in the [return] process they're in. […] visibility creates confidence in the buying cycle." (P8, logistics manager, multichannel retailer)

> "[…] for reverse logistics […] the customer wants to see, have they logged my call? It's approved or not approved, and when are they going to come and collect? […] if you go with a company that does not have it, then you going to be on the phone all the time. It's quite a bad experience then at the end of the day." (P12, Head of logistics, online retailer)

Poor systems involve manual RL operations and systems failure (pitfall elements), linking with a lack of IT resources (section 8.4.1.2.3) and poor visibility pitfalls. Particularly, *manual RL operations* means that consumers must phone a call centre to log a return, the call centre agent must phone the courier to collect the product return, and once the product arrives at the facility all RL processes (e.g. receiving, inspection and processing) are performed manually. Subsequently, neither the consumer service agent nor the consumer can track the progress of the product return, resulting in consumer uncertainty (consumer problem) and poor return communication (online retailer problem). Additionally, manual operations cause return processes to be slow, resulting in poor return processes (online retailer problem) and consumer frustration (consumer problems).

System failures might be worse than manual return operations, if consumers expect that the online return request process and return process tracking takes place online. Therefore, system failures can cause unmet expectations and dissatisfaction, consumer frustration and anger (consumer problems), and service failures (online retailer problem). The following quotations illustrate the impact of poor systems as an information-related service pitfall on consumers and online retailers:

> "I would tell you that reverse logistics is simply not possible without a solid technology platform, because what you'll end up doing is, you'll sit in a position where you manually logging things in, but you've got no idea of who's doing what, and how to track it. And the moment that the customer phones, they're [consumers] going to say, well, what's happening with my product? And you'll [customer service agent] say, oh, sorry, I'll have to get back to you. And that is a sin." (P5, general manager, online retailer)

> "[…] you need an end-to-end inventory management system […]. There's nothing worse than a customer that doesn't know what's going on, how far in the process the return is, when are they getting their money, when are they getting their return, […] because ultimately, in that [return] process, you haven't given the customer their money back yet. So, me as a customer, I paid you X amount of money, you sent me a product that I've returned to you, you've acknowledged the receipt of that product, but you haven't done anything about it yet. So, I'm still sitting at this point as a customer, without money and I'm sitting without the product. So that creates a lot of frustration from the customer's point of view." (P5, general manager, online retailer)

> "But if your front-line system is not up to scratch and there's a lot of glitches within that system, then you're going to have massive problems. You're going to have huge VOC levels. I mean, the voice of customer is going to be crazy […] your call centre will experience a spam of calls from these customers because they feel that you know what? How can you have an online system that doesn't work for us?" (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Finally, *poor external integration* involves the pitfall elements of a lack of SCI (supply chain integration) and CI (consumer integration) that causes consumer and online retailer service problems. Specifically, a *lack of SCI* involves an unintegrated online retailer enterprise resource planning (ERP) and courier systems, which can cause poor return communication, poor return processes and service failures (online retailer problems). Furthermore, participants indicated that online retailers often procure the same products from different suppliers, which means that a lack of integration with suppliers can cause delays in the return process, resulting a poor return experience, unmet expectations and dissatisfaction, consumer frustration (consumer problems) and poor return processes (online retailer problem). The following quotations expand on these findings:

> "[…] when the customer generates a return, she will obviously go into the website into her account and generate that return. And if the courier company and the fulfilment centre's ERPs are not plugged in […] you're going to have a break in communication and a delay [in the return process]. And this is what we don't want […]. It's very slow […]. You want the return process [running] smoothly […]." (P9, regional & online DC manager, online retailer)

> "[…] the more integrated, the less likelihood of collection failures, return failures, service failures. So, whether your logistics provider is external courier or an internal provider, you know that integration from a systems perspective is important." (P1, operations manager, 3PRL provider firm)

> "[…] you can buy the same type of product from multiple suppliers, so you've got to be able to identify which supplier did it come from, […] so we can send it back to the right supplier […]. What is the impact [of poor integration] on your customer? Your customer's experience is, I've got a defective item and I've returned it. And my expectation is either a replacement or a refund. And if it's already taken a week to get the product back to a warehouse, the experience isn't great to tell them, it's taking another two weeks for the supplier to have a look at it and decide whether it's valid or not." (P1, operations manager, 3PRL provider firm)

Associating with poor visibility and systems, *a lack of CI* involves the inability to effectively communicate and share information with consumers in the return process. On the one hand, a lack of

CI may involve poor email or SMS communication systems and a poor website platform that hamper transparency and real-time information sharing, resulting in consumer frustration (consumer problem), poor return communication, a loss of consumer trust and a loss of sales (online retailer problem). On the other hand, a lack of CI may involve automated communication without giving consumers the opportunity to interact with call centre staff on return-related queries, causing consumer frustration, uncertainty (consumer problems) and poor return communication (online retailer problem). The following quotations show the service problems associated with a lack of CI:

> "Because if it's not integrated, then the customer will not have access to all the relevant information, and trust is established through transparency, which means access to current [return] information." (P8, logistics manager, multichannel retailer)

> "[Consumer integration is important] without a doubt. I mean, if you've ever bought online and you can't see what's happened to your order when you try to return it, it frustrates you and it probably will encourage you to shop somewhere else." (P8, logistics manager, multichannel retailer)

> "But it certainly needs integration between transportation management system and a customer relationship management system, which is often lacking […]. You can still return it through an automated system, but you can't talk to the person or get more information […]. And retailers are not making it easier for consumers to interact with them […]. A lot of them have got bots nowadays for chatting, but you can click on that chat-box, and you can ask a question and five hours can go past before you actually get an answer, if you're lucky enough to get an answer." (P2, owner, supply chain consultancy firm)

A few studies from the reviewed literature examined the impact of poor systems and integration on the RLM performance of online retailers. Specifically, poor systems means that online retailers perform the RL process manually (Bozzi *et al.* 2022:15), which hampers return authorisation, visibility (Badenhorst, 2022:330) and RL process efficiency (Frei *et al.* 2020:1619). Likewise, a lack of systems integration with SC partners can hamper consumer return experience (Bozzi *et al.* 2022:19), efficiency of product returns (Bozzi *et al.* 2022:19; Zailani *et al.* 2017:29) and the operational performance of online retailers (Soltany *et al.* 2018:780; Dapiran & Kam, 2017:831). Lastly, Bozzi *et al.* (2022:29) found that consumers dislike communicating with AI chatbots and prefer personal communication, echoing the findings of this study. Nevertheless, this study uniquely identified various consumer and online retailer service problems associated with poor visibility, poor systems and poor external integration, emphasising that online retailers need to implement practices to address information-related service pitfalls and related service problems for the effective RLM of consumer returns.

The next section summarises the interview findings for the service pitfalls and problems that can hamper the effective RLM of consumer returns.

8.5.1.4 Framework and summary of findings of service pitfalls and problems in RLM

The interview findings presented in section 8.5.1 shows that various service pitfalls and problems can hamper the effective RLM of consumer returns in online retailing. Online retailers must identify the service pitfalls and problems and understand the cause-and-effect relationship between the service

pitfalls and problems, which can guide them with the implementation of appropriate practices to mitigate specific pitfalls and problems.

Figure 8.**14** provides an overview demonstrating the links between the service pitfalls and problems in RLM.

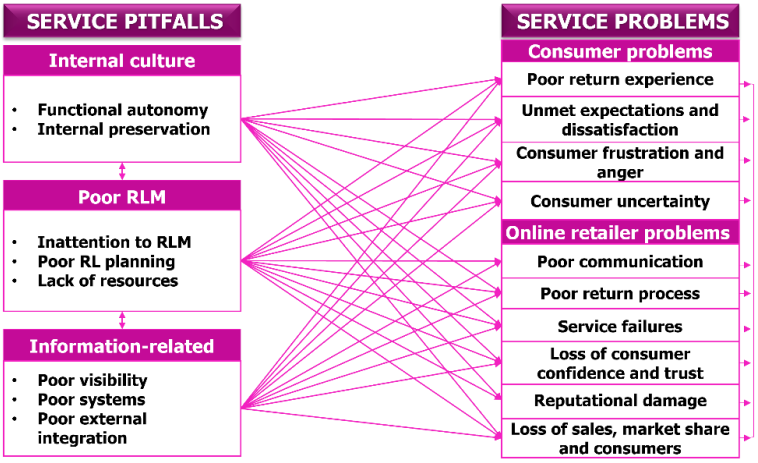

Figure 8.14 Relationship between service pitfalls and problems in RLM
Source: Compiled by the researcher

Figure 8.**14** shows an overview of the relationship between service pitfalls and specific service problems that can hamper the effective RLM of consumer returns. The links between the service pitfalls and problems in RL can demonstrate the most problematic factors in RL, which must be first addressed by online retailers that experience problems related to service in RL. Additionally, the framework illustrates links between the service pitfalls, as well as the links between the service problems, which can be important considerations in identifying the most significant service pitfalls and problems.

Specifically, the framework shows that poor RLM can be the most significant service pitfall category, contributing to all consumer and online retailer problems. Consequently, online retailers that experience service pitfalls related to inattention to RLM, poor RL planning and a lack of resources, can expect all consumer problems and online retailer problems. Therefore, online retailers must prioritise the mitigation of poor RLM pitfalls for the effective RLM of consumer returns. Moreover, the framework demonstrates that the biggest consequences of the service pitfall categories can be all the consumer problems, including a poor return experience, unmet expectations and dissatisfaction, consumer frustration and anger and consumer uncertainty, and most online retailer problems, including poor return processes, service failures, a loss of consumer confidence and trust and a loss of sales, market share and consumers. Subsequently, online retailers with internal culture, poor RLM and information-related service pitfalls can expect all consumer problems and most of the online retailer problems, which can hamper the effective RLM of consumer returns.

From the findings presented in section 8.5.1, examples of links between the service pitfalls include the links between (1) internal preservation (internal culture) and poor external integration (information-related) pitfalls, (2) poor RL planning (poor RLM) and internal preservation (internal culture) pitfalls, and (3) lack of resources (poor RLM) and poor visibility and systems (information-related) pitfalls. Subsequently, addressing internal preservation can help address poor external integration, addressing poor RL planning can help address internal preservation and addressing a lack of resources can help address poor visibility and systems. Therefore, online retailers can benefit from identifying and addressing the service pitfalls that contribute to other service pitfalls first.

Similarly, examples of links between service problems include the links between (1) poor return process and service failures (online retailer) and a poor return experience (consumer) problems, (2) consumer uncertainty (consumer) and a loss of confidence (online retailer) problems, (3) unmet expectations (consumer) and a loss of consumer trust (online retailer) problems, (4) poor return experience (consumer) and reputational damage (online retailer) problems, (5) consumer frustration and anger (consumer) and a loss of sales and a loss of market share (online retailer) problems, and (6) poor return communication (online retailer) and consumer uncertainty (consumer) problems. Consequently, addressing a poor return process and service failures can help to address a poor return experience, addressing consumer uncertainty can help to address a loss of consumer confidence, addressing unmet expectations can help to address a loss of consumer trust, addressing a poor return experience can help to address reputational damage, addressing consumer frustration and anger can help to address and a loss of sales and market share, and addressing poor return communication can help to address consumer uncertainty. Evidently, online retailers should identify and address the service problems that can contribute to other service problems first.

Nevertheless, online retailers may experience specific service pitfalls and related service problems that require identification for the effective RLM of consumer returns. Subsequently, Table 8.18, provides a detailed summary of the interview findings, demonstrating links between the service pitfalls, service pitfall elements (if applicable), and the corresponding consumer and online retailer service problems.

Table 8.18 Service pitfalls and related service problems

Pitfall category	Pitfalls	Pitfall elements	Consumer problems	Online retailer problems
Internal culture	***Functional autonomy***	-	•Poor return experience •Consumer dissatisfaction •Consumer frustration	•Poor return process •Service failures •Reputational damage
	Internal preservation	Strict returns	•Unmet expectations	•Loss of market share
		Stringent return request procedures	•Consumer uncertainty	•Loss of consumer confidence and trust •Loss of sales, market share and consumers
		Inflexible return authorisation	•Unmet expectations and dissatisfaction •Consumer frustration and anger	•Loss of sales and consumers
Poor RLM	***Inattention to RL***	-	-	•Reputational damage •Loss of market share & consumers
	Poor RL planning	Poor return policies	•Poor return experience •Consumer frustration and anger	-

Pitfall category	Pitfalls	Pitfall elements	Consumer problems	Online retailer problems
			•Consumer uncertainty	
		Poor RL procedures	•Unmet expectations and dissatisfaction •Consumer frustration •Consumer uncertainty	•Loss of consumer confidence and trust
		Poor outsourcing decisions	•Poor return experience	•Service failures •Reputational damage
	Lack of resources	Lack of RC in RL	•Poor return experience	•Service failures •Loss of consumers
		Lack of IT resources	•Poor return experience	•Poor return communication •Poor return process •Loss of consumer confidence and trust •Loss of market share and consumers
Information-related pitfalls	***Poor visibility***	-	•Poor return experience •Consumer uncertainty	•Poor return communication •Loss of consumer confidence
	Poor systems	Manual RL operations	•Consumer frustration •Consumer uncertainty	•Poor return communication •Poor return process
		System failures	•Unmet expectations and dissatisfaction •Consumer frustration and anger	•Service failures
	Poor external integration	Lack of SCI	•Poor return experience •Unmet expectations and dissatisfaction •Consumer frustration	•Poor return communication •Poor return process •Service failures
		Lack of CI	•Consumer frustration and anger •Consumer uncertainty	•Poor return communication •Loss of consumer trust and sales

Source: Compiled by the researcher

Table 8.18 summarises the findings for subtheme 1 (of theme 2), linking the service pitfalls, pitfall elements and resulting problems. Online retailers can use the table to identify service pitfalls and related elements with corresponding service problems, which can help them to address specific service pitfalls and problems in RL.

For example, online retailers with strict return conditions (pitfall element of internal preservation) can identify the resulting consumer problem of unmet expectations and online retailer problem of a loss of market share, which might motivate them to relax strict return conditions. Additionally, online retailers that experience, for example, service failures as a service problem can investigate the possible causes, which may include the pitfall elements of poor outsourcing decision-making (poor RL planning), a lack of RC in RL (lack of resources) and a lack of SCI (poor external integration). Subsequently, online retailers that experience service failures can identify that they must prioritise addressing poor RL planning, lack of resources and poor external integration pitfalls.

Moreover, online retailers can use the table to identify the *most problematic service pitfalls and/or pitfall elements* that they should address or avoid for effective RLM. For instance, the most problematic service pitfall includes *poor external integration*, associating with thirteen service problems, which means that online retailers need to address poor external integration for the effective management of consumer returns. Additionally, the most problematic service pitfall elements include *a lack of IT resources* and *a lack of SCI* each associating with seven service problems, which means that online retailers need to address a lack of IT resources and SCI to manage consumer returns effectively. Lastly, online retailers can use the table to identify the *most significant service problems* in RL that they should address for effective RLM. For instance, online retailers can identify that *consumer frustration* (linked

to eight pitfalls/elements), followed by *a poor return experience* (linked to seven pitfalls/elements), can be the most significant service problems in RL, which may motivate them to implement various RL practices to reduce consumer frustration and improve return service experience.

Although online retailers can focus on addressing specific service pitfalls and related problems to improve consumer service in RL, they can gain even more advantages by identifying and implementing appropriate service propositions in RL. Subsequently, the next section will focus on the *service propositions* in RL that online retailers can implement to address service pitfalls and problems in RL as well as realise service profits for the effective RLM of consumer returns.

8.5.2 Service propositions – Subtheme 2

As illustrated in Figure 8.12, and discussed in section 8.2.2., the main service propositions, including *service-orientated returns (SOR)* (section 8.5.2.1), *return service performance (RSP)* (section 8.5.2.2) and *service parameters* (section 8.5.2.3), consist of proposition categories, key practices/parameters and support practices, which can be implemented and considered for the effective RLM of consumer returns. Based on the interview findings, Figure 8.**15** provides a detailed overview of the service propositions for the effective RLM of consumer returns in online retailing.

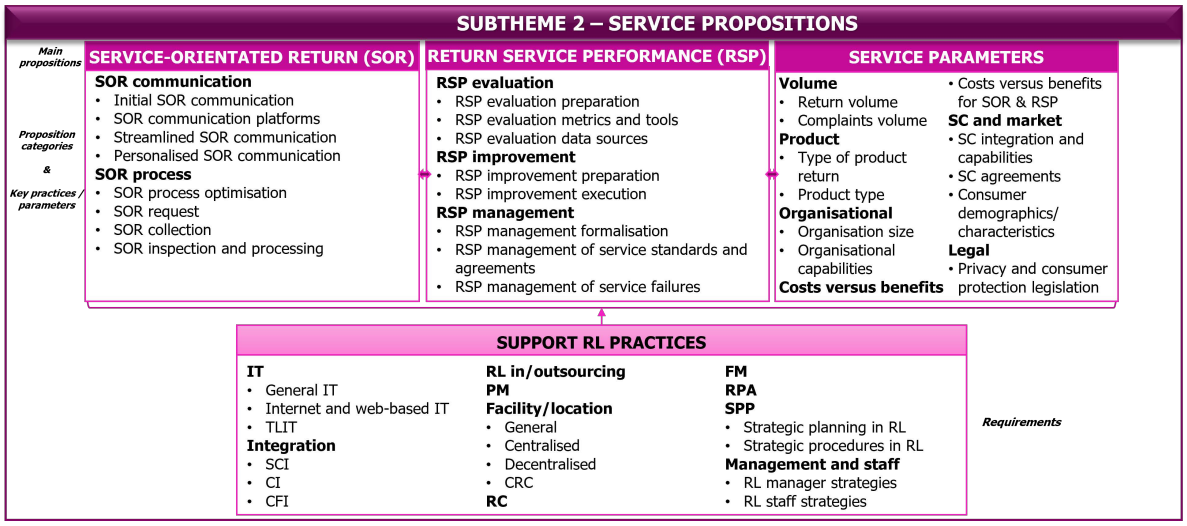

Figure 8.15 Detailed overview of service propositions in RL
Source: Compiled by the researcher

Particularly, Figure 8.**15** shows that the main service propositions, service proposition categories, key practices/parameters and support RL practices. Section 8.2.2 provided details regarding the presentation and format of the propositions applicable to each theme, including key practice/parameter elements (not listed in **Figure 8.15** but emphasised in the discussion). Based on **Figure 8.15**, the main service propositions, including service proposition categories, key practices/parameters, key practice/parameter elements (if applicable) and support RL practices, will be discussed in the

subsequent sections. This section concludes with a service proposition framework and a summary of the findings, demonstrating the links between the service propositions.

8.5.2.1 Service-orientated return (SOR) propositions

SOR as a main service proposition involves the proposition categories of *SOR communication* and *SOR processes*, which can be implemented to address various service pitfalls and problems. In the subsequent sections, SOR communication and SOR processes will be described and analysed.

8.5.2.1.1 Service-orientated return (SOR) communication

SOR communication as a SOR proposition category involves initial and continuous service-oriented communication in RL to address service pitfalls and problems for the effective RLM of consumer returns. As illustrated in **Figure 8.15**, several key practices can be implemented for SOR communication, including (1) initial SOR communication, (2) SOR communication platforms, (3) streamlined SOR communication, and (4) personalised SOR communication, which will be described and analyse in the succeeding sections.

- *Initial SOR communication*

Initial SOR communication practices involve information sharing about return conditions and procedures before a consumer logs a return request. Particularly, online retailers must communicate clear return conditions and procedures to consumers, including clear descriptions of return conditions, clear explanations of return processes, and clear descriptions of consumer responsibilities in the return process. Participants indicated that policies and procedures must be standardised, understandable, identifiable, visible and accessible on the website to avoid unmet consumer expectations and uncertainty. For example, online retailers can provide the return conditions (e.g. 30-day free returns on unused items) on the product description page and provide a return request and procedure link on the order page. The following quotations support these findings:

> "You have to be clear about what the process looks like […] How do you log return? How does that process work? […] you want to make sure that process is as well explained as it can be and as standardised as it can be for your customer." (P13, supply chain manager, multichannel retailer)

> "The return policy […] needs to be posted on your website. If the customer wants to view it, he must be able to click, and all the details should be there. And it must not be difficult for that customer to understand. He must know what's his role and what's his responsibility and he must understand the roles and responsibility of both customer and [the online retailer as the] supplier." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] I think [standardisation in RL] it is imperative […] put it [your return policy] out there boldly, big red letters to say your expectation should be A, B or C. And the guide should be as simplistic, as bold, as easy to read as possible." (P7, owner, 3PRL provider firm)

As support RL practices for the establishment of initial SOR communication, online retailers can implement (as supported by literature) the (1) Internet and web-based IT the strategy of using the

Internet and website for RL (section 6.3.2), (2) consumer integration (CI) strategies of developing and implementing consumer service and support initiatives and consumer communication and information sharing (section 6.4.2), and (3) strategic procedure strategies of defining roles and responsibilities in RL, standardising RL processes and publishing accessible strategic procedures for RL (section 6.9.4). Additionally, the interview findings coincide with a few studies from the reviewed literature, including effective communication of the return policy and procedures on the website (Zhang *et al.* 2023:10), clear presentation of the return policies and conditions at obvious locations on the website and clear presentation of the return procedures (Zhang *et al.* 2017:157), which provide consumers with a better understanding about the return conditions and return processes (Nel & Badenhorst 2020:127; Mathu & Khunou, 2021:443).

Consequently, initial SOR communication can help online retailers address the (1) service pitfalls of poor RL planning (poor RLM) and poor external integration (information-related pitfall), and (2) service problems of poor return experience, unmet expectations, consumer frustration and uncertainty (consumer problems), poor return communication and a loss of consumer trust (online retailer problems).

- *SOR communication platforms*

SOR communication platforms form the foundation for the subsequent key SOR communication practices of streamlined and personalised SOR communication. As key practice elements online retailers can use telephonic and/or electronic SOR communication platforms. Telephonic means that online retailers use call centres and systems for SOR communication and electronic means that online retailers use online systems, messaging and emails for SOR communication. The following quotation illustrates some of the SOR communication platforms that online retailers can select:

> "[…] making sure that the communication [platform] is there. When I'm talking about communication, making sure that you are able to communicate to that customer, whether it's online, whether it's via telephone, whether it's by email, whether it's via SMS." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Using *telephonic SOR communication platforms* means that online retailers must establish call centres to telephonically engage with consumers. The participants indicated that online retailers should commit human resources and use IT platforms for effective telephonic SOR communication. Specifically, human resources must be capable of effectively engaging with consumers telephonically. Additionally, online retailers should use a well-established IT platform with software, like CRM and API (Application Programming Interface), to facilitate call centre staff with ticket logging, changing and updating return statuses, and communicating the correct return statuses telephonically. Alternatively, participants indicated that online retailers could use third-party contact centres for the establishment of a telephonic SOR communication platform. However, online retailers that outsource their contact

centre must ensure that the staff of the service provider be treated as employees for effective SOR communication. These findings can be demonstrated by the following quotations:

> "Look, resources [for] […] customer engagement in your call centres are important [for] customer service in [RL]." (P7, owner, 3PRL provider firm)

> "So, a well-established technology platform that gives you not only the [return] status updates […] [but also] ticket logging. If you can imagine any call centre you phone in your life, you get a reference number and a ticket […] all the type of live updates. That's critical." (P5, general manager, online retailer)

> "So, a solid technology system that gives you the ability to change status, update status and communicate the new status to the customer […]." (P5, general manager, online retailer)

> "And you able to have a system of communication to the customer that comes in various formulas, that is CRMs to APIs, you have various logistics platforms that kind of help you to do those kinds of things. […] So, its CRMs or logistics software systems that allow you to track every event to see where your parcel is so you can communicate that to the customer." (P13, supply chain manager, multichannel retailer)

> "[…] you can outsource the whole [RL process] […] like outsourcing a contact centre […] you still got to make those [contact centre] people feel like they're your [customer service] people […] to not degrade the [consumer's] experience." (P1, operations manager, 3PRL provider firm)

Similarly, using *electronic SOR platforms* means that online retailers can share return information with consumers electronically via the Internet, website, online system, SMS, WhatsApp and/or emails. Subsequently, online retailers can establish a self-service functionality, using the Internet, website and online system, which enable consumers to track return statuses. Additionally, online retailers can establish integrated IT systems (e.g. ERP and website) to notify consumers via SMS or emails about their return statuses. Evidently, like telephonic SOR communication, online retailers can implement a well-established IT platform to electronically communicate return status updates with consumers. The following quotations support these findings:

> "So, if they have returned it, they need to be able to log on their Internet, on the order system […] to get tracking […] information […]." (P8, logistics manager, multichannel retailer)

> "[…] our ERP system that is integrated into the website as well. Every movement or every movement of that [return] shipment the customer gets an SMS notification." (P9, regional & online DC manager, online retailer)

> "So, a well-established technology platform that gives you […] the [return] status updates […]. And email confirmation and SMS all the type of live updates. That's critical." (P5, general manager, online retailer)

As support RL practices for using SOR communication platforms, online retailers can implement (as supported by literature) the (1) general IT strategies of using integrative IT and IT with information management capabilities (section 6.3.1), (2) Internet and web-based IT strategies of web-based systems for RL, using the Internet and website for RL and integrating Internet and web-based IT with other IT (section 6.3.2), (3) TLIT (traditional logistics IT) strategies of integrating TLIT with other IT, using ERP, LIMS (Logistics Information Management System), ordering systems and CRM for RL (section 6.3.3), (4) CI strategies of consumer service and support initiatives and strategic communication, information sharing and interaction with consumers (section 6.4.2), (5) RL outsourcing strategies of deciding on the degree of RL outsourcing, type of RL activities to outsource and type of service providers to select (section 6.5.1), and (6) RC (resource commitment) strategies of IT, infrastructure and human RC for RL (section 6.9.1).

A few studies from the reviewed literature identified the importance of multiple contact points/platforms for effective consumer communication, including telephonic via call centres (Jalil, 2019:4; Mostert *et al.* 2017:13) and electronic via email (Bozzi *et al.* 2022:19; Jalil, 2019:4), SMS, app notification and WhatsApp (Bozzi *et al.* 2022:19), using CRM software (Andresen & Istad, 2019:5). Consequently, the establishment of appropriate SOR communication platforms can be important for online retailers, enabling them to address the service (1) pitfalls of poor RL planning, a lack of resources (poor RLM), poor visibility, poor systems and poor external integration (information-related), and (2) problems of poor return experience, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer trust and confidence, reputational damage and a loss of sales (online retailer problems).

- *Streamlined SOR communication*

Based on the SOR communication platforms, online retailers can establish streamlined SOR communication, ensuring effective execution of SOR communication. The participants indicated that streamlined SOR communication involves continuous updates, speed, consistency, accuracy and proactive information sharing, as illustrated in the following quotations:

> "But from a customer perspective, if I'm being updated continuously, I rather have a spam of information coming through and knowing that where I am within the [return] process, then having nothing coming through. So, I believe that communication flow […] it has to be streamlined." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] the communication channel that you have, you've got to enforce [it], making sure that there's speed. Speed is critical." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "I think it's very important to be able to proactively share information with customers on what's happening." (P13, supply chain manager, multichannel retailer)

> "[…] trust is established through transparency, which means access to current information." (P8, logistics manager, multichannel retailer)

Additionally, the participants mentioned several initiatives for the establishment of streamlined SOR communication, representing the key practice elements of (1) standardised return communication, (2) systems-based communication, and (3) collaborative communication. Particularly, for streamlined telephonic communication, participants indicated that online retailers could *standardise return communication*, ensuring that customer service staff relay the correct information to consumers. For example, as a standard, customer service staff must provide estimated timeframes for collection, receiving, inspection and processing (refunds and replacements) and status updates for each return process. The following quotations demonstrate these findings:

> "[…] you need to tell Mrs. Jones, where is that parcel, what phase of the return is the parcel in, what is the envisaged timeframe we still going to have on it?" (P6, logistics manager, multichannel retailer)

> "[…] if you're communicating that [return status] to the customer, you definitely, have to have it standardised within your business […] because you probably want your customer service to follow the same [communication] processes […]." (P13, supply chain manager, multichannel retailer)

Regarding *systems-based communication,* the participants indicated that online retailers should share information in real-time regardless of the SOR communication platform. For example, telephonically a call centre agent must be able to inform the consumer that the parcel will be collected within 24 hours and processed within 48 hours through a well-established IT platform and a ticket logging system. Similarly, electronically, online retailers can (1) give consumers the option to track product return movement in real-time through the Internet and web-based system and (2) share real-time SMS/email notifications about the completion of each RL process through an integrated ERP system. The following quotations support these findings:

> "So, a well-established technology platform that gives you […] the status updates, […] a program, like a ticket logging [system]. If you can imagine any call centre you phone in your life, you get a reference number and a ticket and […] all the type of live updates. That's critical." (P5, general manager, online retailer)

> "And you need to be able to provide a customer with valid up to date information of where their stuff is. So, if they have returned it, they need to be able to log it on their Internet, on the order system […]. Then you need to get tracking of when the courier is going to come collect it. And then once the courier collected it, you need to be able to track what steps need to happen before you get your refund. So, it's a lot of visibility […]." (P8, logistics manager, multichannel retailer)

> "[…] our ERP system that is integrated into the website […] every movement of that shipment the customer gets an SMS gets a notification. As soon as she logs a return and when it's collected at her door, she gets a notification. When it's logged into the courier company for overnight delivery, she gets notified, once it leaves the courier and it lands into maybe the inter-regional branch at the courier company […] she gets notified. The moment it arrives at our door, she gets notified or the moment we process the return, and she gets a refund, she gets notified." (P9, regional & online DC manager, online retailer)

Finally, for *collaborative communication*, participants suggested that online retailers collaborate with SC partners for streamlined SOR communication. Specifically, online retailers must encourage SC information sharing through integrated systems. One participant provided an example of using SC collaboration for SOR communication, which involves an online retailer obtaining access to a supplier's database, registering a warranty return through a barcode system, sharing information with the consumer about the outcome of the warranty return and tracking the return if the return was sent to the supplier for repair. Evidently, this form of SC collaboration allows the online retailer to communicate return status updates even during disposition processes performed by suppliers. Similarly, online retailers can collaborate with 3PL providers through integrated systems to track returns and communicate return status updates to consumers. The following quotations denote collaborative communication in the SC for the implementation of streamlined SOR communication in RL:

> "So, if you [the consumer] purchased a television set from Retailer C, and the TV set breaks […] Retailer C is saying, we will come and collect it. But we're not going to give you the money, we need to get the money back from the supplier first. And in that case, your supplier needs to act out the warranty. Now, from an integration point of view, it would be brilliant if you [as the online retailer] had access to the supplier system, where they could say to you, you know what, we've got a list of barcodes that we sold to you in the last two or three years because they need to keep a record of those names. And you can simply enter their website and say, […] I'm looking up this barcode and the barcode tells you, no problem, this is still under warranty […]. But then also you can track what's happening on your supplier side, so that you can give accurate information to your customer saying, we've established that this product is still under warranty […] the product has left our hands. The supplier has spoken to us, […] the supplier is going to fix your item. It's going to take X amount of days. We'll keep you updated […]." (P5, general manager, online retailer)

> "[…] when you have a logistics service provider, these APIs are quite important. So, you can see the integration between your system and their systems. You can communicate to the customer so you can track certain events,

> especially in reverse logistics. And you can say to the customer, we've collected your parcel, your parcel is now where it needs to be. We're busy refunding the parcel. Your item is being refunded. And I think that's super important." (P13, supply chain manager, multichannel retailer)

Subsequently, the effective implementation of streamlined SOR communication requires the implementation of various support RL practices (as supported by literature in chapter 6). Specifically, online retailers can implement the (1) *general IT strategies* of integrative IT systems, IT with information management capabilities and using real-time and responsive IT (section 6.3.1), (2) *Internet and web-based IT strategies* of collaborative web-based IT, integration of web-based IT with SC partner IT systems and using the Internet and website for RL (section 6.3.2), (3) *TLIT strategies* of integrating TLIT with other IT and using ERP for RL (section 6.3.3), (4) *barcode strategy* of using barcode IT for RL (section 6.3.4), (5) *SCI strategies* of communicating, collaborating and cooperating in the SC, and integration and sharing of information and IT (section 6.4.1), (6) *CI strategies* of communication, information sharing and interaction with consumers (section 6.4.2), and (7) *strategic procedure strategies* of developing SOPs and manuals for RL, standardising RL processes and implementing strategic procedures in RL (section 6.9.4).

The interview findings show the importance of streamlining communication and information sharing for a consumer-centric return experience. Despite this importance, few studies in the reviewed literature explored streamlined communication for a consumer-centric RL process (see section 2.5.5.3). Nevertheless, Bozzi *et al.* (2022:18) found that an integrated system in the call centre provide customer service staff access to information about the order, which enables them to effectively assist consumers throughout the return process. Additionally, Lai *et al.* (2022:4) indicated that effective communication with consumers and SC partners can be essential for meeting consumer expectations. Moreover, Triani *et al.* (2019:469) found that complete and detailed information sharing demonstrates exceptional service capabilities that enhances consumer trust.

Subsequently, this study provides additional insights into the importance of and initiatives for streamlined SOR communication, which can help online retailers address the service (1) pitfalls of poor RL planning (poor RLM), poor visibility, poor systems and poor external integration (information-related) and (2) problems of poor return experience, unmet expectations and dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor return processes, service failures, and a loss of consumer trust, confidence and sales (online retailer problems).

- *Personalised SOR communication*

Personalised SOR communication is an extension of streamlined SOR communication, which involves personalised assistance and arrangements before collection and personalised contact after return processing (key practice elements).

For *personalised assistance* and *arrangements before collection*, participants indicated that online retailers must demonstrate empathy and facilitate individual consumers that struggle with online return logging procedures as well as contact individual consumers to arrange convenient collection times. Participants suggested that online retailers involve RL managers in the execution of personalised SOR communication, demonstrating attentive care and concern. Additionally, personalised assistance must be prioritised for individual consumers who complained about the delivery that resulted in the return request. For example, a consumer that received the wrong order/item might complain about the inability to log a return for items not linked to the contents of the order. Subsequently, the online retailer must take precaution in placating consumers by facilitating them in return logging and collection. The following quotations support these findings:

> "From a call centre perspective, again, is obviously giving the customer, understanding where the customer is coming from, giving him the empathy […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer) SOR

> "[RL manager is] one of the most underrated positions and functions currently, I believe in the online industry […]. If I [the consumer] pick up a problem and I phone them [the online retailer] up, email them and they say, hang on, no problem, sir, go to this link, onto this portal, give us a little bit more information and we'll take care of you. And within twenty-four hours, they arrange the collection, the pickup and then they look after you." (P12, Head of logistics, online retailer)

> "We log the ticket, we create the return delivery order within the next day, and on day three, we are at your doorstep, collecting the unit. But before we at your doorstep you saying, Mandy, we are here to collect your product, right? We in the vicinity, can we collect it? Today or tomorrow? […] We're sorry about your bad experience. We will collect your units […] and you should have a refund within the next two days." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Similarly, the participants indicated that online retailers must *personalise communication after return processing* with individual consumers that complained about the order/delivery. Specifically, online retailers must personally contact individual consumers, informing them of the refund or replacement (e.g. delivery of correct items) and apologise for an unsatisfactory shopping experience. The following quotation substantiate this finding:

> "And then afterwards you contact the customer, […] we've processed your refund. We do apologise for your experience. Please feel free to contact us again and please feel free to visit our website and purchase another product." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Subsequently, an electronic SOR communication platform might be insufficient for the implementation of personalised SOR communication, indicating that telephonic SOR communication is a requirement for the effective RLM of consumer returns in online retailing. Additionally, as support RL practices for personalised SOR communication, online retailers can implement (as supported by literature) the (1) CI strategies of consumer service and support initiatives and strategic communication, information sharing

and interaction with consumers, (section 6.4.2), (2) RC strategy of human RC (section 6.9.1), and (3) RL manager strategies of creating a full-time RL manager portfolio and assigning a RL expert manager (section 6.9.5).

While no studies from the reviewed literature identified the value of personalised telephonic communication in RL for addressing service failures, Bozzi *et al.* (2022:29) found that online consumers dislike communication with AI bots and prefer more personal communication through WhatsApp. Additionally, Sajjanit and Rompho (2019:789) established evidence that intangible factors, including empathy and assurance, can be important for consumers in the return process. Evidently, online retailers can gain significant value by establishing platforms and resources for personalised SOR communication, which can help them address the service (1) pitfalls of internal preservation (internal culture), inattention to RLM, lack of resources (poor RLM) and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations, dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, service failures, a loss of consumer trust and confidence, reputational damage, and a loss of sales and consumers (online retailer problems).

8.5.2.1.2 Service-orientated return (SOR) processes

SOR processes as a SOR proposition category focus on the implementation of consumer-centric RL processes, addressing various service pitfalls and problems for the effective RLM of consumer returns in online retailing. As illustrated in Figure 8.15, several key practices can be implemented for a SOR processes, including SOR process optimisation, SOR request, SOR collection, SOR inspection and SOR processing, which will be described and analyse in the subsequent paragraphs.

- *SOR process optimisation*

SOR process optimisation as a key SOR process practice involves the establishment of a lenient and efficient RL process as key practice elements. Regarding the establishment of *a lenient SOR process,* the participants suggested that online retailers adopt a consumer-centric stance, implementing consumer-centric RL strategies and policies. Specifically, the participants felt that online retailers must adopt the notion of “the consumer is always right”, which must be captured in their RL strategies. Additionally, online retailers can implement lenient return policies and procedures, for example, providing a longer return period, like 30 days instead of 14 days, and free returns. Consequently, online retailers need to focus on consumers, demonstrate trust towards consumers and provide consumers with the security of returning unwanted products for the effective optimisation of SOR processes. The subsequent quotations support these findings:

> "The starting point is that the customer is always right, but not malicious. And that changes the whole customer's experience of the reverse logistics process." (P1, operations manager, 3PRL provider firm)
>
> "[…] we tend to ensure that our customers are happy. It is the fundamental reasons why we are here, […] and in terms of strategy, it is under the umbrella of focusing on the customer. We try to ensure that the customer always has the advantage over the deal […] So, we try to focus on […] the customer […] from a strategic point of view, our customer is always right." (P9, regional & online DC manager, online retailer)
>
> "[…] there's the [return] policy […] that generally rolls up to customer proposition. […] it's also the service element and the trust element […]. So, you know what? We trust you. No problem, no charge returns […] an easy return, generates trust in a business." (P1, operations manager, 3PRL provider firm)
>
> "[…] but it's worth thinking about the terms and conditions, policy and then customer proposition, […] your proposition could be better […] you could offer returns a lot longer […]." (P1, operations manager, 3PRL provider firm)
>
> "So, as an online retailer, you need to give your customers that peace of mind so that if you are unhappy with the product, we will take it back." (P3, returns manager, online retailer)

Evidently, a lenient SOR process can complement the implementation of initial SOR communication, involving clear communication of return policies, conditions and procedures on the website (see section 8.5.2.1.1).

In terms of *an efficient SOR process*, online retailers can establish a speedy, streamlined and consumer-friendly process with the aim of enhancing consumer experience. The participants suggested that online retailers encourage cross-functional collaboration and train staff to perform RL activities correctly. Moreover, participants advised that online retailers use centralised facilities to allocate more human resources to RL, avoid duplication of RL activities and improve return decision-making for an optimised SOR process. Similarly, the participants indicated that online retailers could invest in IT resources to expedite and streamline RL processes. Alternatively, online retailers can outsource the RL process to 3PRL providers with the appropriate resources and capabilities for the establishment of an optimised SOR process. The following quotations demonstrate some of the practices associated with the establishment of an efficient SOR process as a key practice element of SOR process optimisation:

> "[…] making sure that you have speed, and you expedite and execute [RL processes], making sure that […] you are nimble and swift […] for the logistics part of things. So, integration between departments is critical because the people need to work together. They've got to work hand-in-hand." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "[Staff training in RL is important for] efficiencies and it should enhance the customer experience, and [help] people [the staff] to know what to do, but it's an efficiency and effectiveness issue [in the return process]." (P6, logistics manager, multichannel retailer)
>
> "I would say the best thing is to have a centralised facility […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up [return] processes […] you do not want six or seven reclaim centres where the six or seven people that handled electronics all have a different view of what is used. Because that creates uncertainty with the consumer." (P5, general manager, online retailer)
>
> "I believe with it being centralised is that you collect that unit and deliver it directly to your warehouse for sorting and grading. Why I say that again is because the less activities involved, […] the quicker lead-times, et cetera." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "[…] you should have the resources available to expedite a collection and return. Therefore, I believe that investing in information technology, that's going to expedite and streamline the [return] process." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "We don't annoy the customer by saying, well, the truck will be there in two weeks' time. We have people out there in the field on a very specific logistics model that we've developed, and our [reverse logistics] turnaround

> time is maybe forty-eight hours at max […]. Our facilities are adopted for the management of reverse logistics." (P7, owner, 3PRL provider firm)

Consequently, an efficient SOR process can complement the key SOR communication practice of implementing of streamlined SOR communication (section 8.5.2.1.1). Online retailers can implement (as supported by literature) various support RL practices for SOR process optimisation, including the (1) *general IT strategy* of appropriate and state-of-the-art IT for RL (section 6.3.1), (2) *cross-functional integration (CFI) strategies* of establishing cross-functional teams, developing functional relationships and collaborating, cooperating and coordinating between functions (section 6.4.3), (3) *CI strategies* of adopting a strategic approach for CI, developing customer service elements and developing and implementing consumer-centric return policies and RL processes (section 6.4.2), (4) *RL outsourcing* strategies of deciding on the types of 3Ps for RL outsourcing, and selecting a 3PRL provider (section 6.5.1), (5) centralised facility/location strategy of using centralised facilities for RL (section 6.8.4), (6) RC (resource commitment) strategies of IT and human RC for RL (section 6.9.1), (7) strategic planning strategy of adopting a strategic approach and perspective for strategic planning in RL (section 6.9.4), and (6) RL staff strategies of implementing RL staff training and education and producing skilled and well-trained staff in RL (section 6.9.5).

The interview findings related to the optimisation of the RL process through leniency and efficiency correlate with the reviewed literature. Specifically, Hjort *et al.* (2019:778) found that online retailers generally accept any returns regardless of their return policies to attract more consumers. Similarly, a study by Heyns and Kilbourn (2022:11), focusing on online shopping in South Africa, found that a lenient return policy was regarded as one of the most important factors for shoppers to migrate from traditional (brick-and-mortar) shopping to online shopping. Consequently, a clear return policy and an easy return process reduces the perceived risk of buying online, providing consumers with the security of returning products without hassle (Bozzi *et al.* 2022:26; Jalil, 2019:3). Likewise, various studies aligned with the interview findings in terms of establishing an efficient SOR process through various practices, including using skilled staff (Ashan & Rahman, 2021:22), internal integration (Ashan & Rahman, 2021:21; Mostert *et al.* 2017:13), strategically located facilities (Misni & Lee, 2017:92), appropriate IT systems (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:21, 23; Hjort *et al.* 2019:788; Nel & Badenhorst, 2020:125) and outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2).

Consequently, this study reaffirms the importance of leniency and efficiency for an optimised SOR process, which can help online retailers address the (1) service pitfalls of functional autonomy, internal preservation (internal culture), poor RL planning, lack of resources (poor RLM), poor systems and poor external integration (information-related pitfall), and (2) service problems of a poor return experience, unmet expectations and dissatisfaction, consumer frustration and uncertainty (consumer problems),

poor return processes, service failures, a loss of consumer confidence and trust, and a loss of sales, market share and consumers (online retailer problems).

- *SOR request*

SOR request as a key SOR process practice complements SOR process optimisation, involving the key practice elements of a hassle-free and streamlined return logging procedure and various return request options. A *hassle-free* and *streamlined return logging procedure* involves affording consumers with the option to easily log a return on the website without the need to rely on a call centre or email correspondence to request a return. Consequently, online retailers can utilise their websites and online systems with a self-service return request functionality for an easy, hassle-free and streamlined return logging procedure, as illustrated in the following quotations:

> "[…] it shouldn't be a hassle for any person to log a return […] because then it will make them skittish to buy from you again. So, I think in any circumstances like that, a very good interface between the company and the customer is of the utmost importance to make it work." (P3, returns manager, online retailer)

> "[…] to have a system that is quick, easy to use, streamlined and gives them that unique, authentic customer experience […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "So, I think in that case, if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

Nevertheless, some participants indicated the importance of providing consumers with *various return request options* to accommodate consumers that may be less tech-savvy. For instance, allowing consumers to phone a call centre or email customer service for assistance with the return request process, linking with the key SOR communication practice of SOR communication platforms and personalised SOR communication (section 8.5.2.1.1). Subsequently, online retailers must train staff to assist consumers effectively and empathetically with the return request process, as demonstrated by the following quotation:

> "[Staff training in RL is] absolutely important […]. So, it has to be the sensitivity of that [customer service] department […] where a customer calls in to state that I have an item, [and] she doesn't know how to log in and she doesn't know how to create a return from her account. So, we've got to establish that sensitivity and that urgency to assist, to help [with] return [logging] […]." (P9, regional & online DC manager, online retailer)

Evidently, as support RL practices for a SOR request, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities and using the Internet and website for RL (section 6.3.2), (2) CI strategies of implementing consumer-centric RL processes, consumer service and support initiatives and strategic communication and interaction with consumers (section 6.4.2), and (3) RL staff strategies of implementing RL staff training and education and producing skilled and well-trained staff in RL (section 6.9.5). A few studies from the reviewed literature correspond with the interview findings on a SOR request. Specifically, automating the return request procedure (Hjort *et al.* 2019:788), offering consumers flexible return option channels (De Borba *et al.* 2021:137) and minimising consumer effort (Ashan & Rahman, 2021:20) can be

important for a SOR request. Additionally, Ashan and Rahman (2021:22) identified that using skilled staff for the return request and gatekeeping processes can mitigate service failures in the delivery process and lead to service differentiation.

Essentially, SOR request as a key SOR process practice can help online retailers address the (1) service pitfalls of internal preservation (internal culture), poor systems and poor external integration (information-related), and (2) service problems of poor return experience, consumer frustration and uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer trust and confidence, and a loss of sales, market share and consumers (online retailer problems).

- *SOR collection*

SOR collection as a key SOR process practice involves simultaneous return pick-up and replacement delivery, streamlined SOR collection and various return drop-off points (key practice elements) for the implementation of a speedy, efficient and convenient return collection process.

Regarding *simultaneous return pick-up and replacement delivery,* the participants indicated that as the consumer request a return and selects a replacement the return pickup and replacement delivery must be synchronised. Subsequently, online retailers can simultaneously perform return collection and return processing (i.e. issuing a replacement product), enhancing the consumer's return experience and RL process speed. Furthermore, the participants indicated that online retailers could implement simultaneous return pick-up and replacement delivery through CFI (cross-functional integration), involving coordination between the RL department tasked with return collection and the FL department tasked with replacement delivery. These findings can be supported by the following quotations:

> "I'd like to return this and exchange it for a different size. The two processes happen at the same time, trigger the return and trigger the outbound order for the replacement item. So, the courier going to fetch the returned item is also dropping off the replacement […] [that] truncates that wait period […]." (P1, operations manager, 3PRL provider firm)

> "[…] cross-functional [integration] is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […] they [online retailers] come up with two different deliveries […] so, I thought to myself, if we [as the 3PRL provider] could convince them [the online retailer] that when you [the consumer] do a request for return and you [want to] replace […] you hook the two together. Those are the kind of cross-functional examples that I can think of." (P7, owner, 3PRL provider firm)

Additionally, some participants indicated that online retailers could *streamline SOR collection* using 3PRL providers, which enhances the speed and efficiency of return collection. Moreover, online retailers can *use various return drop-off points*, providing consumers with a convenient return drop-off collection option at locations of their choice. Online retailers can adopt a decentralisation location strategy and use 3PL provider drop-off locations or other bricks-and-mortar retail stores (e.g. convenience stores) as drop-off points. The following quotations support these findings:

> "[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [as the 3PRL provider] pick it up tomorrow and that is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)
>
> "I think what would be awesome for a return process is to have lots of different points of contact with consumers where they can easily drop something off unpackaged […]." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] from an efficiency point of view […] if you can have a lot of drop off points for your consumers to return products, all the better […] they would be able to go to a Caltex garage and there's a drop point there. So, definitely decentralised […]." (P4, owner/CEO, 3PRL provider firm)
>
> "[…] having multiple hundreds of drop off points for returning items, like [the 3PL providers] Pargo, [and] DSV has got their own." (P12, Head of logistics, online retailer)

Subsequently, as support RL practices for SOR collection, online retailers can implement (as supported by literature) the (1) SCI strategies of SC agreements and arrangements and sharing of infrastructure and facilities (section 6.4.1), (2) CFI strategies of establishing cross-functional teams, developing functional relationships and collaborating, cooperating, coordinating and information sharing between functions (section 6.4.3), (3) RL outsourcing strategies of deciding on the type of RL service and third party for RL outsourcing (section 6.5.1), and (4) decentralised facility/location strategies of using retail locations and multiple/flexible locations for RL (section 6.8.4).

The interview findings related to SOR collection matches the findings of few studies from the reviewed literature. Specifically, Bozzi *et al.* (2022:19) identified that online retailers with a highly integrated system can perform simultaneous return pickup and delivery of an exchange. Similarly, Pal (2017:885) found that internal integration between functions can enhance consumer convenience through effective collection. Additionally, De Borba *et al.* (2021:131) discovered that multiple collection points increase convenience in the collection process. Likewise, Nel and Badenhorst (2020:123) suggested that online retailers use 3PL providers or couriers to collect products either at consumer or drop-off locations, enhancing efficiency in the collection process. Essentially, SOR collection can help online retailers mitigate the service (1) pitfalls of functional autonomy (internal culture), poor RL planning (poor RLM) and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, consumer dissatisfaction and frustration (consumer problems), poor return processes, service failures and a loss of sales and consumers (online retailer problems).

- *SOR inspection and processing*

SOR inspection and processing as a key SOR process practice involves pre-return inspection at consumer locations, instant replacement dispatch and fast/instant refunds as key practice elements. Specifically, the participants indicated that online retailers could appoint dedicated inspection staff to *inspect* product returns at *consumer locations* to (1) assist consumers who logged "false failure" returns with the correct use of non-defective products or (2) identify faults in defective products or incompatibility problems in non-defective products and immediately order replacements. Therefore,

pre-return inspection not only enhances consumer service and but also increases return processing speed. The following quotation supports this finding:

> "If you were able to put a dedicated returns team, […] our first line evaluators, […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell. So, they can sell them the correct device […] just to give them a better service […]." (P5, general manager, online retailer)

Alternatively, in absence of pre-return inspection at consumer locations, online retailers can perform *instant replacement dispatch* before returns arrive at the facility. Online retailers that instantly dispatch a replacement before return receipt demonstrates trust to consumers, complementing SOR process optimisation (i.e. establishing a lenient SOR process) that involves the notion of consumers are always right. The following quotation expands on this finding:

> "[…] a lot of the returns there's a replacement attached to it as well. For example, a customer orders an item which is blue, and they receive an item that is red. Now, you want the reverse logistics to kick in, but […] it has to be efficient enough where it comes back to us and the correct item gets shipped out, in time, to the customer […]. So, what I do, I fulfil the correct item first […] and we ship it on an overnight delivery at our cost and then we wait for that [return] to come. So, this is where we announce trust to the customer […]. We know the customer has been satisfied." (P9, regional & online DC manager, online retailer)

Similarly, issuing *fast/instant refunds* means that online retailers process refunds speedily before product returns arrive at their facilities, which can be beneficial for consumers and online retailers. Specifically, the participants indicated that fast/instant refunds can be beneficial for consumers who are uncertain about giving their parcels to the courier, not knowing if the product return will arrive at the online retailer's facility to receive a refund. Additionally, fast/instant refunds can be beneficial for online retailers that issue instant refunds as soon as consumers logged returns on the website, keeping consumers on the shopping site and encouraging them to purchase another product. Evidently, fast/instant refunds as a SOR inspection and processing element complements the SOR request element of a hassle-free and streamlined self-service return request on the website. The following quotations illustrate the value of issuing fast/instant refunds:

> "I think in terms of online retailing, the refund process needs to be quite slick and quite fast." (P8, logistics manager, multichannel retailer)

> "[…] as a consumer don't want to hand it [the returned product] over without knowing that when you've signed it over to the collecting courier that you will be refunded […] because the consumer can't take responsibility for what happens to the product in transit." (P2, owner, supply chain consultancy firm)

> "[…] the instant refund […] to keep you shopping on the site […] So, instead of looking at it as the returns are a fact of life, how do we make this work to our advantage instead of trying to protect ourselves from them?" (P1, operations manager, 3PRL provider firm)

As support RL practices for SOR inspection and processing, online retailers can implement (as supported by literature) the (1) CI strategies of implementing consumer-centric RL processes and consumer service and support initiatives, using CI for RL and interacting with consumers (section 6.4.2), (2) RC strategy of human RC in RL (section 6.9.1) and (3) RL staff strategies of establishing a RL function and producing skilled staff (section 6.9.5). While limited studies from the reviewed literature focused on SOR inspection and processing, Hjort *et al.* (2019:775) observed that online

retailers can use pre-return inspection at consumer locations to ensure that the product condition matches the return claim. Additionally, Euchi *et al.* (2019:44) found that some online retailers send replacements before return receipt, especially, for delayed return pickups.

Nevertheless, no studies from the reviewed literature found that instant refunds can reduce consumer uncertainty and salvage sales on the shopping site. Evidently, this study provides new insights into the value of instant/fast refunds for both consumers and online retailers. Consequently, SOR inspection and processing can help online retailers address the service (1) pitfalls of internal preservation (internal culture), a lack of resources (poor RLM) and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration and uncertainty (consumer problems), poor return process, service failures and a loss of consumer trust and sales (online retailer problems).

In conclusion, implementing SOR propositions, including SOR communication and SOR processes, can help online retailers to improve consumer service in RL as well as address various service pitfalls and problems. Therefore, online retailers must implement SOR propositions for the effective RLM of consumer returns. In the next section, return service performance (RSP) propositions will be discussed and analysed.

8.5.2.2 Return service performance (RSP) propositions

RSP as a main service proposition focuses on evaluating, improving and managing service performance in RL to address several service pitfalls and practices. RSP propositions involve the proposition categories of *RSP evaluation*, *RSP improvement* and *RSP management*, which will be analysed and discussed in subsequent sections.

8.5.2.2.1 Return service performance (RSP) evaluation

RSP evaluation as a RSP proposition category involves the evaluation of service performance in RL to address service pitfalls and problems for the effective RLM of consumer returns in online retailing. As illustrated in **Figure 8.15**, RSP evaluation involves the key practices of (1) RSP evaluation preparation, (2) RSP evaluation metrics and tools, and (3) RSP evaluation data sources, which will be described and analyse in the succeeding paragraphs.

- *RSP evaluation preparation*

Before effective RSP evaluation can be conducted, online retailers must adequately prepare for RSP evaluation, which can simplify the evaluation of service performance in RL. Participants indicated that

RSP evaluation preparation can include standardisation of RL processes and guidelines, staff training and internal and external systems integration (key practice elements).

Specifically, participants indicated that *standardising RL processes* and *guidelines* can help online retailers to prepare for accurate PM of all employees/departments involved in the RL process. Similarly, *training staff* involved in RL enhances consistency in the execution of RL processes, which simplifies RSP evaluation. Moreover, the participants emphasised that *internal* and *external* systems integration can be valuable for accurate and effective RSP evaluation. For internal system integration, the participants suggested the establishment a centralised PM database, providing all departments involved in RL access to metrics and benchmarks in RL for effective cross-functional RSP evaluation. Similarly, online retailers can establish external integration through integrated IT systems for effective RSP evaluation of SC partners. These findings can be supported by the subsequent quotations:

> "And we have to have all employees follow the same guidelines, it's standardised […] it is part of the customer service offering and […] it also affects our KPIs our measures, because if you don't have a standardised formula of the process, you will never be able to measure it." (P9, regional & online DC manager, online retailer)
>
> "[Staff training in RL is important] because it ensures consistency of approach and clear measurement of processes." (P8, logistics manager, multichannel retailer)
>
> "[…] the worst thing that can happen is that different departments get measured on different things and they are reporting on different aspects, which may not be customer centric. So, I think the most important thing is that the [RL] metrics and benchmarks in an organisation need to be centralised and the data visibility must be available to all those parties easily." (P8, logistics manager, multichannel retailer)
>
> "[…] you've got internal/external kind of system integrations, […] so you can measure how long it's taking, are they [the service providers] meeting service level requirements?" (P13, supply chain manager, multichannel retailer)

As support RL practices for RSP evaluation preparation, online retailers can implement (as supported by literature) the (1) SCI strategy of integrating and sharing of IT (section 6.4.1), (2) CFI strategies of coordination and information sharing between functions and implementing CFI for RL (section 6.4.3), (3) PM strategies of benchmarking, establishing teams for PM in RL and establishing standardised PM (section 6.7.1), (4) strategic procedure strategies of developing standard operating procedures (SOPs) and manuals, standardising RL processes and publishing RL standards (section 6.9.4), and (5) RL staff strategy of implementing RL training and education (section 6.9.5). Although unrelated to the preparation of RSP evaluation, a few studies from the reviewed literature identified that (1) staff training ensures staff compliance and consistency in the RL process (Bozzi *et al.* 2022:21), (2) a performance metric system facilitates effective measurement of RLM performance (Lamba *et al.* 2020:384), (3) a centralised information system facilitates capturing and sharing of return information across departments (Mostert *et al.* 2017:8), and (4) internal integration enables cross-functional performance measurement (Karlsson *et al*. 2023:9).

However, no study from the reviewed literature indicated that integrated IT systems with SC partners can help online retailers measuring SC partner performance. Evidently, this study adds to the literature

by highlighting additional reasons for SCI to manage consumer returns effectively. Essentially, RSP evaluation preparation can help online retailers address the service (1) pitfalls of functional autonomy (internal culture), poor RL planning (poor RLM), poor visibility, poor systems and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration and uncertainty (consumer problems), poor return processes, service failures and a loss of consumer confidence and trust (online retailer problems).

- *RSP evaluation metrics and tools*

Following RSP evaluation preparation, RSP evaluation metrics and tools can be identified and used for effective RSP evaluation. As key practice elements, participants suggested that online retailers could identify and use (1) operational metrics and related tools, (2) SC metrics and related tools and (3) consumer service metrics and related tools for effective RSP evaluation.

Regarding *operational metrics* and *tools*, online retailers can identify *return cycle time* and *turnaround time* as appropriate *operational metrics* and use *timestamping* as a related *tool* for effective RSP evaluation. Using timestamping and return cycle time as an operational metric can help online retailers measure the total time of completing the entire return process from the return request to the time of resolving the request (e.g. finalising the refund). Likewise, turnaround time as a metric can be measured by timestamping the completion of each RL process, including the time of the return request and authorisation (or gatekeeping), time of collection and transportation, time of receiving at the facility, time of inspection in the facility and time of processing a refund.

Concerning *SC metrics* and *tools*, participants indicated that online retailers could identify *service performance of service providers* as an appropriate SC *metric*, and *timestamping* as a related *tool* for RSP evaluation. For example, online retailers can use timestamping to measure the time between receiving the collection instruction and physical collection at the consumer location, and the time between physical collection and delivery at the facility. Evidently, the use of operational and SC metrics and tools emphasise the importance internal and external integration as part of RSP evaluation preparation. The following quotations illustrate the use of operational metrics, SC metrics and timestamping as a tool for RSP evaluation:

> "So obviously if you look at forward logistics, you have order cycle time, right from the time the sales orders created all the way to delivery. I just believe that you need to do a reversal and you call it reverse order cycle time […]. We should have a reverse order cycle time because that measures from the time the customer picks up the phone and logs his collection requests to the time he receives his refund." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] from a customer service point of view, your turnaround time is probably the most important metric. The time spent from the time that the call was logged, so they've got different timestamps where they measure […] the call was logged on the first, then we've got a set target of collection. So, we'll collect within 48 hours of receiving your call. There's a measurement for that […]. Did your couriers receive instruction, and did they collect a parcel within the 48 hours that we've agreed with our consumer? Second, once they've delivered it to the distribution

> centre for evaluation, how long did it actually take for it to be received? […] So, the second one is the time it takes from when the driver delivered it to the DC to when you actually updated it as returned on the system. Third measure is once it's been updated, how long did it take to evaluate? And from evaluation, how long did it take to close the call? So, it's all about timestamps trying to understand the turnaround time from when the customer logged the call to when they got the resolve." (P5, general manager, online retailer)

> "[…] how long does it take for that process to be completed? How long does it take for you to refund the customer? […] you have to measure that stuff because it's a touchpoint with the customer in terms of a service that you're delivering. And whether the service providers are achieving the service levels […]." (P13, supply chain manager, multichannel retailer)

> "[…] you've got internal/external kind of system integrations, […] And then those key events are then, like we call it, timestamping […] to understand the time when each [return] event took place […] so you can measure how long it's taking, are they [the service providers] meeting service level requirements?" (P13, supply chain manager, multichannel retailer)

While operational and SC metrics mostly focus on the speed and efficiency of RL processes, *consumer service metrics* and *tools* focus on consumer perceptions and experiences in the RL process. Subsequently, the participants indicated that online retailers could identify *consumer experience* and *consumer satisfaction* as appropriate consumer service *metrics* for RSP evaluation. For example, measuring consumer return experience against consumer shopping experience and measuring the number of consumers complaints in RL. Furthermore, the participants suggested that online retailers could use *experience measuring toolkits* as *tools* for measuring consumer experience, which may involve digital analytic platforms. Additionally, online retailers can use *surveys* and *managers* as *tools* for measuring consumer satisfaction. While a survey can be used as a quantitative satisfaction measurement tool, involving questions on a measurement scale (e.g. highly satisfied, satisfied, unsatisfied and highly unsatisfied), managers can be used as a qualitative tool to effectively evaluate consumer complaints. The following quotations show consumer service metrics and related tools for RSP evaluation:

> "Is your reverse logistic experience for the customer just as good as your outbound?" (P13, supply chain manager, multichannel retailer)."

> "So, Retailer K used to measure their customer service performance, and the way they measured it was they had fewer reverse logistics complaints […]." (P4, owner/CEO, 3PRL provider firm)

> "I think you want to look at sort of your customer experience. So, you […] could look at the usual sort of experience measuring toolkits […]." (P1, operations manager, 3PRL provider firm)

> "If you look at it […] a survey […] you pick up the feeling of your customers […]." (P9, regional & online DC manager, online retailer)

> "[…] the responsible party [to review complaints] has to be the manager […] a majority of our complaints were due to […] reverse logistics and returns right now." (P9, regional & online DC manager, online retailer)

Subsequently, as supporting RL practices for RSP evaluation metrics and tools, online retailers can implement (as supported by literature) the (1) general IT strategy of using integrative and compatible IT systems (section 6.3.1), (2) CI strategy of attaining consumer input (section 6.4.2), (3) PM strategies of establishing appropriate KPIs and metrics, performance monitoring and review, creating feedback mechanisms and evaluating performance results (section 6.7.1), and (4) RL manager strategy of assigning experienced managers to RL (section 6.9.5).

While few studies focus on metrics and tools for RSP evaluation, Sajjanit and Rompho (2019:772) performed an in-depth investigation into the development of metrics for measuring consumer-oriented product return service. Resultingly, Sajjanit and Rompho (2019:772) identified an extensive list of measures that can be used for measuring return service performance, including non-tangible measures like empathy, convenience and communication, which extend the findings of this study. However, aligning with the interview findings, Karlsson *et al.* (2023:10) mentioned that consumer centric KPIs must focus on speed and timeframes for the processing of returns. Additionally, Jalil (2019:2) suggested consumer satisfaction as a metric for the measurement of RL performance. Furthermore, Hjort *et al.* (2019:778) found that online retailers can use a net promoter score tool to measure consumer experience. Finally, De Araújo *et al*. (2018:354) emphasised that effective performance evaluation requires skilled managers.

Consequently, this study uniquely identified SC metrics and timestamping as tools for effective RSP evaluation. Furthermore, this study shows that RSP evaluation metrics and tools can help online retailers address the service (1) pitfalls of inattention to RLM (poor RLM) and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return processes, service failures, a loss of consumer confidence and trust, reputational damage and a loss of market share and consumers (online retailer problems).

- *RSP evaluation data sources*

Complementing RSP evaluation metrics and tools, online retailers can use RSP evaluation data sources for effective RSP evaluation. As key practice elements online retailers can use (1) consumer feedback and complaints data, (2) consumer return data and (3) mystery shopper data as sources for effective RSP evaluation.

Consumer feedback and *complaints data* for RSP evaluation can involve feedback platforms and software and consumer care log sheets. Specifically, the participants indicated that online retailers could use social media as a feedback platform to obtain data for RSP evaluation. Moreover, online retailers can allocate consumer feedback software as an IT resource for consumer feedback as a data source for RSP evaluation. Additionally, consumer care log sheets can be used to obtain consumer complaint data for RSP evaluation. The following quotations illustrate consumer feedback and complaints as data sources for RSP evaluation:

> "If you look at all the other social media platforms, like, Hello Peter, and all of that […], you pick up the feeling of your customers […]." (P9, regional & online DC manager, online retailer)

> "It's probably more from a software consumer feedback perspective. […] We should have as many resources as possible […] [for] consumer relations stuff […]." (P6, logistics manager, multichannel retailer)

> "So, if you keep on getting client complaints about your courier has not collected, […] that needs to raise red flags so that data comes from your customer care log sheets […]." (P12, Head of logistics, online retailer)

For *consumer return data,* participants indicated that online retailers could use third parties, like 3PRL providers, with appropriate consumer return data capabilities to evaluate consumer return experiences and consumer confidence in the return process. Subsequently, using third parties for consumer return data can complement the use of consumer experience and satisfaction as RSP evaluation metrics for evaluating consumer experience and satisfaction. The following quotation identifies the value of using third parties to obtain consumer return data for RSP evaluation:

> "[…] the benefit [of RL outsourcing] lies in all the [return] data and the benefit can be reviewed as a customer experience benefit […]. Does that mean that the customer has got confidence in us handling the return or the product? […] What is the whole experience like? […] knowing that if the customer is going to have a problem, the customer feels it's fine because they deal with any of their returns […]. So, I feel strongly that the benefit in having a company that specialises in reverse logistics is that they [the 3PRL provider] will get much more data that is relevant for your customer experience." (P12, Head of logistics, online retailer)

Finally, *obtaining* and *using mystery shoppers* as a RSP evaluation data source can help online retailers to determine consumer return experience and RL service performance. Consequently, online retailers may appoint mystery shoppers to purchase and return products and record their return experiences and the RL service performance of the online retailer. Evidently, the mystery shopper can provide valuable information to online retailers about user return experience, complementing experience measuring toolkits as a consumer service measure tool for effective RSP evaluation. This finding can be demonstrated by the following quotation:

> "I don't think they [online retailers] spend time on the UX, on the customer [return] experience and the user experience […]. Through the marketing, people are doing things, but they haven't tried and tested it themselves. I think with mystery shoppers in businesses that's going around assessing the actual in-store experience. You need mystery shoppers in an online environment […]." (P2, owner, supply chain consultancy firm)

As supporting RL practices for RSP evaluation data sources, online retailers can implement (as supported by literature) the (1) CI strategy of attaining consumer input and participation (section 6.4.2), (2) RL outsourcing strategy of selecting appropriate 3PRL providers (section 6.5.1), (3) PM strategy of creating PM feedback mechanisms (section 6.7.1), and (4) RC strategies of IT and human RC in RL (section 6.9.1). The interview findings related to obtaining consumer feedback as a data source for RSP evaluation align with the findings of Bozzi *et al.* (2022:15, 16, 21), who identified that online retailers must focus on obtaining feedback from consumers through customer service calls and IT to analyse consumer complaint data. However, no studies identified the use of mystery shoppers as a data source for the evaluation of service performance in RL. Subsequently, this study provides additional initiatives that online retailers can consider for RSP evaluation.

Essentially, RSP evaluation data sources can help online retailers mitigate the service (1) pitfalls of poor RL planning, a lack of resources (poor RLM) and poor external integration (information-related), and (2) service problems of poor return experience, unmet expectations and dissatisfaction, consumer frustration and anger, consumer uncertainty (consumer problem), poor return processes, service

failures, loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers (online retailer problems). In the next section, RSP improvement practices will be analysed and discussed.

8.5.2.2.2 Return service performance (RSP) improvement

RSP improvement as a RSP proposition category involves the identification of service problem areas, development of service improvement plans and implementation of RSP improvement initiatives for the effective RLM of consumer returns. As illustrated in **Figure 8.15**, RSP improvement involves the key practices of RSP improvement preparation and RSP improvement execution, which will be described in the subsequent paragraphs.

- *RSP improvement preparation*

Before online retailers can improve their service performance in RL, they must adequately prepare for effective RSP execution. For RSP improvement preparation, participants indicated that online retailers must (1) understand consumer needs and behaviour, (2) identify and share service problems and (3) brainstorm improvement plans.

In terms of *understanding consumer needs* and *behaviour*, the participants suggested that online retailers start with RSP evaluation to identify consumer requirements (section 8.5.2.2.1). Additionally, the participants indicated that online retailers could create platforms to integrate and engage with consumers for consumer input on their needs, expectations, experiences and requirements. For example, emailing consumers after resolving their return requests, asking them open-ended questions about their return experiences and expectations and asking for any suggestions on improving RSP. However, the participants mentioned that online retailers must engage in active listening for improved understanding of consumer needs. Moreover, the participants suggested that online retailers train staff to understand consumer return experiences and behaviour and use appropriate IT systems with the capabilities to understand consumers and consumer behaviour. The following quotations support these findings:

> "[Performance measurement] is imperative because it has a direct effect on the customer. And [without it] you don't know what's going on with your customer […]." (P7, owner, 3PRL provider firm)

> "I always would like to hear the voice of the customer […] to know what makes that customer happy. What does he believe in? What does he want? What does he prefer? What is his perception and what makes him tick?" (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[External integration is important in RL for] […] listening to your external customer, which is your consumer, then you understand their wants and needs better, which […] harbours a lot of trust between retailer and consumer." (P4, owner/CEO, 3PRL provider firm)

> "[…] that type of engagement is critical. […] to understand how that customer feels about that [RL] journey and knowing how he felt with regards to that experience." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] from the customer's perspective, they were returning something, so [understanding] why they have done it and understanding their [return] experience […]. So, that does require a level of training." (P1, operations manager, 3PRL provider firm)

> "[…] educate the staff […]. Train them on consumer behaviour […]." (P5, general manager, online retailer)

> "[IT in RL is] absolutely [important]. I think, besides understanding the customer more and consumer behaviour, I think it helps you understand product behaviour too." (P4, owner/CEO, 3PRL provider firm)

Pertaining to *identifying* and *sharing service problems*, the participants indicated that online retailers could identify service problems from consumer complaints based on RSP evaluations, for example, using a manager as an evaluation tool and consumer complaints as data sources (see section 8.5.2.2.1). Additionally, the participants suggested that online retailers use appropriate IT systems to share service problems internally. For instance, using CRM software to log service failures in the return process, which can be visible to all functional departments involved in the RL process. Therefore, sharing service problems across functional departments can highlight inefficiencies and problems in specific functions, which can facilitate the development of improvement plans. These findings can be substantiated by the subsequent quotations:

> "[…] the responsible party has to be the manager […] the customer always complained […] 90 percent related to returns. So, it just becomes so important for us because this is where we improve our business. […] we pull from that complaint's to iron out the creases in the [return] processes and to improve […] our offering to the customer." (P9, regional & online DC manager, online retailer)

> "So, if you keep on getting client complaints about your courier has not collected […] that needs to raise red flags so that data comes both from your customer care log sheets and from your customer calling. […] if you're getting four and a half thousand calls a day of which 40 percent relates to […] the time of collection […] that needs to raise some red flags." (P12, Head of logistics, online retailer)

> "So, if there's been a delivery failure or a collection failure that should also appear in your CRM. […] often your customer service [staff] in a warehouse are not the same people that are refunding customers. So, making sure that information is visible […] and [for] feedback […] this is what the customer said […] this is what the customer experienced […]." (P1, operations manager, 3PRL provider firm)

Finally, understanding consumer needs and behaviours and identifying and sharing service problems can help online retailers *brainstorm improvement plans.* The participants claimed that successful improvement plans in RL require collaborative brainstorming. Collaborative brainstorming sessions enable members from various functional departments involved in RL to provide input and share ideas on improving RSP, which can be used for the development of cross-functional improvement plans. Additionally, by documenting the outcomes of the collaborative brainstorming session, online retailers can standardise RL processes and guidelines, which can be important for streamlined SOR communication (section 8.5.2.1.1) and RSP evaluation preparation (section 8.5.2.2.1). The following quotations convey the key practice element of brainstorming improvement plans:

> "[…] we have different departments, you have the service division, and you have the logistics division. And you have the reverse logistics division that falls under service. Everyone was not singing from the same hymn sheet, and there was no [cross-functional] alignment. OK, we would believe that it should be done this way. They believe it should be done the other way. Therefore, when the customer calls, the call centre realise, wow, OK, we're looking terrible here. Guys let's have a caucus. Let's have a workshop that's a brainstorming session. Let us document the processes. So, when that customer contacts the call centre, the call centre agent knows exactly what he needs to say to the customer from the get-go. […] it is critical that you have your returns process drafted, approved and defined." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Online retailers can implement (as supported by literature) various RL support for RSP improvement preparation, including the (1) *general IT strategy* of implementing and using appropriate state-of-the-art and capable IT for RL (section 6.3.1), (2) *TLIT* (traditional logistics IT) *strategy* of using CRM for RL (section 6.3.3), (3) *CI strategies* of communicating and interacting with consumers, attaining consumer input and implementing CI for RL (section 6.4.2), (4) *CFI strategies* of implementing CFI for RL, establishing cross-functional teams and functional collaboration, cooperation, coordination, communication and knowledge and information sharing (section 6.4.3), (5) *PM strategies* of implementing PM in RL, creating feedback mechanisms and using performance data (section 6.7.1), (6) strategic procedure strategies of articulating and defining RL processes and practices, defining roles and responsibilities in RL, standardising RL processes and implementing strategic procedures in RL (section 6.9.4), (7) RL manager strategy of assigning experienced managers to RL, and (8) RL staff strategies of training and education programmes and producing skilled and well-trained staff in RL (section 6.9.5).

Various studies from the reviewed literature identified similar initiatives that can be used by online retailers as foundations for service improvements, including (1) understanding and studying consumer behaviour (Ashan & Rahman, 2021:20; De Borba *et al.* 2021:137), (2) using performance measures and managers (Sajjanit & Rompho, 2019:790), (3) obtaining consumer feedback (Bozzi *et al.* 2022:16; Lamba, *et al.* 2020:388), (4) using customer service interactions, social media platforms and active listening (Bozzi *et al.* 2022:15-16), (5) using appropriate IT (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:15) and centralised information systems (Mostert *et al.* 2017:8), (6) using cross-functional coordination (Ashan & Rahman, 2021:21; Karlsson *et al.* 2023:8; Mostert *et al.* 2017:1), meetings and information sharing (Mostert *et al.* 2017:13), and (7) creating a problem-solving internal culture (Ermes & Niemann, 2023:9). Nevertheless, this study uniquely identifies that online retailers can train staff on consumer return behaviour as a RSP improvement initiative.

Clearly, RSP improvement preparation can be important for the effective management of consumer returns, enabling online retailers to address the service (1) pitfalls of functional autonomy (internal culture), inattention to RLM, poor planning in RL (poor RLM), poor systems and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations and dissatisfaction, consumer frustration and anger, consumer uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers (online retailer problems).

- *RSP improvement execution*

Based on the findings and initiatives from RSP improvement preparation, online retailers can perform RSP improvements. Since RSP improvements can be different for each online retailer, the key practice elements provide suggestions for RSP improvement execution areas. Specifically, online retailers can execute RSP improvements by (1) addressing consumer complaints, (2) enhancing consumer experience, (3) improving consumer service, and (4) improving return processes.

In terms of executing RSP improvements by *addressing consumer complaints*, one participant provided the example of an online retailer who established a separate returns facility using consumer complaints data. Studying the consumer complaints the online retailer noted that consumers located further from the main warehouses complained about slow return lead times. Subsequently, the online retailer adjusted their facility/location strategy in RL from a centralisation strategy using combined facilities to a more decentralised location strategy using a separate returns facility to improve RSP. Similarly, another participant indicated that consumers complained about slow return processing, resulting in the online retailer deciding to outsource RL to a 3PRL provider. By using a 3PRL provider, the online retailer could reduce credit processing from a month to three days, which drastically improved return lead time. The following quotations demonstrate these examples:

> "[…] so, we are only started out with two DCs, the one in Joburg and the one in Cape Town. […] they then made the decision to have a return facility in KZN […]. And so, the guys [consumers] in KZN complained about their returns being taking too long to process […]. So, they made that decision to actually help with the turnaround time […] to kind of mitigate the […] customer complaints of the [returns] turnaround time from KZN […]." (P3, returns manager, online retailer)

> "[…] they [online retailers] had fewer reverse logistics complaints […] we've [the 3PRL provider] taken their credit timings from sort of a month or more to a couple of days. So, where they would wait a month to credit a customer, now they can do it in three days." (P4, owner/CEO, 3PRL provider firm)

Regarding *practices to enhance consumer experience*, participants indicated that online retailers could use third parties, train staff and offer greater visibility in the return process. Specifically, participants indicated that outsourcing RL to appropriate third parties can help enhance consumer return experiences. Additionally, staff training in RL ensures that staff execute the return process correctly, which enhances consumer experience. Similarly, the participants suggested that online retailers could enhance consumer experience through greater return visibility, which involves return status tracking and updates. Therefore, establishing streamlined SOR communication (section 8.5.2.1.1) can form part of RSP improvement execution. The following quotations illustrate executing RSP improvement by implementing practices to improve consumer experience:

> "I believe outsourcing is an amazing opportunity to ensure that the customer gets the best experience possible […]." (P6, logistics manager, multichannel retailer)

> "[…] it should enhance the customer experience and people know what to do […] why do you train anybody? […] you want them to do the right thing […]." (P6, logistics manager, multichannel retailer)

> "The more visibility you give to the customer, the better experience that the customer will have […] So, the customer wants to see, have they logged my call? It's approved or not approved, and when are they going to come and collect. It just makes that whole experience much better." (P12, Head of logistics, online retailer)

For *practices to improve consumer service*, online retailers can consider internal resources and insourcing, outsourcing to 3PRL providers, return leniency and pre-return inspection at consumer locations. Specifically, several participants suggested that online retailers use internal resources and insource RL for the execution of RSP improvements, relating to the poor RL planning practice of poor outsourcing decisions (section 8.4.1.2.2). Evidently, online retailers that previously outsourced RL to incapable service providers that resulted in service failures, can insource RL to improve RSP. Contrastingly, other participants suggested that online retailers can improve consumer service by using 3PRL providers that specialises in RL. Additionally, the participants suggested that online retailers enhance return leniency through the implementation of lenient return policies for improved consumer service, which complements SOR process optimisation (see section 8.5.2.1.2). Similarly, online retailers can improve consumer service through pre-return inspections at consumer locations, involving SOR inspection and processing. The following quotations support these findings:

> "I would rather have control of it [reverse logistics] here in our fulfilment centre, within our company, within our own resources. So, that's effectively giving our customers a better service." (P9, regional & online DC manager, online retailer)

> "[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)

> "[…] but it's worth thinking about the terms and conditions, policy and then customer proposition, […] your proposition could be better […] you could offer returns a lot longer […]." (P1, operations manager, 3PRL provider firm)

> "If you were able to put a dedicated returns team […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] just to give them a better service […]." (P5, general manager, online retailer)

Finally, the participants suggested strategic planning, internal integration and IT resources as initiatives to *improve return processes* for effective RSP improvement execution. Specifically, the participants indicated the importance of including RL in the overall strategic planning of online retailers, which optimise and improve efficiencies in the return processes. Additionally, online retailers must encourage internal integration, involving cross-functional collaboration and information sharing, to counteract silo mentalities that cause bottlenecks in the return process. Lastly, some participants mentioned that developing and investing in appropriate IT resources could help online retailers improve return processes. Evidently, online retailers can implement SOR process optimisation (section 8.5.2.1.2) for the effective execution of RSP improvements. The subsequent quotations convey these findings:

> "[…] you have to [include RL in your strategic planning] […] you can have it [reverse logistics] as part of a strategic plan to […] optimise, building efficiencies [in return processes]." (P6, logistics manager, multichannel retailer)

> "I think when it comes to inter-departmental [integration], the scary part that we have these days in organisations is that everyone works within silos […]. Who suffers in the end, the customer? […] for example, […] if logistics delays on some certain items or certain activities, it'll create an impact or bottleneck on the entire [RL] operation

> […]. So yes, […] integration is critical because the people need to work together. They've got to work hand-in-hand." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "[Investment in IT for RL is] crucial. If somebody could develop a platform that could plug into anyone's online portals to smoothen the reverse logistics that would be great. Because I tell you why, this is where online companies lose business and, in the end, they lose the customer's trust […]." (P9, regional & online DC manager, online retailer)

Based on the examples and suggestions for RSP improvement execution, online retailers can implement (as supported by literature) various support RL practices, including the (1) *general IT strategies* of implementing and using integrative, compatible and capable IT for RL (section 6.3.1), (2) *CI strategies* of implementing consumer-centric return policies, RL processes and consumer service and support initiatives, attaining consumer input, and interacting and sharing information with consumers (section 6.4.2), (3) *CFI strategies* of establishing cross-functional teams, developing functional relationships and functional collaboration, cooperation and coordination (section 6.4.3), (4) *RL in/outsourcing strategies* of analysing RL in/outsourcing decisions and selecting a 3PRL provider (section 6.5.1), (5) *decentralised facility/location strategies* of establishing facilities close to the markets and using decentralised facilities for RL (section 6.8.5), (6) *RC strategies* of allocating sufficient and appropriate resources for RL and financial, IT and human RC in RL (section 6.9.1), (7) *strategic planning strategy* of integrating the strategic plan for RL with organisational strategic plans (section 6.9.4), and (8) *RL staff strategies* of establishing a dedicated RL function, implementing RL staff training and education and producing skilled and well-trained staff in RL (section 6.9.5).

As emphasised in RSP improvement preparation, the interview findings related to RSP improvement coincided with various studies from the reviewed literature. Therefore, executing RSP improvements can be achieved through various RLM practices, including (1) strategic location of facilities for maximum consumer responsiveness (Misni & Lee, 2017:92), (2) outsourcing RL to 3PRL providers for improvement of RL processes and management (Badenhorst, 2017:617; Wang, Dang *et al.* 2021:2), (3) insourcing (Badenhorst, 2017:616) and using of human resources (Lamba *et al.* 2020:384), staff training (Bozzi *et al.* 2022:21; Lamba *et al.* 2020:384) and IT resources (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:21), (4) transparency for enhanced experience (Eriksson & Käck, 2023:25), and (5) integration between functions (Ashan & Rahman, 2021:20; Mostert *et al.* 2017:13; Sajjanit & Rompho, 2019:772).

Clearly, online retailers can improve RSP through assorted proven practices to not only improve RLM but also address various service pitfalls and problems, including the service (1) pitfalls of functional autonomy and preservation (internal culture), poor RL planning, a lack of resources (poor RLM), poor visibility, poor online systems and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations and dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor communication, poor return processes, service failures, a loss of

consumer trust and confidence, reputational damage, a loss of sales, market share and consumers (online retailer problems). In the next section, RSP management practices as the final RSP proposition category, will be analysed and discussed.

8.5.2.2.3 Return service performance (RSP) management

RSP management as a RSP proposition category can be important to manage and maintain service standards and reducing the impact of service failures. Therefore, RSP management ensures that online retailers satisfy consumers in the long-term and continue to maintain effective RL service performance. As illustrated in **Figure 8.15**, the key practices for RSP management involve (1) RSP management formalisation, (2) RSP management maintenance and (3) RSP management of service failures, which will be discussed in subsequent paragraphs.

- *RSP management formalisation*

RSP management formalisation as a key RSP management practice involves the establishment of RL service benchmark, service standards, strategies and policies and service agreements for effective RSP management. Evidently, as key practice elements online retailers can (1) benchmark RL service standards against FL service standards, (2) create consumer-focused RL service standards, (3) establish a consumer service strategy and policy based on RL service standards, and (4) establish service agreements based on RL service standards.

Specifically, the participants indicated that online retailers could *benchmark RL service standards against FL standards* for RSP management formalisation. Therefore, online retailers can adopt the same service standards that guides FL service excellence. For example, if the online retailer created the service standards of efficiency for the delivery process, the online retailer should adopt the same service standards of efficiency for the return process. Based on the benchmarked service standards for RL, participants indicated that online retailers must *create consumer-focused standards* that involves service quality, reliability, dependability, transparency, visibility, efficiency and speed. Subsequently, benchmarking and creating consumer-focused service standards can help online retailers with the implementation of SOR, RSP evaluation and RSP improvement propositions. The following quotations demonstrate these findings:

> "[…] you want everything done online […], it's the same […] when the [forward logistics] order is expedited. You want the same process coming back smoothly in the return process." (P9, regional & online DC manager, online retailer)

> "I'm talking about both forward and reverse logistics […] making sure that you give him the best service in terms of quality, in terms of the product you've been providing […] if you can check those boxes and you can make sure that you're meeting the customer's [needs] […], and the end result is you have a happy customer that buys more from you." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "There is transparency. There's visibility. […] what you are presenting from an online perspective is what that customer would receive in terms of quality, in terms of reliability, dependability, speed, etc." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Following the creation of consumer-focused standards in RL, online retailers can *establish a consumer service strategy* and *policy* to capture the established service standards. Consequently, the consumer service strategy that online retailers can establish for RL must focus on quality, reliability, communication and efficiency for effective RSP management. Additionally, online retailers can formalise the service standards by establishing a consumer service policy, ensuring effective implementation of RL service standards for RSP management. Consequently, establishing service policies based on service standards can facilitate RSP evaluation preparation (see section 8.5.2.2.1). These findings can be supported by the subsequent quotations:

> "[…] from a customer service perspective, we believe in first things first, customer service is all about quality, reliability, […] making sure that the communication is there with the customer. […]. That's the strategy that all businesses need to follow […] if you're not communicating and keeping the customer up to date, up to speed as to what's going on […], that really places a dampener on the customer experience […]. So, quality is important within every step of the [returns] process […] and that's the strategy going forward. And if we follow those steps […] from a strategic perspective, you can thrive on that benchmark of customer service." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "Because policy and guiding guides and principles that's agreed up front drives efficiency and compliance. You know, there's nothing worse than a consumer having an expectation of X but getting Y because somebody decided that the SOP wasn't the one, they wanted to follow today." (P6, logistics manager, multichannel retailer)

Finally, online retailers need to extend RSP management formalisation to the SC and *establish service agreements* with SC partners based on the established consumer-focused RL service standards. The participants indicated that online retailers must clearly define established RL service standards in the service level agreements (SLAs) to effectively manage RSP. For example, if the online retailer wants a service provider to collect a product return within 48 hours, the SLA must stipulate the service standard of 48 hours for return collection. Additionally, participants indicated that the SLA must be captured on the online retailer's system as well as the service provider's system, meaning that systems integration can be important for managing RSP externally. The subsequent quotations support these findings:

> "The courier […] you know, my SLA with him should be defined as close to what I want the consumer to experience." (P6, logistics manager, multichannel retailer)

> "[…] the only integration is our third-party agreement, which you have with the logistics company that's just doing some of your […] reverse logistics. And there's also agreements in place on our system [that] automatically integrates with their system." (P11, Demand and sales manager, FMCG distributor)

As support RL practices for RSP management formalisation, online retailers can implement (as supported by literature) the (1) general IT strategy of using integrative and compatible IT (section 6.3.1), (2) SCI strategies of SC agreements, sharing goals and objectives and integrating IT (section 6.4.1), (3) CI strategies of developing consumer service elements and initiatives and implementing customer service management (section 6.4.2), (4) strategic planning strategy of developing RL strategies, and (5) strategic procedure strategies of developing formal SOPs and manuals for RL,

publishing strategic procedures in RL and formally implementing strategic procedures in RL (section 6.9.4).

No studies from the reviewed literature aligned with the interview findings in terms of benchmarking RL service standards against FL service standards, consumer-focused service standards, consumer service strategy and policy and service agreements based on service standards for RSP management. Therefore, this study identified additional initiatives that online retailers can implement for effective RSP management formalisation. Nevertheless, a few studies mentioned the importance of a consumer-centric approach (Bozzi *et al.* 2022:16; Karlsson *et al.* 2023:8) and focusing on reliability (Sajjanit & Rompho, 2019:772), transparency (Eriksson & Käck, 2023:25; Hjort *et al.* 2019:774), visibility (Triani *et al.* 2019:469), efficiency and speed (Hjort *et al.* 2019:774; Karlsson *et al.* 2023:9-10; Sajjanit & Rompho, 2019:772).

Essentially, RSP management formalisation can help online retailers address the service (1) pitfalls of poor RL planning (poor RLM), poor visibility and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer confidence and trust, and a loss of sales and consumers (online retailer problems).

- *RSP management of service standards and agreements*

RSP management of service standards and agreements as a key RSP management practice entails the monitoring, maintenance and governance of service standards and agreements through various key practice elements, including systems and integrations, performance measures, RL insourcing and dedicated resources, and appropriate facilities.

In terms of *systems* and *integrations*, the participants suggested the implementation of IT with integrative functionalities (such as WMS or CRM software) to ensure that all internal and external RL parties receive instructions to achieve service standards. Additionally, online retailers can create a database to record service events and monitor compliance of service standards. Moreover, some participants suggested the *use of performance measures* for managing and maintaining service standards and agreements. Consequently, online retailers can implement RSP evaluation (see section 8.5.2.2.1) to govern internal and external service performance, ensuring that agreed RL service standards and commitments are met and maintained. The following quotations show the importance of using systems, integrations and performance measures for RSP management of service standards and agreements:

> "[…] we have this IT interface that's channelling every activity or giving instruction to every stakeholder on what needs to be done. And we've got to make sure there's a lead time in place to make sure that it's governing, to

ensure that we meet the total standard lead time to achieve customer service [standards] […] and to make sure that customer is happy […].” (P10, Head of Sales and Logistics, OEM/multichannel retailer)

“[…] so, you’ve got internal/external kind of system integrations, people do in different ways, whether they do it in their CRM or their WMS […] you’re always going to need some internal/external integration. And then those key events are then [monitored], like we call it timestamping. So, when you do SLA management, [systems integration helps] to understand the time when each event took place. So, you need that data somewhere in the data table, so you can measure how long it’s taking, are they [the service providers] meeting service level requirements […].” (P13, supply chain manager, multichannel retailer)

“[RL performance measurement is important for] giving our customer an efficient service that’s one and […] also ensuring that our fulfilment centres and the returns process is carried out efficiently.” (P9, regional & online DC manager, online retailer)

Linking with the of RSP improvement execution through the internal resources and RL insourcing (section 8.5.2.2.2), the participants indicated that effective management of RL service standards and agreements relies on *RL insourcing* and *dedicated resources*. Subsequently, service providers may fail to comply with the established RL service standards and strategies of the online retailer and neglect the management of service standards (i.e. ensuring on-time collection takes place) and agreements with suppliers. However, online retailers should use dedicated resources that involves the commitment of various IT, financial and human resources, enabling consistent achievement of RL service standards. Moreover, online retailers can use a dedicated manager (either a RL or an ecommerce manager) to ensure that service standards and agreements are maintained. The following quotations demonstrate the importance of RL insourcing and dedicated resources for RSP management of service standards and agreements:

“[…] we don’t outsource [reverse logistics] […] because we have our own facility, […] we also like to manage that from a customer service perspective to [use] our own people with our customers. So that’s our view and our strategy.” (P13, supply chain manager, multichannel retailer)

“[…] if you outsource the entire reverse logistics to an external company […], you’re obviously going to struggle to get the supplier agreements and all of that upheld by a different company […] and getting a courier to go and collect your parcels from the customers and making sure it gets delivered [to the facility] […].” (P3, returns manager, online retailer)

“[…] the commitment you make up front as long as you stick to it. So, in that instance, […] we should have as many resources as possible […] to ensure that the commitment we give is the commitment that’s achieved.” (P6, logistics manager, multichannel retailer)

“I think it’s quite an important part of the customer journey, […] you would have to invest in some sort of resources, whether it be IT integration, investing money, putting heads where it counts towards that process and managing it.” (P13, supply chain manager, multichannel retailer)

“I do think you need somebody who’s focused on managing […] online [reverse] logistics […] it’s a very customer orientated one-on-one focus in terms of making sure that it’s running smoothly.” (P13, supply chain manager, multichannel retailer)

Finally, online retailers can *use appropriate facilities* to ensure that service standards are consistently maintained. Specifically, participants indicated that centralised facilities can be important for RSP management of service standards. For instance, the more facilities online retailers use for RL the less uniform the activities, complicating the ability to maintain promised service standards, which can lead to consumer uncertainty. The following quotation illustrates this finding:

“I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense. […] you have got the same method of thinking in one facility; you do not want six or seven reclaim centres where the six or seven people that handled electronics all have a different view of

> what is used. Because that creates uncertainty with the consumer […]. So, I would go towards having a centralised reclaimed centre […] so that you've got that uniform approach in your [RL] activity." (P5, general manager, online retailer)

As support RL practices for RSP management of service standards and agreements, online retailers can implement (as supported by literature), the (1) *general IT strategy* of developing and using integrative and compatible IT systems (section 6.3.1), (2) *TLIT* (traditional logistics IT) strategies of integrating TLIT systems with other systems and use WMS and CRM software for RL (section 6.3.3), (3) *SCI strategy* of integrating and sharing of IT (section 6.4.1), (4) *CFI strategy* of implementing CFI for RL (section 6.4.3), (5) *RL in/outsourcing strategy* of organisational considerations for RL in/outsourcing decisions (section 6.5.1), (6) *PM strategy* of performance monitoring and review (section 6.7.1), (7) *centralised facility/location strategy* of using a centralised facility for RL (section 6.8.4), (8) *centralised return centre* (CRC) *strategy* of establishing and using CRCs (section 6.8.6), (9) *RC strategies* of sufficient and appropriate resources for RL and financial, IT and human RC in RL (section 6.9.1), and (10) *RL manager strategy* of assigning experienced managers to RL (section 6.9.5).

The interview findings related to the practices that can be implemented for RSP management of service standards and agreements coincide with the reviewed literature, including (1) functional integration (Ashan & Rahman, 2021:21; Karlsson *et al.* 2023:8; Pal, 2017:885), (2) appropriate IT systems with integrative capabilities (Karlsson *et al.* 2023:8), (3) performance measures (Jalil, 2019:2; Karlsson *et al.* 2023:9; Sajjanit & Rompho, 2019:790), (4) RLM insourcing (Lamba *et al.* 2020:338), and (5) dedicated human resources (Davidavičienė & Al Majzoub, 2021:4; Mostert *et al.* 2017:13) and service managers (Sajjanit & Rompho, 2019:790). However, this study uniquely identified the use of CRCs or centralised facilities for managing service standards and agreements, providing an additional practice for enhanced RSP management.

Essentially, RSP management of service standards and agreements can help online retailers address the service (1) pitfalls of functional autonomy (internal culture), inattention to RLM, poor RL planning, a lack of resources (poor RLM), poor systems and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations and dissatisfaction, and consumer frustration, anger and uncertainty (consumer problems), poor return processes, service failures, a loss of consumer confidence and trust, reputational damage and a loss of market share and consumers (online retailer problems).

- *RSP management of service failures*

Apart from RSP management of service standards and agreements, online retailers must implement practices for RSP management of service failures, which can minimise the occurrence or impact of

service failures in RL. As key practice elements, online retailers can use systems and integrations, RL insourcing and staff training for the effective RSP management of service failures.

In terms of *using systems and integrations*, some participants indicated that online retailers must capture service failures on the system (such as the CRM system), which can help customer service staff to demonstrate awareness of service failures and communicate mitigating solutions to consumers. Additionally, some participants suggested that effective internal and external integration of systems can minimise the occurrence of RL service failures, reemphasising the importance of systems and integrations for RSP management of service standards and agreements. The following quotations convey these findings:

> "So, if there's been a […] collection failure that should also appear in your CRM, […] and [when] that customer calls in, they're able to service their customers and are able to identify, 'hey, listen, we are aware that there have been these problems and this is what's being done to sort it' […] So, making sure that information is visible." (P1, operations manager, 3PRL provider firm)

> "[…] the more integrated, the less likelihood of collection failures, return failures, service failures. So, whether your logistics provider is external courier or an internal provider, you know that integration from a systems perspective is important." (P1, operations manager, 3PRL provider firm)

Additionally, the participants indicated that *RL insourcing* can be important to minimise the likelihood of service failures, which associates with the RL planning pitfall of poor outsourcing decisions (section 8.5.1.2.2). Subsequently, RL insourcing not only facilitate RSP management of service standards and agreements but also with managing service failures in RL. Furthermore, the participants indicated that online retailers must *train staff* on consumer behaviour, people management and complaint resolutions, which can minimise the impact of service failures for effective RSP management. For example, online retailers can train staff to effectively communicate with consumers who experienced service failures, facilitating personalised SOR communication (section 8.5.2.1.1) and complementing RSP improvement preparation (section 8.5.2.2.2). These findings can be supported by the subsequent quotations:

> "I am totally against outsourcing […], especially the reverse logistics […] because if your outsource company would fail in any of those [RL] services, it's you [the online retailer] that will have to bear the brunt for it […]. I would rather have control of it [reverse logistics] here in our fulfilment centre […]." (P9, regional & online DC manager, online retailer)

> "Train them on consumer behaviour […] there needs to be a big element of human interaction, people management, complaint resolution, [and] to know how to speak to people, etc." (P5, general manager, online retailer)

> "We're sorry about your bad experience. We will collect your units […] and you should have a refund within the next two days. And then afterwards you contact the customer, […] we've processed your refund. We do apologise for your experience. Please feel free to contact us again and please feel free to visit our website and purchase another product." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

As support RL practices for RSP management of service failures, online retailers can implement (as supported by literature) the (1) general IT strategy of using integrative and compatible IT systems (section 6.3.1), (2) TLIT strategy of implementing CRM for RL (section 6.3.3), (3) SCI strategy of integrating and sharing of IT (section 6.4.1), (4) CI strategies of consumer service and support initiatives, consumer communication, information sharing and interaction, and implementing customer

service management (section 6.4.2), (5) RL in/outsourcing strategy of organisational considerations for RL in/outsourcing decisions (section 6.5.1), and (6) RL staff strategies of implementing RL training and education and producing well-managed, -skilled and -trained staff in RL (section 6.9.5).

While no studies from the reviewed literature focused on managing service complaints, Jalil (2019:2) indicated that service recovery can be critical for managing service failures in RL and Bozzi *et al.* (2022:16) identified that IT systems can be used for managing consumer complaints. Additionally, Badenhorst (2017:616) found that RL outsourcing in South Africa was the least favourable practice for addressing RLM barriers and problems. Lastly, Dapiran and Kam (2017:831) emphasised the importance of training staff to communicate effectively with consumers, and Nel and Badenhorst (2020:125) suggested that staff must be trained to provide exceptional consumer service in RL.

Subsequently, RSP management of service failures can help online retailers to mitigate the service (1) pitfalls of inattention to RLM, poor RL planning (poor RLM), poor visibility, poor systems and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations and dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers (online retailer problems).

In conclusion, RSP propositions, including RSP evaluation, RSP improvement and RSP management, can help online retailers to evaluate, improve and manage consumer service performance in RL as well as address various service pitfalls and problems. Therefore, online retailers must implement RSP propositions as a main service proposition for the effective RLM of consumer returns. In the next section, the final service proposition category, namely service parameters, will be analysed and discussed.

8.5.2.3 Service parameters

Service parameters as the final main service proposition, involve various proposition (parameter) categories, including volume, product, organisational, cost versus benefit, SC and market, and legal parameters (see Figure 8.**15**). Like the prevention and control parameters (section 8.4.2.4), no studies in the reviewed literature focused on the factors (parameters) that can impact the implementation of service propositions, meaning that this study adds new insights into important considerations for the effective implementation of service-orientated return (SOR) and return service performance (RSP) propositions. Nevertheless, a few studies (unintentionally) identified parameters that align with the interview findings, which will be referenced in the discussion. The various service parameters will be discussed in the subsequent sections.

8.5.2.3.1 Volume service parameters

As illustrated in Figure 8.**15**, volume service parameters involve the key parameters of return volume and complaints volume, which can be important for the implementation of a few service propositions.

Return volume as a service parameter associates with the key SOR process practice of SOR inspection and processing and the key RSP improvement practice of RSP improvement execution. Particularly, performing pre-return inspection at consumer locations for improved consumer service might be more appropriate for locations with higher return volumes. Additionally, online retailers with lower return volumes might benefit from using 3PL providers for RSP improvement execution. These findings can be illustrated in the following quotations:

> "[…] a practical way of putting a team of people into the street and saying, you know what, returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell. So, they can sell them the correct device […] just to give them a better service […]." (P5, general manager, online retailer)

> "I believe outsourcing is an amazing opportunity to ensure that the customer gets the best experience possible, and the reason I say that is I don't have scale in returns." (P6, logistics manager, multichannel retailer)

In terms of *complaints volume*, online retailers can consider complaints volume for the implementation of RSP propositions, including key RSP evaluation and key RSP improvement practices. Specifically, online retailers should consider complaints volume for (1) RSP evaluation metrics and tools (i.e. consumer satisfaction as a metric), (2) RSP evaluation data sources (i.e. complaints data), (3) RSP improvement preparation (i.e. sharing service problems and brainstorming improvement plans) and (4) RSP improvement execution (e.g. using 3PRL provider to reduce return processing time). Subsequently, complaints volume can be an important consideration for the implementation of RSP propositions. The following quotations support these findings:

> "So, Retailer K used to measure their customer service performance, and the way they measured it was they had fewer reverse logistics complaints […]." (P4, owner/CEO, 3PRL provider firm)

> "So, if you keep on getting client complaints about your courier has not collected […] that needs to raise red flags so that data comes both from your customer care log sheets and from your customer calling. […] if you're getting four and a half thousand calls a day of which 40 percent relates to […] the time of collection […] that needs to raise some red flags." (P12, Head of logistics, online retailer)

> "[…] they [online retailers] had fewer reverse logistics complaints […] we've [the 3PRL provider] taken their credit timings from sort of a month or more to a couple of days. So, where they would wait a month to credit a customer, now they can do it in three days." (P4, owner/CEO, 3PRL provider firm)

As support RL practices for considering volume service parameters, online retailers can implement (as supported by literature) the (1) CI strategies of considerations for CI, attaining of consumer input and interacting with consumers (section 6.4.2), (2) RL in/outsourcing strategies of considering and analysing RL in/outsourcing decisions (section 6.4.1), (3) PM strategy of considerations for PM (section 6.7.1), (4) RC strategy of considerations for RC (section 6.9.1), and (5) RL staff strategy of

establishing a dedicated RL function (section 6.9.5). No studies in the reviewed literature identified the importance of considering return and complaint volume for the effective implementation of service propositions. Subsequently, this study identifies new factors that online retailers can consider for the effective implementation of SOR and RSP propositions.

Additionally, considering volume parameters can facilitate online retailers with addressing the service (1) pitfalls of internal preservation (internal culture), poor RL planning, a lack of resources (poor RLM) and lack of external integration (information-related pitfall), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer trust, reputational damage and a loss of sales (online retailer problems).

8.5.2.3.2 Product service parameters

The product service parameters involve the key parameters of type of product return and product type (see Figure 8.**15**), which associate with SOR propositions.

For instance, *type of product return* as a parameter can be important for implementing key SOR process practices. Specifically, online retailers can consider the type of product return for SOR collection that involves simultaneous return pickup and replacement drop-off and SOR inspection and processing that involves instant replacement dispatch. For example, if the type of product return involves incorrectly received items, online retailers can consider simultaneous return pickup and replacement drop-off and instant replacement dispatch, as displayed in the following quotations:

> "If the guy gets the wrong thing and he wants it replaced […] they [online retailers] come up with two different deliveries […] so I thought to myself, if we could convince them that when you do a request for return and you [want to] replace […] you hook the two together. Those are the kind of cross-functional examples that I can think of." (P7, owner, 3PRL provider firm)

> "[…] a lot of the returns, obviously, there's a replacement attached to it as well. For example, a customer orders an item which is blue, and they receive an item that is red […]. So, what I do, I fulfil the correct item first […] and we ship it on an overnight delivery […]. So, this is where we announce trust to the customer […]. We know the customer has been satisfied." (P9, regional & online DC manager, online retailer)

Moreover, online retailers can consider the *type of product return* and *product type* for the key SOR communication practice of streamlined SOR communication. For example, online retailers can consider defective and warranty returns as product return types, and electronics as product types to collaborate with suppliers to provide consumers with return status updates from suppliers. The following quotation expands on this finding:

> "So, if you [the consumer] purchased a television set from Retailer C, and the TV set breaks […] Retailer C is saying, we will come and collect it. But we're not going to give you the money, we need to get the money back from the supplier first. And in that case, your supplier needs to act out the warranty. Now, from an integration point of view, it would be brilliant if you [as the online retailer] had access to the supplier system […]. And you can simply enter their website and say, […] I'm looking up this barcode and the barcode tells you, no problem, this is still under warranty […]. But then also you can track what's happening on your supplier side, so that you can give accurate information to your customer […]." (P5, general manager, online retailer)

Finally, *product type* can be considered for the key SOR process practice of SOR inspection and processing and the key RSP improvement practice of RSP improvement execution. For example, the online retailer can consider using dedicated staff to perform pre-return inspection at consumer locations for electronics, appliances and computers to improve consumer service, linking with return volume as a parameter (section 8.5.2.3.1). The following quotation shows the importance of considering product type for SOR inspection and processing and RSP improvement execution:

> "So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell. So, they can sell them the correct device […] just to give them a better service […]." (P5, general manager, online retailer)

As support RL practices for product service parameters, online retailers can implement (as supported by literature) the (1) barcode IT strategy of considerations for barcode IT (section 6.3.4), (2) SCI strategies of SCI considerations, collaboration, integration and information sharing (section 6.4.1), (3) CI strategies of CI considerations and interacting with consumers (section 6.4.2), (4) CFI strategy of implementing CFI (section 6.4.3), (5) RC strategy of considerations for RC (section 6.9.1), and (6) RL staff strategy of establishing a dedicated RL function (section 6.9.5).

Like the volume service parameters, this study distinctly identified the consideration of product parameters, including type if product return and return type, for the effective implementation of SOR and RSP propositions. Ultimately, considering product service parameters can help online retailer address the service (1) pitfalls of functional autonomy and preservation (internal culture), a lack of resources (poor RLM), poor visibility and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer frustration and uncertainty (consumer problems), poor return communication, poor return process, service failures, a loss of consumer confidence and trust, and a loss of sales (online retailer problems).

8.5.2.3.3 Organisational service parameters

The organisational service parameters involve the key parameters of organisation size and organisational capabilities (see Figure 8.**15**) that can be important for the implementation of various SOR and RSP propositions.

Organisation size can be an important parameter for the implementation of service propositions that involves third parties. While larger online retailers might be more capable of using internal resources and initiatives for service propositions, smaller online retailers might rely on third parties for service propositions, linking with the return volume parameter (see section 8.5.2.3.1). For example, a smaller online retailer interested in using various drop-off locations for the implementation of SOR collection can use service providers with decentralised locations for drop-off collection. Evidently, online retailers

must consider their size for the implementation of service propositions, involving third parties, like SOR communication platforms, streamlined SOR process and RSP improvement execution (see sections 8.5.2.1.1, 8.5.2.1.2 and 8.5.2.2.2). The following quotations portray organisation size as a service parameter:

> "I think that really is dependent on […] the size of your business […]. I think outsourcing is an option, but it really is depending on what you would like to have happen as a business […] to manage that [reverse logistics] from a customer service perspective […]." (P13, supply chain manager, multichannel retailer)

> "[…] a large firm that has got satellite branches in all your main CBDs, it will be […] a quicker cycle of […] returning an item […] having multiple hundreds of drop off points for returning items, like [the 3PL providers] Pargo, [and] DSV has got their own. So that's another option […]." (P12, Head of logistics, online retailer)

Nevertheless, *organisational capabilities*, involving resources, staff, RL process, IT and information management capabilities (key parameter elements) can be a more significant organisational parameters for the implementation of various service propositions and RL in/outsourcing decision-making. Specifically, online retailers must consider their *resource capabilities* for key RSP improvement and RSP management practices. For example, online retailers can keep RL inhouse if they possess the necessary resources for RSP improvement execution. Likewise, online retailers must consider their existing resources, like infrastructure and human resources for RSP management of service standards and agreements. The following quotations illuminate these findings:

> "I would rather have […] [reverse logistics] here in our fulfilment centre, within our company, within our own resources. So, that's effectively giving our customers a better service." (P9, regional & online DC manager, online retailer)

> "I think outsourcing is an option, but it really is depending on what you would like to have happen […] we don't outsource [reverse logistics] […] because we have our own facility, […] we also like to manage that from a customer service perspective to [use] our own people with our customers." (P13, supply chain manager, multichannel retailer)

Additionally, online retailers can consider their human resource capabilities for SOR communication platforms (key SOR communication practice). Evidently, online retailers that lack human resources can use a third-party contact centre as a telephonic SOR communication platform. Nevertheless, online retailers must be capable of training the employees of the outsourced service providers for effective telephonic SOR communication. Lastly, online retailers must consider their financial resource capabilities to invest in IT and/or facility resources for SOR process optimisation (key SOR process practice) and RSP improvement execution (key RSP improvement practice). The following quotations illustrate the importance of considering organisational resource capabilities for the implementation of SOR and RSP improvement propositions:

> "[…] you can outsource the whole [RL process] […] like outsourcing a contact centre […] you still got to make those [contact centre] people feel like they're your [customer service] people. You still got to train them to talk like your people […] to not degrade the [consumer's] experience." (P1, operations manager, 3PRL provider firm)

> "[…] you should have the resources available to expedite a collection and return. Therefore, […] investing in information technology that's going to expedite and streamline the [return] process." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] so, we are only started out with two DCs, the one in Joburg and the one in Cape Town. […] they [Retailer C] then made the decision to have a return facility in KZN due to Cape Town and Joburg is decentralised from KZN. And so, the guys [consumers] in KZN complained about their returns being taking too long to process […]. So,

> they made that decision to help with the turnaround time […] to kind of mitigate the […] customer complaints of the [returns] turnaround time from KZN […]." (P3, returns manager, online retailer)

Furthermore, online retailers must consider their *staff capabilities* for the key SOR process practices of SOR process optimisation and SOR request. Specifically, for a lenient SOR process (key element of SOR process optimisation), the online retailer's staff must be capable of discerning a legitimate return reason from a non-legitimate (fraudulent) return reason for authorising returns. Additionally, online retailers' staff must be capable of showing empathy and assisting less tech-savvy consumers in the consumer return request process, enabling the use of various SOR request options. These findings can be supported by the subsequent quotations:

> "So, you need to have a discerning employee managing that [return authorisation], because if the customers […] wanted to return the product [legitimately] and you say, no, I [as a consumer] will never go back and buy from those people [the online retailer] again. But then you're also have the other side of it where people [consumers] are trying to commit fraud." (P4, owner/CEO, 3PRL provider firm)

> "So, it has to be the sensitivity of that [customer service] department […] where a customer calls in to state […] she doesn't know how to log in and she doesn't know how to create a return from her account. So, we've got to establish that sensitivity and that urgency to assist, to help [with] return [logging] […]." (P9, regional & online DC manager, online retailer)

In terms of *RL process capabilities*, online retailers must consider their RL process lead-time capabilities to effectively implement the key practices of SOR collection and RSP improvement execution. Consequently, online retailers that lacks the capabilities to implement an efficient return collection process or improve RL process efficiency can use 3PRL providers. These findings can be supported by the subsequent quotations:

> "We don't annoy the customer by saying, well, the truck will be there in two weeks' time. We have […] a very specific logistics model that we've developed, and our turnaround time is maybe forty-eight hours at max to be able to go and pick up a product." (P7, owner, 3PRL provider firm)

> "[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)

Online retailers must consider their *IT capabilities* to implement various key SOR communication, SOR process, RSP evaluation, RSP improvement and RSP management practices. Specifically, IT capabilities can be important SOR communication platforms and streamlined SOR communication. For instance, online retailers must consider the capability of their IT platform to provide return status updates and allow contact centre staff access to the system for telephonic SOR communication. Similarly, online retailers must consider the integration capabilities of their IT for collaborative SOR communication (key practice element). Additionally, considering system capabilities can be important for implementing a hassle-free and streamlined return logging procedure (key practice element of SOR request). Moreover, online retailers must consider their capabilities to develop appropriate IT for SOR process optimisation and RSP improvement execution. Consequently, if online retailers lack IT capabilities they must consider other practices for SOR process optimisation and RSP improvement execution, like using 3PRL provider (see sections 8.5.2.1.2 and 8.5.2.2.2). The following quotations

show the importance of considering IT capabilities for SOR propositions and RSP improvement execution:

> "And you also need a contact centre or a call centre of sort that can actually engage with the technology system, […], they are responsible for actually communicating with the customer. So, they need to be able to access that technology platform and they need to be able to take from the information [on the system] that they can relay back to the customer." (P5, general manager, online retailer)

> "[…] when you have a logistics service provider, these APIs are quite important. So, you can see the integration between your system and their systems. You can communicate to the customer so you can track certain events, especially in reverse logistics." (P13, supply chain manager, multichannel retailer)

> "[…] your systems and technologies that you use within the warehouse should give feedback towards the customer to say what is the update on their return and how long it will take, where it is tracking in the system or in the supply chain at the moment. So, I think for any business, it is highly important to get a system that is very two-way functional to make sure that customers updated at all times as well." (P3, returns manager, online retailer)

> "[…] it shouldn't be a hassle for any person to log a return […] because then it will make them skittish to buy from you again. So, I think in any circumstances like that, a very good interface between the company and the customer is of the utmost importance to make it work." (P3, returns manager, online retailer)

> "[…] if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

> "If somebody could develop a platform that could plug into anyone's online portals to smoothen the reverse logistics that would be great. Because I tell you why, this is where online companies lose business and, in the end, they lose the customer's trust […]." (P9, regional & online DC manager, online retailer)

Finally, online retailers must consider both their *IT* and *information management capabilities* to implement key RSP evaluation, RSP improvement and RSP management practices, including (1) RSP evaluation preparation, (2) RSP evaluation metrics and tools, (3) RSP evaluation data sources, (4) RSP improvement preparation, (4) RSP management of service standards and agreements, and (5) RSP management of service failures. For example, online retailers must consider the integration and data management capabilities of their IT systems (such as CRM or WMS) to measure service performance and manage service standards of SC partners. Similarly, for RSP management of service failures, online retailers must consider the capabilities of the CRM system to capture service failures and provide data visibility of service failures to internal/external RL parties. The following quotations show the importance of considering IT and information management capabilities for RSP propositions:

> "[…] you've got internal/external kind of system integrations, people do it in different ways, whether they do it in their CRM or their WMS […]. And then those key events are then [monitored], like we call it timestamping. So, when you do SLA management, [systems integration helps] to understand the time when each event took place. So, you need that data somewhere in the data table, so you can measure how long it's taking, [and] are they meeting service level requirements […]." (P13, supply chain manager, multichannel retailer)

> "[…] the worst thing that can happen is that different departments get measured on different things and they are reporting on different aspects, which may not be customer centric. So, I think the most important thing is that the [RL] metrics and benchmarks in an organisation need to be centralised and the data visibility must be available to all those parties easily." (P8, logistics manager, multichannel retailer)

> "[…] the benefit [of RL outsourcing] lies in all the [return] data and the benefit can be reviewed as a customer experience benefit […]. What is the whole experience like? […] So, I feel strongly that the benefit in having a company that specialises in reverse logistics is that they will get much more data that is relevant for your customer experience." (P12, Head of logistics, online retailer)

> "[…] we have this IT interface that's channelling every activity or giving instruction to every stakeholder on what needs to be done. And we've got to make sure there's a lead time in place to make sure that it's governing, to ensure that we meet the total standard lead time to achieve customer service [standards] […] and to make sure that customer is happy […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "So, if there's been a […] collection failure that should also appear in your CRM, […] and [when] that customer calls in, they're able to service their customers and are able to identify, 'hey, listen, we are aware that there have been these problems, and this is what's being done to sort it' […]. So, making sure that information is visible." (P1, operations manager, 3PRL provider firm)

Subsequently, online retailers can implement (as supported by literature) various support RL practices for the consideration of organisational service parameters, including the (1) *general IT strategies* of considerations for general IT and IT types for RL and developing IT capabilities and using IT with information management capabilities (section 6.3.1), (2) *Internet and web-based strategy* of developing online return capabilities (section 6.3.2), (3) *TLIT strategies* of integrating TLIT with other systems and using WMS and CRM for RL (section 6.3.3), (4) *SCI strategy* of considerations for SCI (section 6.4.1), (5) *CI strategy* of considerations for CI (section 6.4.2), (6) *RL in/outsourcing strategy* of considering and analysing RL in/outsourcing decisions (section 6.4.1), (7) *PM strategy* of considerations for PM (section 6.7.1), (8) *general facility/location strategy* of considering facility/location decision factors (section 6.8.1), (9) *decentralised facility/location strategies* of decisions and considerations related to decentralisation (section 6.8.5), (10) *RC strategy* of considerations for RC (section 6.9.1), and (11) *return prevention and avoidance (RPA)* strategy of considerations for gatekeeping practices (section 6.9.3).

Clearly, various organisational parameters must be considered for the effective implementation of service performance. While no studies in the reviewed literature directly focused on considering organisational parameters for the implementation of service propositions, a few studies identified the following: (1) resources must be considered for outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2), including appropriate human and IT resources (Prajapati *et al.* 2021:6), (2) staff must be capable of communicating effectively with consumers (Dapiran & Kam, 2017:831) and identify fraudulent returns (Zang *et al.* 2023:16), (3) RL process capabilities must be considered for outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2), (4) appropriate RL network and facility design for RL requires resources (Das *et al*. 2020:48), and (5) IT systems must be capable of internal and external integration, communication, real-time information sharing and supporting performance measurement (Karlsson *et al.* 2023:8-9). Evidently, this study uniquely identified that online retailers must consider their size for the implementation of service propositions.

Essentially, considering organisational service parameters can help online retailers to effectively implement various SOR and RSP propositions, and address the service (1) pitfalls of functional autonomy and preservation (internal culture), inattention to RLM, poor RL planning, a lack of resources (poor RLM), poor visibility, poor systems and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations and dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor

return process, service failures, a loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers (online retailer problems).

8.5.2.3.4 Cost versus benefit service parameters

As illustrated in Figure 8.**15**, the cost versus benefit service parameters involves the key parameter elements of cost versus benefits for SOR process propositions and cost versus benefits for RSP propositions, ensuring that the benefits of implementation outweigh the potential costs.

Specifically, online retailers can consider the *costs versus benefits* for the key *SOR process* practice of SOR process optimisation, relating to the establishment of a lenient SOR process (key element). For instance, online retailers must consider the costs of free returns against the benefits of demonstrating trust to consumers. Evidently, online retailers must ensure that the RL costs associated with return leniency must be less than the benefits of meeting consumer expectations and retaining consumers and market share. Moreover, for establishing an efficient SOR process (key element of SOR process optimisation) online retailers must consider the costs of investment in resources against the benefits of an optimised and efficient return process. The following quotations illustrate these findings:

> "[…] there's the [return] policy […] that generally rolls up to customer proposition. […] it's also the service element and the trust element […]. So, you know what? We trust you. No problem, no charge returns […] an easy return, generates trust in a business." (P1, operations manager, 3PRL provider firm)

> "I think it is because the online retailer that doesn't do so will be behind in the marketplace, because within a very short period of time, the consumer has come to expect that everything is a free delivery and is a free return." (P2, owner, supply chain consultancy firm)

> "[…] you should have the resources available to expedite a collection and return. Therefore, I believe that investing in information technology, that's going to expedite and streamline the [return] process." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Similarly, online retailers must consider the costs versus benefits of the key SOR process practice of SOR inspection and processing, involving instant refunds and instant replacement dispatch (key practice elements). Specifically, participants indicated that online retailers must consider the costs of providing instant refunds that may result in high/fraudulent returns against the benefits of retaining sales/consumers and enhancing consumer certainty in the return process. Additionally, online retailers must consider the transportation cost of an instant replacement dispatch, which contrasts the more cost-effective SOR collection practice of simultaneous return pick-up and replacement drop-off. Consequently, the cost versus benefit parameters associated with SOR inspection and processing and SOR collection links with the key product parameter of product return type (section 8.5.2.3.2). The following quotations support these findings:

> "[…] the instant refund […] to keep you shopping on the site […] So, instead of looking at it as the returns are a fact of life, how do we make this work to our advantage instead of trying to protect ourselves from them?" (P1, operations manager, 3PRL provider firm)

> "[…] a consumer don't [sic] want to hand it [the returned product] over without knowing that when you've signed it over to the collecting courier that you will be refunded […] because the consumer can't take responsibility for what happens to the product in transit." (P2, owner, supply chain consultancy firm)

> "[…] a lot of the returns there's a replacement attached to it as well. For example, a customer orders an item which is blue, and they receive an item that is red. Now, you want the reverse logistics to kick in, but […] it has to be efficient enough where it comes back to us and to the correct item gets shipped out, in time, to the customer […]. So, what I do, I fulfil the correct item first […] and we ship it on an overnight delivery at our cost and then we wait for that [return] to come. So, this is where we announce the trust to the customer […] We know the customer has been so satisfied." (P9, regional & online DC manager, online retailer)

> "[…] cross-functional is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […]. I think we could save […] a fortune […] when you do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)

Regarding the *cost versus benefits of RSP propositions*, online retailers must consider the costs versus benefits for the key RSP improvement practice of RSP improvement execution. For example, online retailers must consider the costs of investing in IT against the benefits of meeting consumer expectations. Similarly, for RSP management of service standards and agreement, online retailers must consider the costs of investing in various resources against the benefits of effectively managing service performance in RL. The following quotations substantiate these findings:

> "I think investment in technology […] is paramount […] So going into the future, it'll be very common practice that customers will expect a retailer to have all those things in place." (P8, logistics manager, multichannel retailer)

> "I think it's quite an important part of the customer journey, […] you would have to invest in some sort of resources, whether it be IT integration, investing money, putting heads where it counts towards that process and managing it." (P13, supply chain manager, multichannel retailer)

Consequently, cost versus benefit parameters can complement organisational capability parameters of resource and IT capabilities (see section 8.5.2.3.3). As support RL practices for cost versus benefit service parameters, online retailers can implement (as support by literature) the (1) CI strategies of considerations for CI and performing a cost-benefit analysis for CI practices (section 6.4.2), (2) RC strategy of considerations for RC (section 6.9.1), and (3) FM (financial management) strategy of performing cost-benefit analyses (section 6.9.2).

A few studies from the reviewed literature align with the interview findings for the costs versus benefits of SOR process optimisation and SOR inspection and processing. Relating to SOR process optimisation (i.e. lenient RL process), studies identified that the costs of a lenient return policy can be larger return volumes and higher RL costs (Andresen & Istad, 2019:7; Oghazi *et al.* 2018:190), while the benefits can be an increase in sales (Andresen & Istad, 2019:7; Dapiran & Kam, 2017:835) and profits (Davidavičienė & Al Majzoub, 2021:4). Additionally, Euchi *et al.* (2019:44) found that online retailers compensate consumers for delays in the return process by sending a replacement before return receipt, echoing the interview findings for the costs versus benefits of an instant replacement dispatch (SOR inspection and processing element). Although a few studies indicated that the cost of investment in resources can enhance RL process efficiency (Meyer *et al*. 2017:1) and improve the management of consumer returns (Frei *et al.* 2020:1619; Jović *et al*. 2020:160; Misni & Lee, 2017:92-93), no studies identified the benefits of meeting consumer expectations and managing service performance in RL.

Evidently, this study contributes to the literature by adding to the benefits of investing in resources for effective RSP improvement execution and RSP management of service agreements and standards.

Essentially, considering cost versus benefit service parameters can help online retailers address the service (1) pitfalls of internal preservation (internal culture), poor RL planning and a lack of resources (poor RLM), and (2) problems of a poor return experience, unmet expectations, dissatisfaction, consumer uncertainty (consumer problems), a poor return process, service failures, a loss of consumer confidence and trust, and a loss of sales, market share and consumers (online retailer problems).

8.5.2.3.5 SC and market service parameters

SC and market service parameters involve the key parameters of SC integration and resource capabilities, SC agreements and consumer demographics/characteristics (see Figure 8.**15**), which can influence the implementation of various SOR and RSP propositions.

SC integration and *resource capabilities* can be important considerations for SOR propositions and RSP propositions, involving 3PL providers/couriers, suppliers and 3PRL providers. Specifically, for the key SOR communication practice of streamlined SOR communication, online retailers must consider the IT integration capabilities and integration willingness of couriers and suppliers to provide return tracking information to keep consumers informed in the return process. Similarly, online retailers must consider the willingness of 3PRL providers to integrate and share information for key SOR process, RSP evaluation, RSP improvement and RSP management practices. Specifically, the SC integration and information sharing capabilities of 3PRL providers must be considered for (1) SOR process optimisation (section 8.5.2.1.2), (2) RSP evaluation data sources (section 8.5.2.2.1), (3) RSP improvement execution (section 8.5.2.2.2), and (4) RSP management of service standards and agreements (section 8.5.2.2.3). The following quotations convey these findings:

> "We have couriers […] so the integration between the systems is very important to make sure that the customer have visibility of where their returns are." (P3, returns manager, online retailer)

> "[…] when you have a logistics service provider, these APIs are quite important. So, you can see the integration between your system and their systems. You can communicate to the customer so you can track certain events, especially in reverse logistics." (P13, supply chain manager, multichannel retailer)

> "[…] from an integration point of view, it would be brilliant if you had access to the supplier system […]. And you can simply enter their website and say, […] I'm looking up this barcode and the barcode tells you, no problem, this is still under warranty […]. But then also you can track what's happening on your supplier side, so that you can give accurate information to your customer […]." (P5, general manager, online retailer)

> "[…] you can outsource all of that and somebody else does all that for you, but you still going to need the […] the visibility from their system." (P13, supply chain manager, multichannel retailer)

> "Look, I think that really is dependent on […] whether you found a partner that can give you what you would like your customer to have and get from you as a business and how you would like to be portrayed. […] I think outsourcing is an option […] [if] they [online retailers] have enough visibility on what that outsource service provider is providing." (P13, supply chain manager, multichannel retailer)

Moreover, online retailers must consider the IT integration capabilities and integration willingness of 3PL providers for the effective implementation of RSP evaluation preparation, RSP management formalisation and RSP management of service standards and agreements. Subsequently, without the willingness or capability of 3PL providers to integrate with online retailers, RSP evaluation and management that involves SC parties would be impossible. Consequently, SC integration and resource capabilities complement the organisational capabilities parameters relating to RL process, IT and information management capabilities (see section 8.5.2.3.3). The following quotations convey these findings:

> "[…] you're always going to need some internal/external integration. […]. So, when you do SLA management, [systems integration helps] to understand the time when each event took place. […] so, you can measure how long it's taking, are they meeting service level requirements […]." (P13, supply chain manager, multichannel retailer)

> "[…] with the logistics company that's just doing some of your […] reverse logistics. And there's also agreements in place on our system [that] automatically integrates with their system." (P11, Demand and sales manager, FMCG distributor)

> "[…] the more integrated, the less likelihood of collection failures, return failures, service failures. So, whether your logistics provider is external courier or an internal provider, you know that integration from a systems perspective is important." (P1, operations manager, 3PRL provider firm)

Regarding *SC agreements*, online retailers must consider their agreements with suppliers before outsourcing the RL process to 3PRL providers, which can be important for RSP management. For example, online retailers must consider supplier agreements before selecting a full RL outsourcing strategy since 3PRL providers might fail to comply with established RL service standards and neglect managing service agreements with suppliers. Moreover, online retailers must consider SC agreements that involves service level agreements (SLAs) with service providers (e.g. couriers) for RSP evaluation metrics and tools (key RSP evaluation practice) and RSP management of service standards and agreements (key RSP management practice). For example, if the courier agreed to collect returns within 48 hours, online retailers can use the agreed service standard to evaluate, manage and monitor the RSP of the courier. The following quotations demonstrate the importance of considering SC agreements for implementing RSP propositions:

> "[…] if you outsource the entire reverse logistics to an external company […], you're obviously going to struggle to get the supplier agreements and all of that upheld by a different company […] and getting a courier to go and collect your parcels from the customers and making sure it gets delivered [or returned] […]." (P3, returns manager, online retailer)

> "Did your couriers receive instruction, and did they collect a parcel within the 48 hours that we've agreed […]. So, it's all about timestamps […]." (P5, general manager, online retailer)

> "So, when you do SLA management, […] you need that data somewhere […] so you can measure how long it's taking, are they meeting service level requirements […]." (P13, supply chain manager, multichannel retailer)

Consumer demographics/characteristics parameters involve consumer region, preferences, generation/skills and types, which can influence the implementation of several SOR and RSP propositions. Specifically, online retailers must consider *consumer region* and *preferences* for the implementation of key SOR communication and SOR process practices. For example, consumers in a certain region might prefer human interaction, which means that online retailers must consider this for

(1) SOR communication platforms, (2) streamlined and personalised SOR communication (section 8.5.2.1.1), (3) SOR request (section 8.5.2.1.2), (4) RSP evaluation data sources (section 8.5.2.2.1), (5) RSP improvement preparation (section 8.5.2.2.2), and (6) RSP management of service failures (section 8.5.2.2.3). The following quotation portray the importance of considering consumer demographics for the implementation of service practices in RL:

> "What is very popular is to go the AI route […]. You've got an online customer service technology tool, which is based on AI, which is based on your standard queries and answers, […] and again, unfortunately, in Africa, there is still the human touch that is required with these types of things." (P12, Head of logistics, online retailer)

Similarly, online retailers must consider the *generation/skills* of their consumers for the implementation of the key SOR process practice of SOR request. Specifically, online retailers with an older-generation or less-technological inclined consumer base must consider implementing various return request options, allowing consumers to log returns via contact centres. Additionally, online retailers must consider *consumer types* for the implementation of SOR inspection and processing. For example, consumers might be less confident to hand a product return parcel over to a courier driver, not knowing if the product will arrive at the online retailer's facility for a refund. Therefore, considering the distrusting nature of consumers, the online retailer can implement instant refunds, linking with cost versus benefit parameters (see section 8.5.2.3.4). The following quotations demonstrate the impact of consumer generation/age/skills and types on the implementation of key SOR process practices:

> "[…] a customer calls in to state that I have an item, [and] she doesn't know how to log in and she doesn't know how to create a return from her account. So, we've got to establish that sensitivity and that urgency to assist, to help [with] return [logging] […]." (P9, regional & online DC manager, online retailer)

> "[…] the fraud on the other side […] so, you as a consumer don't want to hand it over without knowing that when you've signed it over to the collecting courier that you will be refunded at that point in time because the consumer can't take responsibility for what happens to the product in transit." (P2, owner, supply chain consultancy firm)

As support RL practices for the consideration of SC and market service parameters, online retailers can implement (as supported by literature) the (1) SCI strategy of considerations for SCI (section 6.4.1), (2) CI strategy of considerations for CI (section 6.4.2), and (3) RL in/outsourcing strategy of considerations and analysis of RL in/outsourcing decisions (section 6.4.1).

No studies in the reviewed literature focused on considering SC integration and resource capabilities of 3PL/3PRL providers and suppliers and SC agreements for the implementation of SOR and RSP propositions. However, Ashan and Rahman (2021:154) indicated that efficient RLM requires SCI since RL processes can involve suppliers and 3PL/3PRL providers, which emphasises the importance of considering SC integration and resource capabilities of SC partners for various SOR and RSP propositions. Regarding consumer demographics/characteristics, Bozzi *et al.* (2022:29) found that consumers in Brazil dislike talking to AI bots, preferring more personal communication, which aligns with the interview findings of considering consumer region and preferences for consumer communication. Similarly, De Borba *et al.* (2021:137) mentioned that return logging and return processes must be flexible to meet the needs of consumers. Nevertheless, no studies identified the

potential of consumers distrusting the 3PLs/couriers with return collection and transportation to justify an instant refund.

Subsequently, this study identified various SC and market parameters that must be considered for the effective implementation of various SOR and RSP propositions, which can help online retailer address the service (1) pitfalls of internal preservation (internal culture), poor RL planning (poor RLM), poor visibility and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations and dissatisfaction, consumer frustration, anger and uncertainty (consumer problems), poor return communication, poor return processes, service failures, a loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers (online retailer problems).

8.5.2.3.6 Legal service parameters

Legal service parameters involve the key parameter elements of privacy legislation and consumer protection legislation (see Figure 8.**15**), which can influence the implementation of various SOR and RSP propositions.

Specifically, online retailers must consider *privacy legislation*, like the protection of personal information act (POPIA), before implementing key SOR communication, RSP evaluation and RSP improvement practices. For instance, online retailers must consider South Africa's POPIA for streamlined and personalised SOR communication, which involves updating and personally contacting consumers through various SOR communication platforms. Subsequently, online retailers must first obtain permission from consumers to receive correspondence that requires personal information (e.g. cell phone and email contact details). Evidently, online retailers with consumers that opt-out to receive personal communication must consider providing these consumers with the capability to track their returns on the website for streamlined SOR communication. Similarly, online retailers must consider privacy legislation for RSP evaluation data sources (i.e. consumer complaints, feedback and return data) and RSP improvement preparation and execution (i.e. understanding consumer needs and behaviour for RSP improvements). The following quotations demonstrate the impact of privacy legislation on the implementation of service propositions:

> "The more visibility you give to the customer, the better experience that the customer will have. So, […] especially now with the POPI Act […], the customer has got a choice whether or not they want to stay subscribed to a certain online company or not […]. But it also allows you then that if the customer makes a purchase and that the customer is fully integrated with a firm, that customer can track their own purchase order and […] the same applies for reverse logistics." (P12, Head of logistics, online retailer)

> "I believe that I always would like to hear the voice of customer […]. You would like to know what makes that customer happy? What does he believe in? What does he want? What does he prefer? […] But customer information is very delicate, […] not many customers want to be probed and want to be questioned on certain things […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Likewise, online retailers must consider *consumer protection legislation*, like the Consumer Protection Act (CPA), for the implementation of the key SOR process practice of SOR process optimisation, involving the establishment of a lenient SOR process (key practice element). For instance, if South Africa's CPA stipulates that online retailers must accept returns for a seven-day period, they can consider extending the return period to 14 or 30 days for the effective implementation of a lenient SOR process. Consequently, the legal parameter of consumer protection legislation links with the cost versus benefit parameter for SOR process optimisation (section 8.5.2.3.4). The following quotation supports this finding:

> "[…] but it's worth thinking about the terms and conditions, policy and then customer proposition. What's your offer, because you could have terms and conditions that are by the book, straight down by the CPA. But your proposition could be better […] you could offer returns a lot longer than that." (P1, operations manager, 3PRL provider firm)

As a support RL practice for the consideration of legal parameters, online retailers can implement the CI strategy of considerations for CI (as supported by literature in section 6.4.2). No studies from the reviewed literature identified the importance of considering privacy legislation for the implementation of SOR and RSP propositions. Therefore, this study uniquely identifies that online retailers must consider consumer privacy for SOR communication, RSP evaluation and RSP improvement. Although a few studies in the reviewed literature mentioned the significance of consumer protection legislation for RLM adoption (see section 2.4.4), no studies mentioned that online retailers can consider consumer protection legislation for implementing lenient return processes.

Evidently, this study highlights the importance of considering legal parameters for the implementation of various SOR and RSP propositions, which can help online retailers mitigate the service (1) pitfalls of internal preservation (internal culture), poor RL planning (poor RLM), poor visibility and poor external integration (information-related), and (2) problems of a poor return experience, unmet expectations, consumer frustration and anger, consumer uncertainty (consumer problems), poor return communication, a loss of consumer confidence and trust, and a loss of sales and market share (online retailer problems).

Essentially, the service parameters can be important for implementing of SOR and RSP propositions and addressing various service pitfalls and problems. Therefore, online retailers must consider service parameters as a main service proposition for the effective RLM of consumer returns. The next section contains a framework and summary of the findings for service propositions in RLM.

8.5.2.4 Framework and summary of findings for service propositions in RLM

Clearly the discussion in section 8.5.2 showed that service propositions, including service-orientated return (SOR) propositions, return service performance (RSP) propositions and service parameters, can

be important for the effective RLM of consumer returns in online retailing. Based on the discussion of findings, Figure 8.**16** provides a broad overview of the service propositions for RLM, demonstrating the links between the RL support practices, main propositions and propositions categories (listed below the main propositions in the middle and right columns).

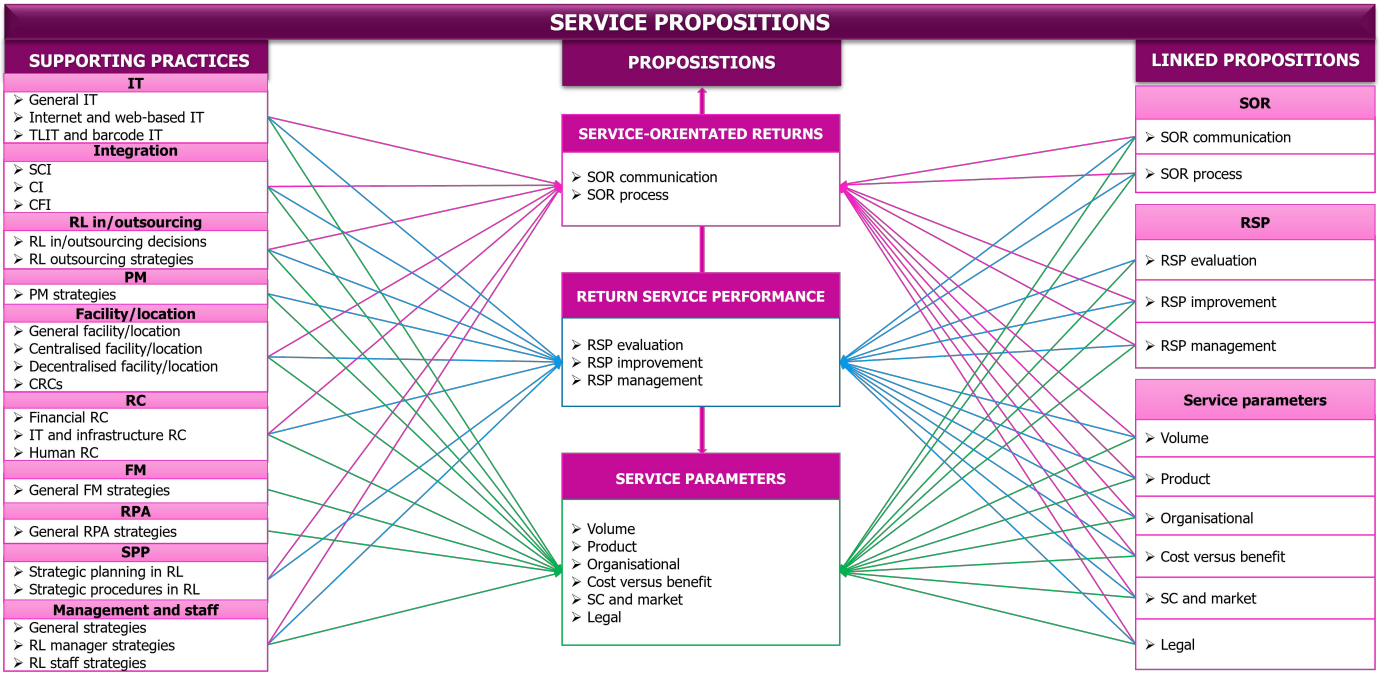

Figure 8.16 Framework for service propositions
Source: Compiled by the researcher

In terms of the *supporting practices*, the framework shows that service propositions can be supported by implementing strategies from most of the RL support practices (except disposition) from the QCA of RL literature findings. The most significant RL practice categories include IT, integration, RL in/outsourcing, facility/location, RC and management and staff practices, which means that online retailers can prioritise the implementation of these RL support practices for the successful implementation of service propositions. In contrast, the least significant support RL practice categories include FM (financial management) and RPA (return prevention and avoidance), which means online retailers can implement FM and RPA practices as a last priority for the successful implementation of service propositions.

In terms of the *propositions*, service parameters, followed by RSP propositions associate with the highest variety of RL support practices. Consequently, online retailers can benefit the most from implementing various RL support practices for the effective consideration of service parameters and implementation of RSP propositions. However, service parameters and RSP propositions might be more complicated to consider or implement for effective consumer service in RL.

Regarding the *links between service propositions*, the framework shows that RSP propositions and service parameters associate with the most proposition categories, indicating that online retailers must

pay attention to RSP propositions and service parameters for the implementation of various service proposition categories. Finally, the framework shows that all proposition categories, except legal parameters, equally link with all the service propositions. Evidently, online retailers may pay less attention to legal parameters in the consideration of various service propositions.

Table 8.**19** provides a detailed proposition framework and summary of the findings, demonstrating the service proposition categories, key practices/parameters (with elements if applicable), support RL practices, linked proposition categories, and the number of requirements per key service practice/parameter and per service proposition category. The links between the service propositions and the service pitfalls and problems will be summarised in the final framework and summary of findings for the service theme (section 8.5.4).

Table 8.19 Summary of findings for service propositions

Proposition categories	Key practices/parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category
SOR communication	**Initial SOR communication**	• Internet and web-based IT • CI • Strategic procedures	• SOR process • RSP management	• Key practices – 1 • Support practices – 3 • Total requirements – 4	• ***Key practices – 8*** • ***Support practices – 19*** • ***Total requirements – 27***
	SOR communication platforms • Telephonic SOR communication platforms • Electronic SOR communication platforms	• General IT • Internet and web-based IT • TLIT • CI • RL outsourcing • RC	• SOR communication & process • RSP improvement and management • Organisational, SC and market parameters	• Key practices – 2 • Support practices – 6 • Total requirements – 8	
	Streamlined SOR communication • Standardised return communication • Systems-based communication • Collaborative communication	• General IT • Internet and web-based IT • TLIT and barcode IT • SCI • CI • Strategic procedures in RL	• SOR communication & process • RSP improvement and management • Product, organisational, SC, market and legal parameters	• Key practices – 3 • Support practices – 7 • Total requirements – 10	
	Personalised SOR communication • Personalised assistance and arrangements before collection • Personalised contact after return processing	• CI • RC • RL manager strategies	• SOR communication & process • RSP improvement and management • SC, market and legal parameters	• Key practices – 2 • Support practices – 3 • Total requirements – 5	
SOR process	**SOR process optimisation** • Establish a lenient SOR process • Establish an efficient SOR process	• General IT • CI and CFI • RL outsourcing • Centralised facility/location • RC • Strategic planning in RL • RL staff strategies	• SOR communication & process • RSP improvement and management • Organisational, cost versus benefits, SC, market and legal parameters	• Key practices – 2 • Support practices – 8 • Total requirements – 10 •	• ***Key practices – 10*** • ***Support practices – 18*** • ***Total requirements – 28***
	SOR request • Hassle-free and streamlined return request • Various return request options	• Internet and web-based • CI • RL staff strategies	• SOR communication & process • RSP management • Organisational, SC and market parameters	• Key practices – 2 • Support practices – 3 • Total requirements – 5	
	SOR collection • Simultaneous return pick-up and replacement delivery • Streamline SOR collection • Various return drop-off points	• SCI • CFI • RL outsourcing • Decentralised facility/location	• SOR process • RSP management • Product and organisational parameters	• Key practices – 3 • Support practices – 4 • Total requirements – 7	
	SOR inspection and processing • Pre-return inspection at consumer locations • Instant replacement dispatch • Fast/instant refunds	• CI • RC • RL staff strategies	• SOR process • RSP improvement and management • Volume, product and cost versus benefits	• Key practices – 3 • Support practices – 3 • Total requirements – 6	
RSP (return service performance) evaluation	**RSP evaluation preparation** • Standardise RL processes and guidelines • Train staff • Internal and external systems integration	• SCI • CFI • PM • Strategic procedures in RL • RL staff strategy	• RSP evaluation, improvement and management • Organisational, SC parameters	• Key practices – 3 • Support practices – 5 • Total requirements – 8	• ***Key practices – 9*** • ***Support practices – 13*** • ***Total requirements – 22***
	RSP evaluation metrics and tools	• General IT • CI	• RSP evaluation, improvement and management	• Key practices – 3 • Support practices – 4	

Proposition categories	Key practices/parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category
	• Operational metrics and related tools • SC metrics and related tools • Consumer service metrics and related tools	• PM • RL manager strategy	• Volume, organisational, SC and market parameters	• Total requirements – 7	
	RSP evaluation data sources • Consumer feedback and complaint data • Consumer return data • Mystery shopper data	• CI • RL outsourcing • PM • RC	• RSP evaluation and improvement • Volume, organisational, SC, market and legal parameters	• Key practices – 3 • Support practices – 4 • Total requirements – 7	
RSP improvement	**RSP improvement preparation** • Understand consumer needs and behaviour • Identify and share service failures • Brainstorm improvement plans	• General IT and TLIT • CI and CFI • PM • Strategic procedures in RL • RL manager strategy • RL staff strategies	***Practices*** • SOR communication • RSP evaluation and improvement • Volume, organisational, SC, market and legal parameters	• Key practices – 3 • Support practices – 8 • Total requirements – 11	• ***Key practices – 7*** • ***Support practices – 17*** • ***Total requirements – 24***
	Execute RSP improvements • Address consumer complaints • Enhance consumer experience • Improve consumer service • Improve return processes	• General IT • CI and CFI • RL in/outsourcing • Decentralised facility/location • RC • Strategic planning in RL • RL staff strategies	• SOR communication & process • RSP evaluation, improvement and management • Volume, organisational, cost versus benefits, SC, market and legal parameters	• Key practices – 4 • Support practices – 9 • Total requirements – 13

Source: Compiled by the researcher

Table 8.**19** provides a detailed summary of the interview findings for service propositions, which can help online retailers identify the (1) requirements for specific service proposition categories, (2) support practices that links with the highest number of service propositions, (3) key practice and key parameter that links with the highest number of service proposition categories, (4) proposition categories that require the most key practices/parameters and key elements, (5) key practice or parameter that require the most key elements, (6) proposition categories that associate with the most support practices, (7) key practice or parameter that associates with the most support practices, and (8) proposition category and key practice/parameter that involves the most requirements for successful implementation/consideration. Some examples of using the framework will be given in the subsequent paragraphs.

In terms of the *requirements for specific service proposition categories*, an online retailer interested in implementing, for example, RSP evaluation propositions in RL can identify (1) RSP evaluation preparation, RSP evaluation metrics and tools and RSP evaluation data sources as key practices, (2) general IT, SCI, CI, CFI, RL outsourcing, PM, RC, strategic procedures in RL, and RL manager and RL staff strategies as required support RL practices, and (3) RSP evaluation, improvement and management and volume, organisational, SC and market-related and legislation parameters as associated proposition categories. Similarly, online retailers that experience, for example, fluctuations in return volume (as a key volume parameter) must focus on return volume when implementing/considering (1) CI, RL in/outsourcing PM, RC and RL staff strategies as support RL practices, (2) SOR process and RSP improvement as associated proposition categories, and (3) product and organisational parameters as associated parameter proposition categories.

The most *significant support RL practices* for the implementation of service proposition categories include CI practices. Subsequently, to effectively implement/consider various service propositions,

online retailers must prioritise the implementation of CI as a support RL practice. Furthermore, the *key practice* of RSP improvement execution and *key parameter* of organisational capabilities *associates with the highest number of proposition categories*, which means that online retailers must pay attention to RSP improvement execution and organisational capabilities for the successful implementation of various service proposition categories. Regarding the *proposition categories*, RSP management *require the most key practices/elements*, which means that online retailers must implement various key practices/elements for the effective implementation of RSP management. Additionally, the *key parameter* of organisational capabilities *requires the most key elements*, which means that online retailers must consider various key elements to effectively consider organisational capabilities.

The *proposition category* of RSP management *associate with the most support RL practices*, which means that support RL practices can be the most beneficial for the implementation of various RSP management practices. Similarly, the *key practice* of RSP management of service standards and agreements, and the *key parameter* of organisational capabilities *associate with the most support RL practices*, which means that support RL practices can be the most beneficial for implementing RSP management of service standards and agreements and considering organisational capabilities. However, RSP management as a proposition category, RSP management of service standards and agreements as a key practice and organisational capabilities as a key parameter might be more complicated to implement/consider for effective consumer service in RL.

Finally, RSP management as a *proposition category* and organisational capabilities as a *key parameter* involve the *highest number of requirements,* which means that RSP management and organisational capabilities might be a too challenging to implement/consider successfully for service effectiveness in RL. Nevertheless, before online retailers choose to implement proposition categories and key practices/parameters based on the number of requirements, they must first identify the linked benefits, which will be identified in section 8.5.4. In the next section, the service profits (subtheme 3) that can be realised through the effective implementation of service propositions, will be analysed and discussed.

8.5.3 Service profits – Subtheme 3

As illustrated in Figure 8.12, and discussed in section 8.2.2., the service profits consist of the profit categories, including consumer and operational, organisational, SC and market, and other themes, profit subcategories and related profits, which can be realised through the implementation/consideration of service-orientated return (SOR) and return service performance (RSP) propositions and service parameters. Figure 8.**17** provides an overview of the service profits, including service profit categories, service profit subcategories and related profits that can be realised through the implementation/consideration of service propositions.

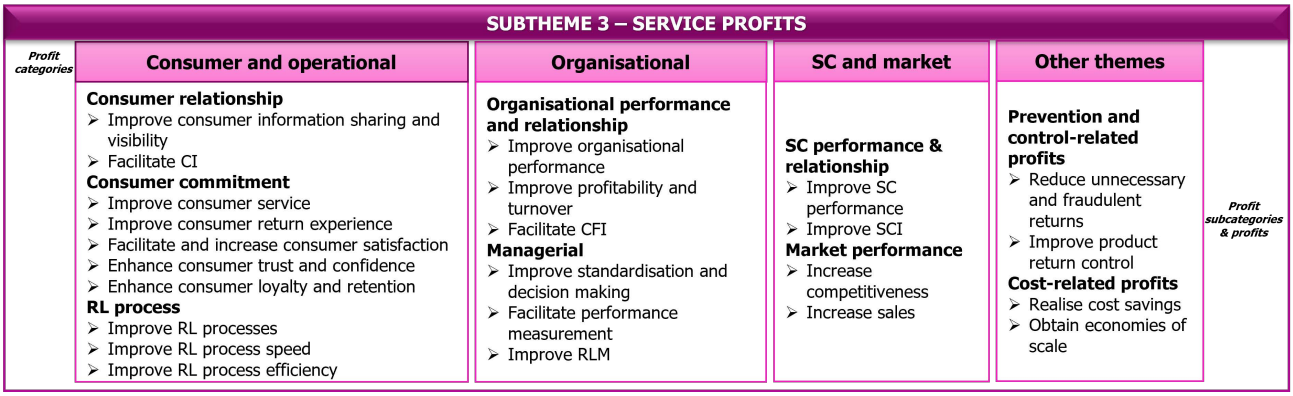

Figure 8.17 Overview of subtheme 3 - Service profits
Source: Compiled by the researcher

In the subsequent sections the main service profit categories, including consumer and operational, organisational, SC and market and other theme profits, with related profit subcategories and service profits will be discussed.

8.5.3.1 Consumer and operational service profits

Consumer and operational profits can be the most significant outcomes associated with the implementation/consideration of service propositions. As illustrated in Figure 8.**17,** consumer and operational service profits can be categorised as (1) *consumer relationship*, (2) *consumer commitment*, and (3) *RL process profits*, which will be discussed in the subsequent sections.

8.5.3.1.1 Consumer relationship profits

Consumer relationship profits involve consumer information sharing and visibility and consumer integration (CI), consumer service, consumer trust and confidence and consumer loyalty and retention, which can be realised through the implementation of various service propositions.

The participants indicated that online retailers could *improve consumer information sharing and visibility* through the implementation of key SOR communication, RSP improvement and RSP management practices and consideration of product, organisational and SC and market parameters. Specifically, consumer information sharing and visibility can be improved and facilitated by (1) implementing SOR communication platforms, streamlined SOR communication, personalised SOR communication, RSP improvement preparation and RSP management of service failures, and (2) considering organisational capabilities, SC integration and resource capabilities and consumer demographics. The following quotations support these findings:

> "So, a well-established technology platform that gives you not only the [return] status updates […] [but also] ticket logging. If you can imagine any call centre you phone in your life, you get a reference number and a ticket […] all the type of live updates. That's critical." (P5, general manager, online retailer)

> "So, if you [the consumer] purchased a television set from Retailer C, and the TV set breaks. So, now Retailer C is saying, we will come and collect it. But we're not going to give you the money, we need to get the money back

from the supplier first. And in that case, your supplier needs to act out the warranty. Now, from an integration point of view, it would be brilliant if you [as the online retailer] had access to the supplier system […] then also you can track what's happening on your supplier side, so that you can give accurate information to your customer […]." (P5, general manager, online retailer)

"We have couriers […] so the integration between the systems is very important to make sure that the customer have visibility of where their returns are." (P3, returns manager, online retailer)

"[RL manager is] one of the most underrated positions and functions currently, I believe in the online industry […] if I [the consumer] pick up a problem and I phone them [the online retailer] up, email them and they say, hang on, no problem, sir, go to this link onto this portal, give us a little bit more information and we'll take care of you." (P12, Head of logistics, online retailer)

"So, if there's been a […] collection failure that should also appear in your CRM, […] and [when] that customer calls in, [the online retailers] they're able to service their customers and are able to identify, "hey, listen, we are aware that there have been these problems, and this is what's being done to sort it […]." (P1, operations manager, 3PRL provider firm)

Moreover, the participants indicated that online retailers could *facilitate CI* by implementing key SOR communication, SOR process and RSP improvement practices and considering legal parameters. Particularly, CI can be facilitated by (1) implementing streamlined SOR communication, SOR request and RSP improvement execution, and (2) considering privacy legislation. The following quotations demonstrate this finding:

"The more visibility you give to the customer, the better experience that the customer will have. So, […] especially now with the POPI Act […], the customer has got a choice whether or not they want to stay subscribed to a certain online company or not […]. But it also allows you then that if the customer makes a purchase and that customer is fully integrated with a firm, that customer can track their own purchase order and […] the same applies for reverse logistics." (P12, Head of logistics, online retailer)

"[…] it shouldn't be a hassle for any person to log a return […] because then it will make them skittish to buy from you again. So, I think in any circumstances like that, a very good interface between the company and the customer is of the utmost importance to make it work." (P3, returns manager, online retailer)

Some studies from the reviewed literature identified profits related to consumer relationships through the implementation of practices related to service propositions. Specifically, (1) consumer information sharing can be enhanced through IT systems (Jalil, 2019:4) and contact centres (Mostert *et al.* (2017:10), (2) consumer visibility can be enhanced through integrated systems between SC partners (Meyer *et al*. 2017:13), and (3) CI can be facilitated through effective consumer information sharing and communication (Ahlén & Johansson, 2023:31; Mostert *et al.* 2017:13)

Subsequently, consumer relationship profits involving consumer information sharing, visibility and integrations, reemphasise that online retailers can address poor visibility, poor systems and poor external integration (information-related) service pitfalls, and consumer uncertainty (consumer) and poor return communication (online retailer) service problems through the implementation of service propositions for the effective RLM of consumer returns.

8.5.3.1.2 Consumer commitment profits

Consumer commitment profits involve consumer service, experience, satisfaction, trust and confidence, loyalty and retention profits, which can be realised through the implementation/consideration of various service propositions.

In terms of *consumer service*, participants emphasised that online retailers could *facilitate and improve consumer service* through key SOR process, RSP improvement and RSP management practices and key volume, product, organisational and legal parameters. Especially, consumer service can be improved through the (1) implementation of SOR process optimisation, SOR inspection and processing, RSP improvement execution and RSP management of service standards and agreements, and (2) consideration of return volume, product type, organisational capabilities and consumer protection legislation. These findings can be demonstrated by the following quotations:

> "[…] but it's worth thinking about the terms and conditions, policy and then customer proposition. What's your offer, because you could have terms and conditions that are by the book, straight down by the CPA. But your proposition could be better […] you could offer returns a lot longer than that." (P1, operations manager, 3PRL provider firm)

> "[…] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] just to give them a better service […]." (P5, general manager, online retailer)

> "I would rather have control of it [reverse logistics] here in our fulfilment centre, within our company, within our own resources. So, that's effectively giving our customers a better service." (P9, regional & online DC manager, online retailer

> "[RL performance measurement is important for] giving our customer an efficient service that's one and […] also ensuring that our fulfilment centres and the returns process is carried out efficiently." (P9, regional & online DC manager, online retailer)

Online retailers can *improve consumer return experience* by implementing key SOR communication, SOR process, RSP evaluation and RSP improvement practices and considering key volume, product, organisational, SC, market and legal parameters. Particularly, the participants mentioned that online retailers could improve consumer return experience by implementing (1) streamlined SOR communication, (2) SOR process optimisation, SOR request and SOR collection, (3) RSP evaluation data sources, and (4) RSP improvement execution. Furthermore, online retailers can improve consumer return experience by considering return volume, type of product return, organisational (information management) capabilities, SC integration and resource capabilities and privacy legislation. These findings can be supported by the following quotations:

> "The more visibility you give to the customer, the better experience that the customer will have. So, […] especially now with the POPI Act […], the customer has got a choice whether or not they want to stay subscribed to a certain online company or not […]. But it also allows you then that if the customer makes a purchase and that the customer is fully integrated with a firm […]." (P12, Head of logistics, online retailer)

> "The starting point is that the customer is always right, but not malicious. And that changes the whole customer's experience of the reverse logistics process." (P1, operations manager, 3PRL provider firm)

> "[Staff training in RL is important for] efficiencies and it should enhance the customer experience, and [help] people [staff] to know what to do, but it's an efficiency and effectiveness issue [in the return process]." (P6, logistics manager, multichannel retailer)

> "Who is going on this whole customer journey? These experiences trying to have a system that is quick, easy to use, streamlined and gives them that unique, authentic customer experience, […] that is as quick as I can purchase a product online, I must be able to return that product online […]. I think that's critical." (P10, Head of Sales and Logistics, OEM/multichannel retailer

> "[…] cross-functional [integration] is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […] they [online retailers] come up with two different deliveries […] so I thought to myself, if we could convince them that when you do a request for return and you [want to] replace […] you hook the two together. Those are the kind of cross-functional examples that I can think of." (P7, owner, 3PRL provider firm)

> "[…] the benefit [of RL outsourcing] lies in all the [return] data and the benefit can be reviewed as a customer experience benefit […]. So, I feel strongly that the benefit in having a company that specialises in reverse logistics is that they will get much more data that is relevant for your customer experience." (P12, Head of logistics, online retailer)

> "I believe outsourcing is an amazing opportunity to ensure that the customer gets the best experience possible, and the reason I say that is I don't have scale in returns." (P6, logistics manager, multichannel retailer)

Similarly, the participants indicated that online retailers could *facilitate* and *increase consumer satisfaction* through key SOR communication, SOR process, RSP evaluation, RSP improvement and RSP management practices and key product, organisational, cost versus benefit, SC and market parameters. Specifically, online retailers can facilitate and increase consumer satisfaction by implementing (1) streamlined SOR communication, (2) SOR process optimisation, SOR collection and SOR inspection and processing, (3) RSP improvement execution, and (4) RSP management formalisation and RSP management of service standards and agreements. Furthermore, considering the type of product return, organisational capabilities, costs versus benefits for SOR process and RSP propositions, SC integration and resource capabilities and SC agreements can facilitate consumer satisfaction. The impact of various service propositions on consumer satisfaction can be illustrated by the subsequent quotations:

> "[…] reverse logistics […] is keeping the customer in the know of what is going on. That's communication […] and the result is you have a happy customer […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] we tend to ensure that our customers are happy. It was the fundamental reasons why we are here, […] and in terms of strategy, it is under the umbrella of focusing on the customer. We try to ensure that the customer always has the advantage over the deal […] So, we try to focus on […] the customer […] from a strategic point of view, our customer is always right." (P9, regional & online DC manager, online retailer)

> "[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer […]." (P7, owner, 3PRL provider firm)

> "[…] a lot of the returns there's a replacement attached to it as well. For example, a customer orders an item which is blue, and they receive an item that is red. Now, you want the reverse logistics to kick in […]. So, what I do, I fulfil the correct item first […] and we ship it on an overnight delivery at our cost and then we wait for that [return] to come. So, this is where we announce trust to the customer […]. We know the customer has been satisfied." (P9, regional & online DC manager, online retailer)

> "I'm talking about both forward and reverse logistics […] making sure that you give him the best service in terms of quality […] and the end result is you have a happy customer […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] we have this IT interface that's channelling every activity or giving instruction to every stakeholder on what needs to be done. And we've got to make sure there's a lead time in place to make sure that it's governing, to

ensure that we meet the total standard lead time to achieve customer service [standards] […] and to make sure that customer is happy […].” (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Regarding consumer trust and confidence, participants indicated that online retailers could *enhance consumer trust* and *confidence* through various key SOR communication, SOR process, RSP improvement practices and key organisational, cost versus benefit and SC and market parameters. For instance, initial SOR communication, streamlined SOR communication, SOR process optimisation, RSP evaluation data sources and RSP improvement preparation can be implemented to enhance consumer confidence and trust. Additionally, considering organisational (information management) capability, costs versus benefits for SOR process propositions and SC integration and resource capabilities can help online retailers increase consumer trust and confidence. The impact of service propositions on consumer trust and confidence can be supported by the following quotations:

“[…] as I say, it’s a very important issue to share the process with the consumers […] So, that the consumer trusts you, and the consumer understands that you’re open to take a product back if they’re not 100 percent satisfied with it […].” (P4, owner/CEO, 3PRL provider firm)

“[…] the customer […] have access to all the relevant information and trust is established through transparency, which means access to current information.” (P8, logistics manager, multichannel retailer)

“We certainly need to be able to show a customer that it’s on its way to a warehouse which will be inspected and […] tell them it’s been inspected and you’re going to get a refund […]. So, that visibility creates confidence in the buying cycle.” (P8, logistics manager, multichannel retailer)

“[…] there’s the [return] policy […] that generally rolls up to customer proposition. […] it’s also the service element and the trust element […]. So, you know what? We trust you. No problem, no charge returns […] an easy return, generates trust in a business.” (P1, operations manager, 3PRL provider firm

“[…] the benefit [of RL outsourcing] lies in all the [return] data and […] you instil credibility with the customer on a reverse logistics […] knowing that if the customer is going to have a problem, the customer feels it’s fine because they deal with any of their returns.” (P12, Head of logistics, online retailer)

“[External integration is important in RL for] […] listening to your external customer, which is your consumer, then you understand their wants and needs better, which […] harbours a lot of trust between retailer and consumer.” (P4, owner/CEO, 3PRL provider firm)

Finally, online retailers can *enhance consumer loyalty* and *retention* by implementing key SOR process, RSP improvement and RSP management practices as well as considering organisational, cost versus benefit, SC and market parameters. Particularly, online retailers can enhance consumer loyalty and retention through the (1) implementation of SOR process optimisation, SOR collection, RSP improvement execution and RSP management formalisation, and (2) consideration of organisational (RL process) capabilities, costs versus benefits for SOR process propositions and SC integration and resource capabilities. The following quotations illustrate these findings:

“No problem, no charge returns […] I [the consumer] will shop there because it’s easy to return.” (P1, operations manager, 3PRL provider firm)

“[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn’t fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again.” (P7, owner, 3PRL provider firm)

“I’m talking about both forward and reverse logistics […] making sure that you give him the best service in terms of quality, in terms of the product you’ve been providing […], and the end result is you have a happy customer that buys more from you.” (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Some studies from the reviewed literature identified profits related to consumer commitment through the implementation of practices related to service propositions. Specifically, previous research found that (1) consumer service can be facilitated through lenient return policies (Hjort *et al.* 2019:782) and measuring service performance (Karlsson *et al.* 2023:9), (2) consumer experience can be enhanced through a consumer-centric approach (Karlsson *et al.* 2023:8), (3) consumer satisfaction can be facilitated and increased through outsourcing to 3PRL providers (Le, 2023:16), reduced RL process lead time (Ashan & Rahman, 2021:20; Nel & Badenhorst, 2020:128) and an efficient RL process (Ashan & Rahman, 2021:20; Ramana *et al.* 2023:6), (4) consumer trust can be enhanced through information sharing and transparency (Eriksson & Käck, 2023:25; Triani *et al.* 2019:471), (5) consumer trust and loyalty can be enhanced through lenient return policies (Oghazi *et al.* 2018:190), (6) consumer loyalty and confidence can be enhanced through a well-developed and easy return policy (Jalil, 2019:1), and (7) consumer loyalty can be enhanced through an effective RL process (Ramana *et al.* 2023:6).

Nevertheless, this study identified additional service propositions that could motivate online retailers to implement/consider SOR propositions, RSP propositions and service parameters for the effective RLM of consumer returns. Additionally, realising consumer commitment profits, reemphasises that online retailers can address the service (1) pitfalls of internal preservation (internal culture), poor visibility, poor systems and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations and dissatisfaction, consumer frustration and anger (consumer problems), poor return communication, poor return processes, a loss of consumer confidence and trust, reputational damage and a loss of sales, market share and consumers (online retailer problems) through the implementation of service propositions.

8.5.3.1.3 RL process profits

RL process profits entail improving RL processes, RL process speed and RL process efficiency through the implementation/consideration of various service propositions.

The participants emphasised that online retailers could *improve RL processes* through the key (1) SOR process practices of SOR process optimisation and SOR request, (2) RSP evaluation practices of RSP evaluation metrics and tools (i.e. using a manager as an evaluation tool) and RSP evaluation data sources, (3) RSP improvement practices of RSP improvement preparation and RSP improvement execution, (4) volume parameter of complaints volume, (5) organisational parameter of organisational (resource and IT) capabilities, and (6) cost versus benefit parameters of costs versus benefits for SOR process propositions. The following quotations convey these findings:

> "[Investment in IT for RL is] crucial. If somebody could develop a platform that could plug into anyone's online portals to smoothen the reverse logistics that would be great. Because I tell you why, this is where online

companies lose business and, in the end, they lose the customer's trust […]." (P9, regional & online DC manager, online retailer)

"[…] if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

"[…] the responsible party has to be the manager […] the customer always complained […] 90 percent related to returns. So, it just becomes so important for us […] we pull from that complaint's to iron out the creases in the [return] processes […]." (P9, regional & online DC manager, online retailer)

Additionally, the participants suggested that online retailers could *improve RL process speed* through key SOR process, RSP improvement and RSP management practices, including (1) SOR process optimisation, SOR collection and SOR inspection and process, (2) RSP improvement execution, and (3) RSP management of service standards and agreements. Moreover, online retailers can improve RL process speed by considering key volume, product, organisational, cost versus benefit and SC and market service parameters, including (1) return volume and complaints volume, (2) type of product return and type of product, (3) organisational size and organisational (resource and RL process) capabilities, (4) costs versus benefits for SOR process and RSP propositions, and (5) SC integration and capabilities. The subsequent quotations support these findings:

"[…] you should have the resources available to expedite a collection and return. Therefore, I believe that investing in information technology, that's going to […] streamline the [return] process." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

"We don't annoy the customer by saying, well, the truck will be there in two weeks' time. We have […] a very specific logistics model that we've developed, and our turnaround time is maybe forty-eight hours at max to be able to go and pick up a product." (P7, owner, 3PRL provider firm)

"I would say the best thing is to have a centralised facility […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up [return] processes […]. So, I would go towards having a centralised reclaimed centre […] so that you've got that uniform approach in your [RL] activity." (P5, general manager, online retailer)

"I'd like to return this and exchange it for a different size. The two processes happen at the same time, trigger the return and trigger the outbound order for the replacement item. So, the courier going to fetch the returned item is also dropping off the replacement […] [that] truncates that wait period […]." (P1, operations manager, 3PRL provider firm)

"[…] a large firm that has got satellite branches in all your main CBDs, it will be […] a quicker cycle of […] returning an item […] having multiple hundreds of drop off points for returning items, like [the 3PL providers] Pargo, [and] DSV has got their own. So that's another option […]." (P12, Head of logistics, online retailer)

"But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time […] [by] putting a team of people into the street and saying, you know what, returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] just to give them a better service [and] save some time and traffic at the DC." (P5, general manager, online retailer)

"[…] they [the online retailer] had fewer reverse logistics complaints […] we've [the 3PRL provider] taken their credit timings from sort of a month or more to a couple of days. So, where they would wait a month to credit a customer, now they can do it in three days." (P4, owner/CEO, 3PRL provider firm)

Finally, online retailers can *improve RL process efficiency* by implementing key SOR process, RSP improvement and RSP management practices and considering key organisational and SC and market service parameters. Specifically, online retailers can improve the efficiency of the RL process through (1) SOR process optimisation and SOR collection, (2) RSP improvement execution, (3) RSP management formalisation and RSP management of service standards and agreements, (4)

organisational size (e.g. smaller firms using drop-off points) and organisational (RL process) capabilities, and (5) SC integration and resource capabilities. The impact of service propositions on RL process efficiency can be illustrated by the following quotations:

> "[Staff training in RL is important for] efficiencies and it should enhance the customer experience, and [help] people [staff] to know what to do, but it's an efficiency and effectiveness issue [in the return process]." (P6, logistics manager, multichannel retailer)

> "[RL outsourcing is important because] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done […] very efficiently." (P7, owner, 3PRL provider firm)

> "[…] from an efficiency point of view […] if you can have a lot of drop off points for your consumers to return products, all the better […] they would be able to go to a Caltex garage and there's a drop point there." (P4, owner/CEO, 3PRL provider firm)

> "Because policy and guiding guides and principles that's agreed up front drives efficiency and compliance. You know, there's nothing worse than a consumer having an expectation of X but getting Y because somebody decided that the SOP wasn't the one, they wanted to follow today." (P6, logistics manager, multichannel retailer)

> "[RL performance measurement is important for] giving our customer an efficient service and […] also ensuring that our fulfilment centres and the returns process is carried out efficiently." (P9, regional & online DC manager, online retailer)

Several studies from the reviewed literature corresponded to the interview findings related to RL process profits. For instance, studies identified that online retailers could improve (1) RL process speed through a streamlined RL process (Nel & Badenhorst, 2020:127), decentralised facilities/locations (Bozzi *et al.* 2022:20; Karlsson *et al.* 2023:8) and dedicated skilled staff (Ahsan & Rahman, 2022:157; Mostert *et al.* 2017:13), (2) RL process efficiency through outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2), skilled staff (Ahsan & Rahman, 2022:157) and appropriate performance measures (Karlsson *et al.* 2023:9), and (3) RL processes through appropriate IT and SC information sharing (Ahlén & Johansson, 2023:31, 32), consumer return data and feedback (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:15; Lamba, *et al.* 2020:388) and managers that analyse service performance (Sajjanit & Rompho, 2019:790).

Subsequently, realising RL process profits through the effective implementation/consideration of service propositions, reemphasise that online retailers can address the service (1) pitfalls of inattention to RLM, poor RL planning, a lack of resources (poor RLM) and poor external integration, and (2) problems of a poor return experience, unmet expectations and dissatisfaction (consumer problems), poor return processes, service failures, a loss of consumer confidence and trust, and a loss of market share and consumers (online retailer problems).

8.5.3.2 Organisational service profits

As illustrated in Figure 8.**17**, organisational service profits can be categorised as *organisational performance and relationship profits* and *managerial profits*, which will be discussed and analysed in subsequent sections.

8.5.3.2.1 Organisational performance and relationship profits

Organisational performance and relationship profits involve the improvement of organisational performance, profitability and turnover, and facilitation of cross-functional integration (CFI) which can be attained through various service propositions.

Specifically, online retailers can *improve organisational performance* through the key (1) RSP evaluation practices of RSP evaluation metrics and tools and RSP evaluation data sources, (2) RSP improvement practice of RSP improvement preparation, and (3) volume parameter of complaints volume. Subsequently, RSP propositions and volume parameters can be beneficial not only for service performance in RL but also for the overall performance of the online retailer. The following quotation illustrates this finding:

> "[…] the responsible party has to be the manager […] the customer always complained […] 90 percent related to returns. So, it just becomes so important for us because this is where we improve our business. […] we pull from that complaint's to iron out the creases in the [return] processes and to improve […] our offering to the customer." (P9, regional & online DC manager, online retailer)

Additionally, online retailers can *improve profitability* and *turnover* through key SOR process and RSP improvement practices and key cost versus benefit parameters. Particularly, online retailers can improve their profitability and turnover by (1) implementing SOR process optimisation (e.g. establishing a lenient return policy and "no questions asked" return acceptance) and RSP improvement preparation, and (2) considering costs versus benefits for SOR process propositions. The impact of service propositions on improved profitability and turnover can be demonstrated by the subsequent quotations:

> "I think you'll find that the online retailers who just accept and take back the product no matter what, no questions asked at the end of the day, have a better turnover and [are] more profitable than the online retailers who are very sticky about taking product back." (P4, owner/CEO, 3PRL provider firm)

> "[…] but in terms of your ability to attract new customers, if they're looking for recommendations, if they're looking for trust, and the general consensus is, this is a great place to shop because their return policies is very good. You know that translates into bottom line." (P1, operations manager, 3PRL provider firm)

> "And if you're listening to your external customer, which is your customer, you know, then you understand their wants and needs better, which ultimately increases profitability […]." (P4, owner/CEO, 3PRL provider firm)

Finally, online retailers can *facilitate CFI,* which involves internal collaboration, cooperation and information sharing between functions involved in RL. Participants indicated that online retailers could improve CFI through the key (1) SOR process practice of SOR collection (i.e. simultaneous return pickup and replacement drop-off), (2) RSP improvement practices of RSP improvement preparation and RSP improvement execution (e.g. improving return processes through internal integration), and (3) product-related parameter of type of product return (e.g. receiving the incorrect item requiring a replacement). The following quotations supports these findings:

> "[…] making sure that you have speed, and you expedite and execute [RL processes], making sure that […] you are nimble and you swift […] for the logistics part of things. So, integration between departments is critical because the people need to work together." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "[…] cross-functional [integration] is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […] they [online retailers] come up with two different deliveries […] so I thought to myself, if we [the 3PRL provider] could convince them that when you do a request for return and you [want to] replace […] you hook the two together. Those are the kind of cross-functional examples that I can think of." (P7, owner, 3PRL provider firm)

> "[…] we have different departments, you have the service division, and you have the logistics division. And you have the reverse logistics division that falls under service. Everyone was not singing from the same hymn sheet, and there was no [cross-functional] alignment. OK, we would believe that it should be done this way. They believe it should be done the other way. Therefore, when the customer calls, the call centre realise, wow, OK, we're looking terrible here. Guys let's have a caucus. Let's have a workshop that's a brainstorming session. Let us document the processes." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

The interview findings on organisational performance profits aligned with limited studies from the reviewed literature. Nevertheless, Bozzi *et al.* (2022:15) indicated that analysing product return data can improve organisational performance. Similarly, Sajjanit and Rompho (2019:790) indicated that online retailers could improve their organisational performance by using managers to analyse service performance in RL. Additionally, Davidavičienė and Al Majzoub (2021:4) and Nel and Badenhorst (2020:127) mentioned that clear and well-designed return policies could enhance profitability. Moreover, Bozzi *et al.* (2022:19) claimed that simultaneous return pickup and exchange delivery associates with high levels of integration. Consequently, this study identified additional organisational performance and relationship profits associated with the implementation of the key SOR process, RSP evaluation and RSP improvement practices and the consideration of various service parameters.

Essentially, realising organisational performance and relationship profits, reemphasise that online retailers can address the service (1) pitfalls of functional autonomy and preservation (internal culture), inattention to RLM, poor RL planning (poor RLM), and (2) problems of a poor return experience, unmet expectations and dissatisfaction, consumer uncertainty (consumer problems), poor return process and service failures, and a loss of sales, market share and consumers (online retailer problems) through the implementation of service propositions for the effective RLM of consumer returns.

8.5.3.2.2 Managerial profits

Managerial profits involve improving standardisation and decision-making, facilitating performance measurement (PM) and improving RLM, which can be attained through various service propositions.

Specifically, some participants indicated that online retailers could *improve standardisation* and *decision-making* through the key (1) SOR process practice of SOR process optimisation, (2) RSP evaluation practice of RSP evaluation preparation (i.e. using staff training), and (3) RSP management practice of RSP management of service standards and agreements. The following quotations expand on these findings:

> "I would say the best thing is to have a centralised facility. […] from a reverse logistics point of view, having a central unit makes a lot of sense. Specifically, because you've got the ability to employ bigger and better teams that can speed up processes, make better decisions, and very importantly, you have got the same method of thinking in one facility […] you do not want six or seven reclaim centres where the six or seven people that

handled electronics all have a different view of what is used. Because that creates uncertainty with the consumer […]. So, I would go towards having a centralised reclaimed centre […] so that you've got that uniform approach in your activity." (P5, general manager, online retailer)

"[Staff training in RL is important] because it ensures consistency of approach and clear measurement of processes." (P8, logistics manager, multichannel retailer)

Additionally, online retailers can *facilitate PM* through key RSP evaluation and RSP management practices and key organisational and SC and market parameters. Particularly, PM can be facilitated through the (1) implementation of RSP evaluation preparation, RSP evaluation metrics and tools and RSP management of service standards and agreements, and (2) consideration of organisational (IT and information management) capabilities and SC integration and resource capabilities and agreements. These findings can be supported by the following quotations:

"And we have to have all employees follow the same guidelines, it's standardised […] it is part of the customer service offering and […] it also affects our KPIs, our measures, because if you don't have a standardised formula of the process, you will never be able to measure it." (P9, regional & online DC manager, online retailer)

"[…] you've got internal/external kind of system integrations, people do it in different ways, whether they do it in their CRM or their WMS […]. And then those key events are and then [monitored], like we call it timestamping. So, when you do SLA management, [systems integration helps] to understand the time when each event took place. So, you need that data somewhere in the data table, so you can measure how long it's taking, [and] are they meeting service level requirements […]." (P13, supply chain manager, multichannel retailer)

Finally, some participants identified that online retailers could *improve RLM* by implementing key SOR process and RSP management practices and considering key organisational, cost versus benefit and SC and market parameters. Specifically, online retailers can improve RLM by implementing SOR process optimisation (e.g. using 3PRL providers) and RSP management of service standards and agreements (e.g. allocating dedicated resources to RL), and considering organisational (RL process) capabilities, costs versus benefits for RSP propositions and SC integration and resource capabilities These findings can be validated by the subsequent quotations:

"We don't annoy the customer by saying, well, the truck will be there in two weeks' time. We have people out there in the field on a very specific logistics model that we've developed, and our turnaround time is maybe forty-eight hours at max to be able to go and pick up a product. Our facilities are adopted for the management of reverse logistics." (P7, owner, 3PRL provider firm)

"I think it's quite an important part of the customer journey, […] you would have to invest in some sort of resources, whether it be IT integration, investing money, putting heads where it counts towards that process and managing it." (P13, supply chain manager, multichannel retailer

No studies from the reviewed literature identified improved standardisation and RL decision making as profits related centralised facilities and staff training. Therefore, this study provides additional profits that can be realised through centralised facilities and staff training in RL for improved standardisation and decision making. Although no study mentioned that SCI can facilitate PM, Karlsson *et al*. (2023:9) found that appropriate RL information systems and internal integration can be important for effective PM in RL. Moreover, Ahlén and Johansson (2023:31) suggested that implementing IT and streamlining the return process can improve RLM. Lastly, Wang, Dang *et al.* (2021:2) agreed that RL outsourcing to 3PRL providers can improve RLM.

Essentially, improving standardisation and decision-making, facilitating PM and improving RLM through the implementation and consideration of service propositions, reemphasise that online retailers can mitigate the service (1) pitfalls of function autonomy (internal culture), inattention to RLM, poor RL planning, a lack of resources (poor RLM) and poor external integration (information-related), and (2) problems of poor return experience, unmet expectations and dissatisfaction, consumer uncertainty (consumer problems), poor return processes and service failures (online retailer problems).

8.5.3.3 SC and market service profits

SC and market service profits can be categorised as *SC performance and relationship profits* and *market performance profits* (see Figure 8.**17**), which will be discussed and analysed in subsequent sections.

8.5.3.3.1 SC performance and relationship profits

SC performance and relationship profits involve the improvement of SC performance and improvement of SC relationships through SC integration (SCI), which can be attained through several service propositions.

Specifically, participants suggested that online retailers could *improve SC performance* and *SCI* through the key (1) RSP evaluation practices of RSP evaluation preparation and RSP evaluation metrics and tools, (2) RSP management practices of RSP management of service standards and agreements and RSP management of service failures, (3) organisational parameter of organisational (IT and information management) capabilities, and (4) SC and market parameter of SC integration and resource capabilities and agreements. Evidently, measuring and monitoring the performance of SC partners can help improve SC performance and SCI. These findings can be substantiated through the subsequent quotations:

> "[…] you've got internal/external kind of system integrations, people do in different ways, whether they do it in their CRM or their WMS […] you're always going to need some internal/external integration. And then those key events are and then [monitored], like we call it timestamping. So, when you do SLA management, [systems integration helps] to understand the time when each event took place. So, you need that data somewhere in the data table, so you can measure how long it's taking, are they meeting service level requirements […]." (P13, supply chain manager, multichannel retailer)

> "[…] the more integrated, the less likelihood of collection failures, return failures, service failures. So, whether your logistics provider is external courier or an internal provider, you know that integration from a systems perspective is important." (P1, operations manager, 3PRL provider firm)

Additionally, online retailers can *improve SCI* by (1) implementing streamlined SOR communication (key SOR communication practice) and RSP management formalisation (key RSP management practice), and (2) considering type of product return and product type (key product parameters). The following quotations convey these findings:

> "So, if you [the consumer] purchased a television set from Retailer C, and the TV set breaks. So, now Retailer C is saying, we will come and collect it. But we're not going to give you the money, we need to get the money back from the supplier first. And in that case, your supplier needs to act out the warranty. Now, from an integration point of view, it would be brilliant if you [as the online retailer] had access to the supplier system, where they could say to you, you know what, we've got a list of barcodes […], I'm looking up this barcode and the barcode tells you, no problem, this is still under warranty […]. But then also you can track what's happening on your supplier side, so that you can give accurate information to your customer […]." (P5, general manager, online retailer) (P5, general manager, online retailer)

> "[…] have with the logistics company that's just doing some of your […] reverse logistics. And there's also agreements in place on our system [that] automatically integrates with their system." (P11, Demand and sales manager, FMCG distributor)

While limited studies from the reviewed literature identified SC performance as an outcome of RLM, Wang *et al.* (2020:67) found that RL information sharing across the SC and sharing of return delivery information can enhance SC performance. Moreover, a few studies identified that SCI can be improved through (1) SC information sharing (Ahlén & Johansson, 2023:32), (2) coordinated RL processes (Mostert *et al.* 2017:1), (3) SC contracts/agreements (Mostert *et al.* 2017:10) and (4) integrated IT (Frei *et al.* 2020:1618) or accessible IT systems (databases) (Mostert *et al.* 2017:10, 13).

Evidently, realising SC performance and relationship service profits, reemphasise that online retailers can address poor visibility, poor systems and poor external integration (information-related pitfalls) poor return communication and service failures (online retailer problems) through the implementation of service propositions for the effective RLM of consumer returns.

8.5.3.3.2 Market performance profits

Linking with organisational performance profits, market performance profits involve increase in competitiveness and sales, which can be attained through a few SOR propositions and service parameters.

Specifically, participants indicated that online retailers could *increase competitiveness* through SOR process optimisation (i.e. lenient SOR process) as a key SOR process practice and considering consumer protection legislation as a key legal parameter, as proven in the following quotation:

> "[…] but it's worth thinking about the terms and conditions, policy and then customer proposition. What's your offer, because you could have terms and conditions that are by the book, straight down by the CPA. But your proposition could be better. And that you could offer returns a lot longer than that […] it becomes a [competitive] differentiator in your offering […]." (P1, operations manager, 3PRL provider firm)

Additionally, online retailers can *increase sales* through key SOR communication and process practices and key cost versus benefit and SC and market parameters. Specifically, online retailers can expect an increase in sales by implementing (1) initial SOR communication (i.e. clearly communicating return processes and conditions on the website), (2) SOR process optimisation (i.e. lenient return process) and (3) SOR inspection and processing (i.e. instant refunds). Moreover, considering costs versus benefits

for SOR process propositions and consumer demographics/characteristics can help increase sales. The subsequent quotations expand on these findings:

> "[…] it's a very important issue to share the process with the consumers […] So, that the consumer […] understands that you're open to take a product back if they're not 100 percent satisfied with it, and then they understand that you're trying to make it as easy as possible for them to return a product. I think that increases your sales too, because they may come back onto your platform or your site […]." (P4, owner/CEO, 3PRL provider firm)

> "[…] the instant refund […] But it's all designed to keep you [the consumer] shopping on the site […] So, instead of looking at it as the returns are a fact of life, how do we make this work to our advantage instead of trying to protect ourselves from them?" (P1, operations manager, 3PRL provider firm)

Surprisingly, limited studies identified competitiveness as an outcome of return leniency, however, Jalil (2019:1) claimed that online retailers could use return policies to gain a competitive advantage. Likewise, no study from the reviewed literature mentioned that sharing information with consumers on the website and offering fast refunds could increase sales. Nevertheless, Andresen and Istad (2019:7) and Dapiran and Kam (2017:835) emphasised that lenient return policies can increase sales. Evidently, this study identified additional profits related to lenient RL processes, information sharing on the website and quick processing of refunds, which might motivate online retailers to implement these practices.

Essentially, the market performance profits, reemphasise that online retailers can address (1) internal preservation (internal culture), poor RL planning (poor RLM) as service pitfalls, and (2) unmet expectations, dissatisfaction, consumer uncertainty (consumer) and a loss of sales, market share and consumers (online retailer) as service problems through the implementation of service propositions for the effective RLM of consumer returns. In the next section, the service profits related to the prevention and control and cost themes will be analysed and discussed.

8.5.3.4 Other themes service profits

As illustrated in Figure 8.**17**, the other themes service profits include profits related to return *prevention and control* (theme 1) and *costs* (theme 3). In the subsequent sections, prevention and control-related and cost-related service profits will be discussed.

8.5.3.4.1 Prevention and control-related service profits

The prevention and control-related service profits involve reduction of unnecessary and fraudulent returns and improvement of product return control, which online retailers can realise through a few service propositions.

Specifically, online retailers can *reduce unnecessary* and *fraudulent returns* by implementing the key SOR process practice of SOR process optimisation (i.e. lenient return process) and the key RSP

improvement practice of RSP improvement execution (i.e. through strategic planning) as well as considering the key organisational parameter of organisational (staff) capabilities. The following quotations illustrate these findings:

> "So, you need to have a discerning employee managing that [return authorisation], because if the customers […] wanted to return the product [legitimately] and you say, no, I [as a consumer] will never go back and buy from those people [online retailers] again. But then you're also have the other side of it where people [consumers] are trying to commit fraud." (P4, owner/CEO, 3PRL provider firm)

> "[…] you can have it [reverse logistics] as part of a strategic plan to reduce [returns and] optimise, building efficiencies [in return processes]." (P6, logistics manager, multichannel retailer)

Additionally, online retailers can *improve product return control* through the key (1) SOR communication practices of SOR communication platforms and streamlined SOR communication, (2) SOR process practice of SOR collection, (3) RSP improvement practice of RSP improvement execution, (4) organisational parameter of organisational (RL process and IT) capabilities, and (5) SC and market parameter of SC integration and capabilities. The following quotations demonstrate the importance of service propositions for improving product return control:

> "So, a solid technology system that gives you the ability to change status, update status and communicate the new status to the customer […] So, you need to keep accurate track of where that product is in the system […] [because] you need to manage the customer's expectation in terms of progress, you also need to make sure that you don't lose that product […]." (P5, general manager, online retailer)

> "[RL outsourcing is important because] the control […] of the stock that it doesn't get left for six months before […] somebody says, we've got to get this nonsense out of here, and […] I [the 3PRL provider] pick it [the product] up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)

The interview findings related to the reduction of unnecessary and fraudulent returns align with the studies of Dapiran and Kam (2017:832) and Zhang *et al.* (2023:10, 16), claiming that trained staff can help reduce unnecessary and fraudulent returns. Moreover, Nel and Badenhorst (2020:128) and Solati *et al.* (2023:2) suggested that a streamlined and efficient RL process can reduce unnecessary returns. However, no studies found improved product return control as a profit that could be realised through practices related to SOR communication, RSP improvement and service parameters. Evidently, this study provides further motivation for online retailers to implement SOR communication and RSP improvement propositions and consider organisational and SC and market parameters.

Subsequently, reducing unnecessary and fraudulent product returns and improving product control as service profits, reemphasise that online retailers can address the service (1) pitfalls of internal preservation (internal culture), poor RL planning (poor RLM), poor visibility, poor systems and poor external integration (information-related), and (2) problems of unmet expectations and dissatisfaction (consumer problems), poor return communication, poor return processes and a loss of sales (online retailer problems) through the implementation of service propositions for the effective RLM of consumer returns.

8.5.3.4.2 Cost-related service profits

The cost-related service profits involve cost savings and economies of scale that can be realised through various service propositions.

The participants indicated that online retailers could realise *cost savings* in RL by implementing key SOR process and RSP improvement practices and considering key volume, product, organisational and SC and market parameters. Specifically, cost savings can be realised through the (1) implementation of SOR process optimisation, SOR collection, SOR inspection and processing and RSP improvement execution, and (2) consideration of return volume, type of product return, type of product, organisational (RL process) capabilities and SC integration and resource capabilities. The following quotations demonstrate these findings:

> "[RL outsourcing is important because] there are significant costs, maybe not directly as a comparison line for line in the income statement, but there are costs that can be saved elsewhere […] how do you attribute saving costs where your customers are getting that kind of service? That you [as the consumer] buy it [a clothing item] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm)

> "[…] cross-functional [integration] is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […]. I think we could save […] a fortune […] when you do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money […] [by] putting a team of people into the street and saying, you know what, returns is such a big thing in our world […]. So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there? […] So, they can sell them the correct device […] just to give them a better service […]." (P5, general manager, online retailer)

Finally, online retailers can obtain *economies of scale* through the key RSP improvement practice of RSP improvement execution, the key volume parameter of return volume and the key SC and market parameter of SC integration and resources capabilities. The following quotation demonstrates economies of scale as a cost-related service profit:

> "I believe outsourcing is an amazing opportunity to ensure that the customer gets the best experience possible, and the reason I say that is I don't have scale in returns. […] it becomes part of the courier is greater scale." (P6, logistics manager, multichannel retailer)

No studies in the reviewed literature identified that cost savings can be realised through outsourcing to 3PRL providers, pre-return inspection and CFI. However, Bozzi *et al.* (2022:19) mentioned that simultaneous collection and delivery avoid vehicle idleness and emptiness, which implies that transportation costs could be saved. Additionally, Gu *et al.* (2019:160) agreed that outsourcing RL can enhance economies of scale, emphasising the importance of considering return volume for the effective RLM of consumer returns.

Evidently, cost-related service profits, reemphasise that online retailers can address functional autonomy (internal culture), inattention to RLM and poor RL planning (poor RLM) service pitfalls, and

a poor return experience, unmet expectations and dissatisfaction (consumer), poor return process, service failures, and a loss of sales and consumers (online retailer) service problems through the implementation of service propositions for the effective RLM of consumer returns.

Essentially, online retailers can realise various consumer, operational, organisational, SC, market, prevention and control-related and cost-related profits through the implementation/consideration of various service propositions, reemphasising that service propositions can be important for the effective RLM of consumer returns. In the next section, the service theme will be concluded with a framework and summary of findings.

8.5.4 Framework, summary and analysis of findings for Theme 2 - Service for the effective RLM of consumer returns

In section 8.2.2, the application of the overall framework, summary and analysis of findings for each theme were described. Accordingly, based on the interview findings presented in section 8.5, Figure 8.**18** shows a broad framework and overview of the links between service pitfalls/problems, propositions and profits.

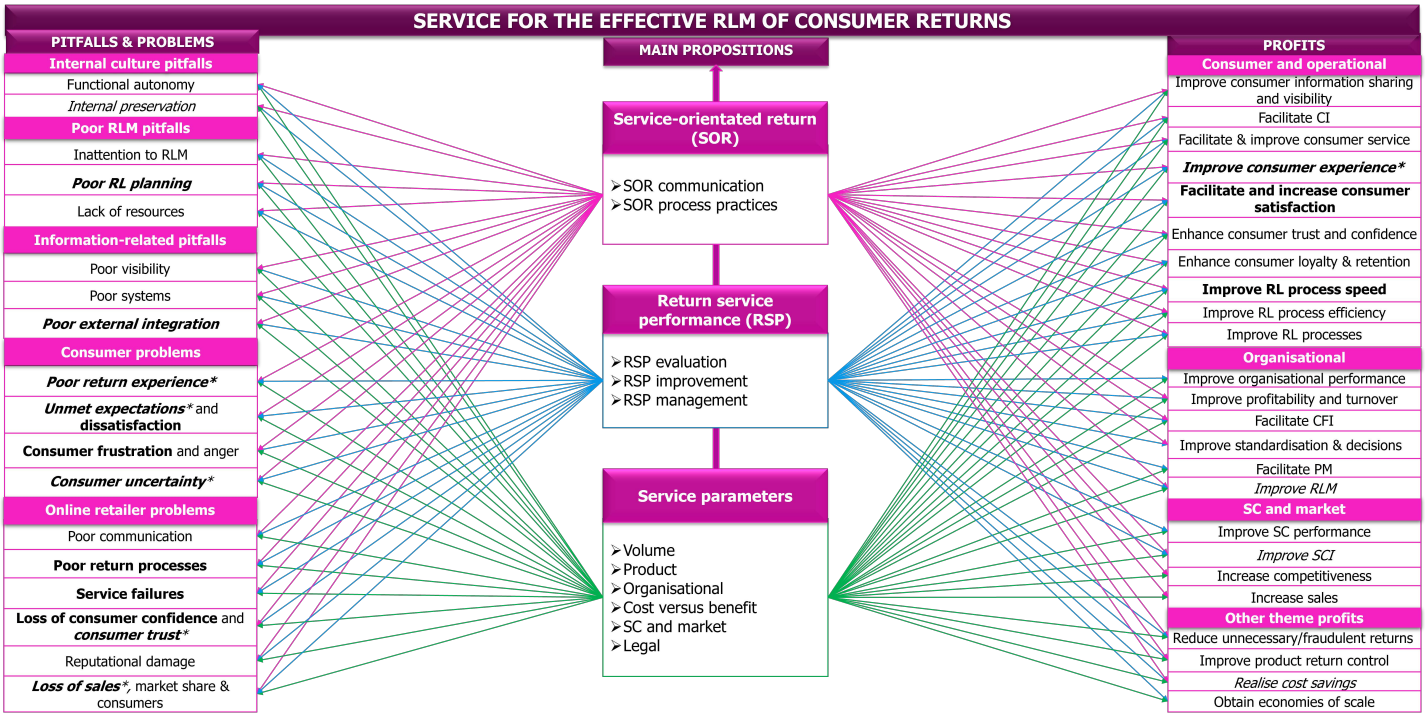

Figure 8.18 Framework for Theme 2 – Service for the effective RLM of consumer returns
Source: Compiled by the researcher

The most significant service pitfalls, problems and profits illustrated in Figure 8.**18** were emphasised in several ways. Particularly, per service pitfall, problem and profit category, the most significant pitfall, problem and profit (associated with the most service proposition categories) was emphasised through *italics*, the top two service pitfalls and problems (associated with ten or more proposition categories)

and service profits (associated with eight or more proposition categories) were emphasised in **bold**, and the highest and most significant service pitfall/problem (associated with eleven proposition categories) and service profit (associated with nine proposition categories) was emphasised through an asterisk*.

Figure 8.**18** shows that all the main *service pitfall/problem* categories associate with all the main propositions, which means that online retailers can address any service pitfall/problem category through the implementation of any service propositions. Likewise, all service pitfalls/problems associate with all service propositions, indicating that any service proposition can be implemented to address service pitfalls and problems. Nevertheless, *per service pitfall/problem category*, the framework shows that the *most significant service pitfalls/problems* (presented in *italics*) that can be addressed by service proposition categories (listed under the main propositions) include (1) internal preservation (internal culture pitfall), (2) poor RL planning (poor RLM pitfall), (3) poor external integration (information-related pitfall), (4) poor return experience, unmet expectations and consumer uncertainty (consumer problems), and (5) loss of consumer trust and a loss of sales (online retailer problems).

Additionally, the *top two most significant service pitfalls/problems* (presented in **bold**) that can be addressed by the implementation of (ten or more out of 11) service proposition categories include, poor return experience, unmet expectations, consumer uncertainty, loss of consumer trust and a loss of sales (11 each), poor external integration, poor RL planning, dissatisfaction, consumer frustration, poor return processes, service failures, and a loss of consumer confidence (ten each). Subsequently, the *highest* and *most significant service pitfalls/problems* (presented with an asterisk*) that can be addressed by service proposition categories include poor return experience, unmet expectations, consumer uncertainty, loss of consumer trust and a loss of sales. Evidently, online retailers can implement any service proposition category to address poor return experience, unmet expectations, consumer uncertainty, a loss of consumer trust and a loss of sales.

In terms of the *service propositions*, the framework shows that all service propositions can be significant in terms of addressing various service pitfalls/problems, reemphasising that online retailers can prioritise the implementation/consideration of service propositions to address service pitfalls/problems. However, the framework demonstrates that RSP propositions and service parameters can be the most significant propositions in terms of realising various service profits, indicating that online retailers can prioritise the implementation of RSP propositions and consideration of service parameters to realise various service profits.

For the *service profits*, the framework shows that all service profit categories associate with all main service propositions, which means that online retailers can realise any service profit category through

the implementation of any service proposition. Furthermore, the service propositions associate with (1) all consumer and operational profits, (2) most organisational profits (except organisational performance and PM), (3) the SC and market profit of improving SCI, and (4) most other service profits (except obtaining economies of scale). Therefore, online retailers can implement any service proposition to realise various consumer and operational profits, organisational profits, improved SCI (SC and market) profit and other theme profits.

Additionally, *per service profit category* the framework shows that the *most significant service profits* (presented in *italics*) that can be realised through the implementation of various service proposition categories, include (1) improving consumer experience (consumer and operational profit), (2) improving RLM (organisational profit), (3) improving SCI (SC and market profit), and (4) realising cost savings (other theme profit). Moreover, the *top two most significant service profits* (presented in **bold**) that can be realised through the implementation of (eight or more out of 11) service proposition categories include improving consumer return experience (nine), facilitating and improving consumer satisfaction and improving RL process speed (eight each). Subsequently, the *highest* and *most significant service profit* (presented with an asterisk*) that can be realised through various service proposition categories includes improving consumer return experience. Evidently, online retailers can implement any service proposition category to improve consumer return experience for the effective RLM of consumer returns.

Table 8.**20** provides a summary of the main findings for the service theme, focussing on the service proposition categories, key practices/parameters and related service pitfalls, problems and profits. Additionally, the table provides columns giving an overview of the costs (total requirements as identified in Table 8.**19**) versus the benefits (total benefits in terms of number of addressed pitfalls and problems and realised profits) per key practice/parameter and proposition category.

Table 8.20 Summary of findings for theme 2 - Service for the effective RLM of consumer returns

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practice/ parameter	Cost/benefit proposition category
SOR communication	**Initial SOR communication**	***Poor RLM*** • Poor RL planning ***Information-related*** • Poor external integration	***Consumer*** • Poor return experience • Unmet expectations • Consumer frustration & uncertainty ***Online retailer*** • Poor return communication • Loss of consumer trust	***Consumer and operational*** • Enhance consumer trust & confidence ***SC and market*** • Increase sales	• Costs – 4 • Benefits – 11 • +7	• ***Costs – 27*** • ***Benefits – 74*** • ***+47***
	SOR communication platforms	***Poor RLM*** • RL planning • Lack of resources ***Information-related*** • Poor visibility • Poor systems • Poor external integration	***Consumer*** • Poor return experience • Consumer frustration and anger • Consumer uncertainty ***Online retailer*** • Poor return communication • Poor return processes • Service failures • Loss of consumer confidence & trust • Reputational damage • Loss of sales	***Consumer and operational*** • Improve consumer information sharing and visibility ***Other themes*** • Improve product return control	• Costs – 8 • Benefits – 19 • +11	
	Streamlined	***Poor RLM***	***Consumer***	***Consumer and operational***	• Costs – 10	

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practice/ parameter	Cost/benefit proposition category
	SOR communication	• Poor RL planning ***Information-related*** • Poor visibility • Poor systems • Poor external integration	• Poor return experience • Unmet expectations & dissatisfaction • Consumer frustration and anger • Consumer uncertainty ***Online retailer*** • Poor return communication • Poor return processes • Service failures • Loss of consumer confidence & trust • Loss of sales	• Improve consumer information sharing and visibility • Facilitate CI • Improve consumer return experience • Facilitate/increase consumer satisfaction • Enhance consumer trust & confidence ***SC and market*** • Improve SCI ***Other themes*** • Improve product return control	• Benefits – 25 • +15	
	Personalised SOR communication	***Internal culture*** • Internal preservation ***Poor RLM*** • Inattention to RLM • Lack of resources ***Information-related*** • Poor external integration	***Consumer*** • Poor return experience • Unmet expectations & dissatisfaction • Consumer frustration and anger • Consumer uncertainty ***Online retailer*** • Poor return communication • Service failures • Loss of consumer confidence & trust • Reputational damage • Loss of sales and consumers	***Consumer and operational*** • Improve consumer information sharing and visibility	• Costs – 5 • Benefits – 19 • +14	
SOR process	**SOR process optimisation**	***Internal culture*** • Functional autonomy • Internal preservation ***Poor RLM*** • Poor RL planning • Lack of resources ***Information-related*** • Poor systems • Poor external integration	***Consumer*** • Poor return experience • Unmet expectations & dissatisfaction • Consumer frustration • Consumer uncertainty ***Online retailer*** • Poor return processes • Service failures • Loss of consumer confidence & trust • Loss of sales, market share and consumers	***Consumer and operational*** • Facilitate/improve consumer service and satisfaction • Improve consumer return experience • Enhance consumer trust, confidence, loyalty and retention • Improve RL process speed • Improve RL process efficiency • Improve RL processes ***Organisational*** • Improve profitability and turnover • Improve standardisation and decision making • Improve RLM ***SC and market*** • Increase competitiveness & sales ***Other themes*** • Reduce unnecessary and fraudulent returns • Realise cost savings	• Costs – 10 • Benefits – 38 • +28	• ***Costs – 28*** • ***Benefits – 93*** • ***+65***
	SOR request	***Internal culture*** • Internal preservation ***Information-related*** • Poor systems • Poor external integration	***Consumer*** • Poor return experience • Consumer frustration & uncertainty ***Online retailer*** • Poor return communication • Poor return processes • Service failures • Loss of consumer confidence & trust • Loss of sales, market share and consumers	***Consumer and operational*** • Facilitate CI • Improve consumer return experience • Improve RL processes	• Costs – 5 • Benefits – 17 • +12	
	SOR collection	***Internal culture*** • Functional autonomy ***Poor RLM*** • Poor RL planning ***Information-related*** • Poor external integration	***Consumer*** • Poor return experience • Unmet expectations & dissatisfaction • Consumer uncertainty ***Online retailer*** • Poor return processes • Service failures • Loss of sales and consumers	***Consumer and operational*** • Improve consumer return experience • Facilitate/increase consumer satisfaction • Enhance consumer loyalty & retention • Improve RL process speed • Improve RL process efficiency ***Organisational*** • Facilitate CFI ***Other themes*** • Improve product return control • Realise cost savings	• Costs – 7 • Benefits – 20 • +13	
	SOR inspection and processing	***Internal culture*** • Internal preservation ***Poor RLM*** • Lack of resources ***Information-related*** • Poor external integration	***Consumer*** • Poor return experience • Unmet expectations & dissatisfaction • Consumer frustration & uncertainty ***Online retailer*** • Poor return communication • Poor return processes • Service failures • Loss of consumer trust • Loss of sales	***Consumer and operational*** • Facilitate/improve consumer service and satisfaction • Improve RL process speed ***SC and market*** • Increase sales ***Other themes*** • Realise cost savings	• Costs – 6 • Benefits – 18 • +12	
RSP evaluation	**RSP evaluation preparation**	***Internal culture*** • Functional autonomy	***Consumer*** • Poor return experience • Unmet expectations & dissatisfaction	***Organisational*** • Improve standardisation and decision making	• Costs – 8 • Benefits – 19	• ***Costs – 22*** • ***Benefits –***

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practice/ parameter	Cost/benefit proposition category
		Poor RLM •Poor RL planning ***Information-related*** •Poor visibility, systems & external integration	•Consumer frustration •Consumer uncertainty ***Online retailer*** •Poor return processes •Service failures •Loss of consumer confidence & trust	•Facilitate PM ***SC and market*** •Improve SC performance & SCI	•+11	***61*** • ***+39***

Source: Compiled by the researcher

Table 8.**20** provides a detailed summary of the service propositions, problems, pitfalls and profits and the cost versus benefit per key practice/parameter and proposition category. Online retailers can use this framework in several ways for the effective RLM of consumer returns. Specifically, online retailers can identify the (1) benefits for specific service propositions categories and key practices/parameters (representing the propositions), (2) propositions for specific service pitfalls, (3) propositions for specific service problems, (4) propositions for specific service profits, (5) most significant propositions for addressing service pitfalls, (6) most significant propositions for addressing service problems, (7) most significant propositions for realising service profits, and (8) most and least beneficial propositions in terms of the costs versus the benefits. Examples of applying Table 8.**20** for the effective RLM of consumer returns will be given in the subsequent paragraphs.

For the *benefits associated with specific propositions*, an online retailer can see that implementing, for example, RSP management propositions can help them (1) address functional autonomy, inattention to RLM, poor RL planning, lack of resources and poor external integration pitfalls, (2) address poor return experience, unmet expectations, dissatisfaction, consumer frustration, anger and uncertainty, poor return processes, service failures, loss of consumer confidence and trust, reputational damage, and a loss of sales, market share and consumers problems, and (3) improve consumer return experience, enhance consumer trust and confidence, improve RL processes, organisational performance, standardisation and decision-making, facilitate PM and improve SC performance and integration. Additionally, an online retailer interested in implementing, for example, the key SOR communication practice of initial SOR communication can identify that (1) poor RL planning and poor external integration pitfalls can be addressed, (2) poor return experience, unmet expectations, consumer frustration and uncertainty, poor return communication and loss of consumer trust problems can be addressed, and (3) consumer trust and confidence and an increase in sales profits can be realised.

In terms of the *propositions for specific service pitfalls*, an online retailer that identified, for example, functional autonomy, as a significant service pitfall can implement/consider the key (1) SOR process practices of SOR process optimisation and SOR collection, (2) RSP evaluation practice of RSP evaluation preparation, (3) RSP improvement practices of RSP improvement preparation and RSP improvement execution, (4) RSP management practice of RSP management of service standards and

agreements, (5) product parameter of type of product return, and (6) organisational parameter of organisational capabilities as mitigating propositions for the effective RLM of consumer returns.

Regarding the *propositions for specific service problems*, an online retailer that identified, for example, reputational damage as a service problem can implement/consider the key (1) SOR communication practices of SOR communication platform and personalised SOR communication, (2) RSP evaluation practices of RSP evaluation metrics and tools and RSP evaluation data sources, (3) RSP improvement practices of RSP improvement preparation and RSP improvement execution, (4) RSP management practices of RSP management of service standards and agreements and RSP management service failures, (5) volume parameters of return volume and complaints volume, (6) organisational parameters of organisational size and capabilities, and (7) SC and market parameters of SC integration and resource capabilities and SC agreements as mitigating propositions for the effective RLM of consumer returns. In terms of the *propositions for specific service profits,* an online retailer seeking, for example, to improve profitability and turnover can implement/consider the key (1) SOR process practice of SOR process optimisation, (2) RSP improvement practice of RSP improvement preparation, and (3) cost versus benefit parameters of cost versus benefits for implementing SOR process propositions.

Concerning the *most significant propositions for addressing service pitfalls*, online retailers that experience various service pitfalls in RL can prioritise the implementation of SOR (communication and process) propositions and consideration of organisational parameters as the most beneficial service proposition categories. Additionally, online retailers that experience various service pitfalls in RL can prioritise the implementation of the key RSP improvement practice of RSP improvement execution and consideration of the key organisational parameter of organisational capabilities as the most beneficial key practice and parameter.

Pertaining to the *most significant propositions for addressing service problems,* online retailers that experience various service problems in RL can prioritise the implementation of SOR process propositions and consideration of SC and market parameters as the most beneficial service proposition categories. Additionally, online retailers that experience various service problems can prioritise the implementation of the key RSP improvement practice of RSP improvement preparation and consideration of the key organisational parameter of organisational capabilities as the most beneficial key practice and parameter. Relating to the *most significant propositions for realising service profits*, online retailers that seek various service profits in RL can prioritise the implementation of SOR process propositions and consideration of SC and market parameters as the most beneficial service proposition categories. Additionally, online retailers that seek various service profits can prioritise the implementation of the key SOR process practice of SOR process optimisation and consideration of the

key organisational parameter of organisational capabilities as the most beneficial key practice and parameter.

Finally, for the *costs versus benefits*, **Error! Reference source not found.** shows that the *most beneficial proposition categories* include SOR process propositions in terms of the costs (28) versus benefits (93), and SC and market parameters in terms of costs (10) versus benefits (65). Consequently, online retailers can prioritise the implementation of SOR process propositions and consideration of SC and market parameters for the effective RLM of consumer returns. Additionally, the *most beneficial key practice* and *parameter* include SOR process optimisation in terms of the costs (10) versus benefits (38) and SC integration and resource capabilities in terms of the costs (4) versus benefits (33). Subsequently, online retailers can prioritise the implementation of SOR process optimisation as a key practice and consideration of SC integration and resource capabilities as a key parameter for the effective RLM of consumer returns.

In contrast, the *least beneficial proposition categories* include RSP evaluation in terms of the costs (22) versus benefits (62), and legal parameters in terms of the costs (4) versus benefits (22), which means that online retailers can implement RSP evaluation propositions and consider legal parameters as last priorities. Additionally, the *least beneficial key practice* and *parameter* include initial SOR communication in terms of the costs (4) versus benefits (11) and organisation size in terms of the costs (4) and benefits (10), indicating that online retailers may implement/consider initial SOR communication as a key practice and organisation size as a key parameter as last priorities.

Nevertheless, all service propositions can be beneficial, and online retailers experiencing specific service pitfalls/problems or seeking specific service profits can identify the most suitable service propositions to implement and consider for the effective RLM of consumer returns. Essentially, "service for the effective RLM of consumer returns" can be regarded as a critical factor for the effective RLM of consumer returns in online retailing. Therefore, online retailers must focus on identifying service pitfalls and problems in RL for the effective implementation/consideration of mitigating service propositions (practices/parameters) and realisation of service profits to manage consumer returns effectively. In the next section, the findings related to theme 3 will be presented and analysed.

8.6 THEME 3: COST FOR THE EFFECTIVE RLM OF CONSUMER RETURNS

Theme 3 involves cost reduction and management initiatives for the effective RLM of consumer returns in online retailing. According to Das *et al.* (2020:48), the motivation for online retailers to implement RLM centres around financial gains. Consequently, online retailers can use RLM to gain

savings and take advantage of opportunities to recover value from consumer returns (Ahsan & Rahman, 2021:21). Accordingly, all participants mentioned throughout their discussions the importance of costs for the RLM of consumer returns in online retailing. Therefore, "cost" was identified as a RLM factor, which means that online retailers must pay attention to costs for the effective RLM of consumer returns. The following quotation illustrates the significance of costs for RLM:

> "You know, as I said at the outset, I got involved because I think people treat reverse logistics with contempt. They don't treat it with the importance that it deserves. And I think it is an area where huge, huge, huge amounts of money could be saved […]." (P7, owner, 3PRL provider firm)

Figure 8.3, in section 8.2.2, provides an overview of theme 3, including the subthemes and related categories. Figure 8.19 provides a snapshot derived from Figure 8.3, showing an overview of Theme 3 – *Cost for the effective RLM of consumer returns*.

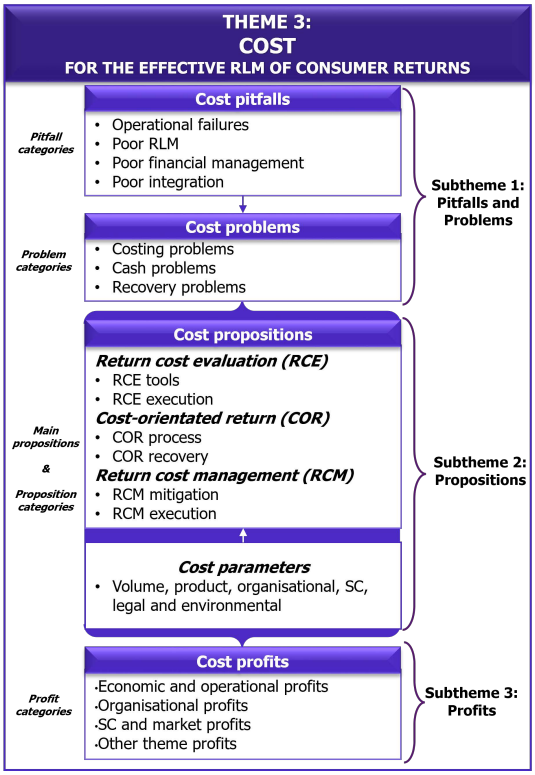

Figure 8.19 Overview of Theme 3 – Cost for the effective RLM of consumer returns
Source: Compiled by the researcher

In the subsequent sections, a detailed overview, analysis and discussion of the interview findings for each subtheme, including cost pitfalls and problems (subtheme 1), cost propositions (subtheme 2) and cost profits[24] (subtheme 3) will be given. The section concludes with a framework, summary and overall analysis of the cost findings for the effective RLM of consumer returns.

[24] Since the term "profit" (subtheme 3) is used to describe the benefits or outcomes of the propositions of all themes, referencing "cost profits" means cost benefits or outcomes, and not revenue or financial gains.

8.6.1 Cost pitfalls and problems – Subtheme 1

As illustrated in Figure 8.19, and discussed in section 8.2.2, the cost pitfall categories include operational failure, poor RLM, poor financial management (FM) and poor integration, and the cost problem categories include costing, cash and recovery problems. Figure 8.**20** provides a detailed overview of the cost pitfalls and problems in RL that will be discussed in this section.

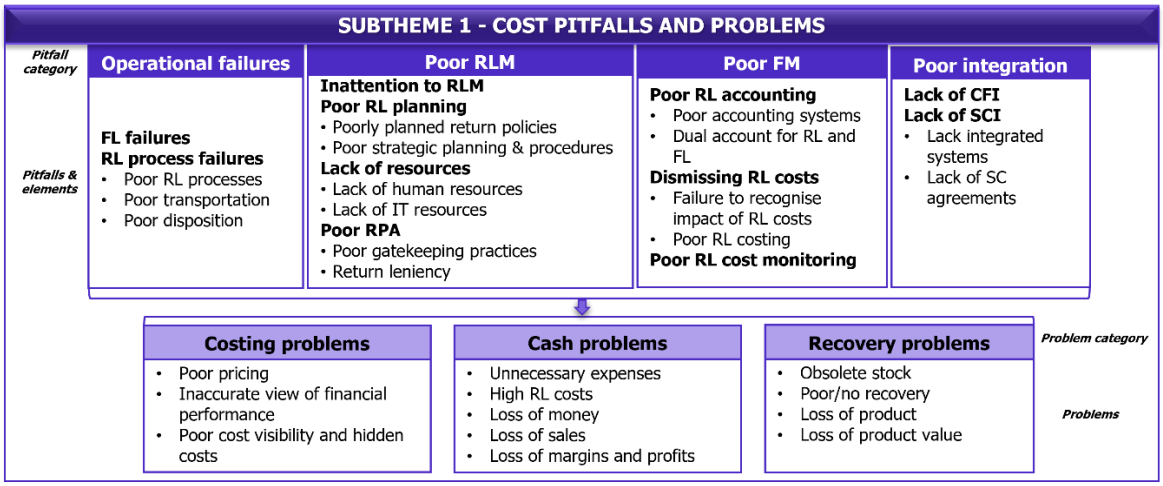

Figure 8.20 Detailed overview of cost pitfalls and problems
Source: Compiled by the researcher

Based on the interview findings, Figure 8.**20** shows the *cost pitfall* categories with related pitfalls and pitfall elements (if applicable), and the *cost problem* categories with related problems, which can hamper the effective RLM of consumer returns in online retailing. Section 8.2.2 provides details regarding the presentation and format of the pitfalls and problems applicable to each theme. In the subsequent sections, the cost pitfall categories of operational failures, poor RLM, poor financial management (FM) and poor integration and associated pitfalls, pitfall elements and costing, cash and recovery problems will be discussed. The section concludes with a framework and summary of findings to demonstrate the relationship between specific cost pitfalls and problems.

8.6.1.1 Operational failures pitfalls and related cost problems

Operational failures as a cost pitfall category involves the cost pitfalls of *FL failures* and *RL process failures* (see **Figure 8.20**), which can result in various costing, cash and recovery problems.

Specifically, *FL failures* as a cost pitfall involves problematic FL practices that lead to high product returns, resulting in poor pricing (costing problem). For example, if poor picking and delivery practices result in wrong order deliveries, online retailers may overinflate product prices, adding unnecessary return transportation costs to the product price. The following quotation demonstrates the impact of FL failures on the costing problem of poor pricing in RL:

> "I can use that percentage of cost to accurately gauge my transport component onto my selling price, but importantly not overinflated because of my own wastage […]. So, my own waste and my own inefficiencies, I'm

> going to load into my price […]. It's just, you know, it's an inaccurate way of doing it […] because of your inefficiencies." (P5, general manager, online retailer)

Although FL failures can lead to costing problems, *RL process failures* as a cost pitfall can be more problematic for online retailers. The participants indicated that RL process failures involve poor RL processes, poor transportation and poor disposition (pitfall elements), which can result in various costing, cash and recovery problems for online retailers. Particularly, if online retailers execute RL processes poorly, they may damage their brand, resulting in hidden costs (i.e. brand costs) (costing problem) and unnecessary expenses (cash problem), as emphasised in the following quotation:

> "[…] there is a brand cost to it, you know, if you did badly, it's going to impact your brand so that, you know, it might be that kind of a hidden cost. And obviously, financial cost in terms of refunding for sales." (P13, supply chain manager, multichannel retailer)

Moreover, poor transportation (i.e. poor handling and packaging of returned products) can result in products being damaged or becoming defective during transportation from the consumer location to the online retailer location. This can be highly problematic for the online retailer since the product may no longer be resaleable and recoverable, involving the cash problems of high RL costs, and a loss of money and sales and the recovery problem of no recovery and a loss of product. The following quotations illuminate these findings:

> "And often when the product is returned, there could be a quality defect that arises in the returns process, not necessarily in the delivery process. And that means that the product now is not salvageable and not saleable when it has been returned. So, it's a double whammy, it is a lost sale plus there's no recovery. Plus, the cost of the initial delivery and the cost of the return collection delivery portion. So, they will pay for that product four times minimum." (P2, owner, supply chain consultancy firm)

> "[…] this customer has returned you your Jimmy Choo stilettos, saying that as an unwanted item. But when they arrive, they've come through the courier network and the head of the heels, snapped off. Now, you could try to hold the customer liable for that, but I think you would get short shifted. So, you actually going to refund the customer, but you're going to dispose of those that items. It's not going to get restocked." (P1, operations manager, 3PRL provider firm)

Finally, poor disposition can cause several cost problems for online retailers, including recovery problems and cash problems. For instance, not making fast and accurate disposition decisions and leaving returned products to accumulate in the warehouse can lead to obsolete products and products losing value with poor/no recovery (recovery problems), unnecessary expenses, high RL costs and a loss of money and margins (cash problems). These findings can be supported by the subsequent quotations:

> "The fact that it becomes obsolete very quickly and that it's difficult to assess and prepare means that at the end of the day, you will actually offload it for a lot less […]. The other problem is what do you do before you dispose [or] before you get rid of it. Where do you stick it? [Retailer A] would generate at peak about 15 pallets a day stacked. So, you're talking a cubic meter of product. Now, that's valuable warehouse space. So, you start to accumulate cost. It's losing value." (P1, operations manager, 3PRL provider firm)

> "[…] if I don't turn my stock in twenty-seven days, it's costing me money to have that stock on the floor." (P12, Head of logistics, online retailer)

> "So, by the time you've worked through all the garbage that […] obsolete stock and affected the repairs, those items are now less desirable for. So, the margin that you can make in it, gets less a lot quicker. The longer it's out of the market, the less money you're making, it becomes less desirable. But it literally is given away for parts or, you know, things like metal salvage kind of stuff." (P1, operations manager, 3PRL provider firm)

A few studies from the reviewed literature identified cost pitfalls and problems in line with the interview findings. Specifically, RL process failures can result in hidden costs related to brand value (Bozzi *et al.* 2022:12), poor handling of product returns causes a loss of product value (Prajapati *et al.* 2021:15) and products returned in damaged condition causes a loss of resale value (Bozzi *et al.* 2022:22). Nevertheless, this study uniquely identifies that FL failures can cause pricing (costing) problems and slow disposition processes can cause various cash and recovery problems. Subsequently, online retailers need to identify practices to mitigate the operational failure pitfalls and related costing, cash and recovery problems for the effective RLM of consumer returns.

8.6.1.2 Poor RLM pitfalls and related cost problems

As illustrated in **Figure 8.20**, Poor RLM as a cost pitfall category involves the cost pitfalls of *inattention to RLM*, *poor RL planning*, *lack of resources* and *poor return prevention and avoidance* (RPA), which will be discussed in subsequent sections with related costs problems.

8.6.1.2.1 Inattention to RLM pitfall and related cost problems

Inattention to RLM as a cost pitfall means that online retailers treat RL as an "afterthought", not paying attention to the effective management of consumer returns. Inattention to RLM mostly stem from the failure of understanding the cost implications of poor RL processes and practices. The participants indicated that inattention to RLM can lead to poor cost visibility (costing problem), high RL costs and a loss of money (cash problems). The consequences of inattention to RLM as a poor RLM pitfall can be demonstrated by the following quotations:

> "The problem is that companies are not paying attention to reverse logistics, and it actually costs a lot of money […] if you just, like, not give attention to it, you don't even know how much it costs […]." (P6, logistics manager, multichannel retailer)
>
> "[…] return logistics needs to be managed because it can grow into a loss for the company in the wink of our eyes." (P11, Demand and sales manager, FMCG distributor)
>
> "[…] reverse logistics was sort of an afterthought for the company. And therefore, when they actually started to do the reverse logistics and the returns, we found a lot of issues. And obviously the company lost a lot of money by doing that." (P3, returns manager, online retailer)

These interview findings related to inattention to RLM as a cost pitfall coincide with the findings of Ahlén and Johansson (2023:31), which identified that a lack of management attention can cause inefficiencies and contribute to high RL costs. Therefore, online retailers need to implement practices to address inattention to RLM for greater cost efficiencies in RL.

8.6.1.2.2 Poor RL planning pitfalls and related cost problems

Poor RL planning as a poor RLM cost pitfall involves the pitfall categories of poorly planned return policies and poor strategic planning and procedures, which can result in various costing, cash and recovery problems.

Specifically, the participants mentioned that *poorly planned return policies* can result in various cash problems, including unnecessary expenses (e.g. expenses related to changing return policies), high RL costs (e.g. high investment costs implement new policies) and a loss of profits. Additionally, online retailers that fail to develop *strategic plans* and *standardise RL procedures* can experience the cash problems of unnecessary expenses and a loss of money. Moreover, online retailers that fail to include disposition decisions in their strategic planning can experience poor cost visibility (costing problem), high RL costs, a loss of money, sales and profits (cash problems), and a loss of product (recovery problem). The following quotations expand on these findings:

> "If you don't have your returns, processes and strategy laid out as part of your total business plan, it's going to cost you money because you won't be ready for the wave of things that's going to hit you, and then you're going to have to throw good money at a bad problem." (P5, general manager, online retailer)

> "[…] you are suffering profitability issues, you then start looking at your returns policy. And then often you've got, hamstrung by legacy systems. So, that's now a good policy. That's great. But how do we go and implement that now without all the wiring at the back or incur huge amounts of expense and building something? And I think that's why they take a long time to change, because, you know, the investment is huge. By the time you get around it […] the cost of investing at that point is very high." (P1, operations manager, 3PRL provider firm)

> "[…] [disposition decision in your strategic planning is important because] if you do not manage your that area of your reverse logistics, it is a pit where your money and all your profits will just fall into." (P3, returns manager, online retailer)

> "They need to have [disposition decisions in their strategic planning] […] otherwise they will not know what's the cost going to be […] it's a lost sale and the loss of the product […] and the cost involved to recover that product or to take it up into the supply chain again safely." (P2, owner, supply chain consultancy firm)

Limited studies from the reviewed literature identified the impact of poor RL planning on the financial performance of online retailers. Nevertheless, Ahlén and Johansson (2023:31) noted that poor return policies can increase RL costs and Robertson *et al.* (2020:174) found that return policies can significantly impact the profitability of online retailers. Additionally, Karlsson *et al.* (2023:8) mentioned that failure to add RL in the strategic planning of the organisation can increase RL costs. However, this study added to the literature by emphasising the cash and recovery problems related to the exclusion of disposition in the overall strategic plan of the online retailer. Consequently, this study emphasises that poor RL planning can cause various costing, cash and recovery problems, which can hamper the effective RLM of consumer returns.

8.6.1.2.3 Lack of resources pitfalls and related cost problems

A *lack of resources* as a cost pitfall involves the failure of online retailers to invest in or commit appropriate human and IT resources (pitfall elements) for effective RLM.

Particularly, online retailers who fail to invest in *human resources* and appoint dedicated and skilled staff (i.e. RL manager and RL staff) for return inspection and disposition activities can experience high RL costs and a loss of money (cash problems) and poor/no recovery (recovery problem). Moreover, failure to commit or *invest in IT resources* (e.g. appropriate online systems) can lead to inefficient FL practices (e.g. incorrect order information), leading to unnecessary product returns and subsequent unnecessary expenses and high RL costs (cash problems).Therefore, a lack of resources can contribute to the operational failure pitfalls of FL failures and RL process failures (section 8.6.1.1). The following quotations illustrate these findings:

> "[Resource commitment for RL is important] because you've spent all this money investing in your outbound [forward logistics], in your sales, in your marketing […], in building your warehouse, building a lovely fulfilment operation, your courier operation to get to the customer. But when they want to return it, if you haven't invested in that process and those people, you know, who's going to be making the assessment decisions […]? How are we going to maximise the disposition return? And if you haven't invested in all of that, how can we offset some of the disposition in some of the cost of servicing with the recovery and disposition […]?" (P1, operations manager, 3PRL provider firm)

> "[…] you don't want an uneducated person dealing with a return claim on a forty- or fifty-thousand-rand electronics item. If you think about telephones these days, iPhones and Samsungs cost you anything between 20 and 40 thousand rand. So, if you employ the incorrect person into the team, they'll make the wrong decision and they'll cost you thousands." (P5, general manager, online retailer)

> "[Investment in IT is important] because it's one of the largest areas of costs now in their businesses. Again, because most online retailers offer free delivery and free returns of that product. So, if they don't invest in it […], they will pay the cost for the product being returned." (P2, owner, supply chain consultancy firm)

While studies from the reviewed literature identified various problems with a lack of resources on the management of RL, limited studies identified the cash and recovery-related consequences of a lack of resources. However, Zailani *et al.* (2017:35) found that a lack of resources hampers the adoption of product disposition management. Likewise, Andresen and Istad (2019:15) indicated that a lack of financial support hampers the ability of online retailers to implement appropriate IT and recovery options for product returns. Nevertheless, no studies identified the financial implications of using untrained/uneducated inspection staff. Evidently, this study identified additional problems associated with a lack of resources, reemphasising the detrimental impact of a lack of resources to effectively manage consumer returns.

8.6.1.2.4 Poor return prevention and avoidance (RPA) pitfalls and related cost problems

Closely related to the prevention and control pitfalls of poor RPA (section 8.4.1.3), poor RPA as a cost pitfall involves the pitfall elements of *poor gatekeeping* and *return leniency*, which can lead high product returns.

Regarding *poor gatekeeping*, online retailers that use human gatekeepers to authorise returns can run the risk of invalid and outdated product returns being accepted, resulting in the cost problems of high RL costs (cash problem), obsolete products and poor/no recovery (recovery problems). Additionally, *return leniency* (e.g. offering free product returns) can increase product returns, resulting in the cash

problems of unnecessary expenses, high RL costs, and a loss of sales, margins and profits. The subsequent quotations emphasise the cost problems related to poor RPA practices:

> So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter [is], this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable. OK, now, once you've agreed to pick it up, there's an expectation in the customer's mind that there's going to be an outcome. But there is also, what are you going to do with this two-year old computer that's now potentially broken? It's nothing. It's old, it's obsolete, and so it's only a cost driver." (P1, operations manager, 3PRL provider firm)

> "[…] the free opportunity to send goods back is, in my opinion, an unsustainable cost for businesses to be able to sustain indefinitely." (P7, owner, 3PRL provider firm)

> "Any return is a profit which is diminished […]. There's no fancy side to returns […] it's a loss because you've got your margin that you have on it doesn't allow for that type of money." (P6, logistics manager, multichannel retailer)

The interview findings related to poor RPA as poor RLM cost pitfalls align with several studies from the reviewed literature. Specifically, studies identified that (1) return leniency causes high RL costs (Ashan & Raham, 2021:158; Robertson *et al.* 2020:174), (2) free returns cause significant cost implications (Biswas & Abdul-Kader, 2018:1016), (3) fraudulent returns cause significant financial losses (Shi *et al.* 2021:2172; Zhang *et al.* 2023:1), and (4) product returns cause profit losses, high costs and price erosions (Bozzi *et al.* 2022:3, 30). Nevertheless, no studies identified the impact of poor RPA on the ability to recover value from returned products. Therefore, this study not only reemphasises the impact of poor RPA on the financial performance of the online retailer but also shows additional problems related to poor recovery.

Essentially, poor RLM involves the cost pitfalls of inattention to RLM, poor RL planning, lack of resources and poor RPA, which can lead to various costing, cash and recovery problems. Subsequently, the financial impact of poor RLM emphasise the importance of implementing appropriate RLM practices for the effective RLM of consumer returns in online retailing.

8.6.1.3 Poor financial management (FM) pitfalls and related cost problems

Poor FM as a cost pitfall category involves *poor RL accounting*, *dismissing RL costs* and *poor RL cost monitoring pitfalls* (see **Figure 8.20**), which will be discussed in subsequent sections with related costs problems.

8.6.1.3.1 Poor RL accounting and related cost problems

Poor RL accounting as a poor FM pitfall involves the use of poor accounting systems for RL and a dual account for FL and RL activities, which can lead to costing and cash problems.

Poor accounting systems means that online retailers use traditional, general or ineffective accounting systems/software for RL. Some participants mentioned that traditional/general accounting systems can

fail to accurately capture and reflect RL costs and associated expenses, leading to an inaccurate view of financial performance, poor return cost visibility and hidden cost (costing problems), as suggested in the following quotations:

> "But traditional accounting systems can't process the additional cost associated with the return, or the credit […] they only see the credit cost and not the other costs of the logistics costs of the return." (P2, owner, supply chain consultancy firm)

> "And I feel, no, most general accounting systems do not take full account of the reverse logistics processes because they are they are different. It's not debtors, creditors or this or that. Reverse logistics process is a facet of logistics that I don't think I have seen any big, big accounting or not even accounting in any software that caters for it adequately." (P7, owner, 3PRL provider firm)

> "[…] you'll get add-ons that can handle the parts of the process, but they don't do the accounting. They feedback to various extents. They'll feed back into your existing system. But they don't do the accounting per say […] So, it's often just a single line, you know, and maybe it gets lost in that […] that number is not rolled up into your returns line." (P1, operations manager, 3PRL provider firm)

Poor accounting systems may also contribute to the practice of using the same account for FL and RL. The participants indicated that using a *dual account for FL and RL* can lead to incorrect absorption of return costs into the selling price (i.e. poor pricing), an inaccurate view of overall financial performance, poor cost visibility, hidden costs (costing problems) and loss of money (i.e. incorrect payment of claims) (cash problem). The following quotations support these findings:

> "It needs to be a completely different dual account. It needs to be completely independent from any other thing you do. The reason for that is if you just calculate that back into transport, then you're going to get an incorrect reflection of what your transport component of your delivery is […] to accurately gauge my transport component onto my selling price […]." (P5, general manager, online retailer)

> […] it extends back into finance because one of the biggest problems in our industry is pick up the goods, no problem. But then when the account from the accounts payable teams of the retailers come and there are claims on there that's an area where we get involved in and to help our customers reconcile their accounts at the end of the month because sometimes there are claims that are illegitimate." (P7, owner, 3PRL provider firm)

> "So, what is the reverse logistics actually costing us? So, it's not just running a truck from point B to point A, it's all the processing and admin around it and repackaging, if necessary, and reselling and liquidating and destruction. That's all put into different categories of income statement, which gets hidden and washed away." (P4, owner/CEO, 3PRL provider firm)

No studies from the reviewed literature identified poor RL accounting, including poor accounting systems and using a dual account for RL and FL, as cost pitfalls to the RLM of consumer returns in online retailing. While studies identified various cost-related problems, no studies identified accounting practices either as problems or as solutions for RLM. Subsequently, this study contributes to the literature by adding additional cost pitfalls and problems that online retailers need to address or avoid for the effective RLM of consumer returns.

8.6.1.3.2 Dismissing RL costs and related cost problems

The poor FM pitfall of dismissing RL costs involves a *failure to recognise the impact of RL costs* and *poor RL costing practices*.

The participants mentioned that online retailers often fail to recognise the high costs of RL processes and activities, contributing to the poor RLM pitfall of inattention to RLM (section 8.4.1.2.1).

Consequently, the *failure to recognise the importance and impact of RL costs* contributes to the costing problems of poor cost visibility and hidden costs and cash problem of high RL costs. Moreover, dismissing RL costs associate with *poor RL costing practices*, which involves the failure of absorbing return costs into the selling price, resulting in the cash problems of high RL costs, a loss of money, margins and profits. The following quotations expand on these findings:

> "It's not cheap reverse logistics. The other day this week with the op's director at one of our clients where he compared the reverse logistics cost to normal distribution costs so that they don't understand that there is a very different cost there. The product that comes back is in a very different state, 90 percent of the time. And more and more, there's much more handling of a reverse product than a normal distribution product. […] a lot of clients seem to think that they don't have a problem with their reverse logistics, because they can't see the cost effect of it. So, if you actually scroll down and identify all the costs in the entire process, that's when they sit up and give some more attention to it." (P4, owner/CEO, 3PRL provider firm)

> "And then you're going to also work in what is your margin that you're making for the firm. […] most companies do not work backwards to say that if you want to return an item, what would that cost be for return?" (P12, Head of logistics, online retailer)

> "Transport, obviously, it's a dead leg, you drive back to a customer that you've already sunk cost into. I mean, you only recover your transport costs on the selling price the first time. The second time you drive to that customer it's an absolute loss." (P5, general manager, online retailer)

> "[…] you don't have profit to pay for it. So, it's an absolute margin sacrifice. You only costed your transport to the customer when you did the selling price calculation. You never provided for a cost to go and recollect it […] it is a sunken cost, which you can't recover." (P5, general manager, online retailer)

While no studies from the reviewed literature noted pitfalls and problems related to dismissing RL costs, Bozzi *et al.* (2022:22) mentioned that product returns involve duplication of operational expenses, increasing total logistics costs and additional losses of returned product value. Nevertheless, this study highlights that ignoring RL costs can hamper the financial performance of online retailers, emphasising the importance of understanding costs for the effective management of consumer returns.

8.6.1.3.3 Poor RL cost monitoring and related cost problems

Poor RL cost monitoring means that online retailer fail to keep track of return cost increases or fluctuations. For instance, failure to monitor higher RL outsourcing costs due to an increase in return volume means that online retailers can miss the opportunity to insource RL at a lower cost (due to economies of scale), leading to the costing problem of hidden costs and cash problems of unnecessary expenses and a loss of money, margins and profits. Additionally, online retailers can contribute to the expensiveness of RL by failing to monitor fluctuations in return transportation charges of 3PL providers/couriers. As one expert indicated that some 3PLs subcontract return collection to other third parties in outlying areas, which can result in hidden costs (costing problem), unnecessary expenses, high RL costs and loss of margins (cash problems). The following quotations denote these findings:

> "[…] to track the cost […]. I've recently seen some studies about online retail in Europe where the returns volume is bigger than the sales volume […]. They think they've sold something, but actually they've not sold it, [products are] returned with such high rates that is no longer feasible." (P2, owner, supply chain consultancy firm)

> "[…] but when your outsource component becomes such a big component of the outsourced company, well, now it becomes a problem because now it's really just a margin depleter [sic] almost because you should be able to do it yourself if there's that much volume that somebody else can run a complete business just on you." (P6, logistics manager, multichannel retailer)

> "However, what the couriers don't tell you is that all the outlying areas, they subcontract to a third courier company that lives in that Koekenaap little dorpie [town], and they will tell that guy, please go fetch that parcel from Mrs. van der Merwe in Koekenaap and keep it at your depot. Our truck comes around maybe once a week and then we will come and collect it. Now, so now you pay the cost for that third agent in Koekenaap, plus you're going to pay on top of that another delivery cost for them sending out their truck to that depot once or twice a week to collect it and bring it back […]. But it all comes back, and it hits you on your margin." (P12, Head of logistics, online retailer)

Limited studies from the reviewed literature mentioned problems related to poor RL cost monitoring. However, Ermes and Niemann (2023:7) indicated that the RL process consists of various hidden expenses that can cause a loss of profits and margins. Additionally, Frei *et al.* (2020:1613) noted that failure to collect, monitor and report consumer return data can cause financial losses. Lastly, Senthil *et al.* (2018:718) mentioned that outsourcing risks to 3PL or 3PRL providers can include hidden outsourcing costs. Subsequently, failure to monitor RL costs can hamper the financial performance of the online retailer, which means online retailers should monitor RL costs for the effective RLM of consumer returns.

Essentially, poor FM in RL involves poor RL accounting, dismissing RL costs and poor RL cost monitoring pitfalls, which can lead to various costing, cash and recovery problems. Therefore, online retailers need to implement appropriate practices to address the cost pitfalls and problems related to poor FM to manage consumer returns cost effectively.

8.6.1.4 Poor integration pitfalls and related cost problems

As illustrated in **Figure 8.20**, poor integration involves the cost pitfalls of a lack of *cross-functional integration* (CFI) and *lack of supply chain integration* (SCI), which can result in costing, cash and recovery problems.

Specifically, a *lack of CFI* as a poor integration cost pitfall involves a lack of collaboration and integration between functional departments, which can hamper effective RL costing. Particularly, a lack of integration between functional departments can result in lack of understanding the true costs associated with RL processes, contributing to the costing problem of an inaccurate view of overall financial performance and poor cost visibility. For example, a lack of collaboration between the sales function and the RL or logistics/operations functions can result in the sales function chasing the sales numbers without understanding or considering RL costs, which can skew the actual financial performance of the online retailer. Therefore, a lack of CFI can contribute to the poor FM pitfall of dismissing RL costs (section 8.6.1.3.2). The subsequent quotations support these findings:

> "[…] sharing of information between different departments and if they can start understanding the cost of these returns […] From a sales point of view, they are chasing the sales numbers without the understanding of what the true returns percentage is and what the true cost of the returns are within the business." (P2, owner, supply chain consultancy firm)

> "And that area of visibility of costs and how it affects the overall sales. So, sales seem to think just of sales and that they don't look at sales at net of returns or net of the cost of returns, not just the cost of the delivery or the

> cost of the item. It's the logistics processing cost is where the money is." (P2, owner, supply chain consultancy firm)
>
> "So, obviously, if you just focus on your sales and you don't look at what's coming back, you're going to have a very distorted view of how your company is actually doing." (P3, returns manager, online retailer)

While a lack of CFI can lead to costing problems, a *lack of SCI,* involving a lack of integrated systems and SC agreements (pitfall elements), can be more problematic for online retailers. The participants provided several examples of the cost implications of poor SCI in RL, mostly relating to RL processes. For instance, *a lack of systems integration* between the online retailer and courier means that online retailers must phone couriers to book a collection, incurring unnecessary telephonic costs (unnecessary expenses) and increasing return collection costs (high RL costs) (cash problems). Additionally, *a lack of agreements* with suppliers/manufacturers means that online retailers must keep defective product returns, resulting in a loss of money (for refunds) (cash problem) or loss of product (for replacements) and poor recovery for the defective returned product (recovery problems). Moreover, a lack of agreements with third-party buyers (e.g. brokers or auctioneers) can result in the unnecessary expenses (cash problem) of shipping the unwanted product returns to the third-party buyer. Consequently, a lack of SCI can be detrimental to the financial performance of online retailers, as emphasised in the subsequent quotations:

> "So, you're going to have your courier fees, they are going to be around R50 to R65 a delivery […] or contacting or phoning a courier to book a collection because you're not integrated." (P1, operations manager, 3PRL provider firm)
>
> "[…] because if they don't collaborate, it makes that every single delivery a lot more expensive." (P2, owner, supply chain consultancy firm)
>
> "[…] agreement with a firm whereby any item that's delivered that's malfunctioning, you can have it directly exchanged with that supplier or manufacturer […] If you don't have such an agreement, then that will be that item you will take into your own stock as a stock loss item […] and then after you've now confirmed with the customer or an action has been taken place to either refund or replace the item, then obviously your financial implications will come into place." (P12, Head of logistics, online retailer)
>
> "[…] if that agreement was not in place, you would then have another cost of shipping those items off to either job lot buyers or auctioneers because they will not come and fetch it." (P12, Head of logistics, online retailer)

While limited studies identified the financial implication of poor internal integration, Frei *et al*. (2020:1619) mentioned that poor internal information sharing means that different departments capture different sets of data that cannot be reconciled, indicating that this also applies to financial information sharing. Regarding a lack of SCI, Hjort *et al.* (2019:774) found that poor integration with 3PLs and manual operations can increase RL costs since pickups must be scheduled manually, which often lead to multiple collections and deliveries. Nevertheless, this study uniquely identified that a lack of SCI with suppliers and third-party buyers can cause several cash and recovery problems, adding to the problems associated with a lack of SCI in RL. Subsequently, online retailers need to address poor integration in RL and related problems for the cost-effective RLM of consumer returns.

The next section summarises the interview findings for the cost pitfalls and problems that can hamper the effective RLM of consumer returns.

8.6.1.5 Framework and summary of findings for cost pitfalls and problems in RLM

The interview findings presented in section 8.6.1 shows that various cost pitfalls and problems can hamper the effective RLM of consumer returns in online retailing. Online retailers should identify the cost pitfalls and problems and understand the cause-and-effect relationship between the cost pitfalls and problems, which can guide them with the implementation of appropriate practices to mitigate specific pitfalls and problems. Figure 8.**21** provides a broad overview demonstrating the links between the cost pitfalls and problems in RLM.

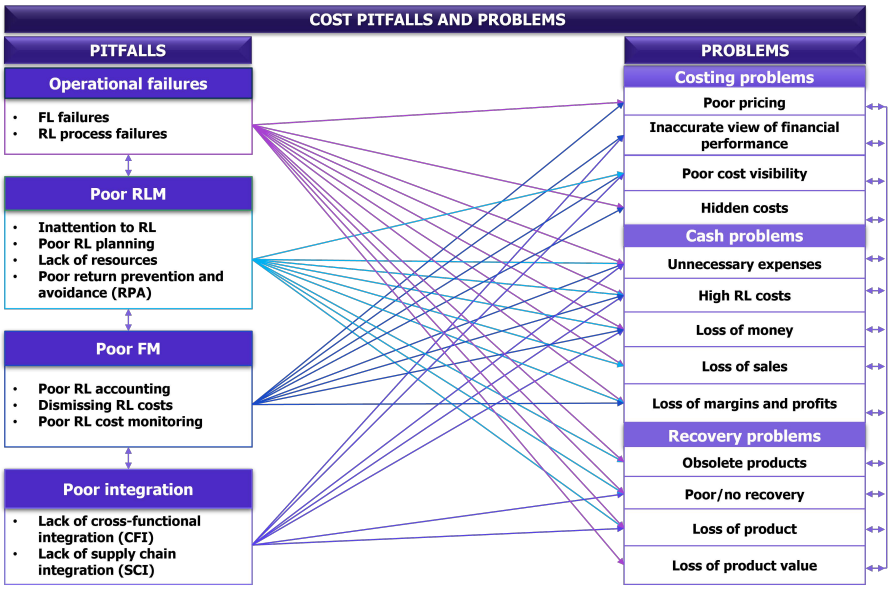

Figure 8.21 Relationship between cost pitfalls and problems in RLM
Compiled by the researcher

Figure 8.**21** provides an overview of the relationship between costs pitfalls and specific cost problems that can hamper the effective RLM of consumer returns. The links between the cost pitfalls and problems in RL can demonstrate the most problematic factors in RL, which should be first addressed by online retailers who experience problems related to cost in RL. Additionally, the framework illustrates links between the cost pitfalls, as well as the links between the cost problems, which can be important considerations in identifying the most significant pitfalls and problems.

Specifically, the framework demonstrates that operational failures can be the most significant cost pitfall category, resulting in various costing, cash and recovery problems. Consequently, online retailers that experience cost pitfalls related to operational failures, including FL failures and RL process failures, can expect a few costing problems and all cash and recovery problems. Therefore, online retailers can address operational failure (especially RL process failures) pitfalls first for cost effectiveness in RL. Additionally, the framework shows that the biggest consequences of the cost pitfall categories can be the unnecessary expenses, high RL costs and a loss of money. Subsequently, online retailers with operational failure, poor RLM, poor FM and poor integration pitfalls can expect

unnecessary expenses, high RL costs and a loss of money, which can hamper the effective RLM of consumer returns.

From the findings presented in section 8.6.1, examples of links between the cost include the links between (1) lack of resources (poor RLM) and FL failures and RL process failures (operational failures), (2) dismissing RL cost (poor FM) and inattention to RLM (poor RLM) and (3) a lack of CFI (poor RLM) and dismissing RL cost (poor FM). Subsequently, addressing a lack of resources can help address FL failures and RL process failures, addressing dismissing of RL costs can help address inattention to RLM and addressing a lack of CFI can help address dismissing RL costs. Therefore, online retailers can identify and address the cost pitfalls that contribute to other cost pitfalls first.

Similarly, examples of links between cost problems include the links between (1) poor pricing (costing problem) and unnecessary expenses (cash problem), (2) hidden costs (costing problem) and high RL cost (cash problem), and (3) poor/no recovery (recovery problem) and loss of sales (cash problem), Consequently, addressing poor pricing can help address unnecessary expenses, addressing hidden costs can help address high RL costs and addressing poor/no recovery can help address a loss of sales. Evidently, online retailers can identify and address the cost problems that contribute to other cost problems first.

Nevertheless, online retailers may experience specific cost pitfalls and related cost problems that requires identification for the effective RLM of consumer returns. Subsequently, Table 8.21, provides a detailed summary of the interview findings, demonstrating links between the cost pitfalls, cost pitfall elements (if applicable), and the specific cost problems that online retailers can encounter.

Table 8.21 Cost pitfalls and related cost problems

Pitfall category	Pitfalls	Pitfall elements	Costing problems	Cash problems	Recovery problems
Operational failures	***FL failures***	-	•Poor pricing	-	-
	RL process failures	Poor RL processes	•Hidden costs	•Unnecessary expenses	•
		Poor transportation	-	•High RL costs •Loss of money •Loss of sales	•No recovery •Loss of product
		Poor disposition	-	•Unnecessary expenses •High RL costs •Loss of money & margins	•Obsolete stock •Poor/no recovery •Loss of product value
Poor RLM	***Inattention to RLM***	-	•Poor cost visibility	•High RL costs •Loss of money	-
	Poor RL planning	Poorly planned return policies	-	•Unnecessary expenses •High RL costs •Loss of profits	-
		Poor strategic planning and procedures	•Poor cost visibility	•Unnecessary expenses •High RL costs •Loss of money •Loss of sales and profits	•Loss of product
	Lack of resources	Lack of human resources	-	•High RL costs •Loss of money	•Poor/no recovery
		Lack of IT resources	-	•Unnecessary expenses •High RL costs	-
	Poor RPA	Poor gatekeeping	-	•High RL costs	•Obsolete stock •Poor/no recovery

Pitfall category	Pitfalls	Pitfall elements	Costing problems	Cash problems	Recovery problems
		Return leniency	-	•Unnecessary expenses •High RL costs •Loss of sales •Loss of margins & profits	-
Poor FM	***Poor RL accounting***	Poor accounting systems	•Inaccurate view of financial performance •Poor cost visibility •Hidden costs	-	-
		Dual account for RL and FL	•Poor pricing •Inaccurate view of financial performance •Poor cost visibility •Hidden costs	•Loss of money	-
	Dismissing RL costs	Failure to recognise impact of RL costs	•Poor cost visibility •Hidden costs	•High RL costs	-
		Poor RL costing	-	•High RL costs •Loss of money •Loss of margins & profits	-
	Poor RL cost monitoring	-	•Hidden costs	•Unnecessary expenses •High RL costs •Loss of money •Loss of margins & profits	-
Poor integration	***Lack of CFI***	-	•Inaccurate view of financial performance •Poor cost visibility	-	-
	Lack of SCI	Lack of integrated systems	-	•Unnecessary expenses •High RL costs	-
		Lack of SC agreements	-	•Unnecessary expenses •Loss of money	•Poor recovery •Loss of product

Table 8.21 summarises the findings for subtheme 3, linking the cost pitfalls, pitfall elements and resulting problems. Online retailers can use the table to identify cost pitfalls and related elements with corresponding cost problems, which can help them to address specific cost pitfalls and problems in RL. For example, online retailers that lack SC agreements with SC parties can identify the resulting cash problems of unnecessary expenses and loss of money, and recovery problems of poor recovery and a loss of product, which might motivate them to obtain SC agreements.

Additionally, online retailers that experience, for example, poor cost visibility as costing problem can investigate the possible causes, namely inattention to RLM, poor strategic planning and procedures, poor accounting systems, dual account for RL and FL, failure to recognise the impact of RL costs and a lack of CFI. Subsequently, online retailers with poor cost visibility can identify that they need to prioritise addressing the poor RLM pitfalls of inattention to RLM and poor RL planning, poor FM pitfalls of poor RL accounting and dismissing RL costs and poor integration pitfall of a lack of CFI.

Moreover, online retailers can use the table to identify the most problematic cost pitfalls and/or cost pitfall elements and the most significant cost problems in RL that they should address or avoid for RLM. For instance, the most problematic cost pitfall elements include poor disposition (RL process failure) and poor strategic planning and procedures (poor RL planning), associating with seven cost problems, which means that online retailers should focus on addressing poor disposition and strategic planning and procedures in RL for the cost-effective management of consumer returns. Additionally, online retailers can identify that high RL costs (linked to 13 cost pitfall elements), followed by

unnecessary expenses (linked to nine cost pitfall elements) can be the most significant cost problems in RL, which may motivate them to implement various RLM practices for improved financial and cost performance.

Although online retailers can focus on addressing specific cost pitfalls and related cost problems to improve their cost performance in RL, they can gain even more advantages by identifying and implementing appropriate cost propositions in RL. Subsequently, the next section will focus on the cost propositions in RL that online retailers can implement to address cost pitfalls and problems in RL as well as realise cost profits for the effective RLM of consumer returns.

8.6.2 Cost propositions – Subtheme 2

As illustrated in Figure 8.19, and discussed in section 8.2.2., the main costs propositions, including *return cost evaluation* (RCE) (section 8.6.2.1), *cost-orientated return* (COR) (section 8.6.2.2), *return cost management* (RCM) (section 8.6.2.3) and *cost parameters* (section 8.6.2.4), consist of proposition categories, key practices/parameters and support practices, which can be implemented and considered for the effective RLM of consumer returns. Based on the interview findings, Figure 8.**22** provides a detailed overview of the cost propositions for RLM.

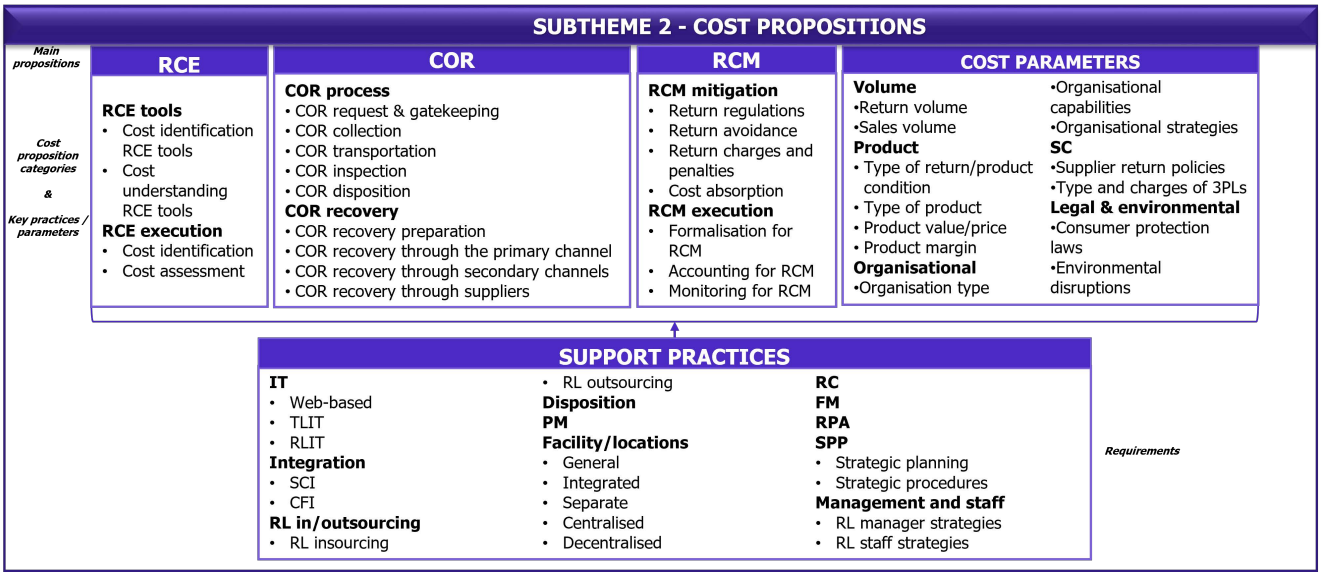

Figure 8.22 Detailed overview of cost propositions for RLM
Source: Compiled by the researcher

Particularly, Figure 8.**22** shows the main cost propositions, proposition categories, key practices/parameters and support RL practices. Section 8.2.2 provides details regarding the presentation and format of the propositions applicable to each theme, including key practice/parameter elements (not listed in **Figure 8.15** but emphasised in the discussion). Based on **Figure 8.15**, the main cost propositions, including proposition categories, key practices/parameters, key practice/parameter elements (if applicable) and support RL practices, will be discussed in the subsequent sections. This

section concludes with a cost proposition framework and a summary of the findings, demonstrating the links between the cost propositions.

8.6.2.1 Return cost evaluation (RCE) propositions

RCE as a main cost proposition involves the understanding, identification and assessment of RL costs, which can help online retailers to effectively implement the subsequent cost propositions of cost-oriented returns (COR) and return cost management (RCM). RCE consist of the proposition categories of *RCE tools* and *RCE execution*, which will be discussed in the subsequent sections.

8.6.2.1.1 Return cost evaluation (RCE) tools

As illustrated in **Figure 8.15**, RCE tools as a RCE proposition category involves the key practices of RCE tools for cost determination and RCE tools for cost understanding, which can help online retailers identify and understand RL costs for effective RCE. The RCE tools for cost determination and understanding will be identified in the subsequent paragraphs.

- *Cost determination RCE tools*

Cost determination RCE tools involve the use of various measures/tools to help online retailers accurately determine RL costs. As key practice elements, online retailers can use appropriate metrics and planning and accounting separation and systems as cost determination tools for RCE.

In terms of *using appropriate measures and planning*, the participants indicated that online retailers should develop appropriate cost metrics and include product disposition in their strategic plans for effective RL cost determination. Specifically, online retailers can use cost metrics to determine RL handling costs per product return, like return cost per unit processing or the RL costs of a single return. Moreover, online retailers can determine RL disposition and redistribution costs by including disposition decisions in their strategic planning. The following quotations demonstrate appropriate measures and planning as tools for RL cost determination:

> "Cost per unit processing, [is] critical, you got to know that your cost per units are [sic] all managed and understood [to identify] what it is costing you to build returns." **(**P6, logistics manager, multichannel retailer)
>
> "[Financial measures] like […] what does it really cost to handle a single customer return […]." (P1, operations manager, 3PRL provider firm)
>
> "They need to have [disposition decisions in their strategic planning] […] to know upfront […] what the cost of that return will be further down the supply chain. So, mostly it's a lost sale and the loss of the product […] because of the [product return] issues and the cost involved to recover that product or to take it up into the supply chain again safely." (P2, owner, supply chain consultancy firm)

Concerning *accounting separation and systems,* the participants indicated that online retailers can either ring-fence return costs or use accounting software with separate return modules as cost

determination tools. As discussed in the cost pitfalls of poor FM, using traditional accounting systems can be problematic for identifying true RL costs (section 8.6.1.3). However, participants indicated that online retailers could use normal accounting systems or protocols but need to ring-fence RL costs to accurately determine RL costs. Examples of ring-fencing return costs can be the separation of return collection and forward delivery costs, inbound receiving and return receiving costs, order processing and return processing costs, and distribution and redistribution costs. Alternatively, online retailers can use sophisticated accounting systems (like SAP) with a separate product return module to record the financial transactions of RL activities, which can help determine RL costs. The following quotations show accounting separation and systems as cost determination tools for RCE:

> "[You can use normal accounting systems for RL] as long as you can ring-fence it. As long as you can identify cost by cost category […]. So, we've got identifiers that says, you know what? This is a returns cart or returns transaction code and those transaction codes are measured separately […]." (P6, logistics manager, multichannel retailer)

> "It needs to be a completely different dual account. It needs to be completely independent from any other thing you do […] you want to do a proper case rate analysis […] to see how much money I spent on positive sales." (P5, general manager, online retailer)

> "[…] they [online retailers] should ring fence it for reverse logistics, […] accounting is [a] pretty standard protocol and just ring fence the cost into reverse logistics elements. And so don't put your reverse logistics warehousing costs into warehousing or rentals, and don't put your reverse logistics transport costs into your transport distribution element […]." (P4, owner/CEO, 3PRL provider firm)

> "Within the system, like an SAP ERP that's quite sophisticated or the bespoke systems that I've dealt with, they have a specific module to deal with returns and to deal with the logistics around the returns, as well as the financial transactions, the credit side of the return and the cost side of the return […]." (P2, owner, supply chain consultancy firm)

As support RL practices for cost determination RCE tools, online retailers can implement (as supported by literature) the (1) disposition strategy of linking disposition strategies to RL strategies (section 6.6), (2) performance measurement (PM) strategy of establishing appropriate metrics (section 6.7), (3) financial management (FM) strategies of using appropriate accounting techniques and systems for RL, identifying RL costs and implementing cost measures (section 6.9.2), and (4) strategic planning strategy of integrating strategic plans for RL with organisational strategic plans (section 6.9.4).

No studies in the reviewed literature focussed on cost determination tools and accounting practices as part of the RLM of consumer returns in online retailing. Resultingly, this study provides new insights into the importance of using tools to determine RL costs for RCE. Additionally, this study shows that cost determination RCE tools can help online retailers address the cost (1) pitfalls of poor RL planning (poor RLM), poor RL accounting, dismissing RL costs, poor return cost monitoring (poor FM) and (2) problems of poor pricing, inaccurate view of financial performance, poor cost visibility and hidden costs (costing problems).

- *Cost understanding RCE tools*

Cost understanding RCE tools involve the use of various measures/tools to help online retailers accurately understand the financial impact of RL costs. The participants indicated that developing appropriate cost metrics, internal information sharing and using capable third parties (key practice elements) can be used as tools for understanding RL costs.

For the *development of appropriate metrics,* the participants mentioned that online retailers can develop cost metrics that helps with understanding RL costs and identifying the impact of RL costs on the bottom line and margins of the online retailer. The participants suggested that cost metrics of return rate versus sales percentage and return costs as percentage of turnover can help online retailers identify RL cost drivers, which enable understanding the financial impact of RL costs. The following quotations demonstrate these findings:

> "[The most important performance metrics for RL must help] understanding what the cost of reverse logistics is to your business and how that [cost] impacts [the] bottom line and margins." (P13, supply chain manager, multichannel retailer)

> "So, your ability to measure […] your financial impact, […] you want to be able to identify what is your return rate as a portion of sales. So, it's about understanding what's driving reverse logistics [costs]." (P1, operations manager, 3PRL provider firm)

> "I think that's […] returns as a percentage of turnover and cost as a percentage of turnover as well." (P7, owner, 3PRL provider firm)

Furthermore, online retailers should encourage *internal information sharing* to enhance RL cost visibility, which can help online retailers understand RL costs. Specifically, the participants suggested that online retailers implement appropriate IT systems, which can facilitate internal information sharing. Additionally, appointing a dedicated RL manager can enhance RL cost visibility and facilitate internal information sharing about RL costs, which can help online retailers understand RL costs. These findings can be supported by the following quotations:

> "[…] if they have more [cost] visibility and sharing of information between different departments, they can start understanding the cost of these returns […]." (P2, owner, supply chain consultancy firm)

> "And that's what for us we have done successfully through many different IT platforms, that this information becomes available to the sales force […] integration is an imperative." (P7, owner, 3PRL provider firm)

> "[…] you need sales, marketing, finance […]. You definitely need someone to account for it. You definitely need someone […] to communicate the whole [return] process […]." (P4, owner/CEO, 3PRL provider firm)

Finally, online retailers can *use capable third parties* to understand RL costs needed for effective RCE. Specifically, online retailers can use 3PRL providers with appropriate RL software, which captures the financial information of product returns and provides cost visibility to understand the cost implications of RL processes and activities. The value of using a capable third party to understand RL cost can be identified from the subsequent quotation:

> "I developed an app that actually does all those processes in the form of physical inspection, photographs of the goods, routing, capturing of the […] financial information […] to know what's coming back […] and […] the [cost] implications thereof." (P7, owner, 3PRL provider firm)

As support RL practices for cost understanding RCE tools, online retailers can implement (as supported by literature) the (1) general IT strategy of using integrative IT and IT with information management capabilities (section 6.3.1), (2) RL information technology (RLIT) strategy of using special return software (section 6.3.5), (3) cross-functional integration (CFI) strategies of information sharing and communication between functions (section 6.4.3), (4) RL outsourcing strategies of deciding on the types of 3Ps for RL outsourcing, and selecting a 3PRL provider (section 6.5.1), (5) PM strategy of establishing appropriate metrics (section 6.7.1), (6) FM strategy of understanding RL costs and implementing cost measures (section 6.9.2), and (7) RL manager strategy of assigning a RL expert manager (section 6.9.5).

Limited studies from the reviewed literature identified practices that can be used to understand RL costs for RCE. However, Karlsson *et al.* (2023:9) found that online retailers need to develop appropriate KPIs to understand the financial implications of RL processes and practices, which confirms that the development of cost metrics can help with understanding return costs. Additionally, Bozzi *et al.* (2022:30) mentioned that online retailers require more internal integration since the parties directly involved in RL understand the financial impact of returns on the organisation. Evidently, internal integration can be important to increase awareness and understanding of RL costs across the organisation. However, no study identified that using 3PRL providers and special return software can facilitate online retailers to understand the cost implications of RL processes and activities. Therefore, this study contributes to the literature by demonstrating additional value of using 3PRL providers and appropriate return software for RLM.

Essentially, cost understanding tools for RCE can help online retailers address the cost (1) pitfalls of inattention to RLM, a lack of resources (poor RLM), poor RL accounting, dismissing RL costs, poor cost monitoring (poor FM) and a lack of CFI (poor integration), and (2) problems of poor pricing, inaccurate view of financial performance, poor cost visibility, hidden costs (costing problems), and a loss of money, margins and profits (cash problems).

8.6.2.1.2 Return cost evaluation (RCE) execution

RCE execution as a RCE proposition category involves the key practices of cost identification for RCE execution and cost assessment for RCE execution (see **Figure 8.15**), which will be discussed in the subsequent paragraphs.

- *Cost identification for RCE execution*

Cost identification for RCE execution focusses on the identification of standard RL costs and hidden RL costs (key practice elements) by using the RCE tools (section 8.6.2.1.1) to effectively evaluate RL

costs. Since RL costs depend on the RL processes and practices of online retailers, only examples from the interview findings can be provided for the potential RL costs that online retailers can identify for RCE.

Regarding *identification of standard RL cost*, the participants provided several examples of standard RL costs that online retailers may incur in the product return process. For instance, administration costs (e.g. helping consumers to log a return), collection costs (e.g. arranging for collection), transportation costs (to and from consumers), unloading and receiving cost, verification costs, inspection costs, sorting costs, processing costs, handling costs, labour costs (e.g. salaries), warehousing costs (e.g. storage, security and inventory costs), packaging costs, disposition costs (e.g. cost of repair or disposal), redistribution costs (e.g. shipping of replacement product to the consumer or shipping to secondary markets) and IT costs. The following quotations identify the standard RL costs associated with product returns:

> "And it's the administrative cost of supporting the logging of the return on some system […]. Then it's the cost of arranging the collection, then it's the cost of the actual transportation, then it's the cost of offloading that vehicle at the site, it's being returned to. It's the cost of inspecting those goods, the cost of processing it onto a system. It's the cost of the put-away or the cost of the destruction with the double handling out again. And it's the cost of the physical space and the systems associated [with it]." (P2, owner, supply chain consultancy firm)

> "So, there's verification cost. There is a transport cost […] There is handling costs because those products are handled at least one, at least up to five or six times. There are the warehousing costs. There is the staffing cost, the sorting process costs, […] and the administration and reporting costs behind all of that." (P4, owner/CEO, 3PRL provider firm)

> "[…] it is a cost of warehouse space and […] you would then have another cost of shipping those items off to either job lot buyers or auctioneers because they will not come and fetch it." (P12, Head of logistics, online retailer)

> "[…] I think the first of all costs of disposal, the logistics costs of getting them back, the cost of storage […] the cost of insuring that they [the products] come comeback properly, we spend a lot of money on bags and tags to bring product back […] So, its packaging, its logistics, its transport, its disposal, recycling and obviously security as well, because at the end of the day, that product is not in a box anymore […] And technology […]." (P7, owner, 3PRL provider firm)

Apart from identifying standard RL costs, *identification of hidden RL costs* can be important for identifying the true costs of RL. The participants mentioned several types of hidden return costs that online retailers can identify, including bank charges, brand and product devaluation costs, consumer experience costs, and hidden collection and transportation charges (subcontracting by third parties). Additionally, online retailers can identify hidden RL expenses related to hiring additional warehouse and customer service staff that handle both forward and RL activities. For example, in the absence of product returns, the online retailer may use ten customer service staff to manage delivery queries, but with product returns, the online retailer might need thirteen customer service staff to manage both delivery and product return queries The following quotations support these findings:

> "[…] potential costs around, your banks, if you start getting chargebacks, you have got to consider what that does in terms of your charge-back rates, the banks often penalise retailers for that." (P1, operations manager, 3PRL provider firm)

> "[…] because now you return the product and, probably, the box is damaged, and you've got to degrade or devalue this product to a certain amount. Let us call it devaluation cost that comes into play […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "And then another cost is the cost in terms of the brand value that is lost when a product is returned. So, when the specific product of an upstanding brand, that's returned because of a quality issue, then you devalue your brand. So, it's an intangible that people don't always consider." (P2, owner, supply chain consultancy firm)
>
> "[…] potentially consumer costs […] If the sales experience did go south." (P6, logistics manager, multichannel retailer)
>
> "And often those numbers are obscured because I've got one customer service team where they handle both sales and returns and you can't really see who's doing what to get that split between sales and returns […]." (P2, owner, supply chain consultancy firm)
>
> "[…] but instead of looking at it as its contribution to business costs, how many extra contact centre agents did I employ, how many extra warehouse staff did I employ? You know that number is not rolled up into your returns line." (P1, operations manager, 3PRL provider firm)

As a supporting practice for cost identification as a key RCE execution practice, online retailers can implement (as supported by literature in section 6.9.2) the FM strategies of considering factors that can influence RL costs, identifying RL costs and identifying hidden RL costs.

A few studies from the reviewed literature identified the costs associated with RL, corresponding to the interview findings. Specifically, standard RL costs can include receiving costs, restocking costs, inventory costs (Gustafsson *et al.* 2021:877), handling costs (Das *et al.* 2020:59), inspection costs, transportation costs (Ahsan & Rahman, 2021:16; Das *et al.* 2020:59; Gustafsson *et al.* 2021:877; Wang *et al.* 2017:681), gatekeeping costs, disposition costs, redistribution costs (Ahsan & Rahman, 2021:16; Wang *et al.* 2017:681), IT costs and staff training and development costs (Zailani *et al.* 2017:35). Additionally, some hidden RL costs can include brand/reputation costs due to poor consumer service (Ahsan & Rahman, 2021:21; Bozzi *et al.* 2022:12), costs associated with a loss of resale value (Bozzi *et al.* 2022:22), hidden outsourcing costs (Senthil *et al.* 2018:718) and additional staff recruitment costs (Zailani *et al.* 2017:35).

Evidently, RL involve various costs, which emphasises the importance of implementing appropriate practices for cost efficiencies and savings. Essentially, cost identification as a key RCE execution practice can help online retailers to address the cost pitfalls of dismissing RL costs and poor RL cost monitoring (poor FM) and the cost problems of poor pricing, inaccurate view of financial performance, poor cost visibility and hidden costs (costing problem).

- *Cost assessment for RCE execution*

Following cost identification for RCE execution, cost assessment for RCE focuses on assessing the cost implications of RL practices, which can help online retailers identify cost inefficiencies. As key practice elements, online retailers can perform costs assessments for return leniency, return acceptance and disposition options.

In terms of *cost assessment for return leniency*, the participants suggested that online retailers assess the costs of free returns versus fee returns through return cost tracking and appropriate cost metrics. For example, online retailers can use return rate/cost per sales percentage, which may help them assess the difference between free returns and fee returns. Moreover, appropriate cost tracking and metrics can help an online retailer curb potential losses associated with return leniency, preventing large financial losses. Evidently, online retailers can use RCE tools (section 8.6.2.1.1) for effective cost assessment of return leniency. These findings can be supported by the following quotations:

> "I think that's important to track the cost […] to perhaps distinguish between products that are returned for free and product where there is a cost in returning it […]. I've recently seen some studies about online retail in Europe where the returns volume is bigger than the sales volume, because of the effect of free returns that these companies start running at a loss. They think they've sold something, but actually they've not sold it, [products are] returned with such high rates that is no longer feasible. So, to look at those kinds of KPI's are important" (P2, owner, supply chain consultancy firm)

> "[…] identify what is your return rate as a portion of sales […]. I think those are the metrics you want to identify and what the cost of that is." (P1, operations manager, 3PRL provider firm)

Concerning *cost assessment for return acceptance*, the participants indicated that online retailers should assess the cost implications of accepting returns of inexpensive products. For example, assessing the cost implications of accepting a return of an unopened CD worth R50 against the cost of issuing a R50 refund without return collection. Therefore, based on the cost identification for RCE, online retailers can effectively assess the cost implications of return acceptance. The following quotations demonstrate this finding:

> "[…] really have a good look at whether or not you want to accept a return in terms of cost. Example, I would if it's under a certain chargeable mass and if it's under a certain product price, I would actually tell the customer not to even return it. I would tell the customer to keep it. And I will refund that customer or give the customer a credit." (P12, Head of logistics, online retailer)

> "[…] you look at the product type and you look at the chargeable mass of that product type, and you also look at the sales or the cost of that product. But it does not warrant to bring an item which is under one kilo and it's costed R100 from an outlaying area back […]." (P12, Head of logistics, online retailer)

Finally, online retailers can perform a *cost assessment for disposition options*, which entails assessing the feasibility of performing recovery activities. For example, assessing the cost implications of repairing a defective device, which can involve handling costs, communication costs, collection costs, transportation costs, repair costs and redistribution costs. The participants indicated that online retailers need to regard disposition decisions as strategic to accurately assess the cost implications of disposition options, linking with the cost determination RCE tool of disposition decisions in strategic plans (section 8.6.2.1.1). The following quotations identify the importance of performing cost assessment for disposition options:

> "[…] to repair can be quite expensive in terms of the lead times, because now the product could be handled into your facility, then it has to be booked up to a repair agent or to repairer on site, and it has to be booked back into your site. […] and then it goes back to stock and then it can be dispatched again. So, that is also quite expensive. And unless you've got very high value goods, the costs of those repairs are not feasible for you to correct that product." (P2, owner, supply chain consultancy firm)

> "[…] because it's also got a cost implication, so [disposition decisions] got to be strategic, so it's got to be worked out […] what it's going to cost you [...]." (P12, Head of logistics, online retailer)

As supporting practices for cost assessment as a key RCE execution practice, online retailers can implement (as supported by literature) the (1) disposition strategies of understanding economic factors for disposition decisions and assessing disposition options (section 6.6.1), (2) PM strategy of establishing appropriate metrics for RL (section 6.7), and (3) FM strategies of performing RL cost estimations, performing cost/benefit analyses and considering factors that can influence RL costs (section 6.9.2).

While no study from the reviewed literature mentioned that online retailers need to perform cost assessments for return leniency, Ashan and Raham (2021:158) and Robertson *et al.* (2020:174) warned that return leniency can contribute to the financial risk of high RL costs, emphasising the importance of assessing the financial impact of return leniency. Furthermore, Hjort *et al.* (2019: 775) identified that some online retailers request consumers to keep and dispose of products, providing consumers with credit to avoid unnecessary expenses. Subsequently, no studies mentioned cost assessments for return leniency, return acceptance and disposition options. Therefore, this study provides additional practices that online retailers can adopt to mitigate the cost (1) pitfalls of poor RL planning, poor return prevention and avoidance (RPA) (poor RLM), dismissing RL costs and poor cost monitoring (poor FM), and (2) problems of inaccurate view of financial performance, poor cost visibility (costing problems), unnecessary expenses, high RL costs, and a loss of sales, money, margins and profits (cash problems).

Essentially, RCE propositions, including RCE tools and RCE execution, can help online retailers to effectively identify, understand and assess RL costs, which not only facilitate the implementation of COR and RCM propositions but also the mitigation of cost pitfalls and problems. Therefore, online retailers can implement RCE propositions for the effective RLM of consumer returns.

In the next section, COR propositions as a main cost proposition will be analysed and discussed.

8.6.2.2 Cost-orientated return (COR) propositions

COR as a main cost proposition involves the proposition categories of *COR processes* and *COR recovery*, which focusses on cost efficiencies and savings in the RL process and cost recovery from consumer product returns. Consequently, based on the RCE (return cost evaluation) propositions, online retailers can identify appropriate practices for cost savings and recovery in RL. In the subsequent sections COR processes and COR recovery propositions will be described and analysed.

8.6.2.2.1 Cost-orientated return (COR) processes

As illustrated in **Figure 8.15**, COR processes as a COR proposition category involves the key practices of (1) COR request and gatekeeping, (2) COR collection, (3) COR transportation, (4) COR inspection, and (5) COR disposition process, which will be discussed in the subsequent paragraphs.

- *COR request and gatekeeping*

COR request and gatekeeping as a key COR process practice involves the key practice elements of self-service return request, online authorisation and using third parties. Particularly, the participants suggested that online retailers implement *self-service return request* procedures and *online return authorisation* to save RL costs and eliminate the hidden expenses of employing extra staff for manual return logging and authorisation. This finding shows the importance of identifying hidden RL costs as an element of cost identification for RCE execution (section 8.6.2.1.2). The following quotations support these findings:

> "I think it saves a lot of costs, […] you don't need to employ as many people when a consumer […] can log a return for themselves, whereas some other companies obviously you need to phone the company or send an email to initiate the return. So, I think in that case, if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

> "So, the whole authorisation was done on online […] the cost saving was disproportionately big because we didn't have the customer interactions […]." (P1, operations manager, 3PRL provider firm)

Alternatively, online retailers can *use third parties*, like a third-party contact centre or 3PRL providers, for COR request and gatekeeping. For instance, online retailers can use contact centres for return logging and authorisation to save administration and labour RL costs. Moreover, online retailers can outsource RL to a 3PRL provider with appropriate return software, which provides immediate authorisation of return requests for cost efficiency. Consequently, the same return software that can be used as a cost understanding RCE tool (see section 8.6.2.1.2) can help online retailers with COR request and gatekeeping. The following quotations show the key COR request and gatekeeping practice of using third parties:

> "[…] like outsourcing a contact centre, the only reason you do it is to gain actual financial savings." (P1, operations manager, 3PRL provider firm)

> "And I developed an app […] to give immediate authorisation […] I could put it into one-word, reverse logistics is immediate." (P7, owner, 3PRL provider firm)

As support RL practices for COR request and gatekeeping, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities and using the Internet and website for RL (section 6.3.2), (2) RL information technology (RLIT) strategy of using special return software (section 6.3.5), and (3) RL outsourcing strategies of deciding on the types of 3Ps for RL outsourcing, and selecting a 3PRL provider (section 6.5.1).

Some studies from the reviewed literature coincided with the interview findings related to COR request and gatekeeping. Specifically, several studies identified that dedicated return software and information systems aimed at automating returns can streamline return processes (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:21; Hjort *et al.* 2019:788). Additionally, Ashan and Rahman (2021:20) found that providing consumers with a hassle-free and efficient return process can result in cost savings. Lastly, Wang, Dang *et al.* (2021:2) mentioned that outsourcing RL to 3PRL providers can result in cost efficiencies. Evidently, COR request and gatekeeping can help online retailers address the cost pitfalls of RL process failures (operational failure), a lack of resources and poor RPA (poor RLM), and cost problems of hidden RL costs (costing problem), unnecessary expenses, high RL costs and a loss of money (cash problems).

- *COR collection*

COR collection involves the key practice elements of simultaneous return pickup and replacement delivery, using drop-off collection and using third parties, which can enhance cost efficiency in the RL process.

The participants mentioned that performing *simultaneous return pickup* and *replacement delivery* can help online retailers save unnecessary collection and transportation costs. The participants indicated that online retailers could use internal integration between the RL and FL functions, enabling synchronised return collection and replacement delivery. The following quotation illustrates the value of simultaneous return pickup and replacement delivery for a COR collection process:

> "[…] cross-functional [integration] is imperative […] If the guy gets the wrong thing and he wants it replaced […] I think we could save [Retailer C] a fortune, because if you return something and you order a replacement, they come up with two different deliveries […]. So, I thought to myself, if we [as the 3PRL provider] could convince them [Retailer C] that when you [the consumer] do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)

Furthermore, *using drop-off collection* can help online retailers enhance cost efficiency by saving RL collection and transportation cost. For online-only retailers, the participants mentioned that online retailers can adopt a decentralisation location strategy using drop-off locations, like convenience stores for COR collection. Alternatively, multichannel retailers can encourage online consumers to drop returns off at their stores, reducing various RL costs and expenses associated with collection and transportation. These findings can be supported by the subsequent quotations:

> "I think decentralised is better from a cost point of view, [and] an efficiency point of view […] that they would be able to go to a Caltex garage and there's a drop point there." (P4, owner/CEO, 3PRL provider firm)

> "[…] go to a store […] it's still a return but you are actually not paying a return logistics costs […]." (P13, supply chain manager, multichannel retailer)

Finally, the participants indicated that online retailers could *use third parties*, like 3PL providers and 3PRL providers, for COR collection. For instance, using 3PL providers for product return collection

can help online retailers save collection costs by reducing human and infrastructural resources. Additionally, using 3PRL providers can improve return collection speed, which can result in non-attributable or indirect cost savings related to improved consumer service and satisfaction. The following quotations demonstrate the value of using third parties for COR collection in RL:

> "[…] because there is so many 3PL services out there that you can just at the drop of a hat, send somebody to go and collect your returns […]. If you still have to focus on getting a driver to going to pick up a certain item at a certain time of the day, you will tend to use more resources and end up spending more money than actually just outsourcing it to somebody else." (P3, returns manager, online retailer)

> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, […] but there are costs that can be saved elsewhere and some non-attributable costs in the form of customer service [….] I [as the 3PRL provider] pick it up [the product return] tomorrow and that […] is done very quickly, very efficiently." (P7, owner, 3PRL provider firm)

Implementing COR collection, shows the importance of identifying standard and hidden costs through the key RCE execution practice of cost identification (section 8.6.2.1.2), which can help online retailers implement appropriate RL process and practices for a COR process. As support RL practices for COR collection, online retailers can implement (as supported by literature) the (1) CFI strategies of establishing cross-functional teams, developing functional relationships and collaborating, cooperating, coordinating and information sharing between functions (section 6.4.3), (2) RL outsourcing strategies of deciding on the type of RL service and third party for RL outsourcing, and (3) decentralised facility/location strategies of using retail locations and multiple/flexible locations for RL (section 6.8.4).

The interview findings related to COR collection matches the findings of few studies from the reviewed literature. Specifically, Bozzi *et al.* (2022:19) identified that online retailers with a highly integrated system can perform simultaneous return pickup and delivery of an exchange. Additionally, Bozzi *et al.* (2022:20) indicated that multi/omnichannel retailers should motivate consumers to return to stores to reduce RL costs. De Borba *et al.* (2021:131) mentioned that convenience collection points can be valuable for online-only online retailers and Nel and Badenhorst (2020:123) suggested that online retailers use 3PL providers or couriers to collect products either at consumers or drop-off locations, enhancing efficiency in the collection process. Essentially, COR collection can help online retailers address the cost (1) pitfalls of RL process failures (operational failures), a lack of resources (poor RLM) and a lack of CFI (poor integration), and (2) problems of poor RL cost visibility, hidden RL costs (costing problems), unnecessary expenses, high RL costs, and a loss of money and margins (cash problems).

- *COR transportation*

COR transportation involves the key practice elements of using bulk transportation and appropriate network designs, which can bring economies of scale and return transportation cost savings.

Regarding *bulk transportation*, online retailers can use 3PLs/couriers to capitalise on return quantities and achieve economies of scale. The participants indicated that online retailers could integrate with 3PL providers through a Transportation Management System (TMS) for COR transportation. Therefore, online retailers can identify 3PLs with the appropriate systems that perform bulk return collections for multiple online retailers, which can significantly reduce the cost of RL transportation. Alternatively, online retailers can outsource the RL process to 3PRL providers with the ability to achieve economies of scale by transporting consolidated returned products in bulk to a centralised facility for processing and disposition. These findings can be illustrated by the following quotations:

> "I believe outsourcing is an amazing opportunity […] the reason I say that is, I don't have scale in returns […] it becomes part of the courier's greater scale." (P6, logistics manager, multichannel retailer)

> "[…] there needs to be like a secondary network of delivery agents and delivery services that can capitalise on the quantity of deliveries that need to take place for […] the returning part […], which are making [return] deliveries very expensive for the retailer […] they need more integration and vertical integration with transportation companies and transportation management systems, which is in the same way that you can broke the loads for normal bigger loads, that you can do a brokering kind of service for the [return] delivery." (P2, owner, supply chain consultancy firm)

> "I [the 3PRL provider] do have centralised facilities, […] I then bring all that stock back up to centralised hubs, where it is all processed, but I don't bring it up parcel-for-parcel. I bring it up truckload-for-truckload." (P7, owner, 3PRL provider firm)

Using appropriate network design can help online retailers reduce return transportation costs for a COR transportation process. The participants identified several network design possibilities for COR transportation. For instance, online retailers can reduce high transportation costs by using a decentralised network design since decentralised facilities reduce travel distances. Similarly, online retailers with a separate return facility can reduce transportation costs by locating the return facility close to their main facilities. Alternatively, online retailers can use centralised facilities to eliminate multiple return transportation trips to various locations, which can duplicate return costs and impact economies of scale. The following quotations demonstrate the use of appropriate network design for COR transportation:

> "[…] decentralised is better from a cost point of view its more cost effective […]. It's a hell of a cost to transport something within 48 hours across the country. But whereas if you decentralise, it takes that waiting period and that associated cost away […]." (P4, owner/CEO, 3PRL provider firm)

> "I think decentralised is better, and the reason being is cost […]. You've got to bring that product back and you've got to bring that [back] cost effectively. I personally think that decentralised operations are far more […] cost effective […] The fact that it gets back to the reclamation centre a little time later than that, that to me is in the ability to save costs […]." (P7, owner, 3PRL provider firm)

> "So, in terms of location, it needs to be, if not inside the DC, very close to the main DC hubs because you want to eliminate any excessive transport […] if you can't fit it in the very same facility […] then the next best option would be to have a centralised unit closest to your main hub […] just to save transport cost." (P5, general manager, online retailer)

> "I believe with it being centralised is that you collect that unit and deliver directly to your warehouse […] because less activities[are] involved, [for a] reduction in costs […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

Online retailers can implement various support RL practices for COR transportation, including (as supported by literature) the (1) traditional logistics (TLIT) strategy of using TMS for RL (section

6.3.3), (2) SC integration (SCI) strategies of integration and sharing of information and IT (section 6.4.1), (3) RL outsourcing strategies of deciding on the type of RL service and third party for RL outsourcing (section 6.5.1), (4) separate facility/location strategy of using separate facilities at a single location (section 6.8.2), (5) centralised facility/location strategy of using a central facility/location for RL (section 6.8.4), and (6) decentralised facility/location strategies of establishing a decentralised network, using decentralised facilities for RL and decentralising specific RL processes (section 6.8.5).

A few studies from the reviewed literature identified similar practices that can be used for cost savings in the transportation process. Specifically, studies identified that (1) economies of scales can be realised by outsourcing to 3PL/3PRL (Gu *et al.* 2019:160; Wang, Wang *et al.* 2021:67), (2) economies of scales and cost savings can be realised by transporting returned products to centralised facilities (Hjort *et al.* 2019:781), (3) transportation costs can be reduced by travelling shorter routes and distances, associated with a decentralised network (Bozzi *et al.* 2022:20, 30), and (4) a coordinated RL network can facilitate cost-effective return transportation (Misni & Lee, 2017:91). However, this study added that integration of information systems and the use of TMS can help online retailers with the implementation of COR transportation, providing additional opportunities for return transportation cost savings.

Essentially, COR transportation can help online retailers mitigate the cost (1) pitfalls of RL process failures (operational failures) and a lack of SCI (poor integration), and (2) problems of unnecessary expenses, high RL costs, a loss of money and margins (cash problems).

- *COR inspection*

COR inspection as a key COR process practice involves cost savings through the key practice elements of pre-return COR inspection and post-return COR inspection.

Like service-orientated return (SOR) inspection (section 8.5.2.1.2), *pre-return COR inspection* entails the use of dedicated staff to perform inspection at consumer locations. Specifically, the dedicated staff can inspect products to assess the true condition of product, which may eliminate unnecessary return transportation, receiving, processing and disposition costs for false failure and fraudulent product returns. Additionally, the staff can perform a resell for false failure returns related to incompatible devices, which helps eliminate a loss of sales. Furthermore, online retailers can train collection staff to perform quick visual inspections at the consumer's location, which can mitigate the cost pitfall of RL process failures related to poor transportation (section 8.6.1.1). Consequently, using visual inspection before transportation can help online retailers avoid accepting ineligible product returns (i.e. consumer claims an unwanted product but returns a damaged product), mitigating cash problems (e.g. a loss of money) and recovery problems (e.g. loss of product). Moreover, pre-return inspection can reduce the

need for additional inspection staff (human resources) in the facilities, which reduce handling costs. The following quotations show the importance of pre-return COR inspection:

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money […] If you were able to put a dedicated returns team, […] our first line evaluators,[…] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]. Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device. No problems, no questions asked. I'll update the return right here now and do a resell. So, they can sell them the correct device." (P5, general manager, online retailer)

> "The staff that's physically going to handle the product from the first time, the guy with the motorbike comes back with that jacket or whatever it is to be able to inspect and do the right thing at that point in time. Too often those processes are separated from each other. One person offloads then it gets moved on. Another person inspects or another person makes a final decision, and you just postpone the handling side. Where if you can train your people up at the right point to say this is good stock or its bad stock, then the decision can be made much sooner in the process without incurring double handling costs." (P2, owner, supply chain consultancy firm)

Regarding *post-return COR inspection*, online retailers can save costs in the long-term by appointing educated inspectors to perform product return inspections accurately and make appropriate processing and disposition decisions. Therefore, post-return COR inspection can help mitigate the cost pitfall of RL process failures related to poor disposition. The following quotation demonstrates the value of post-return COR inspection:

> "[…] employing the right people. It will save you money in the long run because you don't want to be an uneducated person dealing with a return claim on a forty- or fifty-thousand-rand electronics item […]." (P5, general manager, online retailer)

Subsequently, as support RL practices for COR inspection, online retailers can implement (as supported by literature) the (1) RC strategy of human RC in RL (section 6.9.1) and (2) RL staff strategies of providing formal training and skills development opportunities and producing well-trained and skilled staff (section 6.9.5). The findings related to pre-return inspection corresponds with the findings of Hjort *et al.* (2019:775), who observed that online retailers can use of pre-return inspection at consumer locations to ensure that the product condition matches the return claim. However, this study adds that cost savings and reduced human resources requirements can be realised through pre-return inspection.

Essentially, COR inspection can help online retailer address various cost pitfalls and problems, including the cost (1) pitfalls of RL process failures (operational failures), a lack of resources and poor RPA (poor RLM), and (2) problems of unnecessary costs, high RL costs, a loss of money and sales (cash problems), obsolete stock, poor/no recovery and a loss of products (recovery problems).

- *COR disposition*

COR disposition as a key COR process practice focuses on speedy disposition to save costs on transportation, product handling and warehousing (inventory and space). The participants mentioned that online retailers can use decentralisation for speedy disposition of perishable products, avoiding unnecessary transportation expenses to a central point for disposal. Furthermore, online retailers can

outsource RL to 3PRL providers with the capabilities of efficient disposition, avoiding inventory and storage costs as well as preventing obsolete stock, poor/no recovery, a loss of product/product value and a loss of sales. The following quotations demonstrate these findings:

> "I'm going to dispose of something regardless, then you want to do it as quickly as possible without incurring additional transportation or other costs. And then you might want to say, well, I've decentralised points in different cities, and I'll just dispose." (P2, owner, supply chain consultancy firm)

> "So whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, but it will become in the recoverability of the product, the control, the discipline and the turnaround of the stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here […]." (P7, owner, 3PRL provider firm)

As support RL practices, online retailers can implement (as supported by literature) the (1) RL outsourcing strategies of deciding on the type third party for RL outsourcing and selecting a 3PRL provider (section 6.5.1), (2) disposition strategy of benefit-driven disposition options (section 6.6.1), and (3) decentralised facility/location strategy of decentralising specific RL processes (section 6.8.5). While no study from the reviewed literature indicated the use of decentralised facilities for speedy disposition and cost savings, Le (2023:15) mentioned that outsourcing RL can help online retailers with product recovery and savings of costs associated with disposition activities.

Therefore, online retailers can benefit from using 3PRL providers for COR disposition, which with other suggested COR disposition practices can help them address the cost (1) pitfalls of RL process failures (operational failure) and poor RL planning (poor RLM) and (2) problems of unnecessary expenses, high RL costs, a loss of money and sales (cash problems), obsolete stock, poor recovery, a loss of product and loss of product value (recovery problems). Relating to COR disposition, the next section explores COR recovery as the final COR proposition category.

8.6.2.2.2 Cost-orientated return (COR) recovery

While COR process propositions focused on cost efficiencies and savings through various RL processes, COR recovery as a COR proposition category focuses on disposition recovery activities to maximise cost recovery from returned products. Therefore, COR recovery extends COR processes ensuring that online retailers not only save RL costs but also recover costs through return disposition. As illustrated in **Figure 8.15**, COR recovery involves the key practices of (1) *COR recovery preparation*, (2) *COR recovery through the primary channel*, (3) *COR recovery through secondary channels* and (4) *COR recovery through suppliers*, which will be discussed in the subsequent paragraphs.

- *COR recovery preparation*

COR recovery preparation involves the key practice elements of developing a COR recovery strategy, establishing a COR recovery department and establishing COR recovery agreements.

A *COR recovery strategy* involves the development of a recovery strategy with the aim of recovering as much value as possible from consumer returns. Consequently, online retailers must pay attention to RL and identify recovery options related time, resource and cost requirements in advance for effective COR recovery preparation. The following quotation demonstrate the importance of developing a COR recovery strategy:

> "So, I think it's very important as part of your strategy. […] what do you do with that product when it's coming back and it's not resalable? You know, do you just try and mark it down and send it to outlets stores, sell it to third parties, can you maybe do something with it, do you fix it? So, I think it's because there is resources, cost and time. All that stuff is involved with what happens with the product after it's been returned. So, I think you have to take that into account in your strategy." (P13, supply chain manager, multichannel retailer)

Additionally, some participants advised that online retailers establish a *COR recovery department*, consisting of dedicated recovery staff with various roles and responsibilities for COR recovery. Particularly, recovery staff can be involved in product assessment, sorting, repackaging, engagement with third-party buyers from secondary markets and engagement with suppliers. Additionally, online retailers can either appoint a RL manager to manage recovery efforts or use a general manager (dual FL and RL roles) for disposition decision making and engagement with suppliers, enabling maximum cost recovery from product returns. Subsequently, online retailers need to dedicate sufficient human resources for the establishment of a COR recovery department. The following quotations portray these findings:

> "So, we also have a recovery department, in our warehouse, which then will assess the heights and either repackage it or they will put it aside for either Cash Crusaders or Cash Converters, whichever people sell used goods, to come and collect it to actually get some form of profit […]." (P3, returns manager, online retailer)

> "We have a category department. […] So, our category department takes care of all the suppliers on based on the different categories […] we have to establish whether we can send it back or not." (P9, regional & online DC manager, online retailer)

> "[…] the reverse logistics manager is actually managing the inventory component. What are we going to do with the stock? How are we going to handle it? How are we going to disposition it?" (P1, operations manager, 3PRL provider firm)

> "[…] the manager of the fulfilment centre and I have to decide whether which route it should take. So, from there on, we decide whether the packaging is damaged. If the packaging is damaged, then we will contact our supplier […] and let them know that this item has come back. We are returning it to supplier." (P9, regional & online DC manager, online retailer)

> "But when they want to return it, if you haven't invested in that process and those people […] How are we going to maximise the disposition return? And if you haven't invested in all of that, can we offset some of the disposition in some of the cost of servicing with the [cost] recovery and disposition […]." (P1, operations manager, 3PRL provider firm)

Lastly, COR recovery preparation requires the establishment of *COR recovery agreements* with suppliers and third-party buyers. Particularly, online retailers can establish COR recovery agreements with suppliers that aim to maximise COR recovery from consumer returns. Additionally, online retailers can establish agreements with third-party buyers (i.e. jobbers and brokers) operating in secondary markets to maximise COR recovery from unwanted/used product returns. The following quotations emphasise the importance of establishing COR recovery agreements with SC parties:

> "And obviously, I know the service level agreements based on that supplier […] we have an agreement with these guys so that we can send it back […]." (P9, regional & online DC manager, online retailer)

> "[…] there is a cost for that space […] needs to also be sent back to the supplier or the manufacturer. I've had agreements in place that my supplier or manufacturer would come once a month and collect all the items if that agreement was in place, if that agreement was not in place, you would then have another cost of shipping those items off to either job lot buyers or auctioneers because they will not come and fetch it." (P12, Head of logistics, online retailer)

> "So that's what they'll go into agreement with one or two parties at most and say, you know what, every other day we'll call you, you'll come, you'll come and view the stuff in the racks. You'll see what it is. You'll get a fair price, and you'll say, fine, bang, I'll pay you R400 K. I'll take everything. Because it's just a way of salvaging cost." (P5, general manager, online retailer)

Consequently, COR recovery preparation demonstrates the importance of RCE (return cost evaluation) propositions, involving the inclusion of disposition decisions in strategic planning (cost determination RCE tool), identification of standard RL costs (cost identification for RCE execution) and cost assessments for disposition options (cost assessment for RCE execution) (section 8.6.2.1). Additionally, online retailers can implement various support RL practices for COR recovery preparation, including (as supported by literature) the (1) *SCI strategies* of negotiations, developing contracts, SC collaboration, coordination, communication and information sharing and establishing SC agreements (section 6.4.1), (2) *disposition strategies* of preparing for disposition strategy implementation, establishing disposition rules and policies, developing reuse, product recovery and secondary market strategies and implementing a formal disposition strategy (section 6.6.1), (3) *RC strategy* of human RC in RL (section 6.9.1), (4) *RL manager strategies* of creating a full-time RL manager portfolio and assigning experienced managers to RL, and (5) *RL staff strategy* of establishing a RL function (section 6.9.5).

The interview findings related to COR recovery preparation resembles the literature, including (1) the development of a disposition strategy can be essential to recover value from consumer returns (Andresen & Istad, 2019:23), (2) appropriate and skilled staff can be important for product recovery management (Zailani *et al.* 2017:35), (3) collaborative SC partnerships can enhance product reuse (Pal, 2017:883), and (4) agreements with suppliers maximises cost recovery from consumer returns (Biswas & Abdul-Kader, 2018:1019). Subsequently, COR recovery preparation can help online retailers mitigate various cost pitfalls and problems, including the cost (1) pitfalls of RL process failures (operational failures), inattention to RLM, poor RL planning, a lack of resources (poor RLM) and a lack of SCI (poor integration), and (2) problems of unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor/no recovery and a loss of product and product value (recovery problems).

- *COR recovery through the primary channel*

Following COR recovery preparation, COR recovery through the primary channel involves the key practice elements of reselling at full value and reselling at a discount through the primary channel to recover as much value as possible from consumer returns.

Concerning *reselling at full value*, participants indicated that online retailers could prioritise the resale of consumer returns on their online shop as new and at full price, which enables maximum COR recovery. Furthermore, the participants advised that online retailers either use a distribution centre (DC) or a separate returns facility next to the DC for fast restocking and reselling, linking with the key COR process practices (section 8.6.2.2.1) of COR transportation and COR disposition (i.e. speedy disposition). The following quotations convey these findings:

> "[…] your first priority would be to put it [returned products] back for resale […] So, that decision of resale is driven by cost recovery." (P5, general manager, online retailer)

> "[…] recovery on that cost. So, if you're going to resell products, you're able to resell at full value […]." (P4, owner/CEO, 3PRL provider firm)

> "[…] fit it in the very same facility […] which is the best plan, because ultimately you want to put some of that stock back to resell. So, if you can't do that, then the next best option would be to have a centralised unit closest to your main hub." (P5, general manager, online retailer)

Following reselling as new, the participants indicated that online retailers could implement initiatives for *reselling* returned products at a *discount* through the primary channel. Several participants referred to the initiative of "unbox deals", which was implemented by a South African online retailer, as an example to recover costs from reselling at a discount on the primary market. Particularly, this initiative involves products that consumers opened, breaking the seals or damaging the original packaging, and returned as unwanted (e.g. not as expected, size too big/small, dislike the colour/version or incompatible), which cannot be resold at full value through the primary channel. Subsequently, this online retailer created the initiative of unbox deals, informing the consumers on their website that unbox deals involve new but opened products that they can buy at a discount. The following quotations expand on these findings:

> "[…] you could make decisions about trying to move it back into your business. So, in other words, unboxed deals or something like that." (P1, operations manager, 3PRL provider firm)

> "[…] you need to try and salvage whatever you can. […] the unbox deals, which is a pretty good initiative to sell kind of new but unboxed goods to regain some of the profit." (P5, general manager, online retailer)

> "[…] unbox deals […] they'll tell you that it's an unbox deal, that the computer has been unboxed. It is still under warranty […] They have checked it. It is perfect, they still give an internal warranty. The manufacturer warranty is still in-check. The only thing is that it's slightly less expensive because the box may have been opened […]." (P5, general manager, online retailer)

As support RL practices for COR recovery through the primary channel, online retailers can implement (as supported by literature) the (1) disposition strategies of benefit-driven disposition options and developing reuse strategies and practices (section 6.6.1), (2) separate facility/location strategy of using separate facilities at a single location for RL (section 6.8.2), and (3) integrated facility/location strategy of using a standard facility/location for RL (section 6.8.3). A few studies in the literature review indicated that direct reuse of product returns can generate profits (Ahsan & Rahman, 2021:21; Nel & Badenhorst, 2020:128) and result in cost savings (Le, 2023:15; Meyer *et al.* 2017:12), reemphasising the importance of reselling product returns through the primary channel. Additionally, the interview findings related to the use of a separate facility close to the main facility for fast restocking and

reselling of product returns echoes the findings of Meyer *et al.* (2017:13). Nevertheless, no study identified initiatives, like creating unbox deals, as a possibility for online retailers to reclaim value from opened returned products. Consequently, this study contributes to the literature, providing additional avenues for online retailers to reclaim maximum value from reselling unboxed products through the primary channel.

Essentially, COR recovery through the primary channel can help online retailers to address the cost (1) pitfalls of RL process failures (operational failures) and poor RL planning (poor RLM), and (2) problems of unnecessary expenses, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor recovery and a loss of product and product value (recovery problems).

- *COR recovery through secondary channels*

COR recovery through secondary channels involves reselling of product returns to third-party buyers or through liquidation channels at discounted prices. Consequently, COR recovery through secondary channels associates with used returned products that cannot be resold either at full value or at a discount through the primary channel (online shopping site).

Therefore, online retailers can use COR recovery agreements (key practice element of COR recovery preparation) to partner with third-party buyers to resell used product returns in bulk for a discounted lump sum. Alternatively, online retailers can resell used product returns through secondary channels, like factory outlet stores or auctions, to recover some value from returned products. The following quotations illustrate COR recovery through secondary channels:

> "[…] a good example is that people buy a laptop and then say the laptop is slow. And they send it back, and in the meantime, they've loaded windows and they've actually created a profile […] but then […] it's no longer a new item. So, that then becomes tricky […] they'll try and resell the stuff to second-hand dealers […]. You need one or two partners at most that are willing to take the entire consignment of stock for a set price […]. So, you would then say to them, you know what, this stock has got the evaluation of a million rand. We are willing to part with it at 40 percent […] and you'll [the buyer] say, fine, bang, I'll pay you R400 K. I'll take everything. Because it's just a way of salvaging cost." (P5, general manager, online retailer)

> "[…] recovery on that cost. So, if you're going to resell products or you're able to resell at full value, if not, then rather send it through to a liquidation channel […] [like] factory outlets that a lot of stuff [returned products] gets sold through." (P4, owner/CEO, 3PRL provider firm)

> "[…] the other stuff gets bundled up and either auctioned off or sold through secondary channels. And at a massively discounted price." (P1, operations manager, 3PRL provider firm)

As support RL practices for COR recovery through secondary channels, online retailers can implement (as supported by literature) the (1) SCI strategies of using contracts, using SC agreements and partnerships, and SC communication and information sharing (section 6.4.1), and (2) disposition strategies of benefit-driven disposition options and developing secondary market strategies and practices (section 6.6.1).

No recent studies from the reviewed literature identified the value of COR recovery through secondary channels. In fact, Bensalem and Kin (2019:23) found that RL research often overlooks reselling through secondary markets as a disposition option in the RL process. Therefore, this study contributes to the literature by identifying COR recovery through secondary markets as a valuable option for online retailers to recover value from used product returns. Additionally, this study shows that COR recovery through secondary channels can help online retailers address several cost pitfalls and problems, including the cost (1) pitfalls of RL process failures (operational failures), poor RL planning (poor RLM) and a lack of SCI (poor integration), and (2) cost pitfalls of unnecessary expenses, a loss of money and sales (cash problem), obsolete stock, poor/no recovery and loss of product and product value (recovery problems).

- *COR recovery through suppliers*

Like COR recovery through the primary channels, COR recovery through suppliers can be a high priority for online retailers to recover costs from product returns, especially for warranty and defective products. As key practice elements, online retailers can use dedicated staff and agreements for COR recovery through suppliers.

In terms of *using dedicated staff*, the participants suggested that online retailers employ product experts to effectively test and identify faults from defective/warranty returns to lodge warranty claims from suppliers, linking with COR inspection (see section 8.6.2.2.1). Additionally, online retailers can use dedicated staff (i.e. recovery staff and managers) from the established COR recovery department (COR recovery preparation element) to engage with suppliers for effective COR recovery. Using dedicated staff can help online retailers to avoid money and product losses by obtaining credits/refunds and replacements from suppliers to reimburse consumers for defective product returns. Moreover, online retailers can use the COR recovery *agreements* established with suppliers to maximise cost recovery, which enables transfer of the RL costs/expenses of consumer returns to suppliers for full cost recovery. The following quotations denote these findings:

> "As an online retailer, you will always try and get your money back. That's your number one priority. So, sending it back to the supplier for a warranty claim is the easiest thing in the world, done deal." (P5, general manager, online retailer)

> "So, you employ a number of experts in that field […] that's got experience in handling such electronics, for instance, they'll put it to test and right there and then they'll decide, OK, well, you know what, the customer's correct, this item is defective and they can then class that as a […] supplier warranty claim […] the lost sale and the defective item is then made the problem of the supplier to come and collect and replace or credit the business." (P5, general manager, online retailer)

> "That's the 'request for credit' team where we work with the suppliers' hand in hand. When we get the item that the customer returns and says that it's faulty, we will create an RFC back to the supplier for them to either credit us or exchange that product with the new one." (P3, returns manager, online retailer)

> "[…] the manager of the fulfilment centre […] will contact our supplier […] and let them know that this item has come back. We are returning it to supplier." (P9, regional & online DC manager, online retailer)

> "[…] items we sent back to our suppliers. And we get a cost price plus logistics cost return from those vendors, which is agreed up front." (P8, logistics manager, multichannel retailer)

As support RL practices for COR recovery through suppliers, online retailers can implement (as supported by literature) the (1) SCI strategies of using SC agreements and partnerships, SC communication, collaboration and coordination, and information and costs sharing with SC partners (section 6.4.1), (2) disposition strategies of benefit-driven disposition options and developing other recovery strategies and practices (section 6.6.1), (3) RC strategy of human RC in RL (section 6.9.1), (4) RL manager strategy of assigning experienced managers to RL, and (5) RL staff strategies of establishing a RL function and producing well-skilled staff for RL (section 6.9.5).

While the use of dedicated recovery staff and trained product experts are unique to this study, Biswas and Abdul-Kader (2018:1019) confirmed that warranty claims and supplier agreements enable online retailers to return damaged products to suppliers for full cost recovery. Therefore, this study reemphasises the economic value of COR recovery through suppliers, which can help online retailers mitigate the cost (1) pitfalls of RL process failures (operational failure), inattention to RLM, lack of resources (poor RLM) and a lack of SCI (poor integration), and (2) problems of unnecessary expenses, high RL costs, a loss of money (cash problems), obsolete stock, poor/no recovery and a loss of products and product value (recovery problems).

In conclusion, COR propositions, including COR processes and COR recovery, can help online retailers to realise cost savings and cost recovery through RL processes and product recovery initiatives as well as address various cost pitfalls and problems. Therefore, online retailers can implement COR propositions for the effective RLM of consumer returns. In the next section, return cost management (RCM) propositions will be discussed and analysed.

8.6.2.3 Return cost management (RCM) propositions

RCM as a main cost proposition involves the proposition categories of *RCM mitigation* and *RCM execution*, which focusses on mitigating high RL costs and losses and managing and controlling RL costs for the cost-effective management of consumer returns. In the subsequent sections, RCM mitigation and RCM execution as RCM proposition categories will be discussed and analysed.

8.6.2.3.1 Return cost management (RCM) mitigation

RCM mitigation as an RCM proposition category involves the key practices of (1) *return regulation*, (2) *return avoidance*, (3) *return charges and penalties*, and (4) *cost absorption* (see **Figure 8.15**) for the mitigation of high RL costs and financial losses. Consequently, online retailers can use the findings

of the RCE (return cost evaluation) propositions (section 8.6.2.1) to support RCM mitigation. The key RCM mitigation practices will be explored in the subsequent paragraphs.

- *Return regulation for RCM mitigation*

Return regulation for RCM mitigation involves gatekeeping initiatives and inspection initiatives (key practice elements) to prevent losses, mitigate high RL costs and avoid unnecessary expenses associated with product returns.

Linking with post-sales proactive return prevention (PRP) propositions (section 8.4.2.1.2), online retailers can use the *gatekeeping initiatives* of online authorisation and requesting evidence from consumers to regulate returns. For instance, online retailers can digitise their return policies and use their online system to automatically reject illegitimate returns, complementing the use of an online system for COR request and gatekeeping (section 8.6.2.2.1). Additionally, online retailers can use human gatekeepers who review photos to judge the legitimacy of the return reasons provided by consumers. Subsequently, gatekeeping can be essential to regulate return volumes, avoid unnecessary RL costs/expenses and prevent losses associated with ineligible returns for effective RCM mitigation. The following quotations support these findings:

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. The fact of the matter [is], this person [the consumer] bought the item two years ago and it's out of warranty and it is not returnable. […] what are you going to do with this two-year old computer that's now potentially broken? It's nothing. It's old, it's obsolete, and so it's only a cost driver. So, avoiding that on the front end by digitising your returns policy […]. Your computer system understands what the product is and when they [the consumer] bought it, what the return parameters are for that item, what the policy is for that item and allows that customer to return it or rejects the return with treatable messaging." (P1, operations manager, 3PRL provider firm)

> "So, when a customer logs a return, they obviously need to take a photo of an item, a picture of something so that the person [gatekeeper] can see that item has been used. It obviously gets declined right away. So, you don't have that cost incurred to actually go and collect the item, evaluate it at the warehouse and then having to send it back." (P3, returns manager, online retailer)

> "[…] you are going to lose money with returns. There's just no doubt and all you can do is to minimise that risk. And I think gatekeeping is the correct word because if people simply return things because [Retailer C] will just take it back, don't worry. And those floodgates will open, and people will abuse the system […]." (P5, general manager, online retailer)

> "So, gatekeeping, I think, is an absolute prerequisite because, you know, the e-retailer could open themselves up to huge claims […]." (P7, owner, 3PRL provider firm)

While gatekeeping initiatives for return regulation take place before the online retailer accepts a return, *inspection initiatives* take place post-receipt in the facility. The participants indicated that online retailers train and educate inspection staff to (1) test products for false failures, (2) identify user damage (product abuse), (3) identify illegitimate return claims, and (4) avoid making emotional decisions regarding the legitimacy of a return claim. Consequently, the inspection staff should be capable of regulating return claims, enabling prevention of financial losses associated invalid return claims (e.g. accepting a return claim for a used electronic device). As a further cost saving measure, one participant

mentioned that online retailers can request suppliers to educate inspectors, which not only eliminates training costs but also improve return regulation efforts for RCM mitigation. The following quotations demonstrate inspection initiatives as a return regulation measure for RCM mitigation:

> "[…] training goes without question because financially, the checking of a claim […] every facet that we operate with has to be checked and the person doing it has to be suitably qualified to do so." (P7, owner, 3PRL provider firm)

> "So, educating your inspectors with the help of the supplier and possibly even at their cost. So, you can try and educate your inspectors on the supplier's cost, saying that we run thousands of electronic items through your doors every week. We need your team to come and educate our team, so you save a couple bucks […] [and for] the business acumen saying that you can't make an emotional decision when dealing with a R40000 electronic device […]." (P5, general manager, online retailer)

Subsequently, using inspection initiatives for return regulation, complements the COR process practice (section 8.6.2.2.1) of COR inspection (i.e. appointing educated inspection staff) and COR recovery practice (section 8.6.2.2.2) of COR recovery preparation (i.e. establishing agreements with suppliers). Additionally, as support RL practices for return regulation as an RCM mitigation practice, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities and using the Internet and website for RL (section 6.3.2), (2) SCI strategies of using SC agreements and sharing information, resources, responsibilities and costs (section 6.4.1), (3) return prevention and avoidance (RPA) strategy of implementing gatekeeping practices (section 6.9.3) and (4) RL staff strategies of developing staff training and education programmes, providing formal training and producing well-trained and skilled staff for RL (section 6.9.5).

Some studies from the reviewed literature align with the interview findings in terms of return regulation. Specifically, studies identified that (1) gatekeeping as a preventative measure can reduce costs (Andresen & Istad, 2019:8), (2) IT can be used to verify returns for cost reductions (Jović *et al*. 2020:164), (3) proper use of skilled staff for gatekeeping and claims can reduce costs (Ashan & Rahman, 2021:22), and (4) collaboration between suppliers and retailers can enhance resource effectiveness for improved RL process efficiency and enable sharing of information about product return reasons (Dapiran & Kam, 2017:832). Essentially, online retailers can address several cost pitfalls and problems through the implementation of return regulation for RCM mitigation, including the cost (1) pitfalls of poor RL planning, lack of resources, poor RPA (poor RLM) and a lack of SCI (poor integration), and (2) problems of unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor/no recovery and a loss of product and product value (recovery problems).

- *Return avoidance for RCM mitigation*

Closely related to return regulation, return avoidance for RCM mitigation involves the implementation of a zero-return and zero-inventory initiatives (key practice elements) to avoid RL costs/expenses.

Although online retailers must accept returns due to CPA (consumer protection act) legislation, they may implement no-collection returns as a *zero-return initiative*. Subsequently, instead of collecting the product and incurring various RL costs/expenses (e.g. collection, transportation and handling costs), online retailers can issue a refund, requesting the consumer to keep the product. However, participants indicated that online retailers could implement no-collection returns for lower value or inexpensive products where the return costs exceed the product price. Consequently, implementing the zero-return initiative of no-collection returns emphasises the importance of cost assessment for RCE execution, relating to assessing the cost implications of accepting inexpensive product returns (section 8.6.2.1.2). The following quotations illustrate the application and importance of zero-return initiatives for return avoidance to mitigate unnecessary and high RL costs:

> "[…] it had introduced, no-collection returns, in other words, at a certain threshold, if the customer triggered a return, the item wouldn't be collected and be brought back to the warehouse, they would just be refunded. And I'll give you the typical example is a CD or DVD, they cost R100 to R150 per courier and bring it back to the warehouse is R50." (P1, operations manager, 3PRL provider firm)

> "[…] really have a good look at whether or not you want to accept a return in terms of cost. Example, I would if it's under a certain chargeable mass and if it's under a certain product price, I would actually tell the customer not to even return it. I would tell the customer to keep it. And I will refund that customer or give the customer a credit." (P12, Head of logistics, online retailer)

> "[…] have some sort of way to avoid or reduce a return when it's not actually going to give the desired outcome, because you don't want to pay for reverse logistics for no reason." (P13, supply chain manager, multichannel retailer)

As a *zero-inventory initiative*, online retailers can consider adopting a fourth party logistics (4PL) strategy by selling products for suppliers without carrying the inventory in their facilities. Therefore, both the delivery and product return become the responsibility of the supplier, enabling the online retailer to avoid RL collection, transportation, receiving, inspection, sorting, warehousing, disposition and redistribution costs. An example of this strategy can be an online retailer with an online marketplace acting as an intermediary between consumers and sellers. The following quotation depicts the return avoidance initiative of zero inventory for RCM mitigation:

> "[…] we would call that our 4PL process. So, normally when you sell online, […] you can have your own warehouse and you can keep your own stock. [But this is] Not efficient because you've got a stock life cycle, and that's also costly. If you can't return that or turn that stock in 30 days or 50 days, it cost you money. Then you can have the option also of selling directly from your supplier's own warehouse, so you don't carry stock, but your supplier, that manufacturer, carry stock. In other words, you can then do a supply chain 4PL purchase. So, I receive the online purchase from the client. I don't carry any stock, but their purchase is directly redirected to the supplier or manufacturer of a specific product, and that specific supplier or manufacturer will make sure that the delivery takes place from his or her own facility or warehouse. So, that's completely then with that supplier […] and that's the same then in terms of a reverse or a return, is that supplier will get notified by the customer care department that they've logged that return. That return will be redirected to that supplier […]." (P12, Head of logistics, online retailer)

As support RL practices for return avoidance as an RCM mitigation practice, online retailers can implement (as supported by literature) the (1) SCI strategies of communication and information sharing (section 6.4.1), and (2) RPA strategy of a cost-benefit analysis and developing and implementing return avoidance strategies (section 6.9.3). As mentioned in section 8.6.2.1.2, the interview findings related to no-collection returns coincide with the findings of Hjort *et al.* (2019:775). Therefore, online retailers can request consumers to keep and discard products and only pay for the refund, eliminating additional RL costs. Likewise, Chen *et al.* (2017:255) identified that return avoidance can impact both the cost and the profitability of the online retailer by minimising product returns. Concerning a zero-inventory strategy, no studies from literature identified zero-inventory as a possibility for the elimination of RL costs. Therefore, online retailers with high returns and unstainable expenses can consider implementing a zero-inventory strategy for certain product returns.

Essentially, online retailers can mitigate various cost pitfalls and problems through return avoidance for RCM mitigation. Particularly, online retailers can mitigate the cost (1) pitfalls of FL failures, RL process failures (operational failures), poor RPA (poor RLM), dismissing RL costs, poor RL cost monitoring (poor FM) and a lack of SCI (poor integration), and (2) problems of poor pricing, poor cost visibility (costing problems), unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor/no recovery and a loss of product and product value (recovery problems).

- *Return charges and penalties for RCM mitigation*

Return charges and penalties as a key RCM mitigation practice involves charging consumers for product returns and issuing penalties for product return damages or losses (key practice elements).

Particularly, online retailers can implement stricter return policies by *charging consumers* transportation, handling and/or processing fees, which not only helps with return reduction but also avoiding high RL costs. Alternatively, online retailers can add conditions to a neutral (neither strict nor lenient) return policy, only charging consumers that return products for unwanted (e.g. change of mind and order errors) reasons. Consequently, the online retailers only incur the costs of defective returns, which with the implementation of COR recovery through suppliers can be pushed to the suppliers (see section 8.6.2.2.2). Moreover, online retailers might charge a consumer for the original delivery costs if the consumer bought items to qualify for free delivery but returned a product that fall below the original free delivery threshold. Evidently, return charges for RCM mitigation emphasises the importance of cost assessment for RCE execution, which involves assessing the cost implications of return leniency (see sections 8.6.2.1.2). The following quotations demonstrate return charges for RCM mitigation:

> "[…] they will reduce the number of returns if they do attach a cost to the return" (P2, owner, supply chain consultancy firm)
>
> "But if you send it back because you just don't like it, we charge you for the delivery and if it's our fault or product fault, well then, your return pick up is free." (P6, logistics "manager, multichannel retailer)
>
> "You know, like when you place an order to get free delivery, you have to order R500. Something will come that if you want to return, there's going to be a charge […] the free opportunity to send goods back, in my opinion, is an unsustainable cost for businesses […]." (P7, owner, 3PRL provider firm)

In terms of *penalties*, online retailers can charge 3PL providers/couriers for return transportation damages and product losses. However, online retailers can develop appropriate SC performance metrics and integration efforts to successfully charge 3PL/courier partners, linking with the reactive return prevention (RRP) proposition of party-related interventions (see section 8.4.2.2.2). The following quotation convey this finding:

> "And to ensure that you engage with carriers or couriers that will deliver products to your customers, […] [to] take care of your product, and they are measured against any of their own damages. If our carrier loses a parcel or damages a good, they pay for it, which encourages good behaviour." (P8, logistics manager, multichannel retailer)

As support RL practices for return charges and penalties, online retailers can implement (as supported by literature) the (1) SCI strategies of SC agreements, integration and information sharing and cost and risk sharing (section 6.4.1), (2) PM strategies of establishing appropriate KPIs and performance monitoring and review (section 6.7.1), and (3) RPA strategy of implementing return restrictions (section 6.9.3). No studies from the reviewed literature identified return charges as possibilities to mitigate RL costs and losses. However, Zhang *et al.* (2023:10) suggested that online retailers adjust return policies by shortening the return period and Ermes and Niemann (2023:9) suggested that online retailers customise return policies to accommodate fewer returns. Additionally, Andresen and Istad (2019:7) mentioned that stricter return policies and conditions can lower RL costs due to lower returns. Nevertheless, this study distinctly identifies the use of return charges or sharing of returns costs as initiatives that online retailers can consider. Moreover, as mentioned in section 8.4.2.2.2 (RRP interventions), the use of supplier penalties can be a unique practice for South African online retailers due to retailers being more powerful parties in the SCs of South Africa. Evidently, this study adds to the literature, demonstrating an additional avenue for mitigating and managing RL costs effectively.

Essentially, return charges and penalties for RCM mitigation can help online retailers address the cost (1) pitfalls of RL process failures (operational failures), poor RL planning, poor RPA (poor RLM), and a lack of SCI (poor integration), and (2) problems of unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), poor/no recovery and a loss of product (recovery problems).

- *Cost absorption for RCM mitigation*

Cost absorption for RCM mitigation involves the avoidance of RL costs/expenses by effectively absorbing RL costs into the selling price of products through activity-based costing and creating a separate account for RL (key practice elements).

Particularly, participants indicated that online retailers could *perform activity-based costing*, which involves estimating the return costs of various RL processes to accurately include it in the selling price of the product. Additionally, online retailers can *create a separate account* for RL to accurately gauge return transportation costs for effective absorption into the selling price. Evidently, through cost absorption online retailers can avoid additional RL costs/expenses but still satisfy consumers with the appearance of return leniency by not charging return fees. The following quotations demonstrate cost absorption as a key RCM mitigation practice:

> "And so, when we do activity-based costing […] we absorb the cost of the returns into the overall pricing […]. So, we don't always necessarily charge for it separately. But we take the cost of the returns, processing the returns handling and returns transportation, and we add that to the original sales handling cost." (P2, owner, supply chain consultancy firm)

> "It needs to be a completely different dual account. It needs to be completely independent from any other thing you do […]. So that when I do future planning in terms of margin and markup, I can use that percentage of cost to accurately gauge my transport component onto my selling price, but importantly not overinflated because of my own wastage […]. I'm going to load into my price, which is completely fine." (P5, general manager, online retailer)

> "[…] the end-product pricing is included in all the variables. So, obviously return logistics is a variable. So that is priced in the determination of a product, all these kinds of variables are taken into account. And it's built into price." (P11, Demand and sales manager, FMCG distributor)

Consequently, cost absorption for RCM mitigation emphasises the importance of the RCE propositions (section 8.6.2.1), including RCE cost determination tools (i.e. account separation) and cost identification for RCE execution (i.e. cost identification of standard RL costs). Additionally, as support RL practices for cost absorption, online retailers can implement (as supported by literature in section 6.9.2) the FM strategies of using costing techniques for RL, cost value estimations and identifying RL costs (section 6.9.2). No studies from the reviewed literature indicated the use of cost absorption as practices that online retailers can use to avoid RL costs. Therefore, this study exclusively identifies that using cost absorption for RCM can help online retailers mitigate the cost pitfalls of poor RL accounting and dismissing RL costs (poor FM), and cost problems of poor pricing, inaccurate view of financial performance, poor cost visibility (costing problems), high RL costs and a loss of money, margins and profits (cash problems).

In the next section, the RCM execution propositions will be discussed and analysed.

8.6.2.3.2 Return cost management (RCM) execution

RCM execution as an RCM proposition category involves strategies, standards, accountancy, systems and measures to effectively manage, control and monitor RL costs. As illustrated in **Figure 8.15**, the key practices of RCM execution include *formalisation, accounting* and *cost monitoring* for RCM execution, which will be discussed in subsequent paragraphs.

- *Formalisation for RCM execution*

Formalisation for RCM execution involves RLM prioritisation and cost control strategies and standards (key practice elements) to effectively manage and control RL costs.

RLM prioritisation for RCM execution involves paying attention to RLM to effectively manage and control RL costs. The participants indicated that online retailers could prioritise RLM by including RL in the design of logistics processes, developing policies and procedures for RLM and appointing a dedicated RL manager to effectively control RL costs. RLM prioritisation as a formalisation initiative complements RCM mitigation propositions (section 8.6.2.3.1), enabling the prevention of money and profit losses. The following quotations demonstrate the importance of prioritising RLM for RCM execution:

> "[…] returns and reverse logistics was sort of an afterthought for the company. And therefore, when they actually started to do the reverse logistics and the returns, we found a lot of issues. And obviously the company lost a lot of money by doing that. So, I think in any online industry or actually any logistics company, you need to design your supply chain with the mind of having reverse logistics in it." (P3, returns manager, online retailer)

> "[…] return logistics needs to be managed because it can grow into a loss for the company in the wink of our eyes. So, you need to have all your procedures in place, your policies in place and your quality checks needs to be in place." (P11, Demand and sales manager, FMCG distributor)

> "And again, because of the easiness of returning products with free returns in an online environment, that's such a big area of your cost that it warrants someone to look after that portion of your business and you try and control the costs within that portion of your business." (P2, owner, supply chain consultancy firm)

> "[…] if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly. So, I think it is very important to have somebody to oversee that at all times. And also, it's a great loss area to actually gain some of the losses back." (P3, returns manager, online retailer)

For *cost control strategies and standards,* the participants suggested that online retailers include RL in their strategic planning, enabling the development of effective cost control strategies. Additionally, online retailers can develop cost control standards by establishing a RL cost benchmark. Particularly, online retailers need to estimate and identify an acceptable ratio for RL costs per total logistics costs for RCM execution, emphasising the importance of the RCE execution propositions of cost identification and cost assessments (section 8.6.2.1.2). For instance, the online retailer can identify that an acceptable ratio for RL costs can be five percent of the total logistics costs. The following quotations expand on these findings:

> "[…] you can have it [RL] as part of a strategic plan […]. I have to make sure that there's a strategic intent to get the cost down […]. It can be part of a cost containment strategy." (P6, logistics manager, multichannel retailer)

> "[…] you still have your costs, right? Because returns and reverse logistics is inevitable […]. So, normally what you do is you try and work on a ratio that's a benchmark or standard that [it] is not really going to eat into your bottom line. […] you have a ratio of so for the 3000 orders that you've delivered, you probably work on maybe nought point two percent or one percent from an order perspective, from a logistics cost ratio perspective. If it costed you, hypothetically speaking, a million rand or R500000 to deliver those units in terms of logistics cost, you're reverse logistics costs, should be probably one per cent or five or 10 percent of that total logistics cost, and that's the one that needs to be done. Again, you've got to have some sort of a threshold that you need to reach […]. But you've got to as time progresses, you've got to reach an equilibrium where you believe that this is the matrix, that everybody has a standard target of what your logistics cost ratio should be, and that's how it needs to be measured." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

As support RL practices for the formalisation of RCM execution, online retailers can implement (as supported by literature) the (1) PM (performance measurement) strategies of strategic benchmarking, developing performance objectives and metrics and standardising PM (section 6.7.1), (2) FM strategy of implementing cost policies, controls and measures (section 6.9.2), (3) strategic planning strategies of developing strategic plans and strategies for RL and integrating RL strategic plans and strategies with organisational strategic plans strategies, (4) strategic procedure strategies of prioritising strategic procedures in RL, developing a formalisation strategy for RL and developing formal rules and controls for RL (see section 6.9.4), and (5) RL manager strategies of establishing sufficient leadership for RL, creating a full-time RL manager portfolio and assigning experienced managers to RL (section 6.9.5).

Limited studies from the reviewed literature identified practices related to the formalisation of RCM. However, Ahlén and Johansson (2023:32) and Badenhorst (2017:611) identified that top management commitment and support to RL can address economic barriers in RL. Furthermore, Frei *et al.* (2020:1616) noted that product returns should be directed by senior management due to the impact of product returns on the bottom line. Evidently, prioritising RLM can be valuable for online retailers to manage and control RL costs. Concerning cost controls strategies and standards, no studies from the reviewed literature identified the use of strategies and standards to manage RL costs. Therefore, this study contributes to literature by demonstrating the importance of various practices to formalise RCM execution, which can help online retailers address the cost (1) pitfalls of inattention to RLM, poor RL planning, a lack of resources (poor RLM), dismissing RL costs and poor cost monitoring (poor FM), and (2) problems of poor cost visibility, hidden costs (costing problems), unnecessary expenses, high RL costs and a loss of money and profits (cash problems).

- *Accounting for RCM execution*

Accounting for RCM execution involves RL cost isolation and accounting initiatives to effectively manage RL costs. Accounting for RCM execution closely relates to the cost determination RCE (return cost evaluation) tool of accounting separation and systems (section 8.6.2.1.1). Subsequently, the key practice elements of accounting for RCM execution include accounting separation initiatives and the use of third parties to manage RL costs.

Regarding *accounting separation initiatives*, the participants indicated that online retailers establish a dedicated RL department and ring-fence RL costs for RCM execution. Specifically, the participants mentioned that a dedicated RL department can help with the isolation of RL costs on the income statement, which enables improved management and control of return costs. Additionally, using traditional accounting systems and ring-fencing of RL costs, for example, separating return collection and forward delivery costs, enables effective accounting separation for RL cost management. The following quotations illustrate these findings:

> "So, it's not just running a truck from point B to point A, it's all the processing and admin around it and repackaging if necessary, and reselling and liquidating and destruction. That's all put into different categories of [the] income statement, which gets hidden and washed away. So, if you have a dedicated [RL department as a] resource for reverse logistics that all comes out of the income statement into the reverse logistics pool and it's much easier to manage those costs." (P4, owner/CEO, 3PRL provider firm)

> "[You can use a normal accounting system for RL] as long as you can ring-fence […]. So, we've got identifiers that says, you know what? This is a returns cart or returns transaction code and those transaction codes are […] managed separately." (P6, logistics manager, multichannel retailer)

In terms of *using third parties* for RCM execution, online retailers can use 3PRL providers with the necessary accounting expertise to effectively control and manage RL costs through account reconciliation. For example, a consumer claimed that a product was unused but during inspection, the inspector noticed that the product was used, resulting in a return rejection. However, the accounting department may be unaware of the rejection, or the rejection was not captured on the system, resulting in accounting errors. The following quotation illustrates the value of using a 3PRL provider to manage RL costs through accounting:

> "Claims Department, a Reverse Logistics Department […] extends back into finance because one of the biggest problems in our industry is pick up the goods, no problem. But then when the account from the accounts payable teams of the retailers come and there are claims on there, that's an area where we get involved in and to help our customers reconcile their accounts at the end of the month because sometimes there are claims that are illegitimate." (P7, owner, 3PRL provider firm)

Consequently, using third parties for accounting purposes to manage RL costs can be important for the effective execution of return regulations as a key RCM mitigation practice, involving claims regulation through inspection initiatives (section 8.6.2.3.1). As supporting practices for accounting as a key RCM execution practice, online retailers can implement (as supported by literature) the (1) RL outsourcing strategies of deciding on the types of RL services and third parties for RL outsourcing, and selecting a 3PRL provider (section 6.5.1), (2) FM strategies of using financial and accounting statements for RL and applying accounting techniques and systems for RL (section 6.9.2), and (3) RL staff strategy of establishing a dedicated RL function (section 6.9.5).

No studies from the reviewed literature match the interview findings related to accounting for RCM execution. Consequently, this study extends RL literature by demonstrating the importance of appropriate accounting for RCM as well as the ability of online retailers to address the cost (1) pitfalls of lack of resources (poor RLM), poor RL accounting, dismissing RL costs and poor cost monitoring

(poor FM), and (2) cost problems of poor pricing, inaccurate view of financial performance, poor cost visibility, hidden costs (costing problems) and a loss of money (cash problem).

- *Cost monitoring for RCM execution*

Cost monitoring for RCM execution involves measures and cost/benefit analyses to monitor RL costs and practices for effective RCM. Subsequently, as key practice elements online retailers can use appropriate KPIs and perform regular cost/benefit analyses to monitor RL costs.

Specifically, the participants suggested several *KPIs* that online retailers could develop and use as cost metrics to monitor RL cost performance, including RL cost per unit, RL cost performance between two annual periods, RL costs as a percentage of turnover, and RL costs as a percentage of the budget. Therefore, developing appropriate KPIs for cost monitoring complements the RCE tools of using appropriate measures to determine costs (see section 8.6.2.1.1), demonstrating the importance of cost metrics to manage consumer returns cost-effectively. The following quotations support the use of appropriate KPIs for cost monitoring to manage RL costs:

> "So, the first thing you need to measure is the percentage of items that have been returned […] we use cost per unit […] so its [a] cost efficiency measure […]." (P8, logistics manager, multichannel retailer)

> "Cost per unit processing, critical, you got to know that your cost per units are [sic] all managed […] they are constant metrics that we manage on the cost of returns […]." (P6, logistics manager, multichannel retailer)

> "[…] measure are returns costing you less this year than they did last year. And if so, why? And if not, why?" (P4, owner/CEO, 3PRL provider firm)

> "[…] returns as a percentage of turnover and cost as a percentage of turnover as well. Obviously, budget for a quarter of a percent or whatever the case may be for your logistics costs to bring the product back. And that you have to run against the budget […]." (P7, owner, 3PRL provider firm)

Closely related to cost assessments for RCE execution (section 8.6.2.1.2), online retailers can *perform regular cost/benefit analyses* to monitor RL costs associated with RL practices. For example, performing a cost/benefit analysis for return transportation can help online retailers to determine if the economic benefits (e.g. economies of scale) of return transportation outsourcing remains valid or if the online retailer can derive more economic benefits (e.g. cost savings) from insourcing return transportation. Additionally, online retailers can use cost metrics and cost aggregation software to analyse the feasibility of current return transportation routes and practices. For example, measuring the inexpensive routes versus the expensive routes and comparing the rates of various couriers in different regions. Consequently, cost/benefit analyses can be especially important if online retailers outsource RL processes and activities, enabling effective cost monitoring for RCM. The following quotations convey these findings:

> "There's nothing that's not a business case. We will outsource until there's no more economical benefit to outsource. Then we will try and insource if we can do it better or cheaper, but when your outsource component becomes such a big component of the outsourced company, well, now it becomes a problem because now it's really just a margin depleter [sic] […] because you should be able to do it yourself if there's that much volume that somebody else can run a complete business just on you." (P6, logistics manager, multichannel retailer)

> "[…] the transport costs per parcel, per cube, per route. What are our expensive routes versus the non-expensive routes? […] they are constant metrics that we manage on the […] cost of transport […]." (P6, logistics manager, multichannel retailer)

> "[…] you have the software that does some aggregation for you, telling you that you are picking stuff up at outlying areas, this service provider is giving you a better cost on that area […] to manage costs […]." (P13, supply chain manager, multichannel retailer)

As support RL practices for effective cost monitoring for RCM execution, online retailers can implement (as supported by literature) the (1) PM strategies of establishing appropriate KPIs for RL, performance monitoring and evaluation of performance results (section 6.7.1), and (2) FM strategies of using accounting systems, performing cost/benefit analyses and implementing cost controls and measurements (section 6.9.2). The studies from the reviewed literature mostly focus on KPIs and metrics to monitor consumer service performance (see section 8.5.2.2), which means that this study contributes to the literature by emphasising the importance of cost metrics to monitor and manage RL costs. While no study mentioned that online retailers can monitor costs by performing regular cost/benefit analysis, Prajapati *et al*. (2021:14) mentioned that organisations need to perform cost/benefit analysis before selecting a 3PL/3PRL provider. Consequently, online retailers can continue with the cost/benefit analysis after outsourcing, ensuring that the benefits exceed the costs. Additionally, online retailers can apply this approach to all implemented RL practices, ensuring that cost efficiencies are maintained.

Essentially, cost monitoring for RCM execution can help online retailers to mitigate the cost (1) pitfalls of poor RL accounting, dismissing RL costs and poor cost monitoring (poor FM), and (2) problems of inaccurate view of financial performance, poor cost visibility, hidden costs (costing problems), unnecessary expenses, high RL costs and a loss of money, margins and profits (cash problems).

In conclusion, RCM propositions, including RCM mitigation and RCM execution, can help online retailers to effectively control and manage RL costs as well as mitigate various cost pitfalls and problems. Therefore, online retailers can implement RCM propositions for the effective RLM of consumer returns. In the next section, the final cost proposition category of cost parameters, will be analysed and discussed.

8.6.2.4 Cost parameters

Cost parameters as the *final main cost proposition*, involve various proposition (parameter) categories, including volume, product, organisational, SC, legal and environmental parameters (see **Figure 8.15**). Like prevention and control and service parameters (sections 8.4.2.4 and 8.5.2.3), no studies in the reviewed literature focused on the factors (parameters) that can impact the implementation of cost propositions, meaning that this study adds new insights into important considerations for the effective implementation of return cost evaluation (RCE), cost-orientated return (COR) and return cost

management (RCM) propositions. However, some studies from the reviewed literature unintentionally identified parameters that align with the interview findings, which will be emphasised in the discussion. In the subsequent sections, the cost parameter proposition categories will be discussed and analysed.

8.6.2.4.1 Volume cost parameters

Volume cost parameters involve the key parameters of return volume and sales volume (see **Figure 8.15**) that can be important for the implementation of various cost propositions.

Specifically, *return volume* can be an important parameter for implementing several COR and RCM propositions, including key COR process, COR recovery and RCM execution practices. Regarding key COR process practices, the COR inspection initiative of performing pre-return inspection at consumer locations for cost savings might be more appropriate for locations with higher return volumes. Similarly, COR transportation initiatives can be influence by return volume, for example, online retailers with low return volumes may benefit from using 3PLs to obtain economies of scale. Alternatively, online retailers with high volumes can use a separate return facility located next to the main facility for COR transportation. The following quotations demonstrate the association between return volume as a cost parameter and COR process propositions:

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time. […] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […]." (P5, general manager, online retailer)

> "I believe outsourcing is an amazing opportunity […] the reason I say that is, I don't have scale in returns […] it becomes part of the courier's greater scale." (P6, logistics manager, multichannel retailer)

> "So, in terms of location, it needs to be, if not inside the DC, very close to the main DC hubs because you want to eliminate any excessive transport […] if you can't fit it in the very same facility […] then the next best option would be to have a centralised unit closest to your main hub […]." (P5, general manager, online retailer)

Concerning key COR recovery practices, online retailers can consider return volume for the implementation of COR recovery preparation and COR recovery through primary channels and secondary channels. Specifically, for the appointment of a dedicated RL manager as part of COR recovery preparation, online retailers need to consider return volume. Therefore, online retailers with lower return volumes can use general managers (with dual roles) for COR recovery preparation. Additionally, online retailers with high return volumes must be mindful of potential sales cannibalisation by selling returned products at a discount through their primary channels. Consequently, if return volumes are too high, online retailers might benefit more from COR recovery through secondary channels. Lastly, return volume as a cost parameter can be important for the key RCM execution practice of cost monitoring, which involves cost/benefit analyses. For example, if the return volume increases the online retailer's strategy can change from RL outsourcing to RL insourcing for scale advantages and cost saving. The following quotations show the importance of considering return volume for COR recovery and RCM execution:

> "[…] depending on scale […] all the reverse logistics manager is actually [responsible for is] managing the inventory component. What are we going to do with the stock? How are we going to handle it? How are we going to disposition it?" (P1, operations manager, 3PRL provider firm)

> "[…] if you got high volumes of product. Are you going to really be able to do it and are you cannibalising your sales? So, moving it through secondary and tertiary channels is really your only option." (P1, operations manager, 3PRL provider firm)

> "There's nothing that's not a business case. We will outsource until there's no more economical benefit to outsource. Then we will try and insource if we can do it better or cheaper, but when your outsource component becomes such a big component of the outsourced company, well, now it becomes a problem because now it's really just a margin depleter [sic] […] because you should be able to do it yourself if there's that much volume that somebody else can run a complete business just on you." (P6, logistics manager, multichannel retailer)

Finally, both *return volume* and *sales volume* can be important for the key RCE execution practice of cost assessment and key RCM execution practice of formalisation. Specifically, for RCE execution, online retailer can consider sales volumes and return volumes to assess the cost implications of return leniency, which can help online retailers prevent large financial losses if the return volume exceeds the sales volume. Similarly, for RCM execution, online retailers can consider the return and sales volumes for the establishment of costs standards and a RL cost benchmark. Consequently, online retailers can adapt the RL cost benchmark for areas with higher sales since higher sales means higher returns. The following quotations illustrate the importance of considering both return and sales volume for RCE and RCM execution:

> "I think that's important to track the cost […] to perhaps distinguish between products that are returned for free and product where there is a cost in returning it […]. I've recently seen some studies about online retail in Europe where the returns volume is bigger than the sales volume, because of the effect of free returns that these companies start running at a loss. They think they've sold something, but actually they've not sold it, [products are] returned with such high rates that is no longer feasible." (P2, owner, supply chain consultancy firm)

> "So, normally what you do is you try and work on a ratio that's a benchmark or standard that is not really going to eat into your bottom line […] you're reverse logistics costs, should be probably one per cent or five or 10 percent of that total logistics cost, and that's the one that needs to be done. […] you've got to look at the types of volumes that you do […] if more sales taking place within Johannesburg, your returns should be greater within Johannesburg […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

As support RL practices to consider volume cost parameters, online retailers can implement (as supported by literature) the (1) RL in/outsourcing strategies of considering and analysing RL in/outsourcing decisions (section 6.4.1), (2) disposition strategies of considerations for disposition and understanding market-related factors for disposition (section 6.6.1), (3) general facility/location strategy of considering operational factors in facility/location decisions (section 6.8.1), (4) RC strategy of strategic considerations for RC (section 6.9.1), and (5) FM strategy of strategic considerations for factors that influence RL costs (section 6.9.2). No studies in the reviewed literature identified the significance of considering return volume and sale volume for the effective implementation of cost propositions. Subsequently, this study identifies new factors that online retailers can consider for the effective implementation of cost propositions.

Essentially, considering volume as a cost parameter can help online retailers effectively address the cost (1) pitfalls of RL process failures (operational failure), poor RPA (poor RLM), dismissing RL

costs and poor cost monitoring (poor FM), and the (2) problems of hidden costs (costing problem), unnecessary expenses, high RL costs, and loss of money, sales, margins and profits (cash problems).

8.6.2.4.2 Product cost parameters

Product cost parameters involve the key parameters of the type of return and product condition, type of product, product value/price and product margin (see **Figure 8.15**), which associate with various cost propositions.

Particularly, online retailers should consider the of *type of return* and *product condition* for COR recovery and RCM mitigation propositions. Particularly, considering the type of return and product condition can be important for the implementation of the key COR recovery practices of COR recovery through primary channels, secondary channels and suppliers. For example, products in new and unused condition can be recovered through the primary channel, products in used condition can be recovered through secondary channels and defective products can be recovered through suppliers. Nevertheless, online retailers can still consider return volume for the effective implementation of COR recovery (see section 8.6.2.4.1). Concerning RCM mitigation, online retailers can consider the type of return and product condition for the RCM mitigation practice of return charges and penalties. For example, charging consumers for unwanted returns but carrying the return costs for defective or damaged product returns. Online retailers that consider paying for damaged/defective returns may pay more attention to FL efficiencies, addressing the cost pitfall of FL failures. The following quotations demonstrate the importance of considering the type of return and product condition for COR recovery and RCM mitigation practices:

> "The product is still in perfect condition. We can resell it […]. It goes through a vas system of value-added system. They check it and they reintroduce it into the stock inventory network for resale." (P5, general manager, online retailer)

> "So, if the item is in a working condition, but it does not have its packaging, we obviously will make a decision to say, can we repackage it and sell it for a little bit less than the original price? Or is it in such a condition that we cannot resell it on our website and then we have to use external parties like Cash Crusaders […]." (P3, returns manager, online retailer)

> "[…] things like Unbox deals […] are essentially unwanted returns that are in perfect condition […]." (P1, operations manager, 3PRL provider firm)

> "When we get the item that the customer returns and says that it's faulty, we will create an RFC back to the supplier for them to either credit us or exchange that product with the new one." (P3, returns manager, online retailer)

> "But if you send it back because you just don't like it, we charge you for the delivery if you send it back and if it's our fault or product fault, well then, your return pick up is free." (P6, logistics manager, multichannel retailer)

The *type of product* can be important for the implementation of key RCE execution, COR process, COR recovery and RCM mitigation practices. Specifically, online retailers should consider the product type for the key RCE execution practice of cost identification (i.e. standard RL costs) since the type of product can influence disposition costs. For example, a mobile device with personal information must

be wiped before resale, which adds to the disposition costs. Additionally, online retailers can consider product type for COR inspection (COR process practice), for example, using dedicated staff to perform pre-return inspection at consumer locations for electronics, appliances and computers, linking with the return volume parameter (section 8.6.2.4.1). Moreover, the product type can influence COR recovery through suppliers, for example, employing product experts in electronics to effectively test and identify faults to lodge warranty claims from suppliers. Lastly, product type can influence return regulation for RCM mitigation involving gatekeeping initiatives, for example, online retailers who sell computers and electronic products may benefit more from online authorisation for RCM mitigation. The following quotations show the influence of product type on the implementation of various cost propositions:

> "[…] then disposition in some products you need, you have specialist disposal. You know, what are those costs going to look like, or you're sort of stripping out personal information. What about hygiene products? You can't allow those back into secondary market [or] you potentially have a health issue. So, you know, whatever those will cost." (P1, operations manager, 3PRL provider firm)

> "But if you had if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time […]. So, let's put a dedicated team in there that […] can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] Or you know what? I can see that you've got the incorrect phone. It's not compatible with this device." (P5, general manager, online retailer)

> "[…] you employ somebody that's got experience in handling such electronics, for instance, they'll put it to test and right there and then they'll decide, OK, well, you know what, the customer's correct, this item is defective and they can then class that as a supplier claim […]." (P5, general manager, online retailer)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. […] But there is also, what are you going to do with this two-year old computer […] it's only a cost driver. So, avoiding that on the front end by digitising your returns policy […]." (P1, operations manager, 3PRL provider firm)

Furthermore, both the *type of product* and *product value/price* can influence the key RCE execution practice of cost assessment and the key RCM mitigation practice of cost avoidance. For example, assessing the cost implications of accepting a return for a CD worth a R100 and appropriately implementing a zero-return initiative of no-collection returns. Similarly, considering product type and value can influence inspection initiatives for return regulations (key RCM mitigation practice), ensuring that inspection staff are trained in certain product categories for effective return claim regulations for high value products. The following quotations depict this finding:

> "So, if you're looking at an item less, and I worked it out […] if you sell it for R220, there's no ways I will collect an item that has had a sales value of R220 or less, because it will cost you in terms of profit margin to actually go and fetch these items. It makes no sense." (P12, Head of logistics, online retailer)

> "[…] no-collection returns, in other words, at a certain threshold, if the customer triggered a return, the item wouldn't be collected and be brought back to the warehouse, they would just be refunded. And I'll give you the typical example is a CD or DVD, they cost R100 to R150 per courier and [to] bring it back to the warehouse is R50." (P1, operations manager, 3PRL provider firm)

> "So, educating your inspectors with the help of the supplier and possibly even at their cost. Right. So, you can try and educate your inspectors on the supplier's cost, saying that we run thousands of electronic items through your doors every week. We need your team to come and educate our team, so you save a couple bucks […] [and for] the business acumen saying that you can't make an emotional decision when dealing with a R40000 electronic device […]." (P5, general manager, online retailer)

Furthermore, online retailers can consider *product value* for the implementation of cost assessment for RCE execution. Specifically, performing a cost assessment for disposition options, online retailers should consider the product value to assess the feasibility of the repair option. Lastly, *product margin* associates with the key COR process practice of COR transportation, involving a decentralised network design to save transportation costs. For instance, online retailers that sell products with high margins may be less concerned with using decentralisation for COR transportation. The following quotations show the importance of considering product value for RCE execution and product margin for COR transportation:

> "[…] to repair can be quite expensive in terms of the lead times, because now the product could be handled into your facility, then it has to be booked up to a repair agent or to repairer on site, and it has to be booked back into your site. […] and then it goes back to stock and then it can be dispatched again. So, that is also quite expensive. And unless you've got very high value goods, the costs of those repairs are not feasible for you to correct that product." (P2, owner, supply chain consultancy firm)

> "I think decentralised is better, and the reason being is cost […]. The fact that it gets back to the reclamation centre a little time later than that, that to me is in the ability to save costs. If your product has margin that it can sustain flying it around the world twice […] then my argument goes out the window." (P7, owner, 3PRL provider firm)

As support RL practices to consider product cost parameters, online retailers can implement (as supported by literature) the (1) SCI strategies of considerations for SCI, communicating and cooperating with SC partners and sharing information, responsibilities and costs (section 6.4.1), (2) disposition practices of disposition decision factors (section 6.6.2), (3) general facility/location strategies of considering economic and operational factors for facility/location decisions (section 6.8.1), (4) RC strategy of considerations for RC (section 6.9.1), (5) FM strategy of considerations for factors that influence RL costs (section 6.9.2), (6) RPA strategies of considerations for gatekeeping and return avoidance (section 6.9.3), and (7) RL staff strategies of staff training and education initiatives and producing skilled and well-trained staff (section 6.9.5).

Apart from Biswas and Abdul-Kader (2018:1019), who identified that recovery through suppliers can be appropriate for products in defective condition, no studies from the literature review identified the influence of product cost parameters on the implementation of various cost propositions. Subsequently, this study identifies new product-related factors that online retailers can consider for the effective implementation of RCE, COR and RCM propositions, which can help address the cost (1) pitfalls of FL failures, RL process failures (operational failures), a lack of resources, poor RPA (poor RLM), dismissing RL costs (poor FM) and a lack of SCI (poor integration), and (2) problems of poor cost visibility (costing problem), unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor/no recovery and a loss of product and product value (recovery problems).

8.6.2.4.3 Organisational cost parameters

As illustrated in **Figure 8.15**, the organisational cost parameters involve the key parameters of organisation type, capabilities and strategies, which can associate with various cost propositions.

Specifically, *organisation type* associates with the type of retailers, which can influence key RCE execution and COR process practices. Specifically, cost identification for RCE execution will be different for multi/omnichannel retailers and online-only retailers since multi/omnichannel retailers can use their stores to perform RL activities, impacting collection and transportation costs. Similarly, a multichannel retailer can use return to store for COR collection, while an online-only retailer can only use various dop-off points for COR collection. Subsequently, the implementation of cost propositions can be more important for online retailers to manage consumer returns cost effectively. The following quotations demonstrate these findings:

> "[…] a big thing that you obviously don't think about when you started out, is the fact that returns in an online retailing industry is very expensive when it comes to getting the product back to your warehouse. So, the same as you've got that other factor that is different from any brick-and-mortar business that you actually have your external like 3PL and courier services that is added extra on every single thing that goes to and from the customer." (P3, returns manager, online retailer)

> "[Preferring the store option] because then there is no reverse logistics cost involved. And I think because you have the store option in that footprint […] we have a lower return rate percentage, it would seem as compared to maybe some of the other people that are just purely online players." (P13, supply chain manager, multichannel retailer)

Organisational capabilities involve product disposition, IT and accounting capabilities (key parameter elements), which can be important for the implementation of various RCE, COR and RCM propositions. Particularly, *product disposition capability* can be important for the implementation of cost assessment for RCE execution, COR disposition (key COR process practice), COR recovery preparation and COR recovery through suppliers (key COR recovery practices). For example, online retailers that lack the product recovery capability of repair may be less likely to consider the cost implications of the repair option for cost assessment, linking with the product parameter of product value (section 8.6.2.4.2). Additionally, online retailers that lack the capabilities to implement speedy disposition for COR disposition can consider using 3PRL providers with the necessary capabilities for COR disposition. Moreover, online retailers that lack the capability to perform product recovery activities, like repair, need to consider this for the establishment of agreements with suppliers (COR recovery preparation) to perform COR recovery through suppliers. Evidently, product disposition capability links with the product parameters of return type and product condition (section 8.6.2.4.2). These findings can be supported by the subsequent quotations:

> "[…] we don't repair or anything on site. So, if an item needs to be repaired, we need to engage the supplier to get it done." (P3, returns manager, online retailer)

> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, but it will become in the recoverability of the product, the control, the discipline and the turnaround of the stock that it doesn't get left for six months before somebody, when it's starting to encroach on warehouse space, and somebody says, we've got to get this nonsense out of here […]." (P7, owner, 3PRL provider firm)

> "[…] they'll put it to test and right there and then they'll decide, OK, well, you know what, the customer's correct, this item is defective and they can then class that as a […] supplier warranty claim […] the defective item is then made the problem of the supplier to come and collect and replace or credit the business." (P5, general manager, online retailer)

Furthermore, online retailers should consider their *IT capabilities* for the implementation of (1) cost understanding RCE tools (i.e. sophisticated accounting systems and internal information sharing), (2) COR request and gatekeeping (i.e. self-service request and online authorisation), (3) COR transportation (i.e. bulk transportation), and (4) cost monitoring for RCM execution (i.e. using special software for cost/benefit analysis). Subsequently, if online retailers lack the IT capabilities, they can consider using 3PRL providers. Similarly, online retailers that lack the *accounting capabilities* to perform accounting for RCM execution can consider outsourcing to 3PRL providers with the necessary accounting expertise to manage RL costs. The following quotations convey these findings:

> "Within the system, like an SAP ERP that's quite sophisticated or the bespoke systems that I've dealt with, they have a specific module to deal with returns and to deal with the logistics around the returns, as well as the financial transactions, the credit side of the return and the cost side of the return […]." (P2, owner, supply chain consultancy firm)

> "And that's what for us we have done successfully through many different IT platforms, that this information becomes available to the sales force […] integration is an imperative." (P7, owner, 3PRL provider firm)

> "And I developed an app that actually does all those processes the […] capturing of the […] financial information […] to give immediate authorisation […] to know what's coming back […] and […] the [cost] implications thereof." (P7, owner, 3PRL provider firm)

> "[…] there needs to be like a secondary network of delivery agents and delivery services that can capitalise on the quantity of deliveries that need to take place for […] the returning part […], which are making [return] deliveries very expensive for the retailer […] they need more integration and vertical integration with transportation companies and transportation management systems, which is in the same way that you can broke the loads for normal bigger loads, that you can do a brokering kind of service for the [return] delivery." (P2, owner, supply chain consultancy firm)

> So, I think in that case, if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

> "[…] you have the software that does some aggregation for you, telling you that you are picking stuff up at outlying areas, this service provider is giving you a better cost on that area […] to manage costs […]." (P13, supply chain manager, multichannel retailer)

> "[…] extends back into finance because one of the biggest problems in our industry is pick up the goods, no problem. But then when the account from the accounts payable teams of the retailers come and there are claims on there that's an area where we get involved in and to help our customers reconcile their accounts at the end of the month because sometimes there are claims that are illegitimate." (P7, owner, 3PRL provider firm)

In terms of *organisational strategies,* online retailers can consider their facility/location, disposition and network design strategies (key parameter elements) for COR process and RCM execution propositions. Particularly, as part of their *facility/location strategies,* online retailers with space limitations can consider locating a returns facility close to the main facility for COR transportation, linking with the return volume parameter (section 8.6.2.4.1). Additionally, online retailers with *disposition strategies* that involve disposal (e.g. for perishable products) can consider using decentralised locations for COR disposition. Additionally, online retailers should consider their *network design* strategies for the key RCM execution practice of formalisation, which involves the establishment of cost control strategies and standards (key practice element) For instance, online

retailers with a centralised facility in one location can develop a higher RL cost benchmark for long-distance locations, linking with return and sales volume parameters. These findings can be illustrated by the following quotations:

> "So, in terms of location, it needs to be, if not inside the DC, very close to the main DC hubs because you want to eliminate any excessive transport […] if you can't fit it in the very same facility […] then the next best option would be to have a centralised unit closest to your main hub […] just to save transport cost." (P5, general manager, online retailer)

> "[…] I'm going to dispose of something regardless, then you want to do it as quickly as possible without incurring additional transportation or other costs. And then you might want to say, well, I've decentralised points in different cities, and I'll just dispose." (P2, owner, supply chain consultancy firm)

> "So, normally what you do is you try and work on a ratio that's a benchmark or standard that is not really going to eat into your bottom line […]. Cape Town being your longest lead-time or your longest distance if I may call it that. And therefore, the logistics cost to return from the Cape Town is going to be a lot greater than what it is from Johannesburg." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

As support RL practices to consider organisational cost parameters, online retailers can implement (as supported by literature) the (1) Internet and web-based IT strategies of developing online return capabilities (section 6.3.2), (2) TLIT strategy of using TMS for RL (section 6.3.3), (3) RLIT (RL information technology) strategy of considerations for RLIT (section 6.3.5), (4) SCI strategies of considerations for SCI, negotiations, SC agreements and sharing information, responsibilities and costs (section 6.4.1), (5) RL in/outsourcing strategy of considerations and analysis of RL in/outsourcing decisions (section 6.4.1), (6) disposition strategies of considerations for disposition and benefit-driven disposition decisions (section 6.6.1), (7) general facility/location strategies of decisions related to transportation flows, benefit-driven facility/location strategies and considering facility/location decision factors (section 6.8.1), and (8) FM strategies of considerations for FM and considerations for factors that influence RL costs (section 6.9.2).

Several studies from the reviewed literature coincide with the interview findings about organisational cost parameters. Specifically, studies identified that (1) product return costs in online retailing can be more costly than traditional retailing because of additional transportation, gatekeeping, handling, inspection, disposition and redistribution costs (Ahsan & Rahman, 2021:16; Das *et al.* 2020:59; Wang *et al.* 2017:681), (2) multi/omnichannel retailers can realise cost savings through return to store options (Bozzi *et al.* 2022:20), (3) online retailers lacking the capabilities to manage RL can outsource RL (Wang, Dang *et al.* 2021:2), (4) 3PRL providers can perform RL processes and practices on behalf of online retailers (Prajapati *et al.* 2021:6), including product return collection, transportation, inspection, disposition and redistribution (Tombido *et al.* 2018:236), (5) integrating with suppliers through contracts can help online retailers stipulate shared responsibilities in the RL process (Mostert *et al.* 2017:10, 13), and (6) RL network design should focus on efficiency and cost-effectiveness (Misni & Lee, 2017:91). Nevertheless, no studies identified the importance of considering disposition strategies for COR transportation and RL network design strategies for the establishment of a RL cost

benchmark. Evidently, this study highlights additional organisational cost parameters that can be important for the implementation of cost propositions.

Essentially, considering organisational cost parameters can help online retailers with the implementation of various RCE, COR and RCM propositions and mitigation of the cost (1) pitfalls of RL process failures (operational failures), poor RL planning, lack of resources (poor RLM), poor RL accounting, dismissing RL costs, poor cost monitoring (poor FM) and a lack of SCI (poor integration), and (2) problems of inaccurate view of financial performance, poor cost visibility, hidden costs (costing problems), unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems), obsolete stock, poor/no recovery, a loss of product and product value (recovery problems).

8.6.2.4.4 SC cost parameters

SC cost parameters involve the key parameters of supplier return policies and type and charges of 3PLs/couriers (see **Figure 8.15**) that can influence the implementation of several cost propositions.

Specifically, online retailers should consider *supplier return policies* for the key COR recovery practices of COR recovery preparation and COR recovery through secondary channels and suppliers. For example, the supplier return policy may stipulate that the online retailer can return damaged/defective consumer product returns for a period of six months. Therefore, as part of the COR recovery strategy (element of COR recovery preparation), online retailers should plan for consumer product returns that fall outside supplier return policies, identifying alternative avenues, like COR recovery through secondary channels (e.g. selling to third-party buyers) for COR recovery. The impact of supplier return policies on COR recovery can be demonstrated by the following quotation:

> "We have a category department. […] So, our category department takes care of all the suppliers based on the different categories […] And obviously I know the service level agreements based on that supplier. So, before we check it, […] we have to establish whether we can send it back or not. So, I would look at the service level and say, OK, you know what, we have an agreement with these guys so that we can send it, provided that it is sent back within X amount of days, because every supplier will have a different SLA." (P9, regional & online DC manager, online retailer)

Furthermore, online retailers can consider the *type* and *charges of 3PLs/couriers* for key RCE execution and RCM mitigation practices. For instance, the online retailer needs to consider the geographic coverage of the courier for the identification of return transportation costs and potential hidden costs of sub-contracting third-party agents for outlining areas (cost identification for RCE execution). Subsequently, online retailers should consider courier transportation charges for assessing the cost implications of accepting returns for inexpensive products (cost assessment for RCE execution) and for implementing zero-return initiatives (return avoidance for RCM mitigation), linking with product type and product value parameters (section 8.6.2.4.2). The subsequent quotations support these findings:

> "[…] your couriers in South Africa, they charge you per mass, per let's say your kilo mass is one rate […]. So, if you're looking at an item less, and I worked it out, […] if you sell it for R220, there's no ways I will collect an item that has had a sales value of R220 or less, because it will cost you in terms of profit margin to actually go and fetch these items. It makes no sense. So, outlining your areas, your zones, plays a huge role, your size of the commodity or your product, that plays a huge role and then you need to define that courier type. Is it them themselves or is it a third-party agent? But it all comes back, and it hits you on your margin." (P12, Head of logistics, online retailer)

> "[…] you look at the product type and you look at the chargeable mass of that product type, […] But it does not warrant to bring an item which is under one kilo and it's costed R100 […]. It just does not warrant the cost.". (P12, Head of logistics, online retailer)

As support RL practices to consider SC cost parameters, online retailers can implement (as supported by literature) the (1) SCI strategies of considerations for SCI (section 6.4.1), (2) disposition strategies of considerations for disposition (section 6.6.1), (3) FM strategy of considerations for factors that influence RL costs (section 6.9.2), and (4) RPA strategy of considerations for return avoidance (section 6.9.3). This study exclusively identified that online retailers need to consider supplier return policies for COR recovery and types and charges of 3PL products for RCE execution and RCM mitigation. Additionally, this study shows that considering SC cost parameters can help online retailers to address the cost (1) pitfalls of RL process failures (operational failure), poor RL planning, poor RPA (poor RLM), poor cost monitoring (poor FM) and a lack of SCI (poor integration), and (2) problems of poor cost visibility, hidden costs (costing problems), unnecessary expenses, high RL costs, a loss of money, margins and profits (cash problems) and poor/no recovery (recovery problem).

8.6.2.4.5 Legal and environmental cost parameters

As illustrated in **Figure 8.15**, legal and environmental cost parameters involve the key parameters of consumer protection laws and environmental disruptions that associate with a few cost propositions.

In terms of *consumer protection laws*, online retailers should consider the CPA (consumer protection act) for the implementation of COR recovery and RCM mitigation propositions. Specifically, for COR recovery through the primary channel, online retailers can consider the CPA for the reselling of unboxed items at a discount on the primary online store, ensuring that the website clearly stipulates the condition of the product. Therefore, consumer protection law as legal cost parameter links with product condition as a product cost parameter (section 8.6.2.4.2). Moreover, online retailers need to consider the CPA for the implementation of return regulation and return avoidance as key RCM mitigation practices. Evidently, online retailers need to ensure that gatekeeping initiatives and zero-return (no-collection) initiatives comply with the stipulations of consumer protection laws. The following quotations support these findings:

> "So, in other words, unboxed deals or something like that. But you've got to be very sure that product is pristine or that you are able to identify the defects because the CPA makes it very clear [if] you can sell it. But if there's a scratch or a nick or a cosmetic damage, that kind of stuff, you've got to be able to specify it." (P1, operations manager, 3PRL provider firm)

> "[…] massive cost for their returns processes […]. So, you obviously want to reduce the returns, but I think that's going to be very difficult in an online space because it's so easy to return it. […] you've got the Consumer Protection Act and all sorts of things working in the favour of consumers, so you never going to eliminate returns." (P4, owner/CEO, 3PRL provider firm)

For *environmental disruptions* as a key environmental cost parameter, online retailers can consider occurrences, like the Covid pandemic, for implementation of the key COR process practice of COR transportation. For example, changing the network structure from decentralisation to centralisation to reduce activities and labour requirements, which can impact use of appropriate networks to save transportation costs. Therefore, the environmental cost parameter can associate with the key organisational parameter of organisational strategies (i.e. network design strategies). The following quotation points to this finding:

> "[…] we always had ours decentralised because it cost less if you do it regionally. Although now with Covid, we've actually centralised it. So, everything's going up to Joburg. But in my opinion, decentralised is better from a cost point of view its more cost effective […]. It's a hell of a cost to transport something within 48 hours across the country." (P4, owner/CEO, 3PRL provider firm)

As support RL practices to consider legal and environmental cost parameters, online retailers can implement (as supported by literature) the (1) disposition strategy of considerations for disposition (section 6.6.1), (2) general facility/location strategies of considering facility/location decision factors (section 6.8.1), and (3) RPA strategy of considerations for gatekeeping and RA (section 6.9.3).

While Hjort *et al.* (2019:774) found that early gatekeeping in Europe is mostly practiced for information purposes because EU laws mandate that returns must be accepted for online product returns, no studies identified the impact of consumer protection laws on the resale of unboxed returned products through the primary channel. Therefore, this study extends the literature by adding additional legal parameters that can influence the implementation of recovery through the primary channels. Additionally, no study identified the impact of environmental disruptions on the network design strategies of organisations. However, Misni and Lee (2017:85) mentioned that organisations need to design a robust RL network to reduce SC risks, ensuring efficient product return flows. Therefore, online retailers can benefit from considering environmental disruptions on their network design, enabling the cost-effective management of consumer returns.

Essentially, considering legal and environmental cost parameters can help online retailers effectively implement COR and RCM propositions, and mitigate the cost (1) pitfalls of RL process failures (operational failures), poor RL planning and poor RPA, and (2) problems of hidden costs (i.e. penalties for non-compliance) (costing problem), unnecessary costs, high RL costs, a loss of money, a loss of sales (cash problems), poor/no recovery and a loss of product and product value (recovery problems).

In conclusion, the cost parameters can be important for implementing RCE, COR and RCM propositions and addressing various cost pitfalls and problems. Therefore, online retailers should

consider cost parameters as a main cost proposition for the effective RLM of consumer returns. The next section contains a framework and summary of the findings for cost propositions in RLM.

8.6.2.5 Framework and summary of findings for cost propositions in RLM

Clearly the discussion in section 8.6.2 showed that cost propositions, including RCE, COR and RCM practices and cost parameters, can be important for the effective RLM of consumer returns in online retailing. Based on the discussion of findings, Figure 8.**23** provides a broad overview of the cost propositions for RLM.

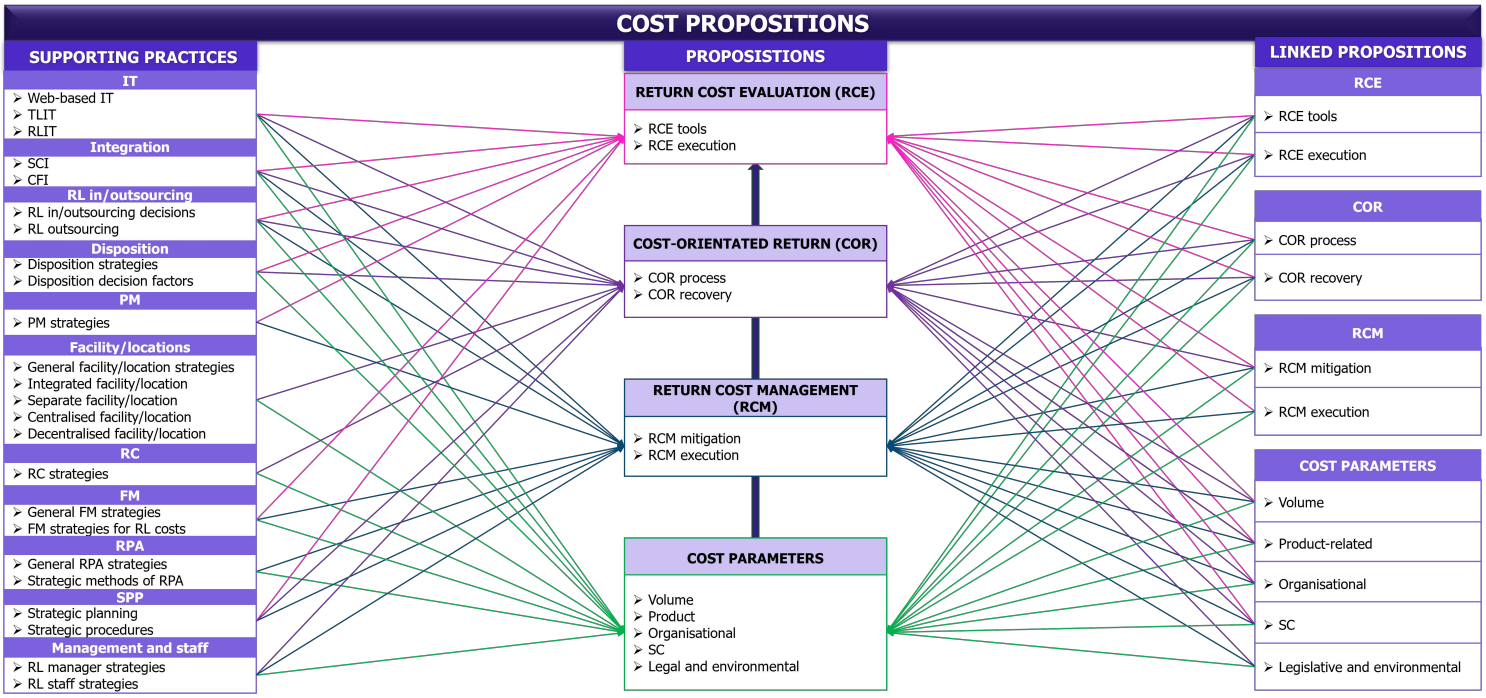

Figure 8.23 Framework for cost propositions
Source: Compiled by the researcher

Figure 8.**23** demonstrates the links between supporting practices and cost propositions, demonstrating the links between the RL support practices, main propositions and propositions categories (listed below the main propositions in the middle and right columns). In terms of the *supporting practices*, the framework shows that cost propositions can be supported by implementing strategies from all RL support practices from the QCA of RL literature findings. The most significant RL practice categories (associated with all main propositions) include IT, integration and RL in/outsourcing, which means that online retailers can prioritise implementing these RL support practices for the successful implementation of cost propositions. In contrast, the least significant support RL practices include PM, facility/location and RC practices, which means online retailers can implement PM, facility/location and RC practices as a last priority for the successful implementation of cost propositions.

In terms of the *cost propositions*, cost parameters associate with the highest variety of RL support practices. Consequently, online retailers can benefit the most from implementing/considering various RL support practices for the effective consideration of cost parameters. However, cost parameters might be more complicated to consider for cost effectiveness in RL. Regarding the *links between* the *cost propositions*, the framework shows that RCM propositions and cost parameters associate with the most proposition categories, indicating that online retailers should pay attention to RCM propositions and costs parameters for the implementation of various costs proposition categories. Finally, the framework shows that the cost proposition categories of RCE tools, RCE execution, COR process, COR recovery, RCM mitigation and volume, product, organisational and SC equally link with the main cost propositions. Subsequently, online retailers can pay attention to these cost proposition categories in the implementation of various cost propositions.

Table 8.**22** provides a detailed proposition framework and summary of the findings, demonstrating the cost proposition categories, key practices/parameters (with elements if applicable), support RL practices, linked proposition categories, and the number of requirements per key practice/parameter and per proposition category. The links between the cost propositions and cost pitfalls and problems will be summarised in the final framework and summary of findings for the cost theme (section 8.6.4).

Table 8.22 Summary of findings for cost propositions

Proposition categories	Key practices/ parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category
RCE tools (return cost evaluation)	**Cost determination tools** • Appropriate measures and planning • Accounting separation and systems	• PM • FM • Disposition • Strategic planning	• RCE execution • COR process • RCM mitigation and execution	• Key practices – 2 • Support practices – 4 • Total requirements – 6	• ***Key practices – 5*** • ***Support practices – 11*** • ***Total requirements – 16***
	Cost understanding tools • Appropriate metrics • Internal information sharing • Use capable third parties	• General IT and RLIT • CFI • RL outsourcing • PM and FM • RL manager strategy	• RCE execution • COR process • Organisational parameters	• Key practices – 3 • Support practices – 7 • Total requirements – 10	
RCE execution	**Cost identification** • Identify standard RL costs • Identify hidden RL costs	• FM	• RCE tools and execution • COR process and recovery • RCM mitigation and execution • Product, organisational and SC	• Key practices – 2 • Support practices – 1 • Total requirements – 3	• ***Key practices – 5*** • ***Support practices – 4*** • ***Total requirements – 9***
	Cost assessment • Cost assessment for return leniency • Cost assessment for return acceptance • Cost assessment for disposition options	• Disposition • PM • FM	• RCE tools and execution • COR recovery • RCM mitigation and execution • Volume, product, organisational and SC parameters	• Key practices – 3 • Support practices – 3 • Total requirements – 6	
COR process (cost-orientated return)	**COR request and gatekeeping** • Self-service return request • Online authorisation • Use third parties	• Web-based IT • RLIT • RL outsourcing	• RCE tools and execution • RCM mitigation • Organisational parameters	• Key practices – 3 • Support practices – 3 • Total requirements – 6	• ***Key practices – 11*** • ***Support practices – 17*** • ***Total requirements – 28***
	COR collection • Simultaneous return pickup and replacement delivery • Drop-off collection • Use third parties	• CFI • RL outsourcing • Decentralised facility/location	• RCE execution • Organisational parameters	• Key practices – 3 • Support practices – 3 • Total requirements – 6	
	COR transportation • Bulk transportation • Use appropriate network design	• TLIT and SCI • RL outsourcing • Separate, decentralised and centralised facilities/locations	• COR recovery • Volume, product, organisational and environmental parameters	• Key practices – 2 • Support practices – 6 • Total requirements – 8	
	COR inspection	• RC	• COR recovery	• Key practices – 2	

Proposition categories	Key practices/ parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category
	• Pre-return inspection • Post-return inspection	• RL staff strategies	• RCM mitigation • Volume and product parameters	• Support practices – 2 • Total requirements – 4	
	COR disposition	• RL outsourcing • Disposition • Decentralised facility/location	• COR recovery • Organisational parameters	• Key practice – 1 • Support practices – 3 • Total requirements – 4	
COR recovery	**COR recovery preparation** • COR recovery strategy • COR recovery department • COR recovery agreements	• SCI • Disposition • RC • RL manager strategies • RL staff strategies	• RCE tools and execution • COR recovery • RCM mitigation • Organisational, product and SC parameters	• Key practices – 3 • Support practices – 5 • Total requirements – 8	• ***Key practices – 9*** • ***Support practices – 15*** • ***Total requirements – 24***
	COR recovery through the primary channel • Resell at full value • Resell at a discount*	• Disposition • Integrated and separate facility/location	• COR process • Volume, product and legal parameters	• Key practices – 2 • Support practices – 3 • Total requirements – 5	
	COR recovery through secondary channels • Resell to third-party buyers • Resell through liquidation channels	• SCI • Disposition	• COR recovery • Volume, product and SC parameters	• Key practices – 2 • Support practices – 2 • Total requirements – 4	
	COR recovery through suppliers • Use dedicated staff • Use agreements	• SCI • Disposition • RC • RL manager strategy • RL staff strategy	• COR process and recovery • RCM mitigation • Product, organisational and SC parameters	• Key practices – 2 • Support practices – 5 • Total requirements – 7	
RCM mitigation (return cost management)	**Return regulation** • Gatekeeping initiatives • Inspection initiatives	• Internet and web-based • SCI • RPA • RL staff strategies	• RCE execution • COR process and recovery • RCM execution • Product parameters	• Key practices – 2 • Support practices – 4 • Total requirements – 6	• ***Key practices – 8*** • ***Support practices – 10*** • ***Total requirements – 18***
	Return avoidance • Zero-return initiatives • Zero-inventory initiatives	• SCI • RPA	• RCE execution • Product, SC and legal parameters	• Key practices – 2 • Support practices – 2 • Total requirements – 4	
	Return charges and penalties • Charge consumers for product returns • Issue penalties to for product damages/losses	• SCI • PM • RPA	• RCE execution • COR recovery • Product and legal parameters	• Key practices – 2 • Support practices – 3 • Total requirements – 5	
	Cost absorption • Activity-based costing • Separate account for RL	• FM	• RCE tools • RCE execution	• Key practices – 2 • Support practices – 1 • Total requirements – 3	
RCM execution	**RCM formalisation** • Prioritise RLM • Cost control strategy and standards	• PM and FM • Strategic planning • Strategic procedures • RL manager	• RCE execution • RCM mitigation • Volume and organisational parameters	• Key practices – 2 • Support practices – 5 • Total requirements – 7	• ***Key practices – 6*** • ***Support practices – 10*** • ***Total requirements – 16***
	Accounting • Accounting separation • Use third parties	• RL outsourcing • PM • RL staff strategy	• RCE tools • RCM mitigation • Organisational parameter	• Key practices – 2 • Support practices – 3 • Total requirements – 5	
	Cost monitoring • Use appropriate KPIs • Cost/benefit analyses	• PM • FM	• RCE tools • RCE execution • Volume parameters	• Key practices – 2 • Support practices – 2 • Total requirements – 4	
Volume parameters	**Return volume**	• RL in/outsourcing • Disposition • General facility/location • RC and FM	• RCE execution • COR process and recovery • RCM execution • Product and organisational parameters	• Key parameter – 1 • Support practices – 5 • Total requirements – 6	• ***Key parameter – 2*** • ***Support practices – 6*** • ***Total requirements – 8***
	Sales volume	• FM	• RCE execution • RCM execution • Organisational parameter	• Key parameter – 1 • Support practices – 1 • Total requirements – 2	
Product parameters	**Type of return/product condition**	• SCI • Disposition • FM	• COR recovery • RCM mitigation • Volume parameter	• Key parameter – 1 • Support practices – 3 • Total requirements – 4	• ***Key parameter – 4*** • ***Support practices – 12*** • ***Total requirements – 16***
	Type of product	• SCI • Disposition • RC, FM and RPA • RL staff strategy	• RCE execution • COR process • RCM mitigation • Volume and SC parameters	• Key parameter – 1 • Support practices – 6 • Total requirements – 7	
	Product value/price	• FM • RPA	• RCE execution • RCM mitigation • Organisational & SC parameters	• Key parameter – 1 • Support practices – 2 • Total requirements – 3	
	Product margin	• General facility/location	• COR process	• Key parameter – 1 • Support practices – 1 • Total requirements – 2	
Organisational parameters	**Organisation type**	• General facilities/ locations • FM	• RCE execution • COR process	• Key parameter – 1 • Support practices – 2 • Total requirements – 3	• ***Key parameter – 7*** • ***Support practices – 11*** • ***Total requirements – 18***
	Organisational capabilities • Disposition capability	• Internet and web-base • TLIT, RLIT and SCI	• RCE tools and execution • COR process and recovery	• Key parameter – 3 • Support practices – 7	

Proposition categories	Key practices/ parameters	Support RL practices	Linked proposition categories	Requirements per key practice/parameter	Requirements per proposition category

Source: Compiled by the researcher

Table 8.**22** provides a detailed summary of the interview findings for cost propositions, which can help online retailers to identify the (1) requirements for specific cost proposition categories, (2) support practices that links with the highest number of cost propositions, (3) key practice and key parameter that link with the highest number of cost proposition categories, (4) proposition categories that require the most key practices/parameters and key elements, (5) key practice or parameter that requires the most key elements, (6) proposition category that associates with the most support practices, (7) key practice or parameter that associates with the most support practices, and (8) proposition category and key practice/parameter that involves the most requirements for successful implementation/consideration. Some examples of using the framework will be given in the subsequent paragraphs.

In terms of the *requirements for specific cost proposition categories*, an online retailer interested in implementing, for example, RCE tools propositions can identify (1) cost determination tools and cost understanding tools as the required key practices, (2) general IT, RLIT, CFI, RL outsourcing, PM, FM, strategic planning and RL manager strategies as required support RL practices, and (3) RCE execution, COR process, RCM mitigation, RCM execution and organisational parameters as associated proposition categories. Similarly, online retailers that experience, for example, various type of returns/product return conditions (as a key product parameter) can focus on return type and product condition for implementing/considering (1) SCI, disposition and FM as support RL practices, (2) COR recovery and RCM mitigation as associated proposition categories, and (3) volume as an associated parameter proposition category.

The most *significant support RL practices* for the implementation of cost propositions include disposition and FM practices. Subsequently, to effectively implement/consider various cost propositions, online retailers can prioritise the implementation of disposition and FM as support RL

practices. Furthermore, the *key practices* of cost identification and cost assessment for RCM execution and *key parameter* of return volume (volume parameter) *associates with the highest number of proposition categories*, which means that online retailers should pay attention to cost identification, cost assessment and return volume for the successful implementation of various cost proposition categories.

Regarding the *proposition categories*, COR processes *require the most key practices/elements,* which means that online retailers can implement several key practices/elements for the effective implementation of COR process practices. Additionally, the *key practices/parameters* of cost understanding tools (RCE tools), cost assessments (RCE execution), COR request and gatekeeping, COR collection (COR process), COR recovery preparation (COR recovery), organisational capabilities and strategies (organisational parameters) *require the most key elements*.

Furthermore, the *proposition category* of COR processes *associate with the most support RL practices,* which means that support RL practices can be the most beneficial for the implementation of various COR process practices. Similarly, the *key practice* of cost understanding RCE tools and the *key parameter* of organisational capabilities *associates with the most support RL practices,* which means that support RL practices can be the most beneficial for implementing cost understanding RCE tools and considering organisational capability parameters. However, COR processes as a proposition category, cost understanding RCE tools as a key practice and organisational capabilities as a parameter might be more complicated to implement for cost effectiveness.

Finally, COR processes as a *proposition category*, cost understanding RCE tools as a *key practice*, organisational capabilities as a *key parameter* involve the *highest number of requirements,* which means that COR processes, cost understanding RCE tools and organisational capabilities might be a too challenging to implement/consider successfully for cost effectiveness. Nevertheless, before online retailers choose to implement proposition categories and key practices/parameters based on the number of requirements, they should first identify the linked benefits. The benefits represent the number of cost pitfall and problems addressed and profits realised, which will be identified in the final framework and summary of finding for the cost theme (section 8.6.4).

In the next section, the cost profits (subtheme 3) that can be realised through the effective implementation of prevention and control propositions, will be analysed and discussed.

8.6.3 Cost profits – Subtheme 3

As illustrated in Figure 8.19 and discussed in section 8.2.2., the cost profits (meaning benefits or outcomes) consist of profit categories, including economic, operational, organisational, SC and market

and other themes, profit subcategories and related profits, which can be realised through the implementation/consideration of return cost evaluation (RCE), cost-orientated return (COR) and return cost management (RCM) propositions and cost parameters. Figure 8.**24** provides an overview of the cost profit categories, subcategories and related profits that can be realised through the implementation/consideration of cost propositions.

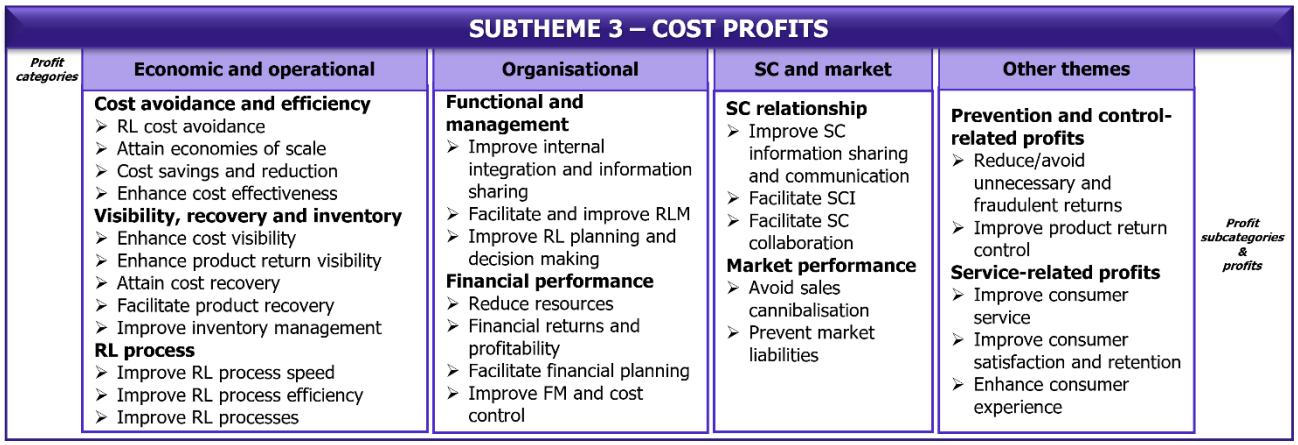

Figure 8.24 Overview of subtheme 3 - cost profits
Source: Compiled by the researcher

In the subsequent sections the main cost profit categories, including economic, operational, organisational, SC and market and other theme profits, with related profit subcategories and cost profits will be discussed.

8.6.3.1 Economic and operational cost profits

As illustrated in Figure 8.**24**, economic and operational cost profits can be categorised as (1) *cost avoidance and efficiency*, (2) *visibility, recovery and inventory*, and (3) *RL process profits*, which will be discussed in the subsequent sections

8.6.3.1.1 Cost avoidance and efficiency profits

Cost avoidance and savings profits involve RL cost avoidance, economies of scales and cost savings and reductions, and cost effectiveness, which can be realised through various cost propositions.

The participants indicated that online retailers could *avoid RL costs* through the implementation of key COR process and RCM mitigation practices and consideration of key product and organisational parameters. Specifically, RL costs can be avoided through the implementation/consideration of (1) COR collection (i.e. store return drop-offs), COR inspection (i.e. pre-return inspection) and COR disposition, (2) return regulation for RCM mitigation (i.e. gatekeeping initiatives) and return avoidance for RCM mitigation (i.e. zero-return and zero-inventory strategies), (3) type of product, and (4)

organisational type and organisational (disposition strategies). The following quotations demonstrate these findings:

> "You can actually go to a store […] it's still a return but you are actually not paying a return logistics costs […]." (P13, supply chain manager, multichannel retailer)

> "The staff that's physically going to handle the product from the first time, the guy with the motorbike comes back with that jacket or whatever it is to be able to inspect and do the right thing at that point in time […]. Where if you can train your people up at the right point […] without incurring double handling costs." (P2, owner, supply chain consultancy firm)

> "[…] I'm going to dispose of something regardless, then you want to do it as quickly as possible without incurring additional transportation or other costs." (P2, owner, supply chain consultancy firm)

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. […] But there is also, what are you going to do with this two-year old computer […] it's only a cost driver. So, avoiding that on the front end by digitising your returns policy […]." (P1, operations manager, 3PRL provider firm)

> "So, when a customer logs a return, they obviously need to take a photo of an item, […] that person can see that item has been used. It obviously it gets declined right away. So, you don't have that cost incurred to actually go and collect the item, evaluate it at the warehouse and then having to send it back." (P3, returns manager, online retailer)

> "[…] have some sort of way to avoid or reduce a return when it's not actually going to give the desired outcome, because you don't want to pay for reverse logistics for no reason." (P13, supply chain manager, multichannel retailer)

> "[…] we would call that our 4PL process. So, normally when you sell online, […] you can have your own warehouse and you can keep your own stock. [But this is] Not efficient because you've got a stock life cycle, and that's also costly. If you can't return that or turn that stock in 30 days or 50 days, it cost you money. Then you can have the option also of selling directly from your supplier's own warehouse, so you don't carry stock, but your supplier, that manufacturer, carry stock. […] So, that's completely then with that supplier […] and that's the same then in terms of a reverse or a return, is that supplier will get notified by the customer care department that they've logged that return. That return will be redirected to that supplier […]." (P12, Head of logistics, online retailer)

Furthermore, online retailers can attain *economies of scale* by implementing/considering the key (1) COR process practice of COR transportation (i.e. bulk transportation and appropriate network design), (2) RCM execution practice of cost monitoring (i.e. performing regular cost/benefit analyses), and (3) volume parameter of return volume. The following quotations support these findings:

> "I believe outsourcing is an amazing opportunity […] the reason I say that is, I don't have scale in returns […] it becomes part of the courier's greater scale." (P6, logistics manager, multichannel retailer)

> "[…] it can be quite costly to go and set up a complete courier network or even part of a courier network. So, potentially the customer to warehouse, bit, is a part that you would normally outsource and just because you would get economies […]." (P1, operations manager, 3PRL provider firm)

> "There's nothing that's not a business case. We will outsource until there's no more economical benefit to outsource. Then we will try and insource if we can do it better or cheaper, […] because you should be able to do it yourself if there's that much volume that somebody else can run a complete business just on you." (P6, logistics manager, multichannel retailer)

In terms of *cost savings* and *reductions* online retailers can implement various key COR process practices and various cost parameters. Particularly, participants indicated that online retailers could save and reduce RL costs by implementing (1) COR request and gatekeeping (i.e. self-service return request, online authorisation and using third parties), (2) COR collection (i.e. simultaneous return pickup and replacement drop-off and using 3PRL providers), (3) COR transportation (i.e. using an appropriate network), (4) COR inspection (i.e. pre-return and post-return inspection), and (5) COR

disposition. Additionally, online retailers can realise cost savings and reductions by considering the key (1) volume parameter of return volume, (2) product parameter of type of product, and (3) organisational parameters of organisational capabilities and strategies. Finally, online retailers can enhance *cost effectiveness* through the key COR process practice of COR transportation, which involves using decentralised facilities/locations for COR transportation. The following quotations illustrate the cost saving, reduction and effectiveness profits:

> "I think it saves a lot of costs […] when a consumer or customer of your goods can log a return for themselves […]." (P3, returns manager, online retailer)
>
> "So, the whole authorisation was done on online […] the cost saving was disproportionately big because we didn't have the customer interactions […]." (P1, operations manager, 3PRL provider firm)
>
> "[…] like outsourcing a contact centre, the only reason you do it is to gain actual financial savings." (P1, operations manager, 3PRL provider firm)
>
> "I think we could save [Retailer C] a fortune, because if you return something and you order a replacement, they come up with two different deliveries […]. So, I thought to myself, if we [as the 3PRL provider] could convince them [Retailer C] that when you [the consumer] do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)
>
> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, but it will become in the recoverability of the product, the control, the discipline and the turnaround of the stock […] [and] there are costs that can be saved elsewhere and some non-attributable costs in the form of customer service ….] I [as the 3PRL provider] pick it up [the product return] tomorrow and that […] is done very quickly, very efficiently." (P7, owner, 3PRL provider firm)
>
> "I personally think that decentralised operations are far more […] cost effective […]. The fact that it gets back to the reclamation centre a little time later than that, that to me is in the ability to save costs […]." (P7, owner, 3PRL provider firm)
>
> "So, in terms of location, it needs to be, if not inside the DC, very close to the main DC hubs […] just to save transport cost." (P5, general manager, online retailer)
>
> "I believe with it being centralised is that you collect that unit and deliver directly to your warehouse […] because less activities[are] involved, [for a] reduction in costs […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
>
> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time. […] a practical way of putting a team of people into the street and saying, you know, what returns is such a big thing in our world […] So, let's put a dedicated team in there that […] can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […]."(P5, general manager, online retailer)
>
> "[…] employing the right people. It will save you money in the long run because you don't want an uneducated person dealing with a return claim on a forty- or fifty-thousand-rand electronics item […]." (P5, general manager, online retailer)
>
> "[…] we always had ours decentralised because it cost less […] decentralised is better from a cost point of view its more cost effective. […] It's a hell of a cost to transport something within 48 hours across the country […]." (P4, owner/CEO, 3PRL provider firm)

Few studies from the reviewed literature identified cost avoidance and efficiency profits through the implementation of practices related to the cost propositions. Specifically, studies from the reviewed literature identified that (1) costs can be avoided through no-collection returns (Hjort *et al.* 2019:775), (2) economies of scales can be realised by outsourcing to 3PLs/3PRLs (Gu *et al.* 2019:160; Wang, Wang *et al.* 2021:67) and using centralised facilities (Hjort *et al.* 2019:781), and (3) cost savings and reductions can be realised through efficient return processes (Ashan & Rahman, 2021:20), IT to verify returns (Jović *et al*. 2020:164), gatekeeping (Andresen & Istad, 2019:8), shorter routes and distances

using decentralised network (Bozzi *et al.* 2022:20, 30), and proper allocation of skilled human resources (Ashan & Rahman, 2021:22; Le, 2023:15). Nevertheless, this study distinctly identifies that online retailers can avoid cost, attain economies of scale, and save and reduce costs through numerous additional key COR process and RCM execution practices and related cost parameters, expanding the literature.

Essentially, cost avoidance and reduction as cost profits, reemphasise that online retailers can address RL process failures (operational failures), poor RPA (poor RLM) and poor cost monitoring (poor FM) pitfalls and unnecessary expenses, high RL costs and a loss of money (cash problems) through the implementation of cost propositions for the effective RLM of consumer returns.

8.6.3.1.2 Visibility, recovery and inventory profits

The visibility, recovery and inventory cost profits involve the enhancement of cost visibility, enhancement of product return visibility, attainment of cost recovery, facilitation of product recovery and improvement of inventory management through the implementation of various cost propositions.

The participants indicated that online retailers could *enhance costs visibility* through RCE tools, RCM execution and organisational parameters. Specifically, online retailers can enhance cost visibility by implementing/considering (1) cost determination RCE tools (i.e. accounting separation and systems), (2) cost understanding RCE tools (i.e. internal information sharing), (3) accounting for RCM execution (i.e. accounting separation through a dedicated RL department), and (4) organisational (IT) capabilities. Similarly, online retailers can *enhance product return visibility* through the key (1) RCE tools practice of cost determination (i.e. using a capable third party), (2) COR process practice of COR request and gatekeeping (i.e. using third parties), and (3) organisational cost parameter of organisational (IT) capabilities. The following quotations demonstrate the attainment of cost and product return visibility profits through various cost propositions:

> "[…] within the system, like a SAP ERP that's quite sophisticated or the bespoke systems that I've dealt with, they have a specific module to deal with returns and to deal with the logistics around the returns, as well as the financial transactions, the credit side of the return and the cost side of the return, so that as much as when you try to do an online purchase, you can select various logistics delivery options. The same thing should be on the reverse, at least for the people in the organisation to see what's the cost of various return options." (P2, owner, supply chain consultancy firm)

> "[…] they have more visibility and [by] sharing of information between different departments, they can start understanding the cost of these returns […]." (P2, owner, supply chain consultancy firm)

> "So, it's not just running a truck from point B to point A, it's all the processing and admin around it and repackaging if necessary, and reselling and liquidating and destruction. That's all put into different categories of [the] income statement, which gets hidden and washed away. So, if you have a dedicated [RL department as a] resource for reverse logistics that all comes out of the income statement into the reverse logistics pool and it's much easier to manage those costs." (P4, owner/CEO, 3PRL provider firm)

> "And I developed an app that actually does all those processes […] to give immediate authorisation […] So, from a point of view of the technologies, obviously, whatever platform you may use […] to know immediately why things are happening, what is happening, what it looks like and the [cost] implications thereof. (P7, owner, 3PRL provider firm)

Online retailers can *attain cost recovery* by effectively implementing key COR recovery and RCM execution practices and considering key product and SC parameters. Specifically, online retailers can attain cost recovery through (1) COR recovery preparation (i.e. establishing a COR recovery department and COR recovery agreements), (2) COR recovery through the primary market (i.e. reselling at full value, (3) COR recovery through the secondary market, (4) COR recovery through suppliers, (5) cost absorption for RCM mitigation (i.e. activity-based-costing), and (6) type of return, product condition and supplier return policy parameters. The subsequent quotations show these findings:

> "But when they want to return it, if you haven't invested in that process and those people […] How are we going to maximise the disposition return? And if you haven't invested in all of that, can we offset some of the disposition in some of the cost of servicing with the [cost] recovery and disposition […]." (P1, operations manager, 3PRL provider firm)

> "So that's what they'll go into agreement with one or two parties at most and say, you know what, every other day we'll call you, you'll come, you'll come and view the stuff in the racks. You'll see what it is. You'll get a fair price, and you'll say, fine, bang, I'll pay you R400 K. I'll take everything. Because it's just a way of salvaging cost." (P5, general manager, online retailer)

> "[…] your first priority would be to put it back for resale […] So, that decision of resale is driven by cost recovery." (P5, general manager, online retailer)

> "I think cost is one, you know, and recovery on that cost. So, if you're going to resell products, you're able to resell at full value, if not, then rather send it through to a liquidation channel." (P4, owner/CEO, 3PRL provider firm)

> "[…] items we sent back to our suppliers. And we get a cost price plus logistics cost return from those vendors, which is agreed up front." (P8, logistics manager, multichannel retailer)

> "As a as an online retailer, always try and get your money back. That's your number one priority. So, sending it back to the supplier to a warranty claim is the easiest thing in the world, done deal." (P5, general manager, online retailer)

> "And so, when we do activity-based costing […] because you can't recover your true returns cost separately, you have to recover that cost somewhere." (P2, owner, supply chain consultancy firm)

Moreover, online retailers can *facilitate product recovery* through RCE, COR propositions and organisational parameters, including the key (1) RCE tools practice of cost determination (i.e. using appropriate planning), (2) COR process practice of COR disposition (i.e. using third parties), (2) COR recovery practice of COR recovery preparation (i.e. establishing a COR recovery department) and (3) organisational parameter of organisational (disposition) capability. Finally, online retailers can *improve inventory management* through the implementation of COR recovery preparation and consideration of the volume parameter of return volume, which involves the appointment of a dedicated RL manager. The following quotation support these claims:

> "They need to have [disposition decisions in their strategic planning] […] to know upfront […] what the cost of that return will be further down the supply chain. […] and the cost involved to recover that product or to take it up into the supply chain again safely." (P2, owner, supply chain consultancy firm)

> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, but it will become in the recoverability of the product […]." (P7, owner, 3PRL provider firm)

> "So, we also have a recovery department, in our warehouse, which then will assess the heights and either repackage it […]." (P3, returns manager, online retailer)

> "[…] depending on scale […] the reverse logistics manager is actually managing the inventory component. What are we going to do with the stock? How are we going to handle it? How are we going to disposition it?" (P1, operations manager, 3PRL provider firm)

No studies from the reviewed literature identified that cost visibility can be enhanced through the implementation of practices related to RCE tools, RCM execution and organisational parameters. However, a few studies identified that product return visibility can be enhanced by using IT in the RL process (Biswas & Abdul-Kader, 2018:1021; Frei *et al.* 2020:1619; Jović *et al*. 2020:164). Additionally, only Biswas and Abdul-Kader (2018:1019) identified that cost recovery can be realised through supplier agreements and shipping product returns to suppliers. Therefore, this study extended the literature by identifying that cost recovery can be realised by implementing various key COR recovery practices, absorbing costs for RCM execution and considering related cost parameters. Nevertheless, a few studies identified that product recovery can be realised through the inclusion of disposition decisions in the strategic planning (Andresen & Istad, 2019:23), appointment of appropriate and skilled staff (Zailani *et al.* 2017:35) and utilisation of third parties in the disposition process (Le, 2023:15). Finally, no studies identified that appointing a dedicated RL manager can facilitate inventory management, meaning that this study extends the literature by emphasising the importance of appointing a dedicated RL manager and considering return volume.

Essentially, realising visibility, recovery and inventory profits, reiterate that implementing/considering cost propositions can help online retailers address (1) RL process failures (operational failure), inattention to RLM, lack of resources (poor RLM), poor RL accounting, dismissing RL costs, poor cost monitoring (poor FM) and a lack of CFI and SCI (poor integration) cost pitfalls, and (2) inaccurate view of financial performance, poor cost visibility, hidden costs (costing), a loss of sales, profits and margins (cash), obsolete stock, poor/no recovery and a loss of product and product value (recovery) cost problems.

8.6.3.1.3 RL process profits

RL process profits entail improving RL process speed, RL process efficiency and RL processes through the implementation/consideration of COR process propositions and a few cost parameters.

The participants identified that online retailers could implement various key COR process practices and related key cost parameters to *improve RL process speed.* Specifically, online retailers can improve RL process speed through the implementation of (1) COR collection involving simultaneous return pickup and replacement delivery and third parties, (2) COR transportation involving appropriate network designs, (3) COR inspection involving pre-return inspection, and (4) COR disposition involving speedy disposition. Additionally, online retailers can improve RL process speed by considering the key (1) volume parameter of return volume, (2) product parameter of product type, and (3) organisational parameters of organisational (disposition) capabilities and organisational (disposition) strategies. The subsequent quotations support these findings:

> "The two processes happen at the same time, trigger the return and trigger the outbound order for the replacement item. OK, so the courier going to fetch the returned item is also dropping off the replacement [which] truncates that wait period […]." (P1, operations manager, 3PRL provider firm)

> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, […] but there are costs that can be saved elsewhere and some non-attributable costs in the form of customer service [...] I [as the 3PRL provider] pick it up [the product return] tomorrow and that […] is done very quickly […]." (P7, owner, 3PRL provider firm)

> "[…] we always had ours decentralised because it's cost less if you do it regionally […] decentralised is […] faster, you don't have to wait, even if you're waiting 48 hours." (P4, owner/CEO, 3PRL provider firm)

> "I believe with it being centralised is that you collect that unit and deliver directly to your warehouse […] because less activities[are] involved, [for a] reduction in costs and quicker expedition time […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time […] [by] putting a team of people into the street and saying, you know what, returns is such a big thing in our world […] So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there […] just to give them a better service [and] save some time and traffic at the DC." (P5, general manager, online retailer)

> "I'm going to dispose of something regardless, then you want to do it as quickly as possible […] And then you might want to say, well, I've decentralised points in different cities, and I'll just dispose." (P2, owner, supply chain consultancy firm)

Additionally, online retailers can *improve RL process efficiency* by implementing COR collection, using decentralised drop-off points and 3PRL providers, and considering organisational parameters of organisation type and organisational strategies. Finally, online retailers can *improve RL processes* through the implementation of COR request and gatekeeping (i.e. self-service return request) and consideration of organisational (IT) capabilities (organisational parameter). These findings can be illustrated by the following quotations:

> "I think decentralised is better from a cost point of view, [and] an efficiency point of view […] that they would be able to go to a Caltex garage and there's a drop point there." (P4, owner/CEO, 3PRL provider firm)

> "So, whilst there is a saving [through RL outsourcing], the saving may not come in direct costs, […] but there are costs that can be saved elsewhere and some non-attributable costs in the form of customer service [...] I [as the 3PRL provider] pick it up [the product return] tomorrow and that […] is done very quickly, very efficiently." (P7, owner, 3PRL provider firm)

> "[...] if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

The interview findings related to RL process profits align with several studies from the reviewed literature. Specifically, studies identified that online retailers could improve (1) RL process speed through a simultaneous return pick-up and replacement delivery (Bozzi *et al.* 2022:20), decentralised facilities/locations (Bozzi *et al.* 2022:20; Karlsson *et al.* 2023:8) and dedicated skilled staff (Ahsan & Rahman, 2022:157; Mostert *et al.* 2017:13), (2) RL process efficiency through outsourcing to 3PRL providers (Wang, Dang *et al.* 2021:2), and (3) RL processes through appropriate IT (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:21; Hjort *et al.* 2019:788). Nevertheless, this study identified that centralised facilities can reduce RL process speed, contradicting the findings of Hjort *et al.* (2019:781), who identified that centralised facilities could reduce RL process speed. Therefore, this study shows that centralised facilities can also increase RL speed, extending the benefits of using

centralised facilities in the RL process. Additionally, this study uniquely identified that COR collection using drop-off collection points can enhance RL process efficiency.

Subsequently, this study not only confirms but also extends RL literature by identifying additional RL process profits that can be realised through cost propositions. Essentially, realising RL process cost profits reemphasise the ability of online retailers to address the cost pitfall of RL process failures (operational failure) and cost problems of unnecessary expenses, high RL costs and a loss of money (cash problems) through the implementation of COR process and cost parameter propositions for the effective RLM of consumer returns.

8.6.3.2 Organisational cost profits

As highlighted in **Figure 8.10**, organisational cost profits can be categorised as *functional and management* and *financial performance profits*, which will be discussed and analysed in subsequent sections.

8.6.3.2.1 Functional and management profits

Functional and management profits involve the facilitation of internal integration and information sharing, improvement of RLM, and improvement of RL planning and decision making, which can be realised through various cost propositions.

Specifically, online retailers can *facilitate internal integration* and *information sharing* through the implementation of cost understanding RCE tools (key RCE tools practice), simultaneous return pick-up and replacement delivery for COR collection (key COR process practice) and consideration of organisational (IT) capabilities (organisational parameter). Additionally, online retailers can *facilitate* and *improve RLM* through the implementation of formalisation for RCM execution, which involves prioritisation of RLM for cost management. The following quotations show the cost profits related to internal integration and information sharing and RLM:

> "And that's what for us we have done successfully through many different IT platforms, that this information becomes available to the sales force […] integration is an imperative." (P7, owner, 3PRL provider firm)

> "[…] you need sales, marketing, finance […]. You definitely need someone to account for it. You definitely need someone […] to communicate the whole [return] process […]." (P4, owner/CEO, 3PRL provider firm)

> "[…] cross-functional [integration] is imperative […] If the guy gets the wrong thing and he wants it replaced […] I think we could save [Retailer C] a fortune, because if you return something and you order a replacement, they come up with two different deliveries […]. So, I thought to myself, if we [as the 3PRL provider] could convince them [Retailer C] that when you [the consumer] do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)

> "[…] return logistics needs to be managed because it can grow into a loss for the company in the wink of our eyes. So, you need to have all your procedures in place, your policies in place and your quality checks needs to be in place." (P11, Demand and sales manager, FMCG distributor)

> "[…] if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly. So, I think it is very important to have somebody to oversee that at all times. And also, it's a great loss area to actually gain some of the losses back." (P3, returns manager, online retailer)

Finally, online retailers can *improve RL planning and decision making* through key RCE tools, RCM mitigation and RCM execution practices and product parameters. Specifically, online retailers can improve RL planning and decision making by implementing/considering (1) cost determination RCE tools (i.e. including disposition decisions in strategic planning), (2) return regulation for RCM mitigation (i.e. using educated/trained inspectors), (3) formalisation for RCM execution (i.e. developing cost control strategy), and (4) product type and product value parameters, as depicted in the subsequent quotations:

> "They need to have [disposition decisions in their strategic planning] […] to know upfront […] what the cost of that return will be further down the supply chain. So, mostly it's a lost sale and the loss of the product […] because of the [product return] issues and the cost involved to recover that product or to take it up into the supply chain again safely." (P2, owner, supply chain consultancy firm)

> "So, educating your inspectors with the help of the supplier and possibly even at their cost. Right. So, you can try and educate your inspectors on the supplier's cost, saying that we run thousands of electronic items through your doors every week. We need your team to come and educate our team, so you save a couple bucks […] [and for] the business acumen saying that you can't make an emotional decision when dealing with a R40000 electronic device […]." (P5, general manager, online retailer)

> "[…] you can have it [RL] as part of a strategic plan […]. I have to make sure that there's a strategic intent to get the cost down […]. It can be part of a cost containment strategy." (P6, logistics manager, multichannel retailer)

A few studies from the reviewed literature coincided with the interview findings related to functional and management cost profits. Specifically, some studies identified that (1) internal information sharing and integration can be facilitated through appropriate IT (Jović *et al*. 2020:164), management involvement and commitment (Mostert *et al.* 2017:9), and simultaneous return pickup and exchange delivery (Bozzi *et al.* 2022:19), (2) RLM can be improved and facilitated through management involvement and commitment (Frei *et al.* 2020:1616), and (3) RL decision making can be improved by training staff to conduct effective gatekeeping and uphold return policies (Dapiran & Kam, 2017:832; Zhang *et al.* 2023:10) and make correct disposition decisions (Zailani *et al.* 2017:35). While no studies mentioned that RL planning can be improved, Hjort *et al.* (2019:769) advised that online retailers must develop a strategic plan for RL and Xu (2019:33) mentioned that online retailers can benefit from including RLM in their overall strategic planning, pointing to improvements in RL planning.

Essentially, the functional and management profits related to internal integration and information sharing, RLM and RL planning and decision making, reemphasise that online retailers can address inattention to RLM, poor RL planning (poor RLM) and a lack of CFI (poor integration) pitfalls and a loss of money, sales and profits (cash) problems through the implementation/consideration of various cost propositions.

8.6.3.2.2 Financial performance profits

Apart from cost avoidance and efficiency profits (section 8.6.3.1.1), financial performance profits can be one of the most significant cost profits that online retailers can realise through various cost propositions. The financial performance profits involve a reduction in resources, realisation of financial returns and profitability, facilitation of financial planning and improvement of financial management (FM).

In terms of *resource reduction*, online retailers can implement key COR process practices and consider key organisational parameters. Specifically, online retailers can reduce resources through the implementation of COR request and gatekeeping (i.e. self-service return request and online authorisation) and COR collection (i.e. using 3PL providers) and consideration of organisational (IT) capabilities. Subsequently, online retailers can reduce both human and physical resources through cost propositions, as demonstrated in the following quotations:

> "I think it saves a lot of costs, […] you don't need to employ as many people when a consumer […] can log a return for themselves, whereas some other companies obviously you need to phone the company or send an email to initiate the return. So, I think in that case, if you have a system that can allow the customer or the consumer to initiate the request for a return by themselves on their own, it makes for a lot more smoother [sic] process." (P3, returns manager, online retailer)

> "[…] because there is so many 3PL services out there that you can just at the drop of a hat, send somebody to go and collect your returns […]. If you still have to focus on getting a driver to going to pick up a certain item at a certain time of the day, you will tend to use more resources and end up spending more money than actually just outsourcing it to somebody else." (P3, returns manager, online retailer)

Furthermore, online retailers can *realise financial returns* and *profitability* through key RCE execution, COR recovery, RCM mitigation and RCM management practices and product and SC parameters. Specifically, financial returns and profitability can be realised through the implementation/consideration of (1) costs assessment for RCE execution (i.e. cost assessment for accepting returns for inexpensive products), (2) COR recovery preparation (i.e. dedicated manager as part of the COR recovery department), (3) COR recovery through the primary market (i.e. reselling at a discount), (4) return avoidance for RCM mitigation (i.e. zero-return initiatives), (5) formalisation for RCM execution (i.e. prioritise RLM), (6) product condition, type of product and product value parameters, and (7) types and chargers of 3PLs/couriers. Additionally, online retailers can *facilitate financial planning* through the key RCE tools practice of cost understanding (i.e. accounting separation) and the key RCM mitigation practice of cost absorption. The following quotations substantiated these findings:

> "So, if you're looking at an item less, and I worked it out […] if you sell it for R220, there's no ways I will collect an item that has had a sales value of R220 or less, because it will cost you in terms of profit margin to actually go and fetch these items. It makes no sense." (P12, Head of logistics, online retailer)

> "[…] as somebody's job […] to focus on it [product recovery], they [the online retailers] are seeing, some significant financial returns being obtained with focus." (P7, owner, 3PRL provider firm)

> "[…] you need to try and salvage whatever you can. […] the unbox deals, which is a pretty good initiative to sell kind of new but unboxed goods to regain some of the profit." (P5, general manager, online retailer)

> "[…] if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly. So, I think it is very important to have somebody to oversee that at all times. And also, it's a great loss area to actually gain some of the losses back." (P3, returns manager, online retailer)

> "It needs to be a completely different dual account. It needs to be completely independent from any other thing you do […] you want to do a proper case rate analysis […] to see how much money I spent on positive sales […]. So, that when I do future planning in terms of margin and markup, I can use that percentage of cost to accurately gauge my transport component onto my selling price, but importantly not overinflated because of my own wastage […]. I'm going to load into my price, which is completely fine." (P5, general manager, online retailer)

Finally, online retailers can *improve FM* and *cost control* in RL through most cost propositions, including key RCE tools, COR process, RCM mitigation and RCM execution practices and various cost parameters. Specifically, online retailers can improve FM in RL through the implementation of (1) cost determination RCE tools (i.e. appropriate measures and accounting separation), (2) COR collection (i.e. simultaneous return pick-up and replacement delivery), (3) return regulation for RCM mitigation (i.e. inspection initiatives), (4) formalisation for RCM execution (i.e. prioritising RLM and establishing cost control strategies and standards), (5) accounting for RCM execution (i.e. accounting separation and using a 3PRL provider), and (6) cost monitoring for RCM execution (i.e. using appropriate KPIs and software for cost/benefit analysis). Additionally, online retailers can improve FM by effectively considering the key (1) volume parameters of return volume and sales volume, (2) organisational parameters of organisational (IT and accounting) capabilities and organisational (network) strategies, and (3) SC parameter of types and charges of 3PLs/couriers. The following quotations convey these findings:

> "Cost per unit processing, [is] critical, you got to know that your cost per units are [sic] all managed and understood [to identify] what it is costing you to build returns." (P6, logistics manager, multichannel retailer)

> "[You can use a normal accounting system for RL] as long as you can ring-fence […]. So, we've got identifiers that says, you know what? This is a returns cart or returns transaction code in those transaction codes are measured separately and managed separately." (P6, logistics manager, multichannel retailer)

> "The two processes happen at the same time, trigger the return and trigger the outbound order for the replacement item. OK, so the courier going to fetch the returned item is also dropping off the replacement […], and it means that you from a cash flow point of view, you're keeping the money in the business." (P1, operations manager, 3PRL provider firm)

> "And like I said, the training goes without question because financially, the checking of a claim […] every facet that we operate with has to be checked and the person doing it has to be suitably qualified to do so." (P7, owner, 3PRL provider firm)

> "And again, because of the easiness of returning products with free returns in an online environment, that's such a big area of your cost that it warrants someone to look after that portion of your business and you try and control the costs within that portion of your business." (P2, owner, supply chain consultancy firm)

> "[…] you can have it [RL] as part of a strategic plan […]. I have to make sure that there's a strategic intent to get the cost down […]. It can be part of a cost containment strategy." (P6, logistics manager, multichannel retailer)

> "So, normally what you do is you try and work on a ratio that's a benchmark or standard that is not really going to eat into your bottom line […] you're reverse logistics costs, should be probably one per cent or five or 10 percent of that total logistics cost, and that's the one that needs to be done. […] you've got to look at the types of volumes that you do […] if more sales taking place within Johannesburg, your returns should be greater within Johannesburg […] Cape Town being your longest lead-time or your longest distance […], the logistics cost to return from Cape Town is going to be a lot greater than what it is from Johannesburg." (P10, Head of Sales and Logistics, OEM/multichannel retailer)

> "So, if you have a dedicated [RL department as a] resource for reverse logistics that all comes out of the income statement into the reverse logistics pool and it's much easier to manage those costs." (P4, owner/CEO, 3PRL provider firm)

> "Claims Department, a Reverse Logistics Department […] extends back into finance because one of the biggest problems in our industry is pick up the goods, no problem. But then when the account from the accounts payable teams of the retailers come and there are claims on there, that's an area where we get involved in and to help our customers reconcile their accounts at the end of the month because sometimes there are claims that are illegitimate." (P7, owner, 3PRL provider firm)

> "[…] returns as a percentage of turnover and cost as a percentage of turnover as well. Obviously, budget for a quarter of a percent or whatever the case may be for your logistics costs to bring the product back. And that you have to run against the budget […]." (P7, owner, 3PRL provider firm)

> "[…] you have the software that does some aggregation for you, telling you that you are picking stuff up at outlying areas, this service provider is giving you a better cost on that area […] to manage costs […]." (P13, supply chain manager, multichannel retailer)

Some studies from the reviewed literature identified that financial performance profits can be realised through the implementation of practices related to the cost propositions. For instance, Wang, Dang *et al.* (2021:2) identified that outsourcing RL can address resource constraints. Additionally, several studies identified that financial returns and profitability could be realised through (1) return avoidance (Chen *et al.* 2017:255), (2) management commitment and involvement (Frei *et al.* 2020:1616), (3) appropriate human resources (Le, 2023:15) and (4) product reuse and reselling (Ahsan & Rahman, 2021:21; Phuong, 2019:12). Moreover, a few studies recognised that improved FM and control can be attained through the appropriate application of RL processes (Solati *et al.* 2023:2), investment in appropriate resources (Phuong, 2019:3) and appropriate KPIs and performance measures (Euchi *et al.* 2019:40; Karlsson *et al.* 2023:9). Evidently, this study extends the literature through the identification of various additional cost propositions that can help online retailers reduce resources, realise financial returns and profitability, improve financial planning, and improve FM and cost control.

Essentially, the financial performance profits emphasise the ability of online retailers to address the cost (1) pitfalls of RL process failures (operational failure), poor RL planning (poor RLM), poor RL accounting, dismissing RL costs and poor cost monitoring (poor FM), and (2) problems of poor pricing, inaccurate view of financial performance, poor cost visibility (costing problems), unnecessary expenses, high RL costs, a loss of money, sales, margins and profits (cash problems) and poor/no recovery (recovery problem) through the implementation of various cost propositions.

8.6.3.3 SC and market cost profits

SC and market profits can be categorised as *SC relationship* and *market performance profits* (see **Figure 8.10**), which will be analysed and discussed in the subsequent sections.

8.6.3.3.1 SC relationship profits

SC relationship profits involve improvement of SC information sharing and communication, facilitation of SCI and facilitation of SC collaboration, which can be realised through the implementation of various cost propositions.

Specifically, online retailers can *improve SC information and communication* through key COR recovery and RCM mitigation practices and key product, organisational and SC parameter. For instance, SC information sharing and communication can be improved by implementing/considering (1) COR recovery preparation (i.e. establish of COR recovery department with a dedicated manager), (2) COR recovery through suppliers (i.e. use dedicated staff), (3) return avoidance for RCM mitigation (i.e. zero-inventory strategy), (4) type of return and product condition, (5) organisational (disposition) capabilities and (6) supplier return policies. These findings can be identified from the following quotations:

> "[…] the manager of the fulfilment centre and I have to decide whether which route it should take. So, from there on, we decide whether the packaging is damaged. If the packaging is damaged, then we will contact our supplier […] and let them know that this item has come back. We are returning it to supplier." (P9, regional & online DC manager, online retailer)

> "[…] we would call that our 4PL process. So, normally when you sell online, […] you can have your own warehouse and you can keep your own stock. [But this is] Not efficient because you've got a stock life cycle, and that's also costly […]. So, I receive the online purchase from the client. I don't carry any stock, but their purchase is directly redirected to the supplier or manufacturer of a specific product, and that specific supplier or manufacturer will make sure that the delivery takes place from his or her own facility or warehouse. […] and that's the same then in terms of a reverse or a return, is that supplier will get notified by the customer care department that they've logged that return. That return will be redirected to that supplier […]." (P12, Head of logistics, online retailer)

> "[…] we don't repair or anything on site. So, if an item needs to be repaired, we need to engage the supplier to get it done." (P3, returns manager, online retailer)

Similarly, online retailers can *facilitate SCI* through key COR process, COR recovery and RCM execution practices and key volume and organisational parameters. Particularly, online retailers can facilitate SCI by implementing/considering (1) COR disposition (i.e. bulk transportation), (2) COR recovery preparation (i.e. establish COR recovery agreements), (3) COR recovery through secondary markets (i.e. resell product return to third-party buyers), (4) return avoidance for RCM mitigation (i.e. zero-inventory strategy), (5) return volume and (6) organisational (IT) capabilities, as illustrated in the subsequent quotations:

> "[…] there needs to be like a secondary network of delivery agents and delivery services that can capitalise on the quantity of deliveries that need to take place for […] the returning part […], which are making [return] deliveries very expensive for the retailer […] they need more integration and vertical integration with transportation companies and transportation management systems, which is in the same way that you can broke the loads for normal bigger loads, that you can do a brokering kind of service for the [return] delivery." (P2, owner, supply chain consultancy firm)

> "[…] they'll go into agreement with one or two parties at most and say, you know what, every other day we'll call you, you'll come, you'll come and view the stuff in the racks. You'll see what it is. You'll get a fair price, and you'll say, fine, bang, I'll pay you R400 K. I'll take everything. Because it's just a way of salvaging cost." (P5, general manager, online retailer)

> "[…] we would call that our 4PL process. So, normally when you sell online, […] you can have your own warehouse and you can keep your own stock. [But this is] Not efficient because you've got a stock life cycle, and that's also costly. If you can't return that or turn that stock in 30 days or 50 days, it cost you money. Then you can have the option also of selling directly from your supplier's own warehouse, so you don't carry stock, but your supplier, that manufacturer, carry stock. In other words, you can then do a supply chain 4PL purchase. So, I receive the online purchase from the client. I don't carry any stock, but their purchase is directly redirected to the supplier or manufacturer […] and that's the same then in terms of a reverse or a return, is that supplier will get notified by the customer care department that they've logged that return. That return will be redirected to that supplier […]." (P12, Head of logistics, online retailer)

Finally, online retailers can *facilitate SC collaboration* through key COR recovery and RCM mitigation practices and key product and SC parameters, including (1) COR recovery preparation (i.e. establish a COR recovery department and agreements), (2) COR recovery through secondary markets, (3) COR recovery through suppliers (i.e. use dedicated staff and agreements), (4) return regulation (i.e. inspection initiatives), (5) product type and value parameters, and (6) supplier return policy parameters. The following quotations support these findings:

> "That's the 'request for credit' team where we work with the suppliers' hand in hand. When we get the item that the customer returns and says that it's faulty, we will create an RFC back to the supplier for them to either credit us or exchange that product with the new one." (P3, returns manager, online retailer)
>
> "So that's what they'll go into agreement with one or two parties at most and say, you know what, every other day we'll call you, you'll come, you'll come and view the stuff in the racks. You'll see what it is. You'll get a fair price, and you'll say, fine, bang, I'll pay you R400 K." (P5, general manager, online retailer)
>
> "And obviously, I know the service level agreements based on that supplier […] we have an agreement with these guys so that we can send it back […]." (P9, regional & online DC manager, online retailer)
>
> […] needs to also be sent back to the supplier or the manufacturer. I've had agreements in place that my supplier or manufacturer would come once a month and collect all the items if that agreement was in place." (P12, Head of logistics, online retailer)
>
> "So, educating your inspectors with the help of the supplier and possibly even at their cost. So, you can try and educate your inspectors on the supplier's cost, saying that we run thousands of electronic items through your doors every week. We need your team to come and educate our team, so you save a couple bucks […] [and for] the business acumen saying that you can't make an emotional decision when dealing with a R40000 electronic device […]." (P5, general manager, online retailer)

The literature findings related to SC relationship cost profits align with a few studies from the reviewed literature, which found that (1) integrated IT systems can improve SC information sharing (Frei *et al.* 2020:1618), (2) SC information sharing (Ahlén & Johansson, 2023:32), SC contracts/agreements and shared responsibilities (Mostert *et al.* 2017:10) can improve SCI, and (3) SC information exchange, cooperative policies (Ahlén & Johansson, 2023:32), partnerships (Pal, 2017:883) and staff training (Mostert *et al.* 2017:10, 13) can improve SC collaboration. Subsequently, this study confirms that SC relationships can be improved through the implementation of various cost propositions that involve SC engagement, integrated systems, information exchange, agreements and shared responsibilities.

Essentially, SC relationship cost profits, reemphasises that online retailers can address a lack of SCI (poor integration) pitfalls and unnecessary expenses (cash), obsolete stock, poor/no recovery and a loss of product and product value (recovery) problems through the implementation of cost propositions for the effective RLM of consumer returns.

8.6.3.3.2 Market performance profits

The market performance profits involve avoidance of sales cannibalisation and prevention of market liabilities, which can be realised through key COR recovery practices and key volume and product parameters.

Specifically, online retailers can *avoid sales cannibalisation* by implementing COR recovery through secondary channels and considering return volume. Therefore, online retailers with high return volumes can avoid sales cannibalisation by shifting COR recovery through the primary market to COR recovery through secondary markets. Furthermore, online retailers can *prevent market liabilities* through the consideration of product type parameters, for example, considering the product type can help online retailers ensure appropriate COR recovery preparation to avoid liabilities related to personal information and health issues. The following quotations show the market performance profits that can be realised through COR recovery practices, volume parameters and product parameters:

> "[…] if you got high volumes of product. Are you going to really be able to do it and are you cannibalising your sales? So, moving it through secondary and tertiary channels is really your only option." (P1, operations manager, 3PRL provider firm)

> "[…] then disposition in some products you need, you have specialist disposal. You know, what are those costs going to look like, or you're sort of stripping out personal information. What about hygiene products? You can't allow those back into secondary market [or] you potentially have a health issue." (P1, operations manager, 3PRL provider firm)

No studies from the reviewed literature identified that practices related to cost propositions can result in market performance profits. Evidently, this study exclusively identifies that online retailers can avoid sales cannibalisation and prevent market liabilities through the implementation of COR recovery practices and considerations of volume and product parameters, thereby extending RL literature. Subsequently, realising market performance profits reemphasises that online retailers can address RL process failures (operational failure) pitfalls and hidden costs (costing) and a loss of money and sales (cash) problems through the implementation of cost propositions for the effective RLM of consumer returns in online retailing.

8.6.3.4 Other theme cost profits

As illustrated in **Figure 8.10**, the other themes cost profits include profits related to prevention and control (theme 1) and service (theme 2). In the subsequent sections, prevention and control-related and service-related cost profits will be discussed.

8.6.3.4.1 Prevention and control-related cost profits

The prevention and control-related cost profits involve reduction of unnecessary and fraudulent returns and improvement of product return control, which online retailers can realise through a few cost propositions.

Online retailers can *reduce/avoid unnecessary and fraudulent returns* through COR process, RCM execution, product parameters and organisational parameters. The participants indicated that online retailers could reduce/avoid unnecessary and fraudulent returns by implementing/considering (1) COR request and gatekeeping (i.e. online authorisation), (2) return regulation for RCM mitigation, (3) return

charges and penalties for RCM mitigation, (4) type of product, and (5) organisational (IT) capabilities. The following quotations illustrate these findings:

> "So, often what happens is [the consumer says] 'I would like to return this laptop'. So, I [as the consumer] phone the contact centre and I spin them a whole story […], and [as the contact centre agent] my heart goes out to this person. And so, I authorise the return. […] But there is also, what are you going to do with this two-year old computer […] it's only a cost driver […]. Your computer system understands what the product is and when they bought it […] and allows that customer to return it or rejects the return […] that avoids those sorts of fraudulent returns right at the outset." (P1, operations manager, 3PRL provider firm)

> "So, when a customer logs a return, they obviously need to take a photo of an item, a picture of something so that the person [gatekeeper] can see that item has been used. It obviously gets declined right away. So, you don't have that cost incurred to actually go and collect the item, evaluate it at the warehouse and then having to send it back […] I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

> "[…] they will reduce the number of returns if they do attach a cost to the return" (P2, owner, supply chain consultancy firm)

Furthermore, online retailers can effectively *control product returns* through key RCE tools and COR process practices and key organisational parameters. Specifically, improved product return control can be realised through the implementation/consideration of (1) cost understanding RCE tools (i.e. using capable third parties), (2) COR request and gatekeeping (i.e. using third parties), (3) COR disposition, and (4) organisational (disposition and IT) capabilities. These findings can be supported by the following quotations:

> "And I developed an App that actually does all those [RL] processes in the form of physical inspection, photographs of the goods, routing, capturing of the information […] to know what's coming back for stock control […]." (P7, owner, 3PRL provider firm)

> "I believe there will be a saving [through RL outsourcing] […] the saving may not come in direct costs, but it will become in the recoverability of the product, the control, the discipline and the turnaround of the stock that it doesn't get left for six months before, when it's starting to encroach on warehouse space, somebody says, we've got to get this nonsense out of here […]." (P7, owner, 3PRL provider firm)

Limited studies from the reviewed literature identified cost profits related to prevention and control. In fact, studies only identified that unnecessary returns can be reduced by return restrictions (Andresen & Istad, 2019:8, 57) and gatekeeping (Andresen & Istad, 2019:8; Hjort *et al.* 2019:774). Consequently, this study contributes to literature by identifying that COR request and gatekeeping (i.e. online authorisation) can avoid fraudulent returns and cost understanding RCE tools, COR request and gatekeeping, COR disposition and organisational capabilities parameters can improve product return control.

Subsequently, reducing/avoiding unnecessary and fraudulent product returns and improving product control as cost profits, reemphasise that online retailers can address the cost (1) pitfalls of RL process failures (operational failure) and poor RPA (poor RLM), and (2) problems unnecessary expenses, high RL costs, a loss of money (cash problems), obsolete stock, poor/no recovery and a loss of product and product value (recovery problems) through the implementation of cost propositions for the effective RLM of consumer returns.

8.6.3.4.2 Service-related cost profits

The service-related cost profits involve improvement in consumer service, improvement in consumer satisfaction and retention, and enhancement of consumer experience, which online retailers can realise through key COR process practices and key volume, product and organisational parameters.

Specifically, online retailers can *improve consumer service* through COR inspection (i.e. pre-return inspection) and consideration of return volume and type of product parameters. Additionally, online retailers can *improve consumer service, satisfaction* and *retention* through the COR collection, involving third parties. Finally, online retailers can *enhance consumer return experience* by implementing COR collection (i.e. simultaneous return pickup and replacement delivery) and COR transportation (i.e. bulk return transportation) and considering return volume as a related parameter. The following quotations illustrate the service-related cost profits:

> "But if you had a team of people that could evaluate at the point of taking it from the customer, you would salvage tons of money and time. […] a practical way of putting a team of people into the street and saying, you know what, returns is such a big thing in our world […]. So, let's put a dedicated team in there that are our first line evaluators […] that can go to the customer and say, you know what, before I take this laptop from you, can we quickly do one, two, three and four, maybe solve them right there? […] So, I think that's possibly another avenue that one can explore just to give them a better service […]." (P5, general manager, online retailer)

> "[…] there are costs that can be saved elsewhere [through RL outsourcing] and some non-attributable costs in the form of customer service […], where your customers are getting that kind of service that you buy it [the dress] today, it doesn't fit. I [the 3PRL provider] pick it up tomorrow and that kind of thing is done very quickly, very efficiently. And you have a very happy customer who buys again." (P7, owner, 3PRL provider firm) (P7, owner, 3PRL provider firm)

> "[…] cross-functional is imperative in providing the customer with a pleasant customer experience. If the guy gets the wrong thing and he wants it replaced […] I think we could save [Retailer C] a fortune, because if you return something and you order a replacement, they come up with two different deliveries […]. So, I thought to myself, if we [as the 3PRL provider] could convince them [Retailer C] that when you [the consumer] do a request for return and you [want to] replace […] you hook the two together." (P7, owner, 3PRL provider firm)

> "I believe outsourcing is an amazing opportunity to ensure that the customer gets the best experience possible, and the reason I say that is I don't have scale in returns. […] it becomes part of the courier is greater scale." (P6, logistics manager, multichannel retailer)" (P6, logistics manager, multichannel retailer)

Apart from Le (2023:16), who identified that consumer satisfaction can be improved through outsourcing to 3PRL providers, no studies from the reviewed literature identified that online retailers could improve consumer service, retention and experience through the implementation of key COR process practices and consideration of key volume, product and organisational parameters. Subsequently, this study contributes to literature by demonstrating additional service-related cost profits that online retailers can realise through cost propositions. Essentially, the service-related cost profits reemphasise that online retailers can address RL process failure (operational failure) pitfalls and unnecessary expenses, high RL costs and a loss of money and sales (cash) problems through the implementation/consideration of cost propositions for the effective RLM of consumer returns.

In conclusion, online retailers can realise various economic, operational, organisational, SC, market, prevention and control-related and service-related cost profits through the implementation of various

cost propositions, reemphasising that cost propositions can be important for the effective RLM of consumer returns. In the next section, the cost theme will be concluded with a framework and summary of findings.

8.6.4 Framework, summary and analysis of findings for Theme 3 - Cost for the effective RLM of consumer returns

In section 8.2.2, the application of the overall framework, summary and analysis of findings for each theme were described. Accordingly, based on the interview findings presented in section 8.6, Figure 8.**25** shows a broad framework and overview of the links between cost pitfalls/problems, propositions and profits. The most significant cost pitfalls, problems and profits illustrated in Figure 8.**25** were emphasised in several ways. Particularly, per cost pitfall, problem and profit category the most significant pitfall, problem and profit (associated with the most cost proposition categories) was emphasised through *italics*, the top three cost pitfalls and problems (associated with nine or more proposition categories), and profits (associated with five or more proposition categories) were emphasised in **bold**, and the highest and most significant cost pitfall/problem and profit was emphasised through an asterisk*.

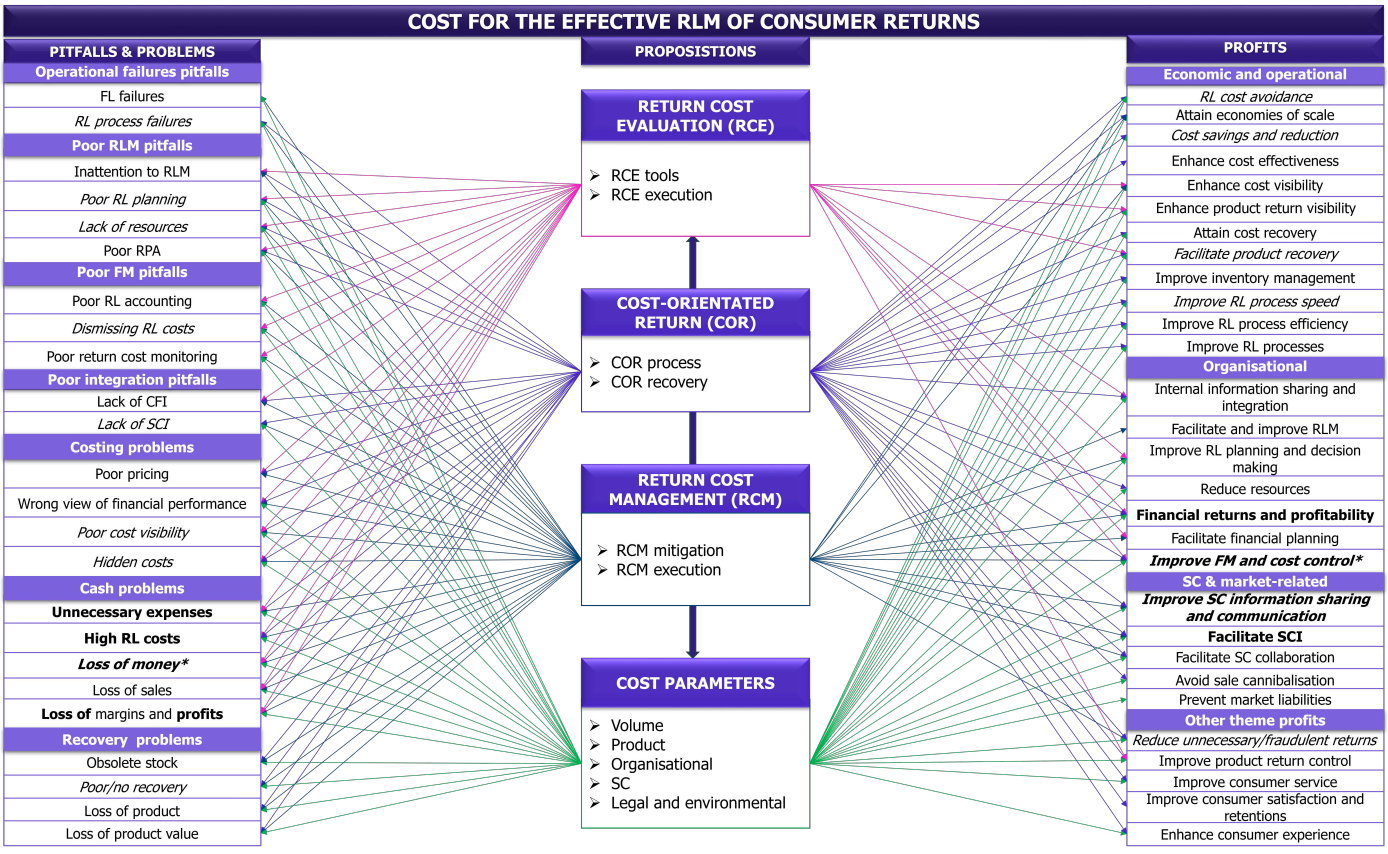

Figure 8.25 Framework for Theme 3 – Cost for the effective RLM of consumer returns
Source: Compiled by the researcher

In terms of the *cost pitfalls/problems,* Figure 8.**25** shows that most main *cost pitfall/problem* categories, except operational failure and poor FM pitfalls and poor recovery problems, associate with all main cost propositions. Subsequently, online retailers can address various pitfalls and problems through various costs propositions. Furthermore, the cost pitfalls/problems that associate with all (four) main cost propositions include (1) all poor RLM pitfalls, except inattention to RLM, (2) all costing problems, except poor pricing, and (3) all cash problems. Subsequently, online retailers can implement any cost propositions to address these cost pitfalls and problems.

Per cost pitfall/problem category, the framework illustrates that the *most significant cost pitfalls/problems* (presented in *italics*) that can be addressed by the cost proposition categories, include (1) RL process failures (operational failure pitfall), (2) poor RL planning and a lack of resources (poor RLM pitfall), (3) dismissing RL costs (poor FM pitfall), (4) a lack of SCI (poor integration pitfall), (5) poor visibility and hidden costs (costing problem), (6) loss of money (cash problem), and (7) poor/no recovery (recovery problem). Additionally, the *top three most significant cost pitfalls/problems* (presented in **bold**) that can be addressed by the implementation of (nine or more out of 11) cost proposition categories include a loss of money (11), unnecessary expenses and high RL costs (ten each), and loss of profits (nine). Subsequently, the *highest* and *most significant cost problem* (presented with an asterisk*) that can be addressed by cost proposition categories includes the cash problem of a loss of money. Evidently, online retailers can implement any cost proposition category to address a loss of money, followed by various proposition categories for addressing unnecessary expenses, high RL costs and a loss of profits.

In terms of the *cost propositions,* the framework shows that cost parameters (21 pitfalls/problems and 25 profits), followed by COR propositions (20 pitfalls/problems and 24 profits), can be the most significant propositions in terms of addressing various cost pitfalls/problems and realising various cost profits. Therefore, online retailers can prioritise the consideration of cost parameters and implementation of COR propositions to effectively address various cost pitfalls and problems and realise various cost profits.

Concerning the *cost profits*, the framework demonstrates that the most significant profit categories (associated with the most propositions) include economic and operational profits, organisational profits and other theme profits, indicating that cost propositions can be the most beneficial for realising economic and operational profits, organisational profits and other theme profits. Furthermore, financial returns and profitability and improved FM and cost control (organisational profits) associate with all main cost propositions, indicating that online retailers can implement any cost propositions to realise financial returns and profitability and improve FM and cost control.

Per cost profit category the framework shows that the *most significant cost profits* (presented in *italics*) that can be realised through the implementation of various cost proposition categories include (1) RL cost avoidance, cost savings and reductions, facilitating product recovery and improving RL process speed (economic and operational profit), (2) improving FM and cost control (organisational profit), (3) improving SC information sharing and communication (SC and market profit), and (4) reducing/avoiding unnecessary and fraudulent returns (other theme profits). Similarly, the *top three most significant cost profits* (presented in **bold**) that can be realised through the implementation of (five or more out of 11) cost proposition categories include (1) improving FM and cost control (seven), (2) realising financial returns and profitability (six), and (3) improving SC information sharing and communication and facilitating SCI (five each). Subsequently, the *highest* and *most significant cost profit* (presented with an asterisk*) that can be realised through various cost proposition categories include improvement in FM and cost control. Evidently, online retailers can expect improvements in FM and control of RL costs through the implementation of various cost proposition categories, reemphasising the significance of costs for the effective RLM of consumer returns in online retailing.

Table 8.**23** provides a summary of the main findings for the cost theme, focussing on the cost proposition categories, key practices/parameters and related cost pitfalls, problems and profits. Additionally, the table provides columns giving an overview of the costs (total requirements as identified in **Table 8.19**) versus the benefits (total benefits in terms of the number of addressed pitfalls and problems and realised profits) per key practice/parameter and proposition category.

Table 8.23: Summary of findings for theme 3 - Cost for the effective RLM of consumer returns

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
RCE tools	**Cost determination RCE tools**	***Poor RLM*** • Poor RL planning ***Poor FM*** • Poor accounting • Dismiss RL costs • Poor cost monitoring	***Costing*** • Poor pricing • Inaccurate view of financial performance • Poor cost visibility • Hidden costs	***Economic and operational*** • Enhance cost visibility • Enhance product return visibility • Facilitate product recovery ***Organisational*** • Improve RL planning and decision making • Improve FM and cost control	• Costs – 6 • Benefits – 13 • +7	• ***Costs – 16*** • ***Benefits – 31*** • ***+15***
	Cost understanding RCE tools	***Poor RLM*** • Inattention to RLM • Lack of resources ***Poor FM*** • Poor accounting • Dismiss RL costs • Poor cost monitoring ***Poor integration*** • Lack of CFI	***Costing*** • Poor pricing • Inaccurate view of financial performance • Poor cost visibility • Hidden costs ***Cash*** • Loss of money, margins and profits	***Economic and operational*** • Enhance cost visibility ***Organisational*** • Improve internal integration and information sharing • Facilitate financial planning ***Other themes*** • Improve product return control	• Costs – 10 • Benefits – 18 • +8	
RCE execution	**Cost identification for RCE execution**	***Poor FM*** • Dismiss RL costs • Poor cost monitoring	***Costing*** • Poor pricing • Inaccurate view of financial performance • Poor cost visibility • Hidden costs	• -	• Costs – 3 • Benefits – 6 • +3	• ***Costs – 9*** • ***Benefits – 19*** • ***+10***
	Cost assessment for RCE execution	***Poor RLM*** • Poor RL planning • Poor RPA ***Poor FM*** • Dismiss RL costs • Poor cost monitoring	***Costing*** • Inaccurate view of financial performance • Poor cost visibility ***Cash*** • Unnecessary expenses • High RL costs	***Organisational*** • Financial returns and profitability •	• Costs – 6 • Benefits – 13 • +7	

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
			• Loss of money, sales, margins and profits			
COR process	**COR request and gatekeeping**	***Operational failure*** • RL process failure ***Poor RLM*** • Lack of resources • Poor RPA	***Costing*** • Hidden costs ***Cash*** • High RL costs • Loss of money	***Economic and operational*** • Cost savings and reduction • Enhance product return visibility • Improve RL process ***Organisational*** • Reduce resources ***Other themes*** • Reduce/avoid unnecessary and fraudulent returns • Improve product return control	• Costs – 6 • Benefits – 13 • +7	• ***Costs – 28*** • ***Benefits – 79*** • ***+51***
	COR collection	***Operational failure*** • RL process failure ***Poor RLM*** • Lack of resources ***Poor integration*** • Lack of CFI	***Costing*** • Poor cost visibility • Hidden costs ***Cash*** • Unnecessary expenses • High RL costs • Loss of money and margins	***Economic and operational*** • RL cost avoidance • Cost savings and reduction • Improve RL process speed • Improve RL process efficiency ***Organisational*** • Improve internal integration and information sharing • Reduce resources • Improve FM and cost control ***Other themes*** • Improve consumer service, satisfaction, retention & experience	• Costs – 6 • Benefits – 21 • +15	
	COR transportation	***Operational failure*** • RL process failure ***Poor integration*** • Lack of SCI	***Cash*** • Unnecessary expenses • High RL costs • Loss of money and margins	***Economic and operational*** • Attain economies of scale • Cost savings and reduction • Enhance cost effectiveness • Improve RL process speed ***Other themes*** • Enhance consumer experience	• Costs – 8 • Benefits – 11 • +3	
	COR inspection	***Operational failure*** • RL process failure ***Poor RLM*** • Lack of resources • Poor RPA	***Costing*** • Poor pricing • Inaccurate view of financial performance • Poor cost visibility • Hidden costs ***Cash*** • Unnecessary expenses • High RL costs • Loss of money and sales ***Recovery*** • Obsolete products • Poor/no recovery • Loss of product	***Economic and operational*** • RL cost avoidance • Cost savings and reduction • Improve RL process speed ***Other themes*** • Improve consumer service	• Costs – 4 • Benefits – 18 • +14	
	COR disposition	***Operational failure*** • RL process failure ***Poor RLM*** • Poor RL planning	***Cash*** • Unnecessary expenses • High RL costs • Loss of money and margins ***Recovery*** • Obsolete products • Poor/no recovery • Loss of product and product value	***Economic and operational*** • RL cost avoidance • Cost savings and reduction • Facilitate product recovery • Improve RL process speed ***SC and market*** • Facilitate SCI ***Other themes*** • Improve product return control	• Costs – 4 • Benefits – 16 • +10	
COR recovery	**COR recovery preparation**	***Operational failure*** • RL process failure ***Poor RLM*** • Inattention to RLM • Poor RL planning • Lack of resources ***Poor integration*** • Lack of SCI	***Cash*** • Unnecessary expenses • High RL costs • Loss of money, sales, margins and profits ***Recovery*** • Obsolete products • Poor/no recovery • Loss of product and product value	***Economic and operational*** • Attain cost recovery • Facilitate product recovery • Improve inventory management ***Organisational*** • Financial returns and profitability ***SC and market*** • Improve SC information sharing and communication • Facilitate SCI and SC collaboration	• Costs – 8 • Benefits – 22 • +14	• ***Costs – 24*** • ***Benefits – 63*** • ***+39***
	COR recovery through the primary market	***Operational failure*** • RL process failure ***Poor RLM*** • Poor RL planning	***Cash*** • Unnecessary expenses • Loss of money, sales, margins and profits ***Recovery*** • Obsolete products • Poor/no recovery • Loss of product and product value	***Economic and operational*** • Attain cost recovery ***Organisational*** • Financial returns and profitability	• Costs – 5 • Benefits – 13 • +8	
	COR recovery through secondary	***Operational failure*** • RL process failure ***Poor RLM***	***Cash*** • Unnecessary expenses • Loss of money and sales	***Economic and operational*** • Attain cost recovery ***SC and market***	• Costs – 4 • Benefits – 14	

Proposition categories	Key practices /parameters	Addressed pitfalls	Addressed problems	Realised profits	Cost/benefit key practices/ parameters	Cost/benefit proposition categories
	markets	• Poor RL planning ***Poor integration*** • Lack of SCI	***Recovery*** • Obsolete products • Poor/no recovery • Loss of product and product value	• Facilitate SCI • Facilitate SC collaboration • Avoid sales cannibalisation	• +10

Source: Compiled by the researcher

Table 8.**23** provides a detailed summary of the various cost proposition categories and related key practices/parameters, addressed pitfalls and problems, and realised profits as well as the costs versus benefits per key practice/parameter and proposition categories. Online retailers can use this framework in several ways for the effective RLM of consumer returns. Specifically, online retailers can identify the (1) benefits for specific cost propositions categories and key practices/parameters (hereafter propositions), (2) propositions for specific cost pitfalls, (3) propositions for specific cost problems, (4) propositions for specific cost profits, (5) most significant propositions for addressing cost pitfalls, (6) most significant propositions for addressing cost problems, (7) most significant propositions for realising cost profits, and (8) most and least beneficial propositions in terms of the costs versus the benefits. Examples of applying Table 8.**23** for the effective RLM of consumer returns will be given in the subsequent paragraphs.

For the *benefits associated with specific propositions*, an online retailer interested in implementing, for example, RCE execution propositions, can identify that (1) poor RL planning, poor RPA, dismissing RL costs and poor cost monitoring pitfalls can be addressed, (2) poor pricing, inaccurate view of

financial performance, poor cost visibility, hidden costs, unnecessary expenses, high RL costs, and a loss of money, sales, margins and profits problems can be addressed, and (3) financial returns and profitability can be realised. Additionally, an online retailer interested in implementing, for example, the key COR process practice of COR transportation can identify that (1) RL process failures and a lack of SCI pitfalls can be addressed, (2) unnecessary expenses, high RL costs and a loss of money and margins problems can be addressed, and (3) economies of scales, cost savings and reductions, cost effectiveness, RL process improvements and consumer experience enhancement can be realised.

In terms of the *propositions for specific cost pitfalls*, an online retailer that identified, for example, inattention to RLM, as a significant cost pitfall can implement the key (1) RCE tool practice of cost understanding, (2) COR recovery practices of COR recovery preparation and COR recovery through suppliers, and (3) RCM execution practice of formalisation for RCM execution, as mitigating propositions for the effective RLM of consumer returns. Regarding the *propositions for specific cost problems*, an online retailer that identified, for example, poor pricing as a cost problem can implement the key (1) RCE tools practices of cost determination and cost understanding, (2) RCE execution practice of cost identification, (3) COR process practice of COR inspection, (4) RCM mitigation practices of return avoidance and costs absorption, and (5) RCM execution practice of accounting as mitigating propositions for the effective RLM of consumer returns. In terms of the *propositions for specific cost profits*, an online retailer seeking, for example, to reduce resources can implement/consider the key (1) COR process practices of COR request and gatekeeping and COR collection, and (2) organisational parameter of organisational capabilities.

Concerning the *most significant propositions for addressing cost pitfalls*, online retailers that experience various cost pitfalls in RL can prioritise the implementation of RCM mitigation propositions and consideration of product parameters as the most beneficial cost proposition categories. Additionally, online retailers that experience various cost pitfalls in RL can prioritise the implementation of the key RCE tool practice of cost understanding and the key RCM execution practice of return avoidance, and consideration of the key organisational parameter of organisational capabilities as the most beneficial key practices and parameter. Pertaining to the *most significant propositions for addressing cost problems*, online retailers that experience various cost problems in RL can prioritise the implementation of RCM execution propositions and consideration of product parameters as the most beneficial cost proposition categories. Additionally, online retailers that experience various cost problems can prioritise the implementation of the key RCM execution practice of return avoidance and consideration of the key organisational parameter of organisational capabilities as the most beneficial key practice and parameter. Relating to the *most significant propositions for realising cost profits*, online retailers that seek various cost profits in RL can prioritise the implementation of COR process propositions and consideration of organisational parameters as the

most beneficial cost proposition categories. Subsequently, online retailers that seek various cost profits can prioritise the implementation of the key COR process practice of COR collection and consideration of the key organisational parameter of organisational capabilities as the most beneficial key practice and parameter.

Finally, online retailers can use the framework to perform a cost-benefit analysis, identifying the costs (sum of the key practices/parameters and the support practices) versus the benefits (sum of addressed cost pitfalls and problems, and realised profits) to implement/consider the most beneficial cost propositions for RLM. Specifically, Table 8.**23** shows that the *most beneficial proposition categories* include COR process propositions in terms of the costs (28) versus benefits (79), and product parameters in terms of costs (16) versus benefits (58). Consequently, online retailers can prioritise the implementation of COR process propositions and consideration of product parameters for the effective RLM of consumer returns. Additionally, the *most beneficial key practice* and *parameter* include return avoidance for RCM mitigation in terms of the costs (4) versus benefits (22) and organisational capabilities in terms of the costs (10) versus benefits (35). Subsequently, online retailers can prioritise the implementation of return avoidance for RCM mitigation as a key practice and consideration of organisational capabilities as a key parameter for the effective RLM of consumer returns.

In contrast, the *least beneficial proposition categories* include RCE execution in terms of the costs (9) versus benefits (19), and legal and environmental parameters in terms of the costs (5) versus benefits (11), which means that online retailers can implement RCE execution propositions and consider legal and environmental parameters as last priorities. Additionally, the *least beneficial key practice* and *parameter* include cost identification for RCE execution in terms of the costs (3) versus benefits (6) and environmental disruptions in terms of the costs (2) and benefits (3), indicating that online retailers may implement/consider cost identification for RCE execution and environmental disruptions as last priorities.

Nevertheless, all cost propositions can be beneficial, and online retailers that experience specific cost pitfalls/problems or seek specific cost profits can identify the most suitable propositions to implement and consider for the effective RLM of consumer returns. Essentially, “cost for the effective RLM of consumer returns” can be regarded as a critical factor for the effective RLM of consumer returns in online retailing. Therefore, online retailers can focus on identifying cost pitfalls and problems in RL for the effective implementation/consideration of mitigating cost propositions (practices/parameters) and realisation of cost profits to manage consumer returns effectively.

In the next section the framework of the factors for the effective RLM of consumer returns in online retailing will be given.

8.7 FRAMEWORK AND SUMMARY OF THE FACTORS FOR THE EFFECTIVE RLM OF CONSUMER RETURNS IN ONLINE RETAILING

Based on section 8.4, 8.5 and 8.6, this section provides a framework and summary of the three factors (i.e. prevention and control, service and cost) for the effective RLM of consumer returns in online retailing, combining corresponding findings for all three themes. Consequently, the aim is to highlight the most significant pitfalls, problems, propositions and profits (factor categories) that associate with at least two main factors. Due to the comprehensiveness of findings presented in the preceding theme sections, the framework provides a broad overview, excluding details. Figure 8.26 presents the framework of the factors for the effective RLM of consumer returns.

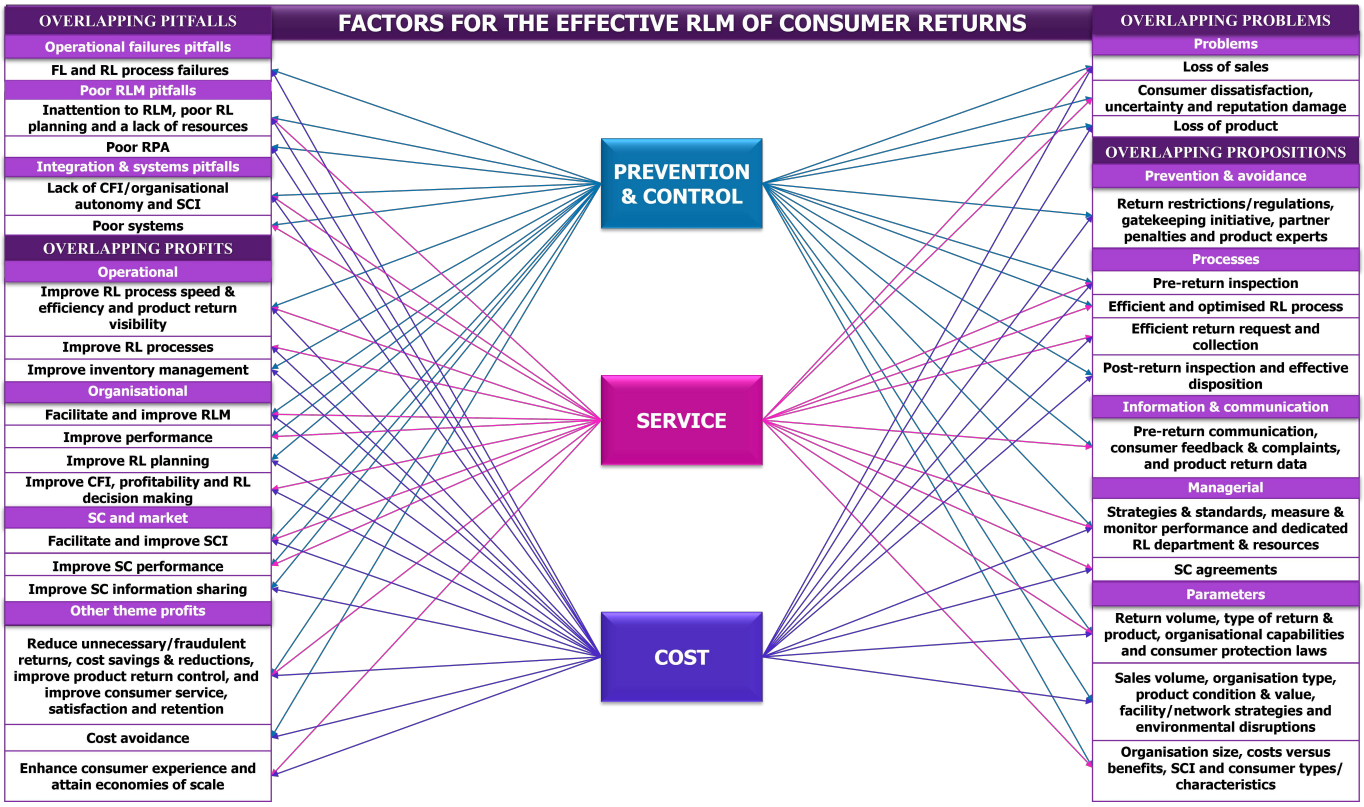

Figure 8.26 Factors for the effective RLM of consumer returns in online retailing
Source: Compiled by the researcher

Figure 8.26 shows that various pitfalls, problems, propositions and profits overlap between the three themes. Specifically, the framework demonstrates that prevention and control factors involve the most overlapping pitfalls and problems, indicating that online retailers can experience various pitfalls and problems that hamper effective return prevention and control. Likewise, the prevention and control factors involve the most overlapping propositions, which means online retailers can focus on prevention and control propositions to effectively manage consumer returns. Nevertheless, the cost factor, closely followed by the service factor, involves the most overlapping profits, implying that the implementation and consideration of cost propositions, followed by service propositions, can be profitable for the effective RLM of consumer returns.

The most overlaps between the factors entail the profits, which indicates that online retailers can generally expect overlapping profits through the implementation/consideration of propositions. The least overlaps between the factors include problems, meaning that online retailers can experience various problems that require selective countermeasures.

The most significant overlaps consist between the prevention and control factors and the cost factor (19 overlaps), indicating that the prevention and control and cost factors involve similar pitfalls/problems, propositions and profits. Therefore, the service factor contains the most unique pitfalls/problems, propositions and profits. Finally, a total of nineteen overlaps exists between the factors, which means online retailers can (1) pay attention to mitigating the overlapping pitfalls and problems, (2) prioritise the implementation/consideration of the overlapping propositions, and (3) expect the overlapping profits through the implementation/consideration of prevention and control, service and cost factors.

From the framework, more specific observations and managerial implications can be provided. Table 8.24 provides the summary of findings, including the factor categories, observations for the factors and managerial implications for the effective RLM of consumer returns.

Table 8.24 Summary of the factors for the effective RLM of consumer returns

Factor category	Observations for the factors	Managerial implications for the effective RLM of consumer returns
Pitfalls and problems	•All factors involve the pitfall of poor RLM, including inattention to RLM, poor RL planning and a lack of resources •All factors involve pitfalls related to poor integration, including a lack of cross-functional integration (CFI) and a lack of supply chain integration (SCI) •The prevention and control and cost factors involve the pitfall of operational failures, including FL failures and RL process failures •The prevention and control factor and cost factors involve pitfalls related to poor return prevention and avoidance (RPA) •The prevention and control and service factors involve the pitfall of poor systems •The prevention and control and service factors involve problems of consumer dissatisfaction, consumer uncertainty and reputational/brand damage •All factors involve the problem of a loss of sales •The prevention and control and cost factors involve the problem of a loss of product	•Online retailers can prioritise RLM, RL planning and the commitment of adequate resources •Online retailers can prioritise the identification and implementation of RLM practices to address poor internal and external (SC) integration •Online retailer can benefit from identifying and implementing prevention, control and cost practices to address FL inefficiencies and RL process inefficiencies •Online retailers can benefit from identifying and implementing prevention, control and cost measures to address poor gatekeeping and excessive return leniency •Online retailers can benefit from improving systems and technology •Online retailers can benefit from identifying and implementing prevention, control and service practices to address consumer dissatisfaction, consumer uncertainty and reputational damage •Online retailers can prioritise and implement RLM practices to counteract a loss of sales •Online retailers can benefit from identifying and implementing prevention, control and cost practices to avoid a loss of returned products
Proposition practices	•All factors involve the practices of pre-return prevention at consumer locations, strategies and standards, performance measuring and monitoring and dedicated departments/resources •The prevention and control and cost factors involve practices related to prevention and avoidance, including return restrictions/regulation, gatekeeping initiatives, partner penalties and product experts	•Online retailers can prioritise the implementation of pre-return inspection at consumer locations and strategies and standards for the effective management of consumer returns •Online retailers can prioritise the development of appropriate KPIs and performance measuring and monitoring for the effective management of consumer returns •Online retailers can prioritise the establishment of a dedicated RL department and use of dedicated RL resources for the effective management of consumer returns •Online retailers can gain from implementing return restrictions and

Factor category	Observations for the factors	Managerial implications for the effective RLM of consumer returns
	•The prevention and control and service factors involve practices associated with an efficient and optimised RL process •The service and cost factors involve practices related to efficient return request and collection processes •The prevention and control and cost factors involve practices related to post-return inspection and effective product disposition •The prevention and control and service factors involve practices associated with information and communication, including pre-return communication, consumer feedback and complaints and product return data •The service and cost factors involve the practice of establishing and using SC agreements	appropriate gatekeeping initiatives for return prevention, control and cost effectiveness •Online retailers can benefit from issuing party penalties for product damages during transportation to and from consumers for return prevention, control and cost effectiveness •Online retailers can gain from appointing product experts for return prevention, control and cost effectiveness •Online retailers can profit from streamlining the RL process for return prevention, control and service effectiveness •Online retailers can benefit from establishing efficient return request and collection processes for service and cost effectiveness •Online retailers can gain from implementing appropriate post-return inspection and disposition processes and practices for return prevention, control and cost effectiveness •Online retailers can benefit from communicating with consumers on the website before product return initiation for return prevention, control and service effectiveness •Online retailers can benefit from obtaining and using consumer feedback, complaints and product return data for return prevention, control and service effectiveness •Online retailers can profit from establishing and using appropriate SC agreements in RL for return service and cost effectiveness
Proposition parameters	•All factors involve the parameters of return volume, type of return, type of product, organisational capabilities and consumer protection laws •The prevention and control and cost factors involve the parameters of sales volume, product condition and value, organisation type, facility/network strategies and environmental disruptions •The prevention and control and service factors involve the parameters of organisation size, costs versus benefits, SCI and consumer types/characteristics	•Online retailers can prioritise the consideration of product return volumes and types, types of products, organisational capabilities and consumer protection legislation for the effective management of consumer returns •Online retailers can gain from considering their sales volume, organisation type and facility/network strategies for return prevention, control and cost effectiveness •Online retailers can benefit from considering the condition and value of returned products and environmental disruptions for return prevention, control and cost effectiveness •Online retailers can profit from considering their organisation size, types of consumers and SC partners' integration capabilities for return prevention, control and service effectiveness •Online retailers can benefit from considering the costs versus benefits of prevention and control and service practices for return prevention, control and service effectiveness
Profits	•All factors involve the operational profits of improvements in RL process speed and efficiency and product return visibility •The service and cost factors involve the operational profit of improvements in the RL process •The prevention and control and cost factors involve the operational profit of improvements in inventory management •All factors involve the organisational profit of facilitating and improving RLM •The service and cost factors involve the organisational profits of facilitating internal integration (CFI) and profitability •The prevention and control and service factors involve the organisational profit of improvement in organisational performance •The prevention and control and cost factors involve the organisational profit of improvement in RL decision making •All factors involve the SC profit of facilitating and improving SCI •The prevention and control and service factors involve the SC profit of improvements in SC performance •The prevention and control and cost factors	•Online retailers that seek to improve RL process speed and efficiency and product return visibility can implement/consider any RLM (prevention and control, service or cost) proposition •Online retailers seeking to improve the RL process can implement/consider service and cost propositions •Online retailers seeking to improve product return inventory management can implement/consider prevention and control and cost propositions •Online retailers that seek to manage RL effectively can implement/consider any RLM proposition •Online retailers seeking to improve integration between departments can implement/consider service and cost propositions •Online retailers seeking higher profitability can implement/consider service and cost propositions •Online retailers seeking to improve their organisational performance can implement/consider prevention and control and service propositions •Online retailers that seek to improve RL decision making can implement/consider prevention and control and cost propositions •Online retailers wishing to improve external integration with SC members can implement/consider any RLM proposition •Online retailers seeking to improve the performance of their SC can implement/consider prevention and control and service propositions •Online retailers that seek to improve information sharing in the SC can implement/consider prevention and control and cost propositions •Online retailers that seek to reduce/avoid unnecessary and fraudulent

Factor category	Observations for the factors	Managerial implications for the effective RLM of consumer returns
	involve the SC profit of improvements in SC information sharing •All factors involve the profits of reducing/avoiding unnecessary and fraudulent returns, saving and reducing costs, improving product return control, and improving consumer service, satisfaction and retention •The prevention and control and cost factors involve the profit of cost avoidance •The service and cost factors involve the profits of enhancing consumer return experience and attaining economies of scale	returns can implement/consider any RLM proposition •Online retailers interested in realising cost savings and reductions can implement/consider any RLM proposition •Online retailers seeking to improve product return control can implement/consider any RLM proposition •Online retailers that seek to improve consumer service, satisfaction and retention can implement/consider any RLM proposition •Online retailers wishing to avoid RL costs can implement/consider prevention and control and cost propositions •Online retailers seeking to enhance consumer return experience can implement/consider service and cost propositions •Online retailers seeking to attain economies of scale in the RL process can implement/consider service and cost propositions

Source: Compiled by the researcher

Table 8.24 provides a summary of the most significant findings from the reflexive TA, involving important factors for the RLM of consumer returns in online retailing. The managerial implications can provide a good starting point for (1) addressing the most significant pitfalls and problems, (2) implementing the most valuable practices, (3) considering the most beneficial parameters and (4) realising important profits associated with the effective RLM of consumer returns. However, online retailers that experience specific pitfalls and problems or seek to realise specific profits can refer to the frameworks and summary of findings for each theme in sections 8.4.4, 8.5.4 and 8.6.4.

In the next section, the conclusion of chapter 8 will be provided.

8.8 CONCLUSION

In this chapter, the findings and discussion of findings for the interviews with the industry experts were presented, analysed and discussed. The aims of this chapter were to achieve the fifth, sixth and seventh secondary research objectives, namely to (1) *determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5)*, (2) *explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6)*, and (3) *investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7).* Additionally, the findings presented in this chapter will be used to achieve the primary research objective of this study, which is to *develop a framework for the effective RLM of consumer returns in online retailing*. The chapter started with the introduction (section 8.1), followed an overview of the interviews with industry experts (section 8.2), including an overview of the descriptive analysis of the interviews with industry experts and an overview of the reflexive TA of the interviews with industry experts.

Following the overview, the findings of the descriptive analysis for consumer return types and RL processes in online retailing were presented and discussed (section 8.3). The aims of the descriptive

analysis were to answer the following questions: (1) *what are the types of consumer returns in online retailing? (RQ-1)* and (2) *what are the RL processes of consumer returns in online retailing? (RQ-2).* More specifically, the descriptive analysis aimed to compare the findings between the interviews with industry experts and QCA of RL literature, and to identify the consumer return types and RL processes that can occur in the online retailing industry of South Africa. Although some differences were identified between the interviews and QCA findings, most categories/subcategories assigned to the QCA findings were confirmed by the interview findings. Additionally, several new findings were identified from the interviews with industry experts, enabling a more accurate understanding of the consumer return types and RL processes applicable to the online retailing industry of South Africa.

Then, the interview findings for the reflexive TA of the interviews with industry experts were presented, analysed and discussed in separate sections, including Theme 1 - *Prevention and control for the effective RLM of consumer returns* (section 8.4), Theme 2 - *Service for the effective RLM of consumer returns* (section 8.5), and Theme 3 - *Cost for the effective RLM of consumer returns* (section 8.6). All themes contained overlapping subthemes, namely pitfalls and problems (subtheme 1), propositions (subtheme 2) and profits (subtheme 3). The aims of the reflexive TA of the interviews with industry experts were to answer the following questions: (1) *what are important RL practices for managing consumer returns in online retailing? (RQ-3),* and (2) *what are important factors for the effective RLM of consumer returns in online retailing? (RQ-4).*

More specifically, the focus of the third research question was to triangulate the interview findings with the QCA findings related to the RL practices. All main RL practices identified in the QCA findings applied to the interview findings, showing that most strategies and practices identified from the QCA of RL literature can apply to the online retailing industry of South Africa. Furthermore, the specific strategies and practices related to the RL practices were emphasised in the discussion of the interview findings in the proposition section (subtheme 2) of each theme. The final question focused on identifying important factors for the effective RLM of consumer returns, representing the three main themes, namely prevention and control, service and cost. Additionally, the common subthemes of pitfalls and problems, propositions and profits represented the factor categories that can be important for the effective RLM of consumer returns in online retailing.

Finally, the chapter concluded with a framework and summary of the factors for the RLM of consumer returns in online retailing (section 8.7). The main findings showed that prevention and control, service and cost are critical factors for the effective RLM of consumer returns in online retailing. Additionally, the findings showed that several common (1) pitfalls and problems can hamper the effective RLM of consumer returns, including the operational failures, poor RLM and integration and systems pitfalls and a loss of sales, consumer dissatisfaction and uncertainty, reputational damage and a loss of product

problems, (2) practices can be implemented for the effective RLM of consumer returns, including prevention and avoidance initiatives, RL process initiatives, information and communication initiatives and managerial initiatives, (4) parameters can be considered for the effective RLM of consumer returns, including volume, product, organisational, cost versus benefit, SCI, consumer types/characteristics, consumer protection law and environmental disruption parameters, and (5) profits can be realised from the effective RLM of consumer returns, including operational profits, organisational profits, SC and market profits, prevention and control-related profits, service-related profits and cost-related profits.

Essentially, the interview findings presented and discussed in this chapter forms part of the final framework for the effective RLM of consumer returns in online retailing, which will be presented in the next chapter (chapter 9).

Chapter 9 – Final framework for the effective RLM of consumer returns in online retailing and conclusion

9.1 INTRODUCTION

As indicated in section 1.1, this study defined reverse logistics management (RLM) as an organisational process that involves the management of returns, RL processes and RL practices within the organisation and across the SC for the purpose of long-term economic and environmental sustainability. However, the effective RLM of consumer returns in online retailing extends this definition, focussing on the most effective RL processes, RLM practices and RLM factors to not only address economic, operational, organisational and external barriers and problems in RL but also realise economic, operational, organisational, environmental, social, market and SC benefits.

In this chapter, the final framework for the effective RLM of consumer returns in online retailing and conclusion of the study are provided. Evidently, Chapter 9 focuses on the primary research objective of the study, which was to a ***develop a framework for the effective RLM of consumer returns in online retailing.*** The framework is based on the findings from the three phases of the study, namely the literature study (chapter 2), QCA of RL literature (chapters 4 to 6) and interviews with industry experts (chapter 8). Figure 9.1 provides an overview of the phases and the primary research objective of this study.

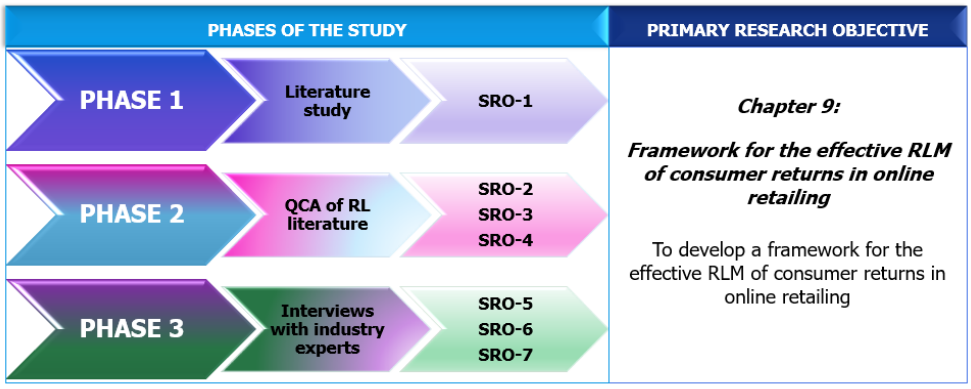

Figure 9.1 Framework for effective RLM - Aim of chapter 9
Source: Compiled by the researcher

Furthermore, this chapter provides an overview of the study, main findings, recommendations and objectives realised, contribution of the study, limitations and future research opportunities.

Figure 9.2 provides an outline of chapter 9.

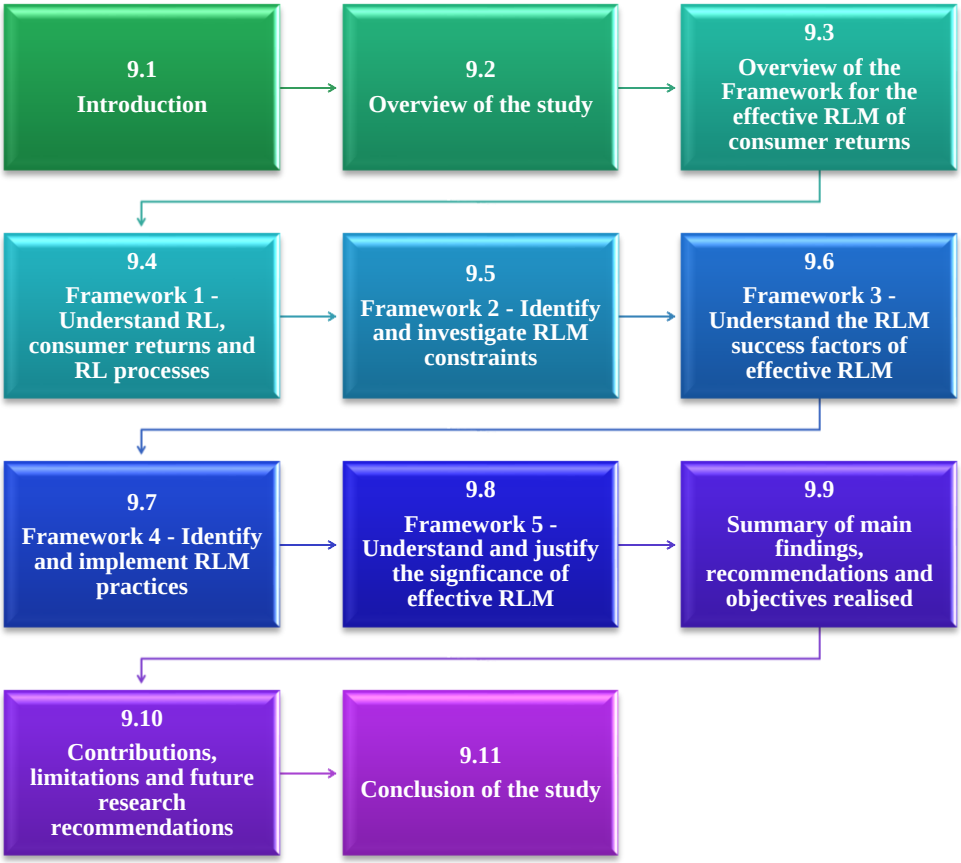

Figure 9.2 Overview of chapter 9
Source: Compiled by the researcher

Figure 9.2 provides an overview of chapter 9, starting with the introduction (this section), followed by an overview of the study (section 9.2) and an overview of the RLM framework (section 9.3). Thereafter, the parts of the RLM framework are presented and described, including Framework 1 – Understand RL, consumer returns and RL processes (section 9.4), Framework 2 – Identify and investigate RLM constraints (section 9.5), Framework 3 – Understand the success factors of effective RLM (section 9.6), Framework 4 – Identify and implement RLM practices (section 9.7) and Framework 5 – Understand and justify the significance of effective RLM (section 9.8). This chapter concludes with a summary of main findings, recommendations and objectives realised (section 9.9), contributions, limitations and future research recommendations (section 9.10), ending with a conclusion of the study (section 9.11).

9.2 OVERVIEW OF THE STUDY

In chapter 1 an outline of the study was presented, showing an overview of the chapters, related research objectives and outcomes/findings. Figure 9.2, provides the overview of the study.

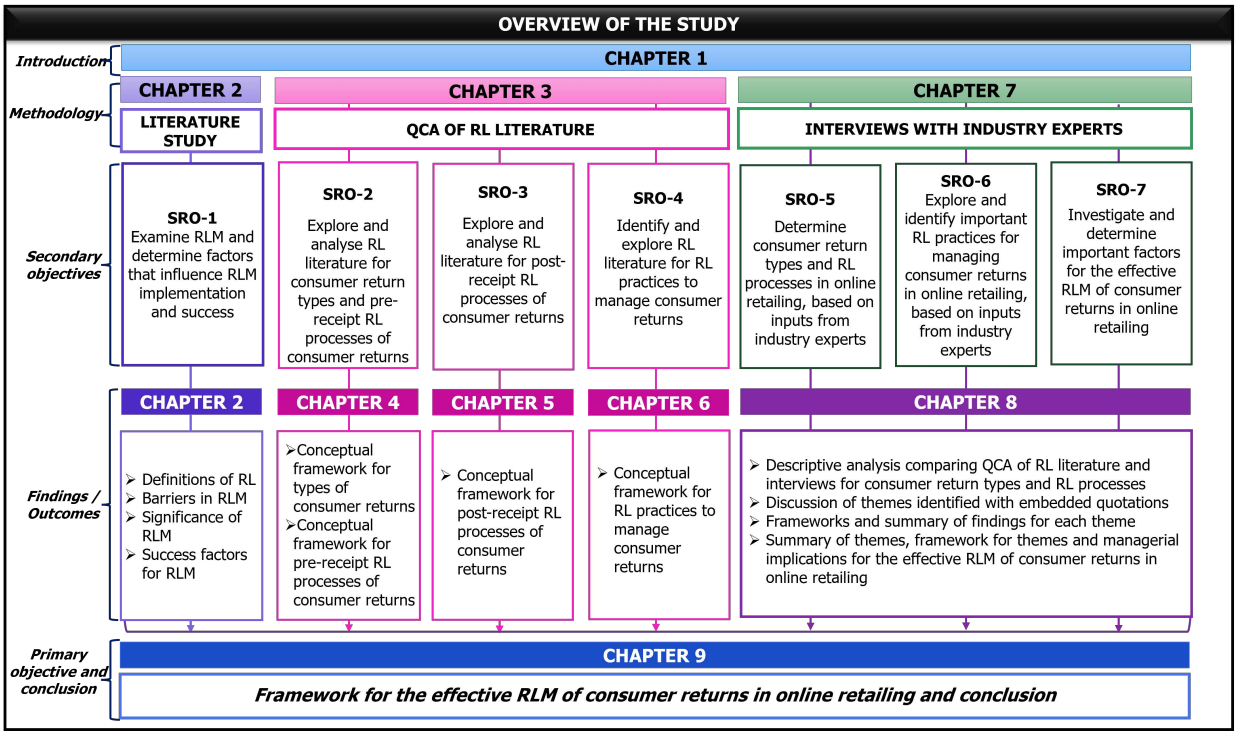

Figure 9.3 Overview of the study
Source: Compiled by the researcher

Specifically, this study included nine chapters that associated with the research objectives of the study, which can be summarised as follows:

- ***Chapter 1: Introduction.*** This chapter introduced the study with a background, problem statement and research objectives, overview of consumer return processes and practices in online retailing, scope, and research design and methodology, unique contribution of the study, an overview of the chapters and methodological map (same as Figure 9.2).

- ***Chapter 2: Overview of RLM.*** This chapter focused on the first secondary research objective (SRO-1) of the study, which was to *examine RLM and determine the factors that influence RLM implementation and success.* SRO-1 was achieved through a literature study, which provided definitions of RL for the examination of RLM, barriers in RLM as factors that influence RLM implementation, and significance of RLM as factors that influence the implementation and success of RLM. Additionally, the findings of the literature study contributed to the primary objective of the study, which formed part of Frameworks 1, 2, 3 and 5 (sections 9.4.1, 9.5, 9.6 and 9.8) for the effective RLM of consumer returns.

- ***Chapter 3: Qualitative research design of the study and research methodology of QCA.*** This chapter consisted of two parts. The first part focused on the overall qualitative research design of this study, including an overview of the justification of qualitative research designs, challenges in

qualitative research, research paradigm and assumptions, research approaches to theory development and multimethod qualitative research. The second part focused on the methodology and application of the QCA of RL literature, including an overview, phases and trustworthiness of the QCA of RL literature. Furthermore, the second part of chapter 3 formed the foundation of achieving SRO-2, SRO-3 and SRO-4.

Chapter 4: QCA findings of RL literature for consumer return types and pre-receipt RL processes of consumer returns. This chapter focused on the second secondary research objective (SRO-2) of this study, which was to *explore and analyse RL literature for consumer return types and pre-receipt RL processes of consumer returns*. SRO-2 was achieved through the presentation, analysis and discussion of findings for the QCA of RL literature for consumer returns and pre-receipt RL processes, which included quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications. Additionally, the findings of the QCA of RL literature for consumer return types and pre-receipt RL processes contributed to the primary objective of the study, which formed part of Framework 1 (section 9.4.1) for the effective RLM of consumer returns.

- ***Chapter 5: QCA findings of RL literature for post-receipt RL processes of consumer returns.*** This chapter focused on the third secondary research objective (SRO-3) of this study, which was to *explore and analyse RL literature for post-receipt RL processes of consumer returns*. SRO-3 was achieved through the presentation, analysis and discussion of findings for the QCA of RL literature for post-receipt RL processes, which included quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications. Additionally, the findings of the QCA of RL literature for the post-receipt RL processes contributed to the primary objective of the study, which formed part of Framework 1 (section 9.4.1) for the effective RLM of consumer returns.

- ***Chapter 6: QCA findings of RL literature for RL practices to manage consumer returns.*** This chapter focused on the fourth secondary research objective (SRO-4) of this study, which was to *explore and analyse RL literature for RL practices to manage consumer returns*. SRO-4 was achieved through the presentation, analysis and discussion of findings for the QCA of RL literature for RL practices to manage consumer returns, which included quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings

and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications. Additionally, the findings of the QCA of RL literature for the RL practices contributed to the primary objective of the study, which formed part of Frameworks 2, 3, 4 and 5 (sections 9.5, 9.6, 9.7 and 9.8) for the effective RLM of consumer returns.

- ***Chapter 7: Research methodology of interviews with industry experts.*** This chapter provided the research methodology for the interviews with industry experts. Specifically, the chapter started with an overview of interviews as a research method, including a description of in-depth interviews in qualitative research, interview styles in qualitative research, roles of the researcher and participants in interviews, potential problems of interviews and motivating factors and advantage of interviews. Additionally, this chapter provided a discussion of the methodology and application of the interviews with industry experts in several steps, which included the purpose and research questions, ethical considerations, development of the interview protocol, sampling and recruitment, pre-interview planning, conducting interviews, post-interview planning, data analysis and trustworthiness. Furthermore, chapter 7 formed the foundation of achieving SRO-5, SRO-6 and SRO-7.

- ***Chapter 8: Findings of the interviews with industry experts.*** This chapter focused on the fifth, sixth and seventh secondary research objectives of the study, which were to (1) *determine consumer return types and RL processes in online retailing, based on inputs from industry experts* (SRO-5), (2) *explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts* (SRO-6), and (3) *investigate and determine important factors for the effective RLM of consumer returns in online retailing* (SRO-7). Chapter 8 consisted of two parts, namely (1) presentation of interview findings for the descriptive analysis, which involved qualitative data tables (text matrices) and discussion of findings, and (2) presentation of interview findings for the reflexive thematic analysis (TA), which involved a discussion of the interview findings with embedded quotations in the text. *SRO-5* was achieved through the descriptive analysis of the interviews with industry experts, which focused on consumer return types and RL processes that can be applicable to online retailing. *SRO-6* was achieved through the reflexive TA for the interviews with industry experts, which focused on important RL practices for the management of consumer returns. *SRO-7* was achieved through the reflexive TA for the interviews with industry experts, which focused on important factors for the effective RLM of consumer returns in online retailing. Additionally, the findings of the interviews with industry experts contributed to the primary objective of the study, which formed part of Frameworks 1, 2, 4 and 5 (sections 9.4, 9.5, 9.7 and 9.8) for the effective RLM of consumer returns.

- ***Chapter 9: Framework for the effective RLM of consumer returns in online retailing and conclusion.*** This chapter focused on the primary research objective of the study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*, and the overall conclusion of the study. This chapter provided an overview of the study, followed by the presentation of the final framework for the effective RLM of consumer returns in online retailing. The final framework was divided into five frameworks, which online retailers can explore and use for the effective RLM of consumer returns in online retailing. Furthermore, this chapter provided a summary of main findings, recommendations and objectives realised, contribution, limitations and future research recommendations, and concluding with the conclusion of this study.

In the next section, and overview of the framework for the effective RLM of consumer returns will be provided.

9.3 OVERVIEW OF THE RLM FRAMEWORK FOR THE EFFECTIVE RLM OF CONSUMER RETURNS

Due to the comprehensiveness of findings in this study, the final framework consists of five separate but interrelated frameworks. The framework focuses on the main themes of the study, starting with RL definitions, consumer returns and RL processes, followed by the RLM barriers and problems (referred to as RLM constraints), success factors of effective RLM, RLM propositions (referred to as RLM practices), and concluding with the significance and justifications of effective RLM. Figure 9.4 provides an overview of the main framework for the effective RLM of consumer returns in online retailing.

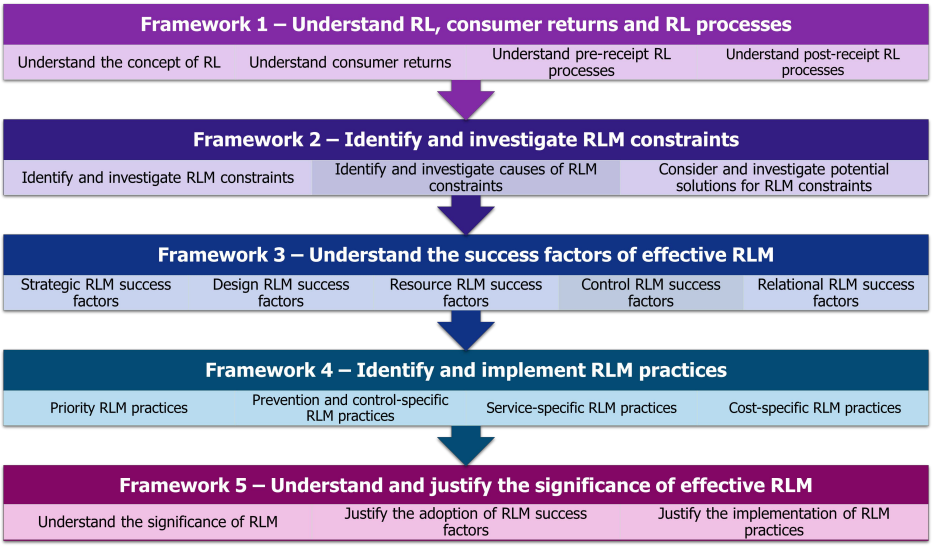

Figure 9.4 Overview of the framework for the effective RLM of consumer returns in online retailing
Source: Compiled by the researcher

The overall (main) framework for the effective RLM of consumer returns in online retailing can consist of five individual frameworks, starting with a basic understanding of RL and concluding with understanding and justifying the significance of effective RLM. Each individual framework can be applied and used separately but the most beneficial approach is to study and apply all individual frameworks for the effective RLM of consumer returns in online retailing. The respective frameworks for the effective RLM of consumer returns will be briefly described in the subsequent sections.

9.3.1 Overview of Framework 1 – Understand RL, consumer returns and RL processes

As a starting point, the first framework focuses on providing online retailers with a concise understanding of RLM, with a description of the concept of RL, consumer returns and RL processes that can take place in online retailing. Without an understanding of RL, consumer returns and RL processes in online retailing, the implementation, improvement and effective management of consumer returns would be difficult. Framework 1 was subdivided into the following four parts: Framework 1A – Understand the concept of RL that focuses on defining and describing RL (based on the literature study presented in section 2.2), Framework 1B – Understand consumer returns that focuses on describing consumer return types (based on the QCA of RL literature presented in section 4.3 and interview findings presented in section 8.3.1), Framework 1C – Understand pre-receipt RL processes that focuses on describing the pre-receipt RL processes (based on the QCA of RL literature presented in section 4.4 and interview findings presented in section 8.3.2), and Framework 1D – Understand post-receipt RL processes that focuses on describing the post-receipt RL processes (based on the QCA of RL literature presented in chapter 5 and interview findings presented in section 8.3.3). Framework 1 is presented and discussed in section 9.4.

9.3.2 Overview of Framework 2 – Identify and investigate RLM constraints

Once online retailers understand the concept of RL, consumer returns and RL processes, they can identify and investigate RLM constraints that hampers the effective RLM of consumer returns. Without identifying and investigating RLM constraints, improvement and effective management of consumer returns would be challenging. Specifically, Framework 2 involves the identification and investigation of (1) RLM constraints that represent RLM barriers, risks, pitfalls and problems (derived from the literature in section 2.3 and the interview findings in sections 8.4.1, 8.5.1 and 8.6.1), (2) causes of RLM constraints that represent RLM barriers, risks, pitfalls and problems (derived from the literature in section 2.3 and the interview findings in sections 8.4.1, 8.5.1 and 8.6.1), and (3) potential solutions for RLM constraints (derived from identified causes in Framework 2). Therefore, Framework 2 can help online retailers to identify and investigate the RLM constraints that they may experience, which can

help them identify and consider mitigating solutions. Framework 2 is presented and explained in section 9.5.

9.3.3 Overview of Framework 3 – Understand the success factors of effective RLM

As ignorance of RLM is often part of the RLM constraints (i.e. barriers, pitfalls and problems), the third framework for the effective RLM attempts to educate online retailers who lack knowledge about the success factors of effective RLM. Specifically, Framework 3 involves an understanding of the characteristics of successful RLM that represents RLM success factors (derived from the literature study in section 2.5) and RL practices (derived from the QCA of RL literature in chapter 6). Additionally, Framework 3 involves the identification of the degree and impact of the adoption of the RLM success factors, which involves the number of practices/requirements associated with the adoption of the RLM success factors (representing the degree of adoption identified from section 2.5 and chapter 6) and the number of contributions to other RLM success factors (representing the degree of impact identified from section 2.5 and chapter 6). The success factors for RLM (section 2.5) can be classified as: (1) strategic RLM success factors, (2) design RLM success factors, (3) resource RLM success factors, (4) control (operational) RLM success factors and (5) relational RLM success factors. Framework 3 is presented and explained in section 9.6.

9.3.4 Overview of Framework 4 – Identify and implement RLM practices

The fourth framework for the effective RLM of consumer returns involves the identification and implementation of RLM practices. Framework 4 mostly focus on the interview findings (reflexive TA), relating to the prevention and control, service and cost propositions, presented in chapter 8. Specifically, Framework 4 involves the identification and implementation of (1) key RLM practices (derived from the interview findings related to the key practices or key practice elements in sections 8.4.2, 8.5.2 and 8.6.2), (2) RLM practice requirements (identified as support RL practices in the interview findings and derived from the QCA findings of RL literature in chapter 6), (3) RLM practice considerations (derived from the interview findings related to key parameters in sections 8.4.2.4, 8.5.2.3 and 8.6.2.4), and (4) RLM success factors to adopt (identified from Framework 3). Furthermore, the structure of Framework 4 includes (1) priority RLM practices (key practices/elements that occurred in at least two themes), (2) prevention and control specific RLM practices (all key practices, excluding priority practices), (2) service specific RLM practices (all key practices, excluding priority practices), and (3) cost specific RLM practices (all key practices, excluding priority practices). Framework 4 is presented and explained in section 9.7.

9.3.5 Overview of Framework 5 – Understand and justify the significance of effective RLM

Since ignorance of the significance of RLM often hampers the adoption and implementation of effective RLM, the fifth framework for the effective RLM of consumer returns attempts to educate online retailers to understand the *significance of RLM* and identify the beneficial outcomes of *adopting RLM success factors* and *implementing RLM practices*. Since the significance and justification of effective RLM can be complex and comprehensive, Framework 5 was divided into three parts, including Framework 5A – Understand the significance of RLM, Framework 5B – Justify the adoption of RLM success factors, and Framework 5C – Justify the implementation of RLM practices.

Specifically, *Framework 5A* involves an *understanding of the significance of RLM* by describing the economic, competitive, social, environmental and legal significance of RLM (derived from the literature study in section 2.4). *Framework 5B* involves the *justification of RLM success factors* (presented in Framework 3) by identifying the RLM constraints addressed (derived from the literature study in section 2.3 and Framework 2) and RLM benefits realised (derived from the literature study in section 2.5 and the QCA of RL literature in chapter 6). Similarly, *Framework 5C* involves the *justification of RLM practices* (presented in Framework 4) by identifying the RLM constraints addressed (derived from the interview findings in sections 8.4.2, 8.5.2 and 8.6.2 and Framework 2), and RLM benefits realised (derived from the interview findings in sections 8.4.3, 8.5.3 and 8.6.3 and the QCA of RL literature in chapter 6). Framework 5 is presented in section 9.8.

9.4 FRAMEWORK 1 – UNDERSTAND RL, CONSUMER RETURNS AND RL PROCESSES

As mentioned in the overview of Framework 1 (section 9.3.1), the aim of Framework 1 is to help online retailers who may be unfamiliar with the concept of RL with a better understanding of RL, consumer return types and RL processes in online retailing. While the aim of this Framework is to educate new and less experienced online retailers (such as younger small-to-medium online retailers), established and larger online retailers can also benefit from understanding RL, consumer returns and RL processes. Lamba *et al.* (2020:381) found that many online retailers, especially in developing countries, hardly pay attention to RL flows and instead focus on FL flows. Zhang *et al.* (2022:192) state that it can be especially important for online retailers to recognise the reasons for consumer returns to devise optimal RLM strategies. Additionally, Eliav (2022:1) indicates that online retailers must gain a deeper understanding of the RL processes to manage returns successfully and realise various benefits (such as cost savings and consumer satisfaction). Therefore, understanding the concept of RL, consumer returns and pre- and post-return RL processes can be a helpful starting point for the effective RLM of consumer returns.

As mentioned in section 9.3.1, Framework 1 consists of four parts, including Framework 1A – Understand the concept of RL (from section 2.2), Framework 1B – Understand consumer returns (from sections 4.3 and 8.3.1), Framework 1C – Understand pre-receipt RL processes (from sections 4.4 and 8.3.2), and Framework 1D – Understand post-receipt RL processes (from chapter 5 and section 8.3.3). Figure 9.5 provides a broad overview of Framework 1.

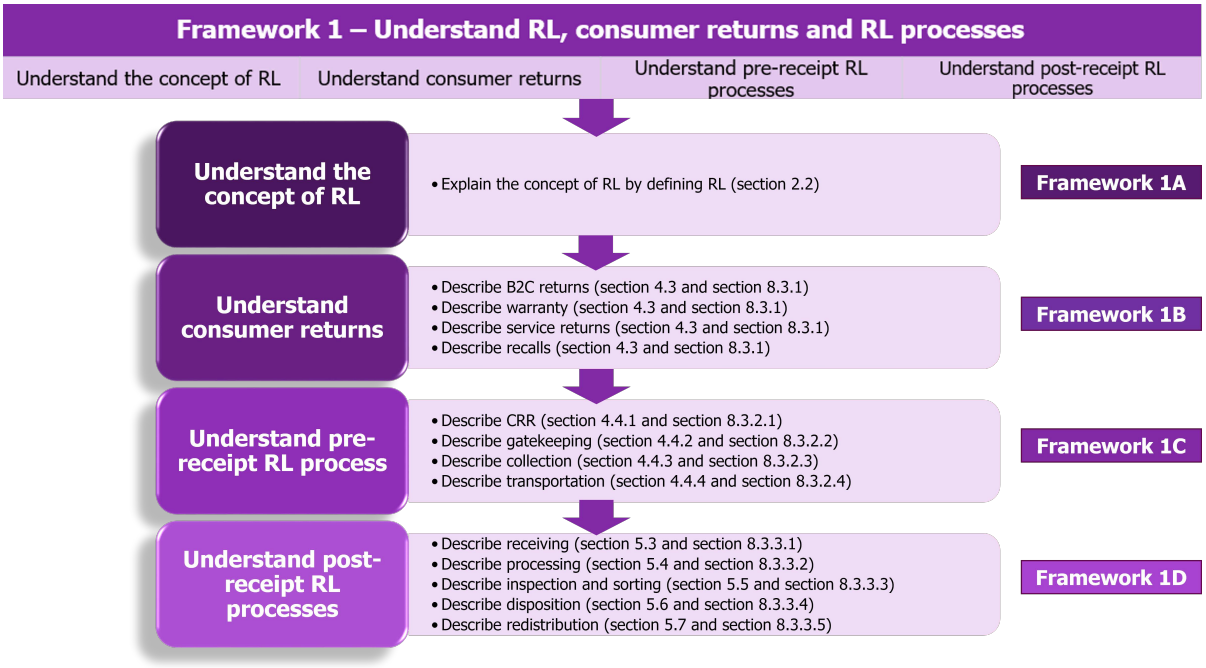

Figure 9.5 Framework 1 - Understand RL, consumer returns and RL processes
Source: Compiled by the researcher

Figure 9.5 shows the part of the main framework associated with Framework 1 (see Figure 9.4), including Framework 1A that involves understanding the concept of RL (identified from section 2.2.), Framework 1B that involves understanding consumer returns with references to the description of consumer return types (identified in chapter 4 and 8), Framework 1C that involves understanding pre-receipt RL processes (identified in chapter 4 and 8), and Framework 1D that involves understanding post-receipt RL processes (identified in chapter 5 and 8) . In the subsequent sections, Frameworks 1A, 1B, 1C and 1D will be presented and discussed.

9.4.1 Framework 1A – Understand the concept of RL

Framework 1A is the most basic part of the RLM framework, focusing on understanding the concept of RL for the effective RLM of consumer returns in online retailing. To understand the concept of RL, an explanation of the definition of RL in online retailing must be provided. In section 2.2 (from the literature study), several RL definitions from various authors/scholars were explored, which formed the foundation of understanding the concept of RL. From the various definitions, this study created a

definition for RL that can be applicable to consumer returns in online retailing. Table 9.1 provides Framework 1A, including the RL definition created for this study and a description of some of the elements of the definition for an improved understanding of the concept of RL.

Table 9.1 Framework 1A - Understand the concept of RL

RL DEFINITION	DESCRIPTION
The reverse logistics (RL) of online consumer returns is the process of managing (planning, implementing and controlling) the efficient and effective flows of returned products and information from the consumer (point of consumption) to an online retailer (point of recovery) or upstream supplier (point of origin) to recapture value, save costs, increase profits, satisfy, serve and retain online consumers, and improve economic and environmental sustainability through RL processes and practices.	• RL is a process that involves various management activities, including planning, implementing and controlling. Therefore, online retailers must view RL as both a process and as a management function, indicating that RL requires managerial and operational involvement. • Successful RL involves the efficient and effective flows of products and information from consumers to the online retailer and potentially the supplier. Online retailers must focus on efficiency and effectiveness in the RL process, ensuring efficient and effective returned product collection, transportation, receipt, processing, inspection/sorting and disposition. • It should be noted that suppliers can be involved in the process, meaning that the RL process extends to include the transfer of returned products to the suppliers. • Focus on efficient and effective information exchange is needed to ensure that proper communication can take place in the RL process. • The economic aim of RL involves recapturing of value from the returned product, including costs savings and higher profits. Therefore, online retailers must view RL as an opportunity to recapture as much value as possible from product returns, seeking measures to save costs and increase profitability • The service aim of RL involves consumer service, satisfaction and retention. Therefore, the focus should be on consumer satisfaction and optimum consumer service for the long-term retention of consumers. • The overall aim of RL includes economic and environmental sustainability, which can be realised through RL processes and practices. Therefore, online retailers can focus on establishing appropriate RL processes and identifying and implementing appropriate RL practices, ensuring long-term economic and environmental sustainability.

Table 9.1 shows the definition of RL and a description of the definition aiming at understanding the basic concept of RL. Understanding these basic elements of RL can help online retailers identify important areas to be considered for the effective RLM of consumer returns. In the next section, the next part of Framework 1 will be provided, which focuses on understanding consumer returns.

9.4.2 Framework 1B – Understand consumer returns

Framework 1B continues with understanding RL by focussing on consumer returns for the effective RLM of consumer returns in online retailing. In sections 4.3 and 8.3.1, various consumer return types and reasons were explored from the QCA of RL literature and interviews with industry experts. The consumer return types in online retailing include business-to-consumers (B2C) returns, warranty returns, service returns and recalls. While end-of-use (EoU) returns were not identified from the interviews, many examples in practise exists from online sellers encouraging EoU returns, which could become a competitive advantage in terms of environmental and social responsibility. Consequently, EoU returns will be added as a potential return type to explore.

Table 9.2 provides Framework 1B, including a description of the various return types (based on the QCA and interview findings) and explanations to help online retailers understand consumer returns for effective RLM.

Table 9.2 Framework 1B - Understand consumer returns

RETURN TYPE	DESCRIPTION	EXPLANATION
B2C returns *(sections 4.3.1 and 8.3.1.1)*	B2C returns in online retailing involve consumers returning new/unused products in good or defective/damaged condition for various reasons, including (1) consumer errors (push returns), involving, order errors, false failure returns, problems with the product, buyer's remorse or a change of minds, dissatisfaction and unwanted products, (2) organisational errors (push and pull returns), involving wrong deliveries, inaccurate quantities, defective/damaged products and quality issues, and (3) other reasons, involving lenient return policies. Depending on the condition and return reasons, B2C returns can be directly reused, repaired or shipped to the supplier.	• For B2C returns, online retailers can expect to receive products in various conditions, including new, unused and unopened, new but opened, defective and damaged • Online retailers can expect to receive B2C returns for various reasons • **Consumer error reasons** can involve the following: o *Order errors* during the purchasing of products online (such as overordering or not reading the descriptions and purchasing incompatible products) o *User errors* where the consumers mistakenly belief that a product is defective (such as purchasing an incompatible device or purchasing the correct product but finding it difficult to operate the product) o *Misperceptions* about the products (i.e. the perception of the product online is different from the product received) that causes dissatisfaction o *Unwanted* because of a change of mind about the purchase and buyer's remorse (such as regret over impulsively purchasing an expensive product) • **Organisational error reasons** can involve the following: o *FL problems* of damages due to poor handling and packaging, picking errors (i.e. picking a blue shirt instead of a red shirt) and switching orders (mislabelling the order and delivery the wrong items) o *Product problems* because of defective and poor-quality products • **Other reasons** involve *return leniency* and *lenient return policies* that cause high unnecessary and fraudulent returns • B2C returns involves various **disposition options** that depend on the return reason and product condition, including: o *Direct reuse* applicable to new and unused returned products that can be placed back in stock to be resold at the same price through the website or new but opened product that can be repackaged and resold at a discounted price through the website o *Repair* applicable to products in defective/damaged condition that can be restored to working order and resold at a discount in secondary markets o *Ship to the supplier* applicable to products in defective/damaged condition forwarded to the supplier for credit or replacement.
Warranty *(sections 4.3.3 and 8.3.1.2)*	Warranty returns in online retailing refer to consumers returning used or defective products (e.g. electronics, computers and TVs) under manufacturer warranty. Warranty returns can include various reasons, including product failures, quality failures, warranty claims, defects or false failures. Based on the reasons for warranty returns and the condition of the product, warranty returns can involve repair, ship to the supplier or return to the consumer as disposition/exit options.	• For warranty returns, online retailers can expect to receive used products in either a defective **condition** or non-defective condition • Warranty returns apply to electronics or any **product type** sold under manufacturer warranty • Online retailers can expect to receive warranty returns for **reasons** related to quality failures and defects, warranty claims and false failures • *Quality failures* and *defects* point to products failing to operate within the specified manufacturer guarantee • *Warranty claims* are based on the warranty terms and conditions for defective products • *False failure* warranty returns apply to new and non-defective products purchased under warranty that get returned because consumers mistakenly belief that a product is defective • Warranty returns involves various **disposition options** that depend on the return reason and product condition, including: o *Repair* applicable to a manufacturer that sell products online to consumers or online retailers that send products on behalf of the manufacturer for repair to be resold in secondary markets o *Ship to the supplier* applicable to online retailers that submit warranty claims and return defective products to suppliers for credit and replacement o *Return to the consumer* applicable to non-defective false failure warranty returns where the consumer receives the non-defective product under warranty back
Service *(sections 4.3.4 and 8.3.1.3)*	Service returns in online retailing involve consumers returning relatively good, used and damaged products (e.g. computers, cameras, cell phones or any electronic and device products) due to a repair service request and product	• For service returns, online retailers can expect to receive products in relatively good but in used and damaged **condition** • Service returns can apply to computers, cameras, cell phones or any electronic **product type** associated with a service option/plan • Online retailers can expect to receive service returns for **reasons** related to service return requests and damages • *Service return requests* are based on a service plan offered with the product that

	damages, involving repair as a disposition option.	enables consumers to return products for a service/maintenance • *Damages* relate to accidental user damage to a product (such as a cracked cell phone screen) that qualifies for a repair service • Service returns exclusively involve the **disposition option** of repair, which entails the fixing of a damaged product to be returned to the original consumer for reuse
Recalls *(sections 4.3.5 and 8.3.1.4)*	Product recalls in online retailing are consumer returns, initiated by online retailers or their suppliers (pull returns), which involve announcements/notifications to consumers about potential defects, quality failures and safety issues related to the consumption of certain products (e.g. electronics, toys, medicine, food, household goods or sports equipment). Online retailers issue refunds to the consumers and ship the recalled products to the manufacturer or supplier for disposition.	• Product recalls **originate** from the supply chain, either initiated by online retailers or their suppliers • Product recalls involve announcements on the website informing consumers about the recall of products for **reasons** related to quality failures, defects or safety issues that may occur during consumption/use of the product • Online retailers can expect product recalls for various **product types,** including electronics, household items and sport equipment, food, pharmaceuticals and toys, which can potentially cause possible risks related to injury, health/illness and death • Online retailers can issue full refunds to consumers upon receiving the recalled products • For online retailers, product recalls exclusively involve the **disposition option** of ship to the supplier/manufacturer for full credit
End of use (EoU) returns *(section 4.3.2)*	EoU consumer returns involve consumers returning used products, in good or defective condition (i.e. electronics, computers and cell phones) due to technological advances, product exchange programmes, incentives and product upgrades. EoU consumer returns can be initiated by organisations based on changing consumer preferences (push and pull returns). Depending on the condition of the product, EoU returns can include product reuse, repair and resale in secondary markets as disposition options.	• For EoU returns, online retailers can expect to receive used products in either a good or defective **condition** • EoU returns apply to any **product types,** like cell phones and computers, involving technology • EoU returns involve return **reasons** related to technological advances, product exchange programmes, incentives and product upgrades ○ *Technology advances* relate to products returned due to outdated technology ○ *Product exchange programmes* allow consumers to return outdated products in exchange for a newer product at a discount ○ *Incentives* allow consumers to return outdated products for credits or refunds ○ *Product upgrades* relate to the return of products purchased on a service contract that qualifies for an upgrade to a newer version • EoU returns can be initiated by both consumers choosing to return used products and organisations (i.e. online retailers or their suppliers) choosing to create take-back programmes and incentives • EoU returns can involve several **disposition options** that depend on the return product condition, including: ○ *Product reuse* applicable to used products in good and working condition that can be repurposed or repackaged to be resold at a discount on the secondary market ○ *Repair* applicable to used products in defective products that require fixing to be resold in secondary markets ○ *Secondary markets* applicable to reselling EoU product to third-party buyers or second consumers based on market demand

Source: Compiled by the researcher

Table 9.2 provides a description and explanation about consumer return types and related product conditions, product types, return reasons and disposition options, which can help online retailers to understand consumer returns for effective RLM. Specifically, understanding consumer returns can help online retailers to (1) adequately prepare for managing consumer returns, (2) identify measures to reduce unnecessary and fraudulent returns, (3) understand consumer behaviour and preferences, and (4) develop appropriate disposition strategies for recapturing maximum value. Additionally, understanding consumer returns can help online retailers to identify, implement and apply correct RL processes and activities as well as effectively consider consumer return types, product condition and product types as factors that can influence the implementation of RLM practices. Essentially, understanding consumer returns can help online retailers to implement appropriate RL processes and practices for the effective RLM of consumer returns.

9.4.3 Framework 1C – Understand pre-receipt RL processes

Framework 1C focuses on understanding pre-receipt RL process for the effective RLM of consumer returns in online retailing. In sections 4.4 and 8.3.2, the pre-receipt RL processes were explored from the QCA of RL literature and the interviews with industry experts. Pre-receipt RL processes start when a consumer notifies a retailer of a return and ends just before the retailer receives the product at a facility. Specifically, the pre-receipt RL processes in online retailing include a consumer return request (CRR), gatekeeping, collection and (initial) transportation, representing flows of information and products from the consumer to the online retailer.

Table 9.3 provides Framework 1 C, including a description of the pre-receipt RL processes (based on the QCA and interview findings) and explanations to help online retailers understand pre-receipt RL processes for effective RLM.

Table 9.3 Framework 1C - Understand pre-receipt RL processes

PROCESS	DESCRIPTION	EXPLANATION
CRR *(sections 4.4.1 and 8.3.2.1)*	The CRR process of consumer returns in online retailing can be described as the first pre-receipt RL process, starting with a consumer and the recognition of a product return. The CRR process involves costs and technology, relates to the return reasons and the return policy, and links with the gatekeeping, collection, processing and inspection processes. The CRR process involves methods and activities related to information flows, including online, telephonic or electronic communication, acknowledging the return request, recording return reasons, requesting and providing evidence, reviewing the request, initial assessment of product condition and pre-return authorisation or rejection, which can be performed by the consumer and online retailer.	• In the CRR process an online retailer gets informed about a consumer's intention to return a product • Online retailers can expect to incur CRR costs • Online retailers can use technology systems for the CRR process • The return reasons and return policy must be considered during CRR process • Online retailers can identify the links between the CRR process and other RL processes for efficiency and effectiveness • Online retailers can consider appropriate **methods** that can be implemented for the CRR process, including: o *Online method* that enables the consumer to log a request on the online platform o *Telephonic method* that enables the consumer to phone a call centre to request a return o *Electronic method* that enables the consumer to log a request via email or electronic communication platform (e.g. WhatsApp) o The CRR process involves information flow **activities**: o *Acknowledgement of the request* based on the platform (e.g. system-generated, verbal or written acknowledgement) o *Recording the return reason* can involve selecting return reasons from a drop-down list on the online platform that automatically records the return reason or capturing the return reason manually on the system by the call centre agent or consumer service representative o *Requesting and providing evidence* based on the implemented procedures/policies consumers can be requested to provide photos to establish the product condition o *Reviewing the request* to determine if the return can be accepted based on the return policy parameters, return reasons and photo evidence o *Initial assessment* of the product condition based on the photo evidence o *Pre-return authorisation or rejection* based on the review and initial assessment of the return • The CRR process include consumers and online retailers as parties • Both consumers and online retailers can share responsibilities in the CRR process
Gatekeeping *(sections 4.4.2 and 8.3.2.2)*	The gatekeeping process of consumer returns in online retailing can be described as the entry point of the RL process to determine if a product return is allowed based on the return policy. The gatekeeping process involves technology and links with other RL processes, including CRR, collection,	• In the gatekeeping process an official determination can be made if a return can be allowed based on the return policy • Online retailers can use technology systems for the gatekeeping process • The returns reasons and return policy must be considered during the gatekeeping process • Online retailers can identify the links between the gatekeeping process and other RL processes for efficiency and effectiveness • Online retailers can consider the **type** of gatekeeping to implement, including: o *Online virtual gatekeeping* performed before the returned product is collected o *Physical gatekeeping* performed once the product can be physically viewed either at

	processing, inspection and sorting processes. Gatekeeping can be performed virtually before returns are received and/or physically at the collection point, centralised facility or decentralised facility. The online retailer (or its outsourced 3PRL provider) performs the gatekeeping activities of screening, verification, decision making, return authorisation or rejection and communicating the outcomes to the consumers.	the consumer's home or at centralised or decentralised facilities ○ The gatekeeping process mostly involve information flow **activities**: ○ *Screening* and *verification* to determine the legitimacy of the return claim ○ *Decision making* based on the screening and verification to determine if a return can be accepted or rejected ○ *Return authorisation* or *rejection* based on the decision making ○ *Communication* to inform the consumer about the return authorisation or rejection • The gatekeeping process can involve consumers, online retailers and third parties as **parties** ○ *Consumers* play secondary roles in the gatekeeping process, waiting to be informed about return authorisation or rejection ○ *Online retailers* play primary roles if the gatekeeping process is conducted in-house performing all the gatekeeping activities ○ If online retailers outsource the gatekeeping process, *service providers* (such as 3PRLs) can perform the gatekeeping activities on behalf of the online retailer
Collection *(sections 4.4.3 and 8.3.2.3)*	The collection process of consumer returns in online retailing can be described as the start of product flows in the RL process, involving costs, time, technology, availability, retrieval and possession of products. Collection can be based on the product condition and return reasons and linked with various pre- and post-receipt RL processes. The collection process can include pick-up and drop-off collection methods and involve various activities, including the information flow activities of arranging, booking, notifying, verifying, signing and documenting, and product flow activities of handling, moving, loading, shipping and delivery. The collection activities can be performed by consumers, retailers and/or outsourced third parties at retail stores, collection points, warehouses, DCs, fulfilment centres or RL facilities.	• The collection process represents the start of the product flows in the RL process • Online retailers can consider the party responsible for incurring the collection costs • Time can be an important factor in the collection process that can be measured for efficiency and effectiveness • Collection may involve technology, relating to the collection activities • The condition of the product and return reasons must be considered during collection (e.g. influence the party responsible for paying the collection costs) • Online retailers can identify the links between the collection process and other RL processes for efficiency and effectiveness • Online retailers can consider the most suitable collection **methods** to implement, including: ○ *Pick-up method* the collection of a product return from the consumer's home ○ *Drop-off method* enables the consumer to drop the product at convenient locations • The collection process involves several **information flow activities**, including: ○ *Arranging* involves issuing an instruction to a driver or courier to collect a product ○ *Booking* involves contacting the consumer to arrange a convenient collection time and place ○ *Notifying* the consumer electronically about the date and time of the collection ○ *Verifying* involves matching of the waybill against the request ○ *Signing* occurs after verification either electronically or by hand on the documentation ○ *Documentation* involves providing the consumer with a waybill pickup confirmation or retrieving the signed documentation from the consumer for record • Following the information flow activities, **product flow activities** can take place, including: ○ *Handling and moving* involve the transfer of ownership from the consumer to the driver ○ *Loading* involves the physical loading of the parcel on the vehicle ○ *Shipment* involves the physical movement of the product from the consumer's premises ○ *Delivery* can be the physical drop-off of the product return by the consumer to retail stores or collection points or by the driver to online retailer facilities • The collection process can involve consumers, online retailers and third parties as **parties** ○ *Consumers* play important roles in the collection process by performing either information flow activities or physical drop-off ○ *Online retailers* may play primary roles if the collection process is conducted in-house or secondary roles (such as arranging the collection) if collection is outsourced ○ If online retailers outsource the collection process, *service providers* (such as couriers and 3PLs) can perform both information and product flow activities on behalf of the online retailer
Transport *(sections 4.4.4 and 8.3.2.4)*	The transportation process of consumer returns in online retailing can be described as important, involving product flows between locations, options, decisions, cost, time, routes and networks, lacking economies of scale and requiring efficient handling. The transportation process can be influenced by organisation size, return volume and	• The transportation process involves the physical flow and movement of a returned product from one location to another • Online retailers can select transportation options either using private fleet (in-house vehicles) or contract fleet (using carriers) • Online retailers can consider the party responsible for incurring the transportation costs • Time can be an important factor in the transportation process that can be measured for efficiency and effectiveness • Routes and networks can be planned for cost-effective transportation • Online retailer can consider the lack of scale associated with return transportation for the establishment of a cost-effective transportation process

	product condition and can link with various pre-and post-receipt RL processes. Transportation includes several product flow activities, including the movement, shipment, transfer, unloading, handling, delivery and consolidation of returned products from the point-of-origin (consumer) to the point-of-recovery (online retailer/third parties, first-tier and second-tier facilities).	• Efficient handling practices can be important to avoid in-transit damages • Online retailers can consider their size, return volume and product condition for return transport decisions and activities • Online retailers can identify the links between the transportation process and other RL processes for efficiency and effectiveness • The transportation process involves several **product flow activities,** including: o *Shipment* from a location and *movement* to another location o *Delivery* involves the physical arrival at the destination with the returned item o *Unloading* involves the physical removal of the returned parcel from the vehicle o *Transfer* involves either transfer of the product from one location to another or transfer of ownership from the driver to the receiver o *Consolidation* might occur if returned products are transported to decentralised locations before bulk transportation to centralised facilities o *Handling* occurs during the removal, transfer and consolidation activities o *Delivery* can be the physical drop-off of the product return by the consumer to retail stores or collection points or by the driver to online retailer facilities • The locations in the transportation process involves the point-of-origin, representing the consumer's home or a collection point and the point-of-recovery, representing the final destination for post-receipt RL processes

Source: Compiled by the researcher

Table 9.3 provides a description and explanation about the pre-receipt RL processes and related characteristics, methods, activities, facilities/locations and parties, which can help online retailers to understand pre-receipt RL processes for effective RLM. Specifically, understanding pre-receipt RL processes can help online retailers to (1) adequately prepare for managing consumer returns, (2) make informed decisions about appropriate procedures and practices to implement, (3) identify necessary resources and costs, (4) determine important factors to consider, (5) identify the necessary activities to perform, and (6) understand the roles and responsibilities of the parties involved in the pre-receipt RL process. Essentially, understanding the pre-receipt RL process can help online retailers to establish appropriate RL processes and practices for the effective RLM of consumer returns.

9.4.4 Framework 1D – Understand post-receipt RL processes

Framework 1D focuses on understanding post-receipt RL process for the effective RLM of consumer returns in online retailing. In chapter 5 and section 8.3.3, the post-receipt RL processes were explored from the QCA of RL literature and the interviews with industry experts. The post-receipt RL processes start once a consumer product return arrives at the facility and ends at the redistribution of returned/recovered products to various locations. Specifically, the post-receipt RL processes in online retailing include receiving, processing, inspection, sorting, disposition and redistribution processes, involving information flows, product flows and cash flows.

Table 9.4 provides Framework 1D, including a description of the post-receipt RL processes (based on the QCA and interview findings) and explanations to help online retailers understand post-receipt RL processes for effective RLM.

Table 9.4 Framework 1D - Understand post-receipt RL processes

PROCESS	DESCRIPTION	EXPLANATION
Receiving *(sections 5.3 and 8.3.3.1)*	The receiving process of consumer returns in online retailing can be *described as* the arrival and inbound flow of returned products, which can be labour intensive, time-consuming and *influenced by* product return volume. Receiving *involves* technology, documentation and costs and links with other pre- and post-receipt RL processes. The receiving process involves the (1) *information flow activities* of identification, acknowledgement of receipt, administration, registration, verification and scanning, and (2) *product flow activities* of unloading, handling, movement, unpacking and counting, which can be *performed by* the staff of online retailers or 3PRL providers at FL facilities (such as warehouses and DCs) or RL facilities (such as return facilities).	• The receiving process represents the first post-receipt RL process that signifies the arrival and inbound flows of returned products at the facility • It should be noted that receiving can be labour-intensive and time consuming especially without technology systems • Depending on the established operations, receiving can involve technology systems and documentation that relates to the activities • Online retailers can expect to incur receiving costs • Product return volume must be considered during receiving for efficiency (e.g. high product volumes requires separate receiving areas) • Online retailers can identify the links between the receiving process and other RL processes for efficiency and effectiveness • The receiving process involves several **information flow activities**, including: ○ *Identification* of the product return at arrival ○ *Acknowledgement* of receipt associates with the transfer of ownership by confirming official receipt ○ *Administration* and *registration* relate to manual documentation and updating the system ○ *Scanning* relates to the use of devices to scan products that automatically update the inventory system • The **product flow activities** in the receiving process can include: ○ *Unloading* of the item from the vehicle/pallet ○ *Handling* and *movement* occur during all stages of the receiving process ○ *Unpacking* involves the removal of the returned product from the parcel/package ○ *Counting* occurs in the absence of scanning solutions, ensuring that product quantities are correctly captured on the system • The staff of the online retailer or outsourced service provider (i.e. 3PRL provider) act as the main receiving parties, responsible for all receiving activities • Receiving can take place at standard facilities (such as warehouse and DCs) or separate return facilities
Processing *(sections 5.4 and 8.3.3.2)*	The processing process of consumer returns in online retailing can be *described as* an internal and time-consuming RL process, which (1) *requires* financial and infrastructural resources, technology, accuracy and speed, (2) *involves* costs, consumer service and accounts, (3) can be *influenced by* product type, product condition, return reasons, service levels, channel type and return policies, and (4) *links with* other pre- and post-receipt RL processes. The activities of the processing process involve (1) *information flow activities*, including credit/refund authorisation, recordkeeping, cross-verification of return authorisation, information sharing and communication, tracking and data entry/capturing, (2) *cash flow activities*, including issuing credits/refunds and settling claims, and (3) *product flow* activities, including product exchanges, handling, restocking and delivery, which can be *performed by* the staff/departments of the online retailer, other third parties (credit processing sites, couriers or 3PRL providers) or suppliers in *various facilities/locations* (stores, warehouses, DCs, fulfilment centres, decentralised points or service centres) for the benefit of the consumer.	• The processing process mostly takes place internally • It should be noted that successful processing requires resources and technology systems • The focus should be on accuracy and speed in the processing process • Online retailers can expect to incur processing costs • The customer service and finance departments can be involved in processing • Online retailers can consider the type of product, return reason, product condition and return policy for the selection of the processing outcome (e.g. exchange, refund or rejection) and related activities • The service levels and channel type can be considered for processing speed • Online retailers can identify the links between the processing process and other RL processes for efficiency and effectiveness • The processing process involves various **information flow activities**, including: ○ *Credit/refund authorisation* to accept a refund/credit claim ○ *Recordkeeping* and *data entry/capturing* to update consumer accounts and financial information ○ *Cross-verification* to determine if the information provided by the consumer during gatekeeping about the product condition is accurate ○ *Information sharing* and *communication* to inform the consumer about the processing outcomes ○ *Tracking* provides consumers with status updates (e.g. refund or replacement status) • The processing process represents the first RL process that involves **cash flow activities**, including: ○ *Issuing credit/refund* to the consumer that may involve money transfers through banks or credit transfer for future transactions ○ *Settling claims* to finalise the payment or credit transfer • The **product flow activities** in the processing process can include: ○ *Product exchanges* that represent the other processing outcome that occurs instead of a refund or credits ○ *Restocking* of new/unused condition ○ *Delivery* of the replacement product or original product (e.g. rejected refund) to the consumer responsible for returning a product for an exchange or refund • Various **parties** can be involved in the processing process: ○ *Consumers* play secondary roles, waiting to receive confirmation about the refund/exchange and accepting the credit/refund or product exchange ○ *Online retailers* may play primary roles, providing human, physical and financial

		resources for processing ○ *Staff* can include consumer service, finance and logistics, depending on the processing outcomes and activities ○ *Third parties* include credit processers (payment gateways) or 3PLs, responsible for exchange delivery ○ *Suppliers* might be involved with the processing of warranty returns (i.e. issuing a credit or ship a replacement product) • Processing can take place at retail locations, standard facilities (such as warehouse and DCs) or service centres
Inspection *(sections 5.5.1 and 8.3.3.3)*	The inspection process of consumer returns in online retailing can be *described as* an important, complex and labour-intensive RL process, which (1) *requires* skilled/trained staff and an infrastructure, (2) *involves* costs, time and options, (3) can be *influenced by* product and return type, product quality, product value and the return policy, and (4) *links* with other pre- and post-receipt RL processes. The activities of the inspection process involve the (1) *information flow activities* of verifying information and consumer communication/notifications, and (2) *product flow activities* of product evaluation, assessment, testing, grading, classification, determining disposition/ exit options, storage and handling, which can be *performed by* the staff/departments of the online retailer, 3PRL providers or manufacturers in traditional FL facilities (such as warehouses, DCs and fulfilment centres) or RL processes facilities (CRCs or dedicated RL facilities).	• The inspection process in RL should be prioritised • The inspection process can be labour intensive and requires skilled/trained staff and infrastructure for efficiency and effectiveness • Online retailers can expect to incur inspection costs • Time can be an important factor in the inspection process that can be measured for efficiency and effectiveness • Online retailers can select inspection options, including basic inspection, visual inspection and full inspection • Online retailers can consider the type of product, product quality and product value for the appropriate inspection options and activities • The return reason and return policy should be considered for appropriate inspection outcomes • Online retailers can identify the links between the inspection process and other RL processes for efficiency and effectiveness • The inspection process involves a few **information flow activities**, including: ○ *Verifying* if the product condition and return reason information provided by the consumer matches the physical condition of the product ○ *Communication* with the consumer regarding additional information about the return reason and *notifying* the consumer of the inspection outcome (e.g. return claim accepted) • The **product flow activities** in the inspection process can include: ○ *Product evaluation, assessment* and *testing* to determine the condition and quality of the product ○ *Grading* and *classing* of the product based on the quality assessment and condition ○ *Determining the disposition decision* based on the inspection outcomes ○ *Storing* the product for disposition ○ *Handling* occurs during all stages of the inspection process • Various **parties** can be involved in the inspection process: ○ *Consumers* play secondary roles by providing information if requested and waiting to receive confirmation about the outcomes of inspection ○ *Online retailers* may play primary roles, incurring costs and providing skilled human, physical and financial resources for inspection ○ *Staff/departments* play primary roles by physically performing inspection, contacting consumers and making disposition decisions ○ *Third parties*, like 3PRL providers, can perform inspection on behalf of online retailers if the RL process is outsourced ○ *Manufacturers* of luxury items might perform physical inspections on the premises of the online retailer • Inspection can take place at retail locations, collection points (e.g. consumer residences), standard facilities (warehouses and DCs) or specialised facilities (RL facilities and CRCs)
Sorting *(sections 5.5.2 and 8.3.3.4)*	The sorting process of consumer returns in online retailing can be *described as* an important, complex, labour-intensive and time-consuming RL process, which (1) *requires* skilled/trained staff, (2) involves costs, (3) can be *influenced by* product type, characteristics, condition, return type and return volume, and (4) can be *linked* with other pre- and post-receipt RL processes. The activities of the sorting process involve the (1) *information flow* activity of verifying product return information provided by consumers, and (2) *product flow* activities of product evaluation, determining disposition/exit options, product classification and	• The sorting process in RL should be prioritised • The sorting process can be complex, labour intensive, time consuming and requires skilled/trained staff for efficiency and effectiveness • Online retailers can expect to incur sorting costs • Online retailers can consider the type of product for the required skilled staff • Product condition and the return type should be considered for accurate sorting • Return volume should be considered for the feasibility of sorting operations (e.g. only high return volumes can be appropriate for sorting operations) • Online retailers can identify the links between the sorting process and other RL processes for efficiency and effectiveness • The sorting process can involve the **information flow activity** of the *verification* of product return information provided by consumers during the CRR/gatekeeping process • The **product flow activities** in the sorting process can include: ○ *Product evaluation* to determine the condition and quality of the product ○ *Determining the disposition options* based on the condition and quality of the product ○ *Grouping, classing* and *separating* products based on the disposition options

	grouping, separation, storage, handling and movement, which can be *performed by* staff of the retailer or 3PRL providers in traditional FL facilities (warehouses and DCs), RL processes facilities (sorting facilities) and recovery facilities (repair facilities).	○ *Storing* the product for sorting to increase volumes or for disposition ○ *Handling* and *movement* occur during all stages of the sorting process • A few **parties** can be involved in the sorting process: ○ *Consumers* play secondary roles by providing information that can be verified ○ *Online retailers* may play primary roles, incurring costs and providing skilled human resources for sorting ○ *Staff* play primary roles by physically performing sorting and making disposition decisions ○ *Third parties*, like 3PRL providers, can perform sorting on behalf of online retailers if the RL process is outsourced • Sorting can take place in standard facilities (warehouses and DCs) or specialised facilities (sorting facilities and repair centres)
Disposition *(sections 5.6 and 8.3.3.5)*	The disposition process of consumer returns in online retailing can be *described as* an important, complex and time-consuming RL process, which (1) *requires* skilled/trained staff, resources, technology and speed, (2) *involves* costs, time, options/alternatives, routes, channels, destinations, markets, risks, discounted/lower prices, negotiations, contracts/agreements, partnerships and information sharing, (3) can be *influenced by* industry and organisation type, product type, characteristics, condition and quality, return type/reasons, volume and policies, manufacturer specifications and legislation, and (4) *links* with other pre- and post-receipt RL processes. The disposition process can include the (1) *information flow* activities of administration, scanning, booking and communication, (2) *product flow* activities of product examination/ evaluation, disposition decisions, repackaging, restocking/return to inventory, disassembly, fixing, cleaning, treatment, packing, storage, loading, shipment, delivery and handling, and (3) *cash flow activity* of reselling, which can be *performed by* the staff/departments of online retailers or 3PRL providers in traditional FL facilities/locations (such as stores, warehouses, DCs and fulfilment centres), RL process facilities (such as CRCs) and recovery facilities (such as repair facilities and recovery/service centres). The *aim*s of the disposition process can include (1) recovery of returned products through direct reuse and repair, (2) shipment of returned/recovered products to the suppliers or original consumers, (3) reselling of returned products in primary markets, and (4) selling of returned/recovered/used products to staff or second consumers, second retailers or third-party buyers in secondary markets.	• The disposition process in RL should be prioritised • The disposition process can be complex, labour intensive and time consuming • It should be noted that that the disposition process requires skilled/trained staff, resources and technology for efficiency and effectiveness • Speed and time can be important in the disposition process for maximum value recovery • Online retailers can expect to incur disposition costs • The disposition process involves various options that can be influenced by the industry/organisation type, product type, condition and quality, return type and return volume • The disposition process associates with routes, channels and markets • Online retailers can identify the risks associated with the disposition process (e.g. brand liabilities and sales cannibalisation) • The disposition process can involve discount/lower prices based on the product condition and quality and market destination • For the disposition process, online retailers must perform negotiations, establish agreements, create partnerships and share information with suppliers and third-party buyers • Online retailers can consider manufacturer specifications and legislation for appropriate disposition decision-making • Online retailers can identify the links between the disposition process and other RL processes for efficiency and effectiveness • The disposition process involves a few **information flow activities**, including: ○ *Administration* and *booking* associate with the arrangement of recovery options (such as repair) ○ *Scanning* of products that leave the facility for disposition ○ *Communication* to arrange for repair and inform consumers about the status of their products' repair or outcomes of the disposition decisions • The **product flow activities** in the disposition process can include: ○ *Product examination/evaluation* to confirm the condition and quality of the product ○ *Disposition decisions* based on the product examination/evaluation ○ *Repackaging* for opened/damaged packaging ○ *Restock/return to inventory* for products in new and repackaged condition ○ *Disassembly and fixing* of defective electronic items ○ *Cleaning* and *treatment* of worn (i.e. for fit purposes) but new clothing ○ *Storage* of returned products for disposition to next destination ○ *Packing* and *loading* for *shipment* to the next destination ○ *Delivery* of the product destined for disposition or resale ○ *Handling* occurs during all stages of the disposition process • The disposition process can involve the **cash flow activity** of reselling of recovered/returned products either through the primary or secondary channels • The disposition process involves various **parties** responsible for performing disposition activities: ○ *Online retailers* may play primary roles, incurring costs and providing skilled human, physical and financial resources, establishing partnerships and adhering to laws for successful disposition ○ *Staff/departments* play primary roles by physically performing disposition activities, including information, product and cash flow activities ○ *Third parties*, like 3PRL providers, can perform disposition on behalf of online retailers if the RL process is outsourced • Disposition can take place in standard facilities (warehouses and DCs) or specialised facilities (CRCs, repair centres and service centres) • The disposition process involves various aims related to the disposition options, activities and other parties associated with the disposition process • The specific **aims** of the disposition process involve*:* ○ *Cost and economic value recovery* through *direct reuse* of new/unused and

		repackaged products for resale in the primary market ○ *Product recovery* through *repair* of defective/damaged products for *shipment* to consumers for reuse ○ *Cost recovery* through *shipment* of returned products *to suppliers* ○ *Economic value recovery* through *reselling* of returned/recovered products to *second consumers*, *second retailers* and *third-party buyers* in the secondary markets
Redistribute *(sections 5.7 and 8.3.3.6)*	The redistribution process of consumer returns in online retailing can be *described as* a costly and exit process in RL, which (1) *requires* speed, (2) *involves* networks and product reuse, (3) can be *influenced by* product condition and quality, return type and demand, and (4) *links* with other pre- and post-receipt RL processes. The redistribution process can include the (1) *information flow* activity of communication, (2) *product flow activities* of storage, packing, loading, shipping/dispatch and delivery, and (3) *cash flow activity* of reselling, which can be performed by online retailers, distributors and/or 3PL/3PRL providers in traditional FL facilities/locations (such as stores, warehouses and DCs), RL process facilities (such as CRCs) and market locations. The *aims* of the redistribution process include preparing of returned/recovered products for transportation to suppliers, original consumers, third-party buyers or second consumers in primary or secondary markets.	• The redistribution process represents the exit or final RL process • Redistribution can be a costly process due the transportation of returned/recovered products through networks and locations for reuse • Online retailers can consider product condition and quality, return type and demand for selecting the most appropriate redistribution destination • Online retailers can identify the links between the redistribution process and other RL processes for efficiency and effectiveness • The redistribution process can involve the **information flow activity** of *communication* relating to shipment arrangements • The redistribution process involves a few **product flow activities,** including: ○ *Storage* of returned products for redistribution to next destination ○ *Packing* and *loading* for *shipment/dispatch* and *delivery* to the final destination • The redistribution process may involve the **cash flow activity** of reselling of recovered/returned products on the primary or secondary market • A few **parties** can be involved in the redistribution process: ○ *Online retailers* can play primary roles by being responsible for the redistribution activities of communication, storage, packing, loading and reselling ○ *Third parties*, including 3PLproviders or 3PRL providers, can play primary roles either by being responsible for most redistribution activities on behalf of online retailers or for shipment and delivery activities to the markets • Redistribution can take place in standard facilities/locations (stores, warehouses and DCs) or specialised facilities (CRCs) and concludes at market locations • The redistribution process involves a few **aims** related to redistribution activities and destination parties, including: ○ Preparing products for transportation to the *original consumer* for reuse ○ Preparing sold returned/recovered products for transportation to *second consumers* or *third-party buyers* in the primary or secondary markets

Source: Compiled by the researcher

Table 9.4 provides a description and explanation for the post-receipt RL processes and related characteristics, methods, activities, facilities/locations, parties and aims (if applicable), which can help online retailers to understand post-receipt RL processes for effective RLM. Specifically, understanding post-receipt RL processes can help online retailers to make relevant decisions in this regard by (1) adequately preparing for the management of consumer returns, (2) making informed decisions about appropriate procedures and practices to implement, (3) identifying necessary requirements for efficiency and effectiveness in the process, (4) determining important factors that can influence the execution of post-receipt RL processes, (5) identifying the necessary activities to perform during the process, (6) understanding the roles and responsibilities of the parties involved in the post-receipt RL process, (7) identifying the appropriate facilities/locations associated with post-receipt RL processes, and (8) understanding the value of effective and efficient post-receipt RL processes.

Essentially, understanding RL, consumer returns and RL processes can be important for the effective RLM of consumer returns in online retailing. Therefore, online retailers can use Framework 1 as a foundation to develop an understanding about the concept of RL, consumer returns and RL processes,

which can enable the effective management of consumer returns. In the next section, Framework 2 for the effective RLM of consumer returns in online retailing will be provided.

9.5 FRAMEWORK 2 – IDENTIFY AND INVESTIGATE RLM CONSTRAINTS

The effective RLM of consumer returns require the identification and investigation of RLM constraints before solutions can be identified and implemented. According to Davidavičienė and Al Majzoub (2021:21), the RLM of consumer returns may be the most complex challenge for online retailers. The requirements of effective RLM may hamper online retailers' willingness and capability to manage consumer returns (Wang, Dang *et al.* 2021:2). However, poor RLM can lead to various problems, including high costs (Foo & A-Jalil, 2021:45; Robertson *et al.* 2020:174), operational problems (Franklin, 2022:1), a lack of internal and external information and knowledge sharing (de Araújo *et al.* 2018:346) and consumer dissatisfaction (Foo & A-Jalil, 2021:45), which can be detrimental to the online retailer's profitability, market share and corporate image (Davidavičienė, & Al Majzoub, 2021:2). Therefore, online retailers must identify and investigate RLM constraints to identify and implement countermeasures for effective RLM (Badenhorst, 2022:330; Zailani *et al.* 2017:22).

As explained in section 9.3.2, the RLM constraints represent the RLM barriers, challenges, pitfalls and problems (derived from the literature study in section 2.3 and the interview findings in sections 8.4.1, 8.5.1 and 8.6.1), which can both serve as RLM constraints and RLM constraint causes. Since the findings related to the barriers, pitfalls and problems are diverse, Framework 2 was structured according to the main RLM barriers and barrier categories identified in section 2.3. Evidently, the main RLM *constraint categories* include financial, operational, organisational and external RLM constraints, and the *specific RLM constraints* represent the various financial, operational, organisational and external RLM constraints (identified in section 2.3, excluding the risk categories) with related risks, pitfalls and problems (identified in sections 2.3, 8.4.1, 8.5.1 and 8.6.1). Additionally, the *causes* can be any barrier, risk, pitfall or problem (identified in sections 2.3, 8.4.1, 8.5.1 and 8.6.1) that contributes to the specific RLM constraints. Finally, online retailers can identify and investigate *potential solutions* for each RLM constraint, which relates to addressing the causes of the RLM constraint. Figure 9.6 provides a broad overview of Framework 2.

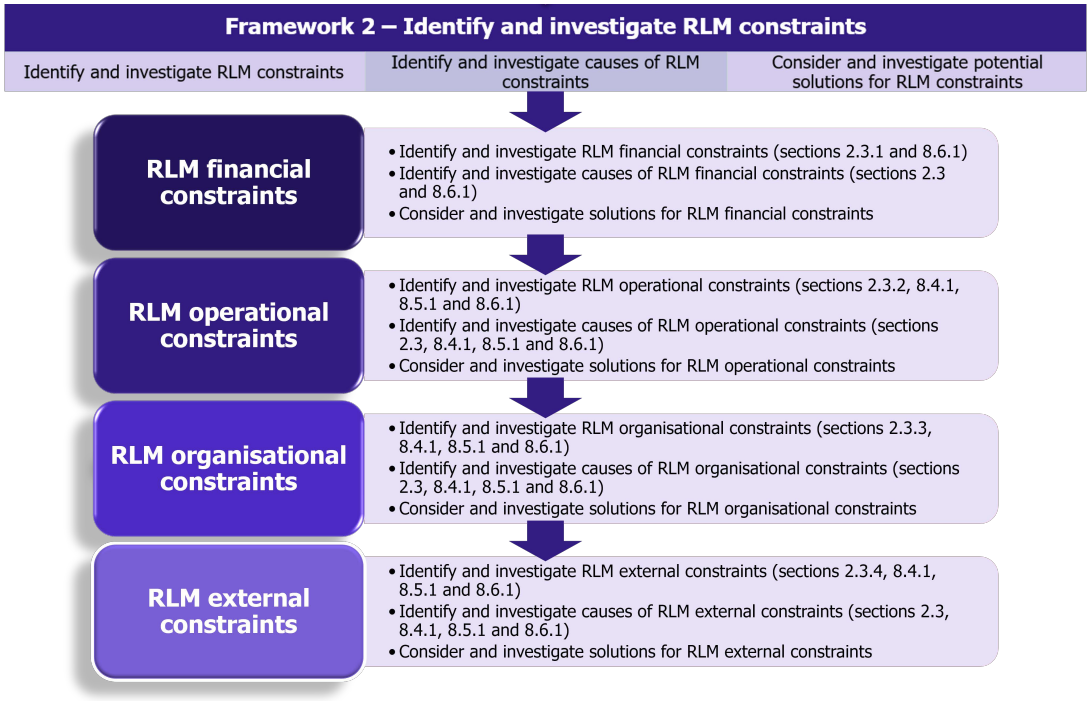

Figure 9.6 Framework 2 - Identify and investigate RLM constraints
Source: Compiled by the researcher

Figure 9.6 shows the part of the main framework associated with Framework 2 (see Figure 9.4), the RLM constraint categories, including the constraints and causes that must be identified and investigated (with references to chapters 2 and 8) and the solutions that may be considered and investigated. As a part of the investigation of RLM constraints, the framework indicates the (1) *degree of constraints*, which include the number of barriers and problems (listed in the first column of Table 9.5) for each RLM constraint and the impact on other constraints (identified from the solutions of all constraint categories listed in the third column of Table 9.5), (2) *degree of causes*, which include the number of causes related to each RLM constraint (listed in the second column of Table 9.5), and (3) *degree of solutions*, which include the number of solution focus areas that can be considered for each RLM constraint (listed in the third column of Table 9.5).

Table 9.5 provides a detailed overview of Framework 2, including the main RLM constraint categories, specific RLM constraints, including degrees of constraints, causes and solutions (first column), RLM constraint causes (second column) and solution focus areas (third column).

Table 9.5 Framework 2 - Identify and investigate RLM constraints

RLM FINANCIAL CONSTRAINTS		
RLM financial constraints	**RLM financial constraint causes**	**Solution focus areas**
Investment and costing constraints • Heavy financial investment • Lack of investment in resources • Lack of funding	***Financial causes*** •Prioritise FL investment due to a lack of awareness economic benefits of RLM •Unavailability of financial resources •Poor accounting systems	• Address investment and costing constraints • Address financial and cash constraints • Address product return and

• Financial instability, capacity and investment risks • Losing and attracting new investors • Raising additional capital • Inaccurate view of financial performance • Poor cost visibility and hidden costs • Poor pricing *(Sections 2.3.1.1 and 8.6.1)* ***Degree of constraint – 12 + 8 = 20*** ***Degree of causes – 12*** ***Degree of solutions – 7***	•Using a dual account for RL and FL processes •Failure to identify the impact of RL costs •Poor RL cost monitoring ***Organisational causes*** •Lack of management commitment and inattention to RLM •Poor RL strategic planning and procedures •Poor internal integration between departments ***External cause*** •Fraudulent return behaviours ***Other cause*** •FL inefficiencies *(Sections 2.3 and 8.6.1)*	recovery constraints • Address management constraints • Address strategic and control constraints • Address functional constraints • Address consumer and market constraints
Financial and cash constraints • High RL cost • Indirect expenses • Unnecessary expenses • Loss of money and high RL cost risks • Loss of profits and margin *(Sections 2.3.1.3. and 8.6.1)* ***Degree of constraint – 7 + 3 =10*** ***Degree of causes – 33**** ***Degree of solutions – 8****	***Financial causes*** •Additional product return transportation and handling costs •Product return uncertainties and lack of economies of scale •Hidden expenses •Using a dual account for RL and FL processes •Failure to recognise impact of RL costs •Poor RL costing and cost monitoring ***Operational causes*** •Lack of forecasting and planning •Poor RL process, inspection, disposition and transportation •Lack of appropriate IT systems •Failure to recognise value of product recovery •Inventory and product quality risks ***Organisational causes*** •Inattention to RLM and poor strategic planning •Return leniency •Restrictive, lenient and poorly planned return policies •Poor internal integration •Lack of human and IT resources ***External causes*** •Lack of SC collaboration, information sharing and integration •Lack of integrated systems and SC agreements •Opportunistic buying and fraudulent return behaviours •Reputational damage *(Sections 2.3 and 8.6.1)*	• Address financial and cash constraints • Address product return and recovery constraints • Address operational support constraints • Address management barriers • Address strategic and policy constraints • Address functional constraints • Address SC constraints • Address consumer and market constraints
RLM OPERATIONAL CONSTRAINTS		
RLM operational constraints	**RLM operational constraint causes**	**Solution focus area**
Product return and recovery constraints • Product return uncertainties • Poor product return visibility • Limited forecasting and planning • Unpredictable quality and condition of returned products • Demand and forecasting risks • Product quality risks • Inventory risks • Poor return process and RL process failures • Obsolete stock • Poor/no recovery • Loss of product, product control and product value • Contaminated and disorganised inventory • Stockpiling • Poor product return decision making *(Sections 2.3.2., 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 18 + 6 = 24*** ***Degree of cause – 31***	***Financial causes*** • Lack of investment in IT resources ***Operational causes*** • Complexity of product returns • Poor return inspection, transportation and disposition processes • Poor product return segregation • Unpredictable consumer return demand and return volume • Poor information systems and manual operations ***Organisational causes*** • Management inattention to RLM • Poor internal relationships and integration • Poor return policies • Poor strategic planning and procedures • Poor facility and network design • Poor gatekeeping and return leniency • Poor outsourcing decisions • Lack of resource commitment • Poor performance measurement • Lack of skilled/trained staff ***External causes*** • Lack of support from SC parties • Lack of SC information sharing • Lack of SC agreements and integration • Opportunistic buying and fraudulent return behaviours • Poor information sharing with consumers	• Address investment and costing constraints • Address product and recovery constraints • Address operational support constraints • Address management constraints • Address strategy and policy constraints • Address functional constraints • Address SC constraints • Address consumer and market constraints

Degree of solutions – 8*	***Other causes*** • Poor FL processes • Poor procurement *(Sections 2.3, 8.4.1, 8.5.1 and 8.6.1)*	
Operational support constraints • Inadequate information systems and technology • Lack of infrastructure and development • Technology and data management risks • Manual operations and poor systems *(Sections 2.3.2, 8.4.1 and 8.5.1)* ***Degree of constraint 6 + 7 = 13*** ***Degree of cause – 6*** ***Degree of solutions – 4***	***Financial causes*** • Lack of investment in resources ***Operational cause*** • Technology changes ***Organisational cause*** • Lack of top management commitment • Management inattention • Lack of strategic planning • Lack of IT resources *(Sections 2.3, 8.4.1 and 8.5.1)*	• Address investment and costing constraints • Address operational support constraints • Address management constraints • Address strategic constraints
RLM ORGANISATIONAL CONSTRAINTS		
RLM organisational constraints	**RLM organisational constraint causes**	**Solution focus area**
Management constraints • Lack of awareness about the importance of RLM • Lack of top management commitment • Management inattention • Resistance to change • Management risks • Culture risks *(Sections 2.3.3., 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 6 + 8 = 14*** ***Degree of cause – 7*** ***Degree of solutions – 2***	***Financial cause*** •Dismissing RL costs ***Organisational causes*** •Lack of understanding the impact of product returns •Negative management attitude •Fear of the unknown •Weak management •Lack of experienced managers •Inadequate knowledge about people's culture *(Sections 2.3 and 8.6.1)*	• Address investment and costing constraints • Address management constraints
Strategy, policy and control constraints • Lack of strategic planning • Lack of RL strategy • Lack of RL policies • Restrictive policies • Poor return policies • Poor performance measurement and management • Loss of managerial control • Poor accountability and reporting • Internal preservation and strict return conditions *(Sections 2.3.3. 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 11 + 7 = 18*** ***Degree of cause – 18*** ***Degree of solutions – 8****	***Financial cause*** •Lack of investment in IT resources •Lack of financial investment and high costs ***Operational causes*** •Uncertainties of product returns •Poor systems and product return visibility ***Organisational causes*** •Lack of top management commitment •Inattention to RLM •Lack of strategic planning •Poor strategic procedures (formalisation/standardisation) •Poor outsourcing decision making •Lack of resource commitment •Lack of a centralised performance measurement database •Poor internal coordination •Internal preservation and organisational-centric •Return policy design based on legislation ***External causes*** •Fear of sales cannibalisation •Competitive pressures *(Sections 2.3, 8.4.1, 8.5.1 and 8.6.1)*	• Address investment and costing constraints • Address financial and cash constraints • Address product return and recovery constraints • Address operational support constraints • Address management constraints • Address strategic, policy and control constraints • Address functional constraints • Address consumer and market constraints
Functional constraints • Lack of staff training and education • Labour risk of unskilled and untrained staff • Lack of internal coordination and integration • Silo mentality and internal autonomy • Poor internal information sharing • Poor accountability *(Sections 2.3.3, 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 8 + 7 = 15***	***Financial causes*** •Lack of investment in human resources ***Operational causes*** •Inadequate IT systems ***Organisational causes*** •Lack of top management commitment •Different departments capture different return information •Lack of strategic planning •Different departments get measured on different RL performance areas •Poor performance measurement •Lack of resource commitment *(Sections 2.3.3, 8.4.1, 8.5.1 and 8.6.1)*	• Address investment and costing constraints • Address operational support constraints • Address management constraints • Address strategic, policy and control constraints • Address functional constraints

Degree of constraint cause – 8 ***Degree of solutions – 5***		
RLM EXTERNAL CONSTRAINTS		
RLM external constraints	**RLM external constraint causes**	**Solution focus area**
SC constraints • Lack of support from SC parties • Lack of SC collaboration • Lack of SC information sharing • Lack of SCI • Lack of integrated systems • SC risks • Outsourcing risks • Poor return communication *(Sections 2.3.4, 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 8 + 4 = 12*** ***Degree of cause – 14*** ***Degree of solutions – 5***	***Financial causes*** •Lack of investment in IT resources ***Operational causes*** •Inadequate IT systems •Poor product return visibility •Manual operations ***Organisational causes*** •Lack of internal coordination and integration •Poor outsourcing decisions ***External causes*** •SC uncertainties •Shortage of data exchange and information •Poor SC coordination and collaboration •A lack of integrated systems and information sharing •Lack of SC and consumer integration *(Sections 2.3.4, 8.4.1, 8.5.1 and 8.6.1)*	• Address investment and costing constraints • Address product return and recovery constraints • Address operational support constraints • Address functional constraints • Address SC constraints
Consumer and market constraints • Opportunistic buying behaviour • Fraudulent return behaviour • Unnecessary returns • High fraudulent and ineligible returns • Poor return experience • Unmet expectations and dissatisfaction • Consumer frustration and anger • Consumer uncertainty • Poor communication • Service failures • Loss of consumer confidence and trust • Market liabilities • Brand/brand image damage • Reputational damage and risk • Loss of sales • Loss of market share • Loss of consumers *(Sections 2.3.3, 8.4.1, 8.5.1 and 8.6.1)* ***Degree of constraint 21* + 5 = 26*** ***Degree of cause – 21*** ***Degree of solutions – 8****	***Financial causes*** •Lack of investment in IT resources ***Operational causes*** •Inadequate/poor IT systems •Poor RL process •Poor return inspection, segregation and disposition •Poor return visibility ***Organisational causes*** •Inattention to RL •Return leniency and poor gatekeeping •Poor and lenient return policies •Poor strategic planning and procedures •Poor facility/network structure •Poor outsourcing decision-making •Lack of resource commitment •Poor performance measurement •Functional autonomy and poor internal integration •Internal preservation and high return restrictions ***External causes*** •Lack of SC integration and consumer integration •A lack of collaboration with 3PRL providers •Outsourcing risk •Poor pre-return information sharing with consumers ***Other causes*** •Poor FL *(Sections 2.3.4, 8.4.1 and 8.5.1)*	• Address investment and costing constraints • Address product return and recovery constraints • Address operational support constraints • Address management constraints • Address strategic, policy and control constraints • Address functional constraints • Address SC constraints • Address consumer and market constraints

Table 9.5 shows a detailed overview of Framework 2 with the various RLM constraints, causes and solution focus areas. Online retailers can use this framework to identify and investigate (1) RLM constraints (i.e. barriers, risks, problems and pitfalls) that might be applicable to them, (2) potential causes (i.e. barriers, risks, problems and pitfalls) of their specific RLM constraints, and (3) solution focus areas relating to other RLM constraints that can be addressed as potential mitigating solutions. For example, an online retailer that lacks top management commitment can note that dismissing RL costs, a lack of understanding the impact of product returns, negative management attitudes, fear of the unknown, weak management and a lack of experienced managers might be the causes. Evidently, the solution focus areas include addressing investment constraints and management constraints.

Additionally, the online retailer can note that a lack of top management commitment can contribute to other RLM constraints, including investment and costing, operational support, strategy, policy and control and functional constraints, which might motivate them to address a lack of top management commitment for the effective RLM of consumer returns.

Moreover, online retailers can explore the degree of their RLM constraints and related causes and solutions, which can help them to investigate the most significant RLM causes, constraints and solution focus areas. Specifically, in terms of the *degree of constraints*, the framework demonstrates that consumer and market constraints (external RLM) include the highest number of barriers, risks, pitfalls and problems (degree marked with an asterisk), meaning that this RLM constraint category can be highly problematic for online retailers. Furthermore, investment and costing constraints (financial RLM) and management constraints (organisational RLM) contributes to the highest number of RLM constraints (degree marked with a red dot), meaning that online retailers must address these constraints first. Additionally, these constraints will form part of the solution focus areas of most other RLM constraints, meaning that addressing investing and costing constraints and management constraints can help address various other constraints. In terms of the *degree of causes*, financial and cash constraints (financial RLM) include the highest number of causes (degree marked with an asterisk), meaning that any RLM constraint (or poor RLM practice) can cause financial and cash constraints. In other words, poor RLM will result in high RL costs, unnecessary expenses and money, profit and margin losses, which might motivate online retailers to address RLM constraints for the effective RLM of consumer returns.

Concerning the *degree of solutions*, the framework shows that financial and cash constraints (financial), product return and recovery constraints (operational), strategy, policy and control (organisational) and consumer and market constraints (external) involve the highest number of solution focus areas (degree marked with an asterisk). Therefore, if the online retailer chooses to focus on addressing only one RLM constraint, like operational support constraints, they can also expect to lessen the degree of financial and cash, product return and recovery, strategy, policy and control and consumer and market constraints. Finally, the *most problematic RLM constraint* (highest total of barriers, risks, problems, pitfalls and causes) includes consumer and markets constraints. Consequently, online retailers can benefit from focusing on avoiding and addressing consumer and market constraints for the effective RLM of consumer returns.

While the solution focus areas can help online retailers identify and investigate potential measures to counteract the RLM constraints, they must first develop an understanding of the success factors of

effective RLM to effectively address the RLM constraints. Consequently, the next section provides Framework 3 that focuses on understanding the success factors of effective RLM.

9.6 FRAMEWORK 3 – UNDERSTAND THE SUCCESS FACTORS OF EFFECTIVE RLM

According to Lamba *et al.* (2020:398), a lack of understanding effective RLM practices can impede online retailers' ability to manage RL effectively. Consequently, online retailers can benefit from understanding the success factors of effective RLM. While the RLM constraints (Framework 2) represented "what not to do", an understanding of the RLM success factors represent "what to do" for the effective RLM of consumer returns in online retailing. Understanding effective RLM of consumer returns requires an understanding of (1) strategic RLM success factors, (2) design RLM success factors, (3) resource RLM success factors, (4) control RLM success factors and (5) relational RLM success factors. Figure 9.7 provides a broad overview of Framework 3.

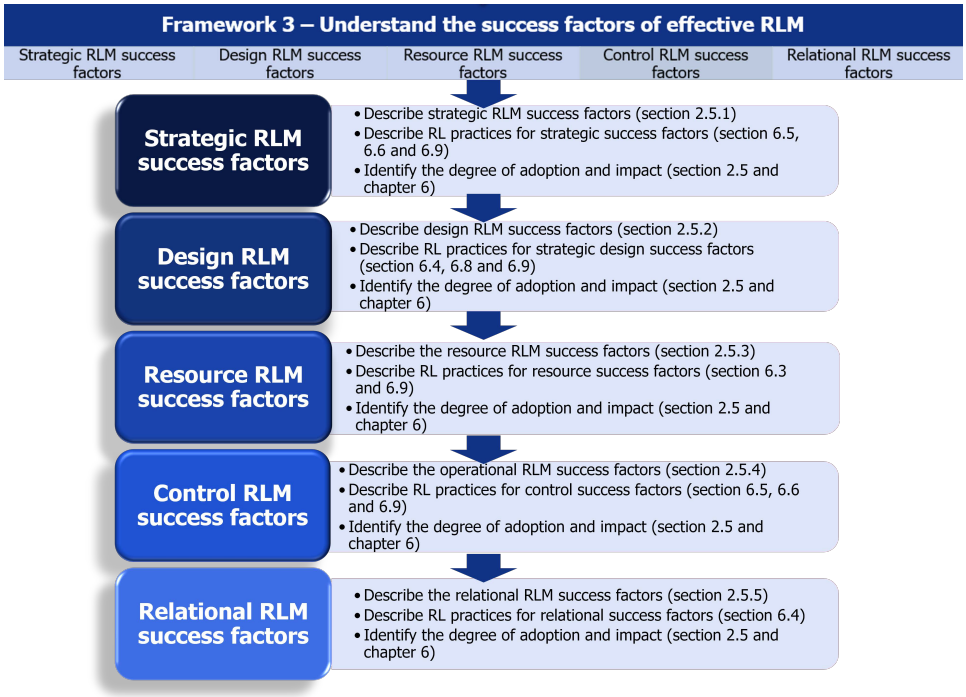

Figure 9.7 Framework 3 - Understand the success factors of effective RLM
Source: Compiled by the researcher

Figure 9.7 shows the part of the main framework associated with Framework 3 (see Figure 9.4) and the main RLM success factor categories, including RLM success factors (from section 2.5), RL practices (from chapter 6) and the degree of adoption and impact. The degree of adoption involves the number of practices/requirements (identified from section 2.5 and chapter 6) associated with the adoption of the RLM success factor (listed in the second column of Table 9.6) and the degree of impact involves the number of contributions (support) that a RLM success factor can provide to other RLM success factors

(identified from the third column of Table 9.6). This can help online retailers identify both the requirements (costs of adoption) and the value (benefits of adoption) of key RLM success factors for the effective RLM of consumer returns. A total of fifteen key RLM success factors were identified from the success factors for RLM (section 2.5) and RL practices (chapter 6).

Table 9.6 provides a detailed overview of Framework 3, including the main RLM success factor categories, fifteen key RLM success factors, including the degree of adoption and impact, and the description and impact of each RLM success factor (with references to chapters 2 and 6).

Table 9.6 Framework 3 - Understand the success factors of effective RLM

STRATEGIC RLM SUCCESS FACTORS		
Key strategic success factors	**Description of strategic RLM success factors**	**Impact on other RLM success factors**
Strategic importance of and commitment to RLM ***Degree of adoption – 5*** ***Degree of impact – 13***	• RLM orientation with management commitment and resource support • Holistic view of RLM to direct RLM strategies • Well-developed understanding of RLM significance • Regard RLM as a strategic asset for consumer acquisition and retention, understanding consumer behaviour and recognising the impact of RLM on the triple bottom line • Senior management involvement to provide a clear RLM vision, strategic and tactical plans, control over the RL function and access to the board of directors for corporate RL decision making *(Sections 2.5.1.1 and 6.9.4)*	• Enables strategic implementation of RLM • Important for well-developed RL strategies and systems • Supports a well-designed return policy and RL process • Enables appropriate and sufficient resources and IT • Contributes to skilled and trained staff • Important for well-developed RL performance management • Supports consumer-centric return prevention • Important for well-controlled RL costs and risks • Enhances well-established functional, SC and consumer relationships *(Section 2.5 and chapter 6)*
Strategically implemented RLM ***Degree of adoption – 7*** ***Degree of impact – 7***	• Strategic implementation of inhouse RLM represents full control over RL based on cost-benefit analysis and identification of strategic implications and requirements of outsourcing • Strategic implementation of RLM through outsourcing based on cost-benefit analysis, identification of strategic implications, requirements and degree of RL outsourcing, identification of types of services, RL processes and types of third parties for RL outsourcing, and strategic selection of the most suitable outsourced partner *(Sections 2.5.1.2 and 6.5)*	• Important for well-developed RL strategies and systems • Enables a well-designed RL process and network • Supports appropriate and sufficient resources • Enables appropriate IT • Promotes well-established SC and consumer relationships *(Section 2.5 and chapter 6)*
Well-developed RL strategies and systems ***Degree of adoption – 5*** ***Degree of impact – 6***	• Well-developed strategic plan for RL integrated with the strategic plan of the organisation • Well-planned RL strategy focused on RL and marketing interface, return policy, disposition, recovery and stakeholders • Well-developed disposition strategy based on well-developed reuse, product recovery and secondary markets and strategies and strategic understanding and analysis of disposition decision factors • Well-developed RL strategies incorporated into overall organisational strategies • Well-planned RL system focused on RL process efficiency and cost effectiveness *(Sections 2.5.1.3, 6.6.1 and 6.9.4)*	• Important for a well-designed return policy and RL process • Directs well-developed performance management • Enables well-controlled RL costs and risks • Supports well-established functional and consumer relationships *(Section 2.5 and chapter 6)*
DESIGN RLM SUCCESS FACTORS		
Key design success factors	**Description of design RLM success factors**	**Impact on other RLM success factors**
Well-designed return policy ***Degree of adoption – 5*** ***Degree of impact – 6***	• Return policy aligned with RL strategies • Return policy with clear terms and conditions • User-friendly return policy enables consumers to understand their roles and responsibilities • Return policy based on consumer behaviour and impact of RL performance • Return policy based on well-considered level of leniency and strictness through a cost/benefit analysis *(Sections 2.5.2.1, 6.4.2 and 6.9.3)*	• Facilitates a well-designed RL process • Supports skilled and trained staff • Important for well-developed performance management • Directs consumer-centric return prevention • Enables well-established SC and consumer relationships *(Section 2.5 and chapter 6)*
Well-designed RL process	• Formalised RL process designed by an experienced manager • Formalised RL process with written policies, SOPs, manuals, job	• Enables appropriate IT • Supports skilled and trained staff

Degree of adoption – 4 ***Degree of impact – 8***	descriptions and flow charts that enables staff to understand their roles and responsibilities • Clear and consumer-centric RL process focused on user-friendliness, minimal effort, speed and convenience • Streamlined RL process based on pre-receipt RL process automation *(Sections 2.5.2.2 and 6.9.4)*	• Directs well-developed performance management • Important for consumer-centric return prevention • Important for well-controlled RL costs and risks • Promotes well-established functional, SC and consumer relationships *(Section 2.5 and chapter 6)*
Well-designed RL network ***Degree of adoption – 4*** ***Degree of impact – 7***	• Robust, integrated, technology-enabled, consumer-centric and flexible RL network • Well-considered network design type through cost-benefit analysis and strategic decisions • Well-considered facility locations through cost-benefit analysis and strategic decisions • Well-considered facility types through cost-benefit analysis and strategic decisions *(Sections 2.5.2.3 and 6.8.1)*	• Facilitates strategic implementation of RLM • Important for a well-designed RL process • Supports a well-developed performance management • Enables well-controlled RL costs and risks • Promotes well-established functional, SC and consumer relationships *(Section 2.5 and chapter 6)*
RESOURCE RLM SUCCESS FACTORS		
Key resource success factors	**Description of resource RLM success factors**	**Impact on other RLM success factors**
Appropriate and sufficient resources ***Degree of adoption – 8*** ***Degree of impact – 8***	• Prioritised resource commitment • Appropriate and sufficient financial resources • Consistent devotion of capital resources • Appropriate and sufficient commitment and investment in IT resources • Investment in an appropriate RLM infrastructure • Appropriate and sufficient commitment and investment in human resources • Appropriate and sufficient RL process resources • Establish a dedicated function *(Sections 2.5.3.1, 6.9.1 and 6.9.4)*	• Enables a well-designed RL process and network • Important for appropriate IT • Important for skilled and trained staff • Supports well-developed performance management • Important for well-controlled RL costs and risks • Enables well-established functional and consumer relationships *(Section 2.5 and chapter 6)*
Appropriate IT ***Degree of adoption – 6*** ***Degree of impact – 9***	• Prioritise IT for RLM • Established IT infrastructure • State-of-the art with tracking and tracing and information management and analysis capabilities • Appropriate IT enables integration, communication and real-time information sharing • Appropriate IT supports decision-making, performance measurement, gatekeeping and return avoidance • Well-considered IT types with continuous IT development *(Sections 2.5.3.2 and 6.3.1)*	• Directs strategic implementation of RLM • Enables a well-designed RL process and network • Important for well-developed performance management • Supports consumer-centric return prevention • Facilitate well-controlled RL costs and risks • Important for well-established functional, SC and consumer relationships *(Section 2.5 and chapter 6)*
Skilled and trained staff ***Degree of adoption – 4*** ***Degree of impact – 8***	• Skilled staff can facilitate product returns, disposition, and speedy returns processing, practice gatekeeping and service recovery and analyse product return data and assess RL performance • Well-developed staff training and education programmes in RL • Continued skills development and training initiatives • Staff trained on consumer communication, RL processes, consumer service and satisfaction, gatekeeping, IT use and consumer behaviour *(Sections 2.5.3.3 and 6.9.5)*	• Directs strategic implementation of RLM • Important for a well-designed RL process • Supports appropriate IT • Supports well-developed performance management • Important for consumer-centric return prevention • Enables well-controlled RL costs and risks • Supports well-established SC and consumer relationships *(Section 2.5 and chapter 6)*
CONTROL RLM SUCCESS FACTORS		
Key control success factors	**Description of control RLM success factors**	**Impact on other RLM success factors**
Well-developed performance management ***Degree of adoption – 7*** ***Degree of impact – 8***	• Well-developed performance management framework and measurement system • Performance focused on consumers, service performance, efficiency, costs, strategies, return policy and RL process design • Well-developed KPIs and metrics capable of measuring, tracking and evaluating RL performance • Standardised and centralised performance measurement • Constant monitoring and evaluation based on return data, consumer feedback and performance audit • Reported RL performance to senior management and perform annual performance evaluation and examination of RL metrics • Developed reward systems and incentives *(Sections 2.5.4.1 and 6.7.1)*	• Supports well-developed RL strategies and systems • Facilitates a well-designed RL process and network • Important for consumer-centric return prevention • Important for well-controlled RL costs and risks • Enables well-established functional, SC and consumer relationships *(Section 2.5 and chapter 6)*
Consumer-centric return prevention ***Degree of adoption – 4***	• Well-informed consumer and support during online shopping • FL efficiency and quality management and control • Well-developed gatekeeping function • Use and share consumer feedback and return data for	• Promotes skilled and trained staff • Informs a well-developed performance management • Important for well-controlled RL costs and risks • Important for well-established functional, SC and

Degree of impact – 6	improvements *(Sections 2.5.4.2 and 6.9.3)*	consumer relationships *(Section 2.5 and chapter 6)*
Well-controlled RL costs and risks ***Degree of adoption – 6*** ***Degree of impact – 8***	• Total cost approach and well-understood RL costs • Well-developed accounting systems and costing techniques for RL • Implemented cost strategies, policies and control • Well-defined RL risks • Well-developed RL risk classification and assessment system • Well-developed RL risk mitigation strategies *(Sections 2.5.4.3 and 6.9.2)*	• Important for strategic implementation of RLM • Supports well-developed RL strategies and systems • Motivates appropriate IT • Motivates skilled and trained staff • Enables a well-developed performance management • Enables consumer-centric return prevention • Enables well-established functional and SC relationships *(Section 2.5 and chapter 6)*
RELATIONAL RLM SUCCESS FACTORS		
Key relational success factors	**Description of relational RLM success factors**	**Impact on other RLM success factors**
Well-established functional relationships ***Degree of adoption – 6*** ***Degree of impact – 8***	• Supportive culture • Clear functional roles and responsibilities in RL • Integrated departmental functions • Common goals and centralised IT system • Cross-functional information and knowledge sharing • Cross-functional collaboration, cooperation and communication *(Sections 2.5.5.1 and 6.4.3)*	• Important for a well-designed return policy • Promotes appropriate and sufficient resources • Supports skilled and trained staff • Enables well-developed performance management • Important for consumer-centric return prevention • Important for well-controlled RL costs and risks • Enables well-established SC and consumer relationships *(Section 2.5 and chapter 6)*
Well-established SC relationships ***Degree of adoption – 5*** ***Degree of impact – 10***	• Established collaborative agreements, partnerships or alliances • Shared goals, processes, policies, responsibilities, resources, costs and risks • SC information and knowledge sharing • Integrated IT and SC partners • SC collaboration, coordination, cooperation and communication *(Sections 2.5.5.2 and 6.4.1)*	• Supports strategic implementation of RLM • Enables well-developed RL strategies and systems • Important for a well-designed RL process and network • Supports appropriate and sufficient resources and IT • Directs well-developed performance management • Supports consumer-centric return prevention • Important for well-controlled RL costs and risks • Enables well-established consumer relationships *(Section 2.5 and chapter 6)*
Well-established consumer relationships ***Degree of adoption – 5*** ***Degree of impact – 10***	• Adoption of a consumer-centric approach and focus on consumer experience, expectations, interests and value • Established consumer support system • Consumer integration and participation • Consumer information sharing and communication • Consumer relationship and service management systems *(Sections 2.5.5.3 and 6.4.2)*	• Motivates strategic importance and commitment to RLM • Directs strategic implementation of RLM • Motivates well-designed return policy, RL process and RL network • Enables appropriate IT and skilled and trained staff • Directs well-developed performance management • Important for consumer-centric return prevention • Enables well-established SC relationships *(Section 2.5 and chapter 6)*

Source: Compiled by the researcher

Table 9.6 shows a detailed overview of Framework 3 with the key RLM success factors and related description and impact on other RLM success factors. This framework can be used as a benchmark for online retailers to compare their current RL practices, processes and procedures to further identify shortcomings or potential sources to improve effectiveness in RLM, and the compound effect of the success factors on other success factors. For example, the online retailer can determine if the functional relationships within their organisation can be characterised as being supportive, having clear functional roles and responsibilities for RL, having integrated, common goals and systems, having cross-functional information and knowledge sharing and having cross-functional collaboration, cooperation and communication. Consequently, online retailers can focus on adopting these specific success factor characteristics as well as other RLM success factors, including strategic importance and commitment to RLM, well-developed RL strategies and systems, a well-designed RL process, a well-designed RL network, appropriate and sufficient resources, appropriate IT, well-developed performance

management, consumer-centric return prevention and well-controlled RL costs and risks as support for the establishment of functional relationships for the effective RLM of consumer returns. Additionally, the online retailer can identify that well-established functional relationships can support or enable other RLM success factors, including a well-designed return policy, appropriate and sufficient resources, skilled and trained staff, well-developed performance management, consumer-centric return prevention, well-controlled RL costs and risks and well-established SC and consumer relationships, which may further motivate them to adopt well-established functional relationships for the effective RLM of consumer returns.

Furthermore, online retailers can explore the degree of adoption and impact of the fifteen identified key success factors, which can help them understand the requirements of adoption and importance of each. Regarding the degree of adoption and impact, the framework illustrates that the most important RLM success factor includes strategic importance and commitment to RLM (strategic RLM success factor) in terms of the degree of adoption (5) and degree of impact (13). Evidently, online retailers can prioritise the adoption of strategic importance and commitment to RLM for the effective RLM of consumer returns. Following, strategic importance and commitment, well-established SC and consumer relationships (relational RLM success factors) can be significant in terms of the degree of adoption (5) and impact (10), demonstrating that well-established external relationships must be a priority for online retailers. Nevertheless, the true significance of adopting the success factors of effective RLM can only be understood through the support of RLM practices (see the conclusion of section 9.7) and justification of adoption through the number of RLM constraints addressed and benefits realised (Framework 5 presented in section 9.8).

Essentially, Framework 3 can help online retailers to shift focus and understand the key success factors (or benchmarks) for the effective RLM of consumer returns. In the next section, Framework 4 that associates with the identification and implementation of effective RLM practices, will be presented.

9.7 FRAMEWORK 4 – IDENTIFY AND IMPLEMENT RLM PRACTICES

According to Ratchford *et al.* (2022:170), with an increase in competition in the online retail industry, effective RLM of consumer returns must be a key strategic focus area for retailers. However, Eriksson and Käck (2023:1) found that RLM in online retailing can be multifaceted, complex and costly, requiring various initiatives for efficiency and effectiveness. Consequently, the purpose of Framework 4 is to help online retailers identify and implement suitable RLM practices for the effective RLM of consumer returns.

As explained in section 9.3.4, Framework 4 consist of (1) key RLM practices (key practices from sections 8.4.2, 8.5.2 and 8.6.2), (2) requirements (support RL practices from sections 8.4.2, 8.5.2 and 8.6.2 and chapter 6), (3) considerations (key parameters in sections 8.4.2.4, 8.5.2.3 and 8.6.2.4), and (4) RLM success factors to adopt (identified from Framework 3). The structure of the RLM practices in Framework 4 include *priority RLM practices* (most significant key practices in terms of occurring in more than one theme from sections 8.4.2, 8.5.2 or 8.6.2), *prevention and control specific RLM practices* (section 8.4.2), *service specific RLM practices* (section 8.4.3), and (3) *cost specific RLM practices* (section 8.4.4). Figure 9.8 provides a broad overview of Framework 4.

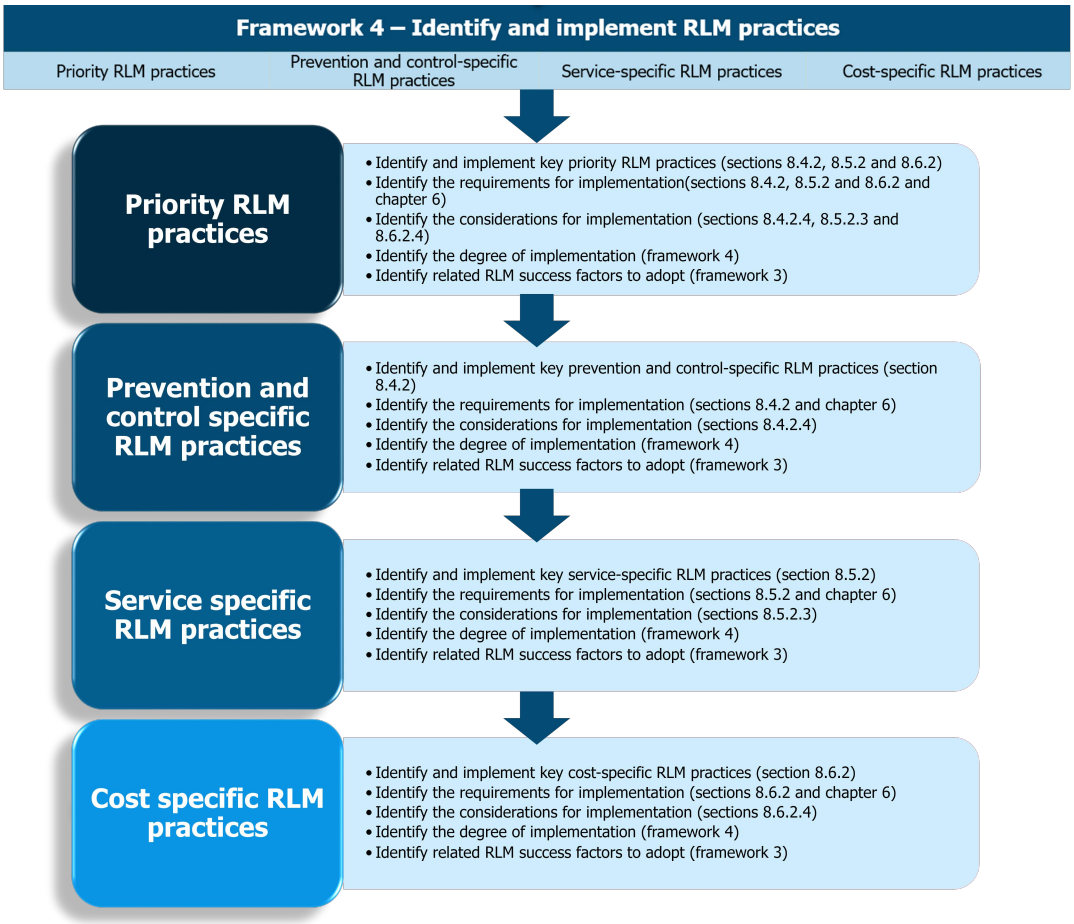

Figure 9.8 Framework 4 - Identify and implement RLM practices
Source: Compiled by the researcher

Figure 9.8 shows the part of the main framework (see Figure 9.4) associated with Framework 4, and the RLM practice categories, including the key RLM practices, requirements and considerations (identified from sections 8.4.2, 8.5.2 and 8.6.2 and chapter 6) for identification and implementation, and the degree of implementation (identified in Framework 4) and RLM success factors to adopt (from Framework 3). The degree of implementation represents the number of elements (repeated throughout) the description, requirements and considerations (first number in Table 9.7) of each key RLM practice

and the number of success factors to adopt (second number in Table 9.7). This provides an indication as the potential effort or complexity of implementing specific key RLM practices.

Additionally, the framework includes the proposition categories from chapter 8 (interview findings) associated with the key RLM practices. The proposition categories included abbreviations, which will be referenced in Framework 4 for presentation purposes. The specific propositions referenced in the framework include the (1) proactive return prevention (PRP) categories of pre-sales PRP and post-sales PRP, (2) reactive return prevention (RRP) categories of RRP examination and RRP interventions, (3) reverse logistics control (RLC) categories of operational RLC and managerial RLC, (4) service-oriented return (SOR) categories of SOR communication and processes, (5) return service performance (RSP) categories of RSP evaluation, RSP improvement and RSP management, (6) return cost evaluation (RCE) categories of RCE tools and RCE execution, (7) cost-orientated return (COR) categories of COR processes and COR recovery, and (8) return cost management (RCM) categories of RCM mitigation and RCM execution (see sections 8.4.2, 8.5.2 and 8.6.2).

Table 9.7 provides a detailed overview of Framework 4, including the main RLM practice categories of priority RLM practices, prevention and control specific RLM practices, service specific RLM practices and cost specific RLM practices (headings in table 9.7). The *key RLM practices* are presented in the first column (in **bold**, *italics* and underlined) with references to the relevant sections in chapter 8. Also presented under key RLM practices (first column) are the *associated key practices* (or proposition categories), and the degree of implementation. In the second column the *description* (same reference as the key RLM practice), *requirements* (with references to chapter 6) and *considerations for implementation* of the key RLM practices (with references to chapter 8) are presented. In the final column, the related RLM success factors (identified from Framework 3) can be found.

Table 9.7 Framework 4 - Identify and implement RLM practices

PRIORITY RLM PRACTICES		
Key priority RLM practices	**Description, requirements and considerations for implementation**	**Related RLM success factors**
Pre-return inspection *(sections 8.4.3.2.1, 8.5.2.1.2 and 8.6.2.2.1)* ***Associated key practices*** • RL process optimisation for operational RLC • SOR inspection • COR inspection ***Degree of implementation 6 + 4 = 10***	***Description*** • Dedicated staff to inspect products at consumer homes enables the prevention of unnecessary false failure or fraudulent returns, enhances consumer service and enable cost savings by avoiding unnecessary transportation, receiving, processing and redistribution processes. ***Requirements*** • Consumer-centric RL processes, consumer service and support initiatives and interacting with consumers *(section 6.4.2)* • Human resource commitment *(section 6.9.1)* ***Considerations*** *(sections 8.4.2.4, 8.5.2.3 and 8.6.2.4)* • Pre-return inspection feasible for high return regions • Pre-return inspection appropriate for technology, electronics and appliances with higher chances of false failure returns • Consider consumer protection legislation to ensure that pre-return inspection is feasible	• Well-developed system • Well-designed RL process • Appropriate and sufficient resources • Well-established consumer relationships *(See Framework 3)*
Optimised RL process* *(sections 8.4.3.2.1 and 8.5.2.1.2)*	***Description*** • Optimising the RL process through the implementation of various practices and initiatives (see requirements) to improve the control of product returns and RL processes and provide	• Strategic importance and commitment to RL

Associated key practices • RL process optimisation for operational RLC • SOR process optimisation ***Degree of implementation 15 + 10* = 25***	consumers with a lenient, hassle-free and an efficient return process ***Requirements*** • State-of-the-art IT and IT with integrated functionalities for RL *(section 6.3.1)* • Consumer-centric return policies and RL processes, consumer service and support initiatives and interacting with consumers *(section 6.4.2)* • Cross-functional teams, functional relationships and collaborating, cooperating and coordinating between functions *(section 6.4.3)* • Deciding on the degree and type of 3Ps for RL outsourcing and selecting a 3PRL provider *(section 6.5.1)* • Performance measurement for RL and performance monitoring and review *(section 6.7.1)* • Centralised facilities for RL *(section 6.8.4)* • Financial, IT and infrastructure, RL process and human resource commitment *(section 6.9.1)* • Strategic approach and perspective for strategic planning in RL and integrating strategic plans for RL with organisational strategic plans *(section 6.9.4)* • Establish a RL function, implement RL staff training and education and produce skilled and well-trained staff *(section 6.9.5)* ***Considerations*** *(sections 8.4.2.4 and 8.5.2.3)* • Consider product characteristics for the training of staff to handle returns efficiently • Consider capabilities to invest in financial resources, use facility resources, develop appropriate integrated IT and staff capabilities for optimised RL process • Consider the resource capabilities and willingness of 3PRL providers to integrate • Consider the cost of investment versus the benefits of an optimised RL process • Consider consumer protection legislation for more leniency in the return process	• Strategic implementation of RLM • Well-developed RL strategies and systems • Well-designed RL process • Well-designed RL network • Appropriate and sufficient resources • Appropriate IT • Skilled and trained staff • Well-developed RL performance management • Well-established functional relationships *(See Framework 3)*
Streamlined return logging *(sections 8.5.2.1.2 and 8.6.2.2.1)* ***Associated key practices*** • SOR request • COR request ***Degree of implementation 5 + 3 = 8***	***Description*** • Online web-based system for self-service return request that enables both a consumer-centric and cost-effective return logging ***Requirements*** • Online return capabilities and using the Internet and website for RL *(section 6.3.2)* • Consumer-centric RL processes *(section 6.4.2)* ***Considerations*** *(sections 8.5.2.3 and 8.6.2.4)* • Consider IT capabilities to establish self-service return request portal • Consider capabilities of consumers to use self-service return logging on the platform	• Well-developed system • Well-designed RL process • Appropriate IT *(See Framework 3)*
Online authorisation *(sections 8.4.2.1.2, 8.6.2.2.1 and 8.6.2.3.1)* ***Associated key practices*** • Gatekeeping for post-sales PRP • COR request and gatekeeping • Return regulation for RCM mitigation ***Degree of implementation 6 + 3 = 9***	***Description*** • Digitise the return policy and transmit it into the online functionality to automatically reject product returns outside the return policy parameters • Online authorisation not only facilitate with the prevention of ineligible and fraudulent returns but also enables cost-effective gatekeeping and control of return costs ***Requirements*** • Online return capabilities and using the Internet and website for RL *(section 6.3.2)* • Implement gatekeeping practices *(section 6.9.3)* ***Considerations*** *(sections 8.4.2.4 and 8.6.2.4)* • Consider capabilities to establish an online authorisation system • Online authorisation can be important for electronics and technology type of products to avoid acceptance of obsolete products	• Well-designed return policy • Well-designed RL process • Appropriate IT *(See Framework 3)*
Efficient return collection *(Sections 8.5.2.1.2 and 8.6.2.2.1)* ***Associated key practices*** • SOR collection • COR collection ***Degree of implementation 10 + 6 = 16***	***Description*** • Simultaneous return pick-up and replacement/exchange drop-off reduce waiting time and improves consumer service • Convenient return drop-off points that enable both a consumer-centric and cost-effective return collection • Outsourcing to a 3PRL provider enables a fast, cost-effective and consumer-centric return collection ***Requirements*** • Cross-functional teams, functional relationships and collaborating, cooperating, coordinating and information sharing between functions *(section 6.4.3)* • Deciding on the type of RL service and third party for RL outsourcing *(section 6.5.1)* • Decentralised retail locations and multiple/flexible locations for RL *(section 6.8.4)* ***Considerations*** *(sections 8.5.2.3 and 8.6.2.4)* • Online-only retailers can use convenience stores or third-party drop-off locations • Multi/omnichannel retailers can use stores • Consider RL process capabilities for efficient return collection • Consider the capabilities of the 3PRL provider to integrate and resources for efficient collection	• Strategic implementation of RLM • Well-developed system • Well-designed RL process • Well-designed RL network • Well-established functional relationships • Well-established SC relationships *(See Framework 3)*
Effective product disposition and recovery •	***Description*** • Disposition management enables the management and control of returned products in the disposition process, which can involve supplier engagement, training of disposition staff,	• Strategic importance and commitment to RLM

(sections 8.4.2.1.1 and 8.6.2.2) ***Associated key practices*** • Product disposition management for operational RLC • COR disposition • COR recovery ***Degree of implementation 24 + 8 = 32***	maintaining internal disposition control or using specialist 3PRL providers • The establishment of a cost-effective and speedy disposition process involves the use of decentralised locations fast disposal or specialist 3PRL providers • Effective product and cost recovery involves a recovery strategy, dedicated department/function that includes recovery staff and a dedicated manager, and SC agreements • The most valuable recovery approach includes reselling directly through the website or if products require repackaging at a discounted price on the website, which can be enhanced through a traditional facility (DC) or return facility next to the main facility for fast restocking • SC agreements with third-party buyers of product returns enable cost-effective recovery through secondary channels • Agreements with suppliers and the use of dedicated staff to engage with supplier enable the transfer of RL costs/expenses of consumer returns to suppliers for full cost recovery ***Requirements*** • SC collaboration, coordination and communication, SC contract and agreements, and information, risks and responsibilities sharing *(section 6.4.1)* • RL in/outsourcing decisions, decide the type of RL processes, services and 3Ps for RL outsourcing, and select 3PRL provider *(section 6.5.1)* • Focus on benefit-driven disposition options, prepare for disposition strategy implementation, establish disposition rules and policies, develop reuse, product recovery and secondary market strategies and implement a formal disposition strategy *(section 6.6.1)* • Use a separate facility at a single location for RL *(section 6.8.2)* • Use a standard facility/location for RL *(section 6.8.3)* • Decentralise specific RL processes *(section 6.8.5)* • Commit human resources *(section 6.9.1)* • Full-time RL manager portfolio and assign an experienced manager to RL *(section 6.9.5)* • Establish a RL function, implement and conduct RL staff training and education initiatives, and produce well-skilled staff for RL *(section 6.9.5)* ***Considerations*** *(sections 8.4.2.4 and 8.6.2.4)* • The product type must be considered for the training of disposition staff • Consider capabilities for effective disposition and recovery, which can help with the decision of using a 3PRL provider and alternative recovery operations • Consider the capabilities of 3PRL providers to perform effective disposition and willingness to integrate and share information • Consider compliance requirements with environmental policies, which can help with the decision of using a 3PRL provider • High return volume might be more appropriate for recovery through the secondary markets to avoid sales cannibalisation • Consider the type of return and product condition for the best recovery option • For perishable products consider fast disposal using decentralised locations • Consider supplier return policies for suitable recovery operations • Consider consumer protection legislation when selling repacked items at a discount through the website	• Well-developed RL strategies and systems • Well-designed RL process • Well-designed RL network • Appropriate and sufficient resources • Skilled and trained staff • Well-controlled RL costs and risks • Well-established SC relationships *(See Framework 3)*
Clearly communicated return policies *(Sections 8.4.2.1.1 and 8.5.2.1.1)* ***Associated key practices*** • Return restrictions for pre-sales PRP • Initial SOR communication ***Degree of implementation 5 + 3 = 8***	***Description*** • Clear communication of the return policy, procedures and conditions means that the return policy must be easy-accessible on the website (e.g. clear link) and understandable (e.g. without legal terms), and the return conditions must be clearly presented both in the return policy and on the product page, which can be important for consumer service and prevention of unnecessary returns ***Requirements*** • Consumer communication and information sharing *(section 6.4.2)* • Clear return policies and return restrictions for return prevention *(section 6.9.3)* • Defining roles and responsibilities in RL, standardising RL processes and publishing accessible strategic procedures for RL *(section 6.9.4)* ***Considerations*** • None	• Well-designed return policy • Consumer-centric return prevention • Well-established consumer relationships *(See Framework 3)*
Return charges and penalties *(Sections 8.4.2.1.1, 8.4.2.2.2 and 8.6.2.3.1)* ***Associated key practices*** • Return restrictions for pre-sales PRP • Party interventions for RRP • Return charges and penalties for RCM	***Description*** • Increasing return restrictions by charging for returns can help reduce high returns and mitigate financial losses due to high returns • With the help of SC metrics and integration, monetary penalties can be given to couriers/3PLs that damage products during delivery, which helps prevent unnecessary damaged product returns, recover costs and minimise monetary losses ***Requirements*** • Return restrictions for return prevention *(section 6.9.3)* • SC agreements, integration and information sharing and cost and risk sharing *(section 6.4.1)* • Appropriate KPIs and performance monitoring and review *(section 6.7.1)* ***Considerations*** *(sections 8.4.2.4 and 8.6.2.4)* • Consider the benefits of charging return fees against the potential costs of losing consumers	• Well-developed RL performance management • Well-controlled RL costs and risks • Well-established SC relationships *(See Framework 3)*

mitigation ***Degree of implementation 10 + 3 = 13***	• Consider charging consumers for unwanted returns but cover the return costs for damaged/defective products • Consider charging consumers delivery fees if the return eliminates the qualification of the free delivery threshold • Market share must be considered before charging for returns, if penetration is low, return charging might be damaging • Consider consumer protection legislation to determine if return charges can be applied	
Preventative gatekeeping • *(sections 8.4.2.1 and 8.6.2.3)* ***Associated key practices*** • Gatekeeping for post-sales PRP • Return regulation for RCM mitigation ***Degree of implementation 7 + 4 = 11***	***Description*** • Requesting photo evidence from consumers as a gatekeeping measure enables the prevention of unnecessary or fraudulent returns and mitigate the financial losses of accepting ineligible returns • Managers can be valuable gatekeepers to ensure that correct gatekeeping decisions are made to avoid unnecessary returns ***Requirements*** • Consumer communication, information sharing and interaction *(section 6.4.2)* • Gatekeeping practices for return prevention *(section 6.9.3)* • Assign experienced managers to RL *(section 6.9.5)* ***Considerations*** *(sections 8.4.2.4 and 8.6.2.4)* • Consider consumer protection legislation for effective implementation of preventative gatekeeping measures • Focus on determining the product condition during the review of photographs for appropriate gatekeeping decisions	• Strategic importance and commitment to RLM • Consumer-centric return prevention • Well-controlled RL costs and risks • Well-established consumer relationships *(See Framework 3)*
Preventative inspection *(sections 8.4.2.1, 8.6.2.2 and 8.6.2.3)* ***Associated key practices*** • Inspection for post-sales PRP • COR inspection • Return regulation for RCM mitigation ***Degree of implementation 11 + 6 = 17***	***Description*** • Manufacturer inspections on the premises can be used to prevent counterfeit returns • Appoint educated inspectors and train inspection staff to (1) understand the return policy for detection of fraudulent returns, (2) test for false failures, (3) identify product abuse, (4) identify illegitimate claims and (5) avoid making emotional decisions, which enables effective return prevention, cost savings and avoid large financial losses associated with return claims • Use disposition staff tasked with cleaning and packaging of products to spot signs of wear or use ***Requirements*** • SC collaboration, cooperation and sharing of responsibilities and costs *(section 6.4.1)* • Human resource commitment *(section 6.9.1)* • Establish a RL function, develop RL skills/knowledge and staff training and education programmes, provide formal training and produce well-trained and skilled staff for RL *(section 6.9.5)* ***Considerations*** *(sections 8.4.2.4 and 8.6.2.4)* • Consider asking suppliers to train inspectors on their products at their costs for effective inspection • Consider the product type and condition for the allocation of appropriate disposition/recovery staff • Consider product value and returned product characteristics, like luxury consumer goods, for using manufacturer inspections • Consider capabilities to implement preventative inspection • Consider SC partners willingness to collaborate and integrate	• Well-designed return policy • Well-designed RL process • Appropriate and sufficient resources • Skilled and trained staff • Well-controlled RL costs and risks • Well-established SC relationships *(See Framework 3)*
Consumer feedback, complaints and product return data *(Sections 8.4.2.1.1, 8.5.2.2.1 and 8.5.2.2.2)* ***Associated key practices*** • Information usage and analysis for RRP examination • RSP evaluation data sources • RSP improvement preparation • RSP improvement execution ***Degree of implementation 15 + 7 = 22***	***Description*** • Establish robust consumer feedback loops to use and analyse consumer feedback and complaints data to identify problems in the FL process and procurement that leads to high returns and evaluate service performance for improvement initiatives • Product return data from AI and predictive analytics software or 3PRL providers can be used to identify problems with products or brands associated with high returns and evaluate service performance • Create platforms to attain input from consumers with open-ended questions for service improvement preparation • Managers can be used to analyse consumer feedback and complaints data and product data to perform a root cause analysis for return reasons, evaluate service performance and help prepare for and execute return service improvements • Create platforms to attain input from consumers with open-ended questions for service improvement preparation ***Requirements*** • Use IT with information management capabilities *(section 6.3.1)* • Attain consumer input and participation *(section 6.4.2)* • Select appropriate 3PRL providers *(section 6.5.1)* • Commit IT and human resources *(section 6.9.1)* • Identify product return drivers and use return analytics for return avoidance (section 6.9.3) • Assign experienced managers to RL *(section 6.9.5)*	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Appropriate and sufficient resources • Appropriate IT • Consumer-centric return prevention • Well-established SC relationships • Well-established consumer relationships *(See Framework 3)*

	Considerations *(sections 8.4.2.4 and 8.5.2.3)* • Consider complaints volume for the evaluation of service performance, the need for improvement plans and appropriate improvement executions • Consider the product condition and type for the effective analysis of product data for reactive return prevention • Consider IT and information management capabilities for product return data, which might help the decision if a 3PRL provider can be used • Consider the information sharing capabilities of a 3PRL provider • Consider privacy legislation for obtaining consumer feedback and complaints data	
PREVENTION AND CONTROL-SPECIFIC RLM PRACTICES		
Key RLM practices	**Description, requirements and considerations for implementation**	**Related RLM success factors**
Logistics excellence and information sharing initiatives for pre-sales PRP *(section 8.4.2.1.1)* ***Degree of implementation 8 + 2 = 10***	***Description*** • Logistics excellence for return prevention involves an efficient logistics process, quality management, picking and dispatch control measures, packaging solutions and training of logistics staff to understand the impact of poor logistics on returns • Information sharing initiatives for return prevention involves accurate meta-data (e.g. size guides) on website for product descriptions, detailed and informative product descriptions, in-house photography for improved product pictures, product videos, showrooming, consumer reviews or any other initiatives to help consumers make better purchase decisions ***Requirements*** • Consumer education initiatives for consumer integration *(section 6.4.2)* • Consumer support and product-related initiatives for return avoidance *(section 6.9.3)* • RL training and education programmes *(section 6.9.5)* ***Considerations*** *(section 8.4.2.4)* • Consider the type of product for the suitable information sharing initiative • Consider the costs of implementing effective procurement and inbound inspection against the benefits of preventing consumer returns • Consider the costs of uploading photographs and providing detailed description of products against the benefits of avoiding consumer returns	• Consumer-centric return prevention • Well-established consumer relationships *(See Framework 3)*
Metrics, product experts and abuse investigations for RRP examination *(section 8.4.2.2)* ***Degree of implementation 12 + 3 = 15***	***Description*** • Appropriate metrics for reactive return prevention examination can include returns versus sales percentage to identify and examine causes of high product returns and return reasons and SC metrics to examine logistics failures that cause high and unnecessary returns • Product experts in the RL department can help investigate return causes related to problematic products as a targeted return prevention initiative • Investigate individual return abusers as a targeted return prevention initiative ***Requirements*** • Appropriate KPIs and evaluate and analyse performance results *(section 6.7.1)* • Commit human resources and RL process resources *(section 6.9.1)* • Classify consumers, develop a consumer database and implement return avoidance strategies *(section 6.9.3)* • Establish a RL function *(section 6.9.5)* ***Considerations*** *(section 8.4.2.4)* • Consider product return volume for return prevention examination • Consider the product condition for the return prevention examination using product return reasons and SC metrics • Consider the product type for the allocation of appropriate product experts for targeted investigations • Consider consumer behaviour for the investigation of individual abusers since some consumers might be uncertain about their purchases (because of poor information sharing on the website) without engaging in abusive behaviour • Consider consumer rights for the investigation of return abuse	• Appropriate and sufficient resources • Well-developed RL performance management • Consumer-centric return prevention *(See Framework 3)*
Product interventions, supplier exit and account suspensions for RRP intervention *(section 8.4.2.2.2)* ***Degree of implementation 11 + 4 = 15***	***Description*** • Product interventions as reactive return prevention initiatives involve sharing information with procurement and suppliers to consider product or packaging redesign to reduce defective/damage returns, contacting manufacturers with unusually high defective returns to consider a product recall and share information with procurement to discontinue selling products associated with high returns • Using appropriate metrics, supplier contracts can be cancelled based on the percentages of defects • Consumer accounts can be suspended based on the outcomes of return abuse investigations ***Requirements*** • SC collaboration and knowledge, information, cost and risk sharing *(section 6.4.1)* • Functional collaboration and knowledge and information sharing *(section 6.4.3)* • Appropriate KPIs and evaluate and analyse performance results *(section 6.7.1)* • Product initiatives and account suspensions for return avoidance *(section 6.9.3)*	• Well-developed RL performance management • Consumer-centric return prevention • Well-established functional relationships • Well-established SC relationships *(See Framework 3)*

	Considerations *(section 8.4.2.4)* • Consider the product condition for the redesign of packaging and cancelling of supplier contracts • Consider the product type for the ability to redesign products • Consider consumer behaviour before closing accounts since some consumers might be uncertain about their purchases • Consider consumer rights for the investigation of return abuse	
Product return visibility, segregation and inventory management for operational RLC • *(section 8.4.2.3.1)* ***Degree of implementation 22 + 6 = 28***	***Description*** • Through the investment in or use of third parties for appropriate and integrated IT systems, product return visibility can be enhanced for control over product returns and RL processes • Product return segregation for operational control involves the physical separation of returned products and RL processes from new products and FL operations through space allocation, facility layout design for RL processes, a dedicated RL department or a separate RL facility • Product return inventory management involves the use of appropriate systems, like an end-to-end inventory management system, dedicated return inventory staff and a RL manager or a 3PRL provider to control returned products and minimise inventory risks ***Requirements*** • Develop online return capabilities and integrate Internet/web-based IT with other IT *(section 6.3.2)* • Customise and use WMS, use existing ERPs and ordering systems for RL *(section 6.3.3)* • Product return IT and software *(section 6.3.5)* • SC collaboration, cooperation and coordination, and information and IT integration and sharing *(section 6.4.1)* • Decide on the type of RL processes, services and 3Ps for RL outsourcing, select a 3PRL partner and develop outsourcing terms *(section 6.5.1)* • Use separate facilities, separate a single facility for RL and FL, and separate RL and FL processes *(section 6.3.8)* • Commit IT, human, financial and infrastructure resources *(section 6.9.1)* • Develop standard operating procedures (SOPs) for RL *(section 6.9.4)* • Create a full-time RL manager portfolio *(section 6.9.5)* • Create a RL function *(section 6.9.5)* ***Considerations*** *(section 8.4.2.4)* • Consider return volume and organisation type (online only or multichannel) for product return segregation and appointing of a dedicated RL manager • Consider the condition of returned products to determine the need for return segregation • Consider the value of inventory for the selection of a 3PRL provider • Consider the size of the organisation for the level of management involvement • Consider information and IT capabilities for product return visibility and inventory management • Consider the cost of redesigning the facility or creating a separate return facility against the benefits of product return segregation • Consider the 3PL/3PRL providers capabilities and willingness to share information • Consider market demand for directing returned inventory to appropriate locations • Consider environmental compliance for the use of a 3PRL provider with the capabilities to correctly manage and disposition returned inventory	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Well-designed RL network • Appropriate and sufficient resources • Appropriate IT • Well-controlled RL costs and risks *(See Framework 3)*
Control mechanisms, dedicated resources, standards, guidelines and maintenance for Managerial RLC* *(section 8.4.2.3.2)* ***Degree of implementation 18 + 8* = 26***	***Description*** • Internal control mechanisms involve the use of a centralised RL facility and performance measurement of staff and external management control involves the use of 3PRL providers with the capability to manage the RL function • Dedicated resources involve the allocation of dedicated staff and managers and the use of a separate RL facility for managerial control or the selection of a 3PRL provider with appropriate human resources for managerial control • Standardise return processes, use return policies as guidelines and centralisation of the RL function ensure that RL staff follow the same standards, rules and procedures for managerial control • Maintaining managerial control enables effective monitoring of the return function to control return volume and trends, processes and products through RL performance measurement, a standard centralised facility and a dedicated RL department ***Requirements*** • RL in/outsourcing decisions, decide on the degree of outsourcing and select a 3PRL provider *(section 6.5.1)* • Use appropriate metrics, standardise and implement performance measurement, create feedback mechanisms and conduct performance monitoring and review *(section 6.7.1)* • Use a separate facility for RL *(section 6.3.8)* • Use a centralised return system and a centralised facility for RL *(section 6.8.4)* • Use a centralised return centre (CRC) *(section 6.8.5)* • Sufficient and appropriate resources for RL and human resource commitment *(section 6.9.1)*	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Well-designed return policy • Well-designed RL process • Well-designed RL network • Appropriate and sufficient resources • Well-developed RL performance management • Well-controlled RL costs and risks *(See Framework 3)*

	• Define formal rules and controls for RL, develop SOPs and manuals, standardise RL processes, publish RL standards and formally implement strategic procedures *(see section 6.9.4)* • Maintain management and staff initiatives, create a full-time RL manager portfolio and assigning a RL manager *(section 6.9.5)* • Establish a RL function *(section 6.9.5)* ***Considerations*** *(section 8.4.2.4)* • Consider return volume for the appropriate dedicated resources to use (such as RL manager or a manager with dual roles) and monitoring return volumes through metrics • Consider the size of the organisation for the level of management involvement • Consider network design for managerial control initiatives • Compare the benefits of using a centralised facility for managerial control against the cost of losing cost efficiency • Consider a 3PRL provider's capabilities and willingness to share information	
SERVICE-SPECIFIC RLM PRACTICES		
Key RLM practices	**Description, requirements and considerations for implementation**	**Related RLM success factors**
Platforms, streamlining and personalisation for SOR communication *(section 8.5.2.1.1)* ***Degree of implementation 18 + 6 = 22***	***Description*** • Establish a telephonic communication platform through human resources, well-established IT systems or outsourcing of the contact centre and establish an electronic communication platform through integrated and well-established IT systems for information sharing via the Internet, website, online system, SMS, WhatsApp and/or emails • Streamlined communication involves continuous updates, speed, consistency, accuracy and proactive information sharing through (1) standardised return communication for correct information about return timeframes and status updates, (2) systems-based communication for real-time return tracking and sharing of status updates and (3) collaborative communication through integrated IT systems with suppliers to share warranty/repair return information • Personalised telephonic communication by providing consumers with assistance to log a return, arranging return collection, informing the consumer about the refund and using a manager to apologise about complaints in the delivery process that resulted in a return ***Requirements*** • Integrative, real-time and responsive IT and IT with information management capabilities *(section 6.3.1)* • Web-based systems for RL, use the Internet and website for RL, integrate Internet and web-based IT with other IT, use collaborative web-based IT and integrate web-based IT with SC partner IT systems *(section 6.3.2)* • Integrate and use ERP, logistics information management systems, ordering systems and CRM systems for RL *(section 6.3.3)* • Use barcode IT for RL *(section 6.3.4)* • Consumer service and support initiatives and communication, information sharing and interaction with consumers *(section 6.4.2)* • Decide on the degree of RL outsourcing, type of RL activities to outsource and type of service providers to select *(section 6.5.1)* • Commit IT, infrastructure and human resources for RL *(section 6.9.1)* • Develop SOPs and manuals for RL, standardise RL processes and implement strategic procedures in RL *(section 6.9.4)* • Assign an expert manager for RL *(section 6.9.5)* ***Considerations*** *(section 8.5.2.3)* • Consider the type of return and product for the use of collaborative communication with suppliers • Consider the size of the organisation for using outsourced contact centres • Consider human resources and IT capabilities for service-orientated RL communication • Consider IT integration capabilities and integration willingness of couriers and suppliers for streamlined communication • Consider consumer regions and preferences for appropriate communication platforms • Consider privacy laws for the feasibility of telephonic and electronic communication	• Strategic importance and commitment to RLM • Well-designed RL process • Appropriate and sufficient resources • Appropriate IT • Well-established SC relationships • Well-established consumer relationships *(See Framework 3)*
SOR processing for a SOR process *(section 8.5.2.1.2)* ***Degree of implementation 6 + 2 = 8***	***Description*** • Instant replacement/exchange dispatch before return receipt demonstrates trust and commitment • Fast/instant refunds to address consumer uncertainties and keep consumers on the shopping site for new purchases ***Requirements*** • Implement a consumer-centric RL processes and consumer service and support initiatives *(section 6.4.2)* ***Considerations*** *(section 8.5.2.3)* • Consider the type of product return (such as wrong delivery due to picking errors) for instant exchange dispatch • Consider the costs of providing instant refunds and exchange dispatch against the benefits of retaining sales/consumers	• Well-designed RL process • Well-established consumer relationships *(See Framework 3)*

	• Consider consumer types for issuing fast refunds since some consumers might be less confident to hand a product return parcel over to a courier driver, not knowing if the product will arrive at the online retailer's facility for a refund	
Preparation, metrics, tools and mystery shopper data for RSP evaluation *(section 8.5.2.2.1)* ***Degree of implementation 14 + 8 = 22***	***Description*** • Prepare for service performance evaluation in RL through standardising RL processes and guidelines for standardised performance measures, training of staff and internal and external systems integration • Use operational and SC metrics with timestamping as a tool to measure return cycle time and consumer metrics with experience measuring toolkits, surveys and managers as tools to measure consumer experience and satisfaction • Use mystery shoppers as data sources to share information about shopping and return experience for evaluating return service performance ***Requirements*** • Use integrative and compatible IT systems *(section 6.3.1)* • Integrating and sharing of IT with SC partners *(section 6.4.1)* • Attain consumer input *(section 6.4.2)* • Coordination and information sharing between functions (section 6.4.3) • Benchmarking, use appropriate KPIs and metrics, establish standardised performance measures, performance monitoring and review, create feedback mechanisms and evaluate performance results *(section 6.7.1)* • Develop SOPs and manuals, standardise RL processes and publish RL standards *(section 6.9.4)* • Assign experienced managers to RL *(section 6.9.5)* • Implement RL training and education *(section 6.9.5)* ***Considerations*** *(section 8.5.2.2.3)* • Consider complaints volume for the use of consumer metrics and tools • Consider IT capabilities for service performance evaluation • Consider IT integration capabilities and integration willingness of SC partners and supplier service level agreements (SLAs) to evaluate return service performance	• Strategic importance and commitment to RLM • Well-designed RL process • Appropriate IT • Skilled and trained staff • Well-developed RL performance management • Well-established functional relationships • Well-established SC relationships • Well-established consumer relationships *(See Framework 3)*
RSP improvement preparation and execution *(section 8.5.2.2.2)* ***Degree of implementation 17 + 10 = 27***	***Description*** • Preparation of return performance service improvements involve staff training and appropriate IT to understand consumer behaviour and experience, appropriate software to capture and share service failures and cross-functional collaborative brainstorming for improvement plans and formalising return procedures and processes • Use various practices and initiatives (see requirements) to execute return service performance improvement focussing on enhancing consumer experience, improving consumer service and improving return processes ***Requirements*** • Appropriate state-of-the-art, integrative, compatible and capable IT for RL *(section 6.3.1)* • Use CRM software for RL *(section 6.3.3)* • Cross-functional teams and functional collaboration, cooperation, coordination, communication and knowledge and information sharing *(section 6.4.3)* • RL in/outsourcing decisions and selection of a 3PRL provider *(section 6.5.1)* • Establish facilities close to the markets and use decentralised facilities for RL *(section 6.8.5)* • Allocate sufficient and appropriate resources for RL and commit financial, IT and human RC in RL *(section 6.9.1)* • Integrate the strategic plan for RL with organisational strategic plans *(section 6.9.4)* • Define RL processes, practices, roles and responsibilities, standardise RL processes and implement strategic procedures *(section 6.9.4)* • Establish a dedicated RL function, implement RL training and education programmes and produce skilled and well-trained staff *(section 6.9.5)* ***Considerations*** *(section 8.5.2.2.3)* • Consider return volume for appropriate return service improvement practices • Consider product type for RL process improvement initiatives • Consider the size of the organisation for using third parties to improve service performance • Consider resource, IT and RL process capabilities for RSP improvement initiatives • Consider the investment requirements for RSP improvement against the benefits of improving return service performance • Consider the resource capabilities and willingness of 3PRL providers to integrate	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Well-developed RL strategies and systems • Well-designed RL process • Well-designed RL network • Appropriate and sufficient resources • Appropriate IT • Skilled and trained staff • Well-established functional relationships • Well-established SC relationships *(See Framework 3)*
Formalisation, service standards and agreements, and service failure reduction for RSP management *(section 8.5.2.2.3)* ***Degree of implementation***	***Description*** • Formalisation for RSP management involves benchmarking RL service standards against FL service standards, creating consumer-focused RL service standards, establishing a consumer service strategy and policy based on RL service standards, establishing SLAs with SC partners based on RL service standards and capturing of service agreements on systems • Managing and monitoring service standards and agreements can be achieved through integrative IT, a database to record service events and monitor compliance, performance measures, RL insourcing to manage service agreements with suppliers, and dedicated resources and centralised facilities to consistently maintain service standards	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Well-developed RL strategies and systems

20 + 10 = 30	• Managing service failures focus on reducing the impact of occurrence of service failures through integrated systems to capture and share service failures internally and externally, RL insourcing and staff training on consumer behaviour, people management and complaints resolutions ***Requirements*** • Use integrative and compatible IT *(section 6.3.1)* • Use WMS and CRM software for RL *(section 6.3.3)* • SC agreements, sharing goals and objectives and integrating IT with SC partners *(section 6.4.1)* • Develop consumer service elements and initiatives, consumer communication, information sharing and interaction, and customer service management *(section 6.4.2)* • Organisational considerations for RL in/outsourcing decisions *(section 6.5.1)* • Performance monitoring and review *(section 6.7.1)* • Use a centralised facility for RL *(section 6.8.4)* • Establish and use a CRC facility *(section 6.8.6)* • Sufficient and appropriate resources for RL and financial, IT and human resource commitment in RL *(section 6.9.1)* • Develop RL strategies *(section 6.9.4)* • Develop formal SOPs and manuals for RL, publish strategic procedures in RL and formally implement strategic procedures in RL *(section 6.9.4)* • Assign experienced managers to RL *(section 6.9.5)* • Implement RL training and education and produce well-managed, -skilled and -trained staff in RL *(section 6.9.5)* ***Considerations*** *(section 8.5.2.3)* • Consider resource, IT and information management capabilities for the implementation of RSP management • Consider the costs of investing in various resources against the benefits of effectively managing service performance in RL • Consider the resource, IT integration capabilities, integration willingness and service agreements of SC partners for effective RSP management • Consider consumer region and preference for the management of service failures since some consumers might prefer human communication for resolving service failures	• Well-designed RL network • Appropriate and sufficient resources • Appropriate IT • Skilled and trained staff • Well-developed RL performance management • Well-controlled RL costs and risks • Well-established SC relationships • Well-established consumer relationships *(See Framework 3)*
COST-SPECIFIC RLM PRACTICES		
Key RLM practices	**Description, requirements and considerations for implementation**	**Related RLM success factors**
Cost determination and understanding RCE tools *(section 8.6.2.1.1)* ***Degree of implementation 12 + 6 = 18***	***Description*** • Cost determination RCE tools involve the use of various measures/tools, including appropriate cost metrics (e.g. handling cost per product return), adding disposition decisions to strategic planning, ring-fencing return costs through accounting separation and sophisticated accounting systems with separate return modules, to effectively determine RL costs • Cost understanding RCE tools to understand the financial impact of RL costs can include appropriate cost metrics (e.g. return rate versus sales percentage), internal information sharing through IT systems and a dedicated manager for greater cost visibility, and capable 3PRL providers with specialised return software ***Requirements*** • Integrative IT and IT with information management capabilities *(section 6.3.1)* • Special return software *(section 6.3.5)* • Information sharing and communication between functions *(section 6.4.3)* • Decide on the types of 3Ps for RL outsourcing and select a 3PRL provider *(section 6.5.1)* • Link disposition strategies to RL strategies *(section 6.6)* • Establish and use appropriate metrics *(section 6.7)* • Use appropriate accounting techniques and systems for RL, understand RL costs, identify RL costs and implement cost measures *(section 6.9.2)* • Integrate strategic plans for RL with organisational strategic plans *(section 6.9.4)* • Assign a RL expert manager *(section 6.9.5)* ***Considerations*** *(section 8.6.2.4)* • Consider IT and accounting capabilities for identifying the appropriate RCE tools	• Strategic implementation of RLM • Well-developed RL strategies and systems • Appropriate IT • Well-developed RL performance management • Well-controlled RL costs and risks • Well-established functional relationships *(See Framework 3)*
Cost identification and assessment for RCE execution *(section 8.6.2.1.2)* ***Degree of implementation 11 + 3 = 14***	***Description*** • Cost identification for the execution of return cost evaluation involves the identification of standard RL costs and hidden costs using RCE tools • Cost assessment focuses on assessing the cost implications of RL practices, including the cost assessments of free returns versus fee returns (return charges) through cost metrics, return leniency through cost tracking, accepting returns for inexpensive products through RCE tools and performing disposition/recovery activities through RCE tools ***Requirements*** • Understand the economic factors for disposition decisions and assessing disposition options *(section 6.6.1)* • Use appropriate metrics for RL *(section 6.7)*	• Well-developed RL strategies and systems • Well-developed RL performance management • Well-controlled RL costs and risks *(See Framework 3)*

	• Perform RL cost estimations and cost/benefit analyses, consider factors that can influence RL costs, identify RL costs and identify hidden RL costs *(section 6.9.2)* ***Considerations*** *(section 8.6.2.4)* • Consider the return and sales volume for assessing the costs of return leniency • Consider the type of product for the identification of disposition costs and cost assessment for return acceptance • Consider the product value for assessing the cost of return acceptance and disposition options • Consider organisation type for the identification of RL costs (e.g. multichannel retailers can use stores to eliminate collection and transport costs) • Consider product disposition capability for the cost assessment of disposition options • Consider courier types and charges for the return transport cost identification and cost assessment for return acceptance	
COR transportation for COR processes *(section 8.6.2.2.1)* ***Degree of implementation 13 + 4 = 17***	***Description*** • Cost-orientated return transportation involves economies of scale through bulk/volume transportation using 3PLs and integrated transport management systems with transporters • Cost-orientated return transportation involves cost saving through appropriate network design, decentralised facilities for shorter distances, a separate RL facility next to the main facility or a centralised facility for fewer trips. ***Requirements*** • Use TMS for RL *(section 6.3.3)* • Integrate and share information and IT with SC partners *(section 6.4.1)* • Decide on the type of RL service and third party for RL outsourcing *(section 6.5.1)* • Use a separate facility at a single location *(section 6.8.2)* • Use a central facility/location for RL *(section 6.8.4)* • Establish a decentralised network, use decentralised facilities for RL and decentralise specific RL processes *(section 6.8.5)* ***Considerations*** *(section 8.6.2.4)* • Consider return volume for the selection of appropriate COR transportation initiatives • Consider product margin to select the appropriate network structure • Consider IT capabilities for bulk transportation initiatives • Consider facility/location strategies for the implementation of COR transportation • Consider the impact of environmental disruptions (such as Covid) on the network design for COR transportation	• Well-designed RL network • Appropriate IT • Well-controlled RL costs and risks • Well-established SC relationships *(See Framework 3)*
Return avoidance and cost absorption for RCM mitigation *(section 8.6.2.3.1)* ***Degree of implementation 7 + 3 = 10***	***Description*** • Return avoidance for RCM mitigation focusses on avoiding RL costs through a zero-return strategy, involving a no-collection return if the return cost exceeds the refund value of an inexpensive product, and a zero-inventory inventory strategy, involving a 4PL strategy by selling products on behalf of suppliers without carrying the stock and the RL costs of returns • Cost absorption for RCM mitigation involves the avoidance of RL costs by absorbing RL costs into the selling price of products through activity-based costing and a separate account for RL to effectively gauge return transportation costs ***Requirements*** • SC communication and information sharing *(section 6.4.1)* • Use costing techniques for RL, perform cost value estimations and identify RL costs *(section 6.9.2)* • Develop and implement return avoidance strategies *(section 6.9.3)* ***Considerations*** *(section 8.6.2.4)* • Consider courier types and charges for the implementation of a zero-return strategy • Consider consumer protection laws for the feasibility of a zero-return strategy	• Consumer-centric return prevention • Well-controlled RL costs and risks • Well-established SC relationships *(See Framework 3)*
Formalisation, accounting and cost monitoring for RCM execution *(section 8.6.2.3.2)* ***Degree of implementation 13 + 6 = 19***	***Description*** • Formalisation for the management and control of RL costs involves the (1) prioritisation of RLM by including RL in the design of logistics processes, developing policies and procedure for RLM and appointing a dedicated RL manager, (2) development of a cost control strategy and (3) development of cost control standards by benchmarking RL costs and identifying an acceptable ratio of RL costs per total logistics costs • Accounting for RCM execution involves accounting separation initiatives, like a dedicated RL department and ring-fencing of RL costs, to manage RL costs and the use of 3PRL providers with accounting expertise to perform account reconciliation for return claims • RL cost monitoring can be performed through appropriate cost metrics, regular cost/benefit analysis to ensure that the benefits of RL practices (e.g. economies of scale through 3PL transportation) outweigh the costs (of outsourcing) and the use of cost aggregation software ***Requirements*** • Decide on the type of RL service and third party for RL outsourcing, and select a 3PRL provider *(section 6.5.1)* • Strategic benchmarking, develop performance objectives and appropriate metrics, standardise performance measures, monitor performance and evaluate performance results *(section 6.7.1)* • Use financial and accounting statements for RL, apply accounting techniques and systems for	• Strategic importance and commitment to RLM • Strategic implementation of RLM • Well-developed RL strategies and systems • Appropriate and sufficient resources • Well-developed RL performance management • Well-controlled RL costs and risks *(See Framework 3)*

	RL, perform cost/benefit analyses, implement cost policies, controls and measures *(section 6.9.2)* • Develop strategic plans and strategies for RL and integrate RL strategic plans and strategies with organisational strategic plans strategies *(see section 6.9.4)* • Prioritise strategic procedures in RL, develop a formalisation strategy and develop formal rules and controls for RL *(see section 6.9.4)* • Establish sufficient leadership for RL, create a full-time RL manager portfolio and assign experienced managers to RL *(section 6.9.5)* • Establish a dedicated RL function *(section 6.9.5)* ***Considerations*** *(section 8.6.2.4)* • Consider return volume for the cost/benefit analyses of RL practices • Consider return and sales volume and network design for establishing appropriate RL cost benchmarks • Consider IT capabilities for cost aggregation software and accounting capabilities for accounting cost management initiatives	

Source: Compiled by the researcher

Table 9.7 shows a detailed overview of Framework 4 with the key RLM practices and the related description, requirements, considerations and RLM success factors. The framework can be used by online retailers to identify priority RLM practices, key prevention and control specific RLM practices, key service specific RLM practices and key cost specific RLM practices, which they can implement for the effective RLM of consumer returns. Additionally, online retailers can determine key aspects of each RLM practice (given in the description), requirements (support RL practices), considerations (parameters), and related RLM success factors (from Framework 3) for the successful implementation of the key RLM practice. For example, an online retailer can see that the implementation of the priority RLM practice of preventative gatekeeping (marked with a blue dot for ease of reference) involves (1) the descriptions of requesting photo evidence and using a manager for sound gatekeeping decisions, (2) the requirements of consumer communication, information sharing and interaction, gatekeeping practices for prevention of returns and the assignment of an experienced manager, and (3) the considerations of consumer protection legislation and product condition. Furthermore, the online retailer can note the related RLM success factors of strategic importance and commitment to RLM, consumer-centric return prevention, well-controlled RL costs and risks and well-established consumer relationships for successful preventative gatekeeping.

Other key observations can be made from the framework, which online retailers can consider for the implementation of RLM practices. In terms of the priority RLM practices, most key practices associate with the prevention and control and cost themes, showing a strong correlation between return prevention and control practices and cost practices. Most priority RLM practices relate to the RL process, demonstrating the significance of understanding RL processes for the effective RLM of consumer returns (see Framework 1 in section 9.4). Furthermore, the most significant priority RLM practice include pre-return inspection, which associate with prevention and control, service and cost practices (first practice presented in Table 9.7). Therefore, online retailers can prioritise the implementation of pre-return inspection but should first identify the requirements and considerations to

determine the feasibility of implementing pre-return inspection. Regarding specific RLM practices, online retailers can implement key RLM practices associated with prevention and control, service or cost to address specific RLM constraints and adoption of appropriate RLM success factors.

For the degree of implementation per RLM practice category, the framework illustrates that the *most complex RLM priority practice* (and overall, most complex RLM practice) includes *effective product disposition and recovery* (marked with a red dot), involving multiple descriptions, requirements, considerations and RLM success factors. Therefore, online retailers need to identify various initiatives, requirements and considerations and adopt several RLM success factors before product disposition and recovery can be implemented successfully. Furthermore, from the priority RLM practices, an *optimised RL process* associates with the *most RLM success factors* (shown with an asterisk), indicating that online retailers need to develop an understanding of effective RLM before attempting the optimisation of the RL process.

Concerning the degree of key *prevention and control specific RLM practices*, the framework demonstrates that *product return visibility, segregation and inventory management* for operational RLC (marked with a purple dot) can be the *most complex* key RLM practice to implement. Therefore, online retailers need to identify and implement various practices, requirements and considerations for operational RLC. However, *control mechanisms, dedicated resources, standards and guidelines and maintenance* for managerial RLC associates with the *most RLM success factors* (marked with an asterisk), indicating that online retailers need to develop an understanding of the requirements of effective RLM before attempting to implement managerial RLC practices.

For the *service specific RLM practices*, the framework shows that most key service RLM practices can be complex. However, the *most complex* key service RLM practice involves the *formalisation, standards and agreements and service failure reduction* for RSP management (marked with a purple dot), meaning that online retailers need to identify various initiatives, requirements and considerations and adopt several RLM success factors before effective RSP management can be implemented successfully. The *most complex key cost specific RLM practice* includes *formalisation, accounting and cost monitoring* for RCM execution (marked with a purple dot). Evidently, online retailers should identify and implement various practices, requirements and considerations, and adopt various RLM success factors for effective RCM execution.

In Framework 3 (section 9.5) it was mentioned that RLM success factors can also be important in terms of facilitating the implementation of RLM practices. Therefore, from the findings presented in Table 9.7, the most important RLM success factors for the implementation of twelve key RLM practices,

included a well-designed RL process, appropriate and sufficient resources, well-controlled RL costs and risks and well-established SC relationships, which means online retailers can also take these RLM success factors into consideration for the effective RLM of consumer returns. Nevertheless, before online retailers consider RLM success factors based on the degree of support and implement RLM practices based on the degree of implementation, they can benefit from understanding and justifying the significance of effective RLM, which will be provided in Framework 5 next.

9.8 FRAMEWORK 5 – UNDERSTAND AND JUSTIFY THE SIGNIFICANCE OF EFFECTIVE RLM

Since the adoption of RLM success factors (Framework 3) and implementation of RLM practices (Framework 4) requires substantial effort and commitment, online retailers might be reluctant to adopt and implement effective RLM. In fact, Wang, Dang *et al.* (2021:2) mentioned that due to the complexity of RLM, many online retailers refrain from adopting and implementing RLM. However, effective RLM can be vital for the survival of online retailers (Anderson, 2020:11). Despite the significance of effective RLM, many online retailers still fail to recognise the importance of RL and RLM, and view consumer returns as a cost and necessary evil to normal business (Bozzi *et al.* 2022:27; Chen *et al.* 2017:252; Dobson, 2023:2; Schooling, 2023:1). Therefore, understanding and justifying the effective RLM of consumer returns can be critical for the adoption and implementation of effective RLM, which Framework 5 aims to achieve. As mentioned in section 9.3.5, Framework 5 consists of three parts, including Framework 5A – Understand the significance of RLM, Framework 5B – Justify the adoption of RLM success factors, and Framework 5C – Justify the implementation of RLM practices. Figure 9.9 provides a broad overview of Framework 5.

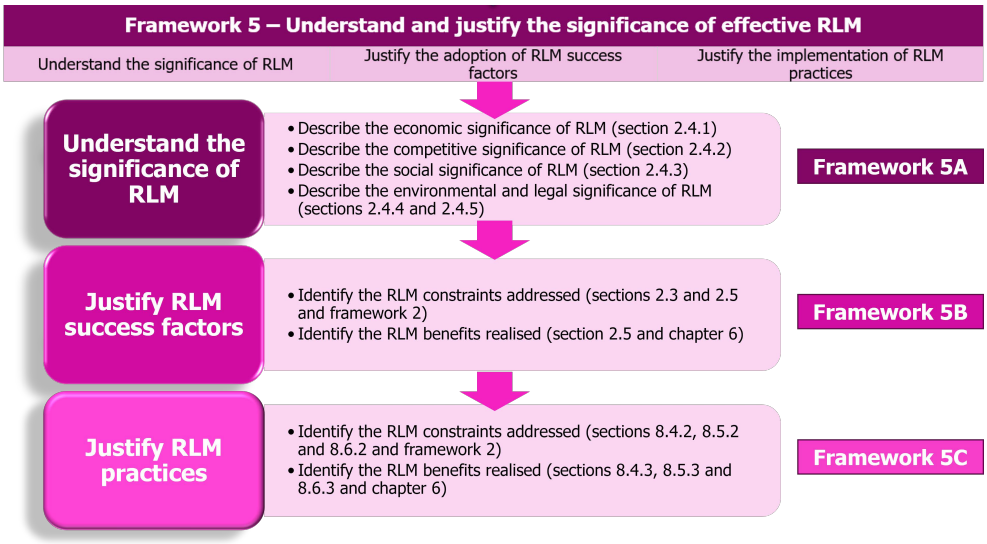

Figure 9.9 Framework 5 - Understand and justify the significance of effective RLM
Source: Compiled by the researcher

Figure 9.9 shows the part of the main framework (see Figure 9.4) associated with Framework 5, which consists of three sub-frameworks, including Framework 5A that involves understanding the *significance of RLM* with related descriptions and references, Framework 5B that involves the *justification of RLM success factors* with references to the RLM constraints addressed and RLM benefits realised, and Framework 5C that involves the *justification of RLM practices* with references to the RLM constraints addressed and RLM benefits realised. In the subsequent sections, Frameworks 5A, 5B and 5C will be presented and discussed.

9.8.1 Framework 5A – Understand the significance of RLM

Framework 5A focuses on providing online retailers with a greater understanding of the significance of RLM, which might motivate them to pay more attention to the RLM of consumer returns. Specifically, Framework 5A involves descriptions of the economic, competitive, social, environmental and legal *significance factors* of RLM (identified in section 2.4) that generally motivate organisations to pay attention to and implement RL processes and practices. The framework includes (1) an explanation of the different significance factors, (2) the impact on other factors in terms of enhancing/enabling other significance factors, and (3) the focus areas in terms of other frameworks to focus on for a greater understanding of the significance factor.

Table 9.8 provides a detailed overview of Framework 5A, including the RLM significance factors and the description of the RLM significance factors.

Table 9.8 Framework 5A - Understand the significance of RLM

RLM SIGNIFICANCE FACTORS	DESCRIPTION OF RLM SIGNIFICANCE FACTORS
Economic significance •Capture economic value •Financial gains •Increase profits •Cost savings •Increase economic power •Improve the overall bottom line *(section 2.4.1)*	***Explanation*** •Understanding the economic value of RLM motivates the adoption of RLM to recapture economic value •Financial gains and profits can be increased by product disposition and product recovery activities •Cost savings can be realised through product/material reuse •Economic power can be increased through the adoption of a circular economy approach that associates with the reuse of resources •The overall bottom line can be improved through the adoption and implementation of disposition and product recovery activities ***Impact on other factors*** •Contributes to the competitive significance by bringing a competitive advantage •Contributes to the environmental significance by reducing resource usage and waste ***Focus areas*** •Understand RL definition and the disposition process (Framework 1) •Identify and investigate RLM financial constraints (Framework 2) •Understand strategic RLM success factors (Framework 3) •Identify priority and cost specific RLM practices (Framework 4) •Confirm economic significance in Frameworks 5B and 5C
Competitive significance •Competitiveness •Consumer satisfaction •Improve consumer service •Increase consumer trust and loyalty	***Explanation*** •Competitiveness associates with improved consumer satisfaction and service in RL •Providing consumers with a better service through RLM can discourage new entrants to the market and provide competitive advantage •Improving consumer satisfaction levels through RLM increase consumer retention

• Discourage future entrants to the market • Increase market share • Competitive pressure • Consumer retention and confidence • Competitive advantage • Prevent competitor access *(section 2.4.2)*	• RLM can positively impact consumer buying behaviour and improve market share • Competitive pressures and consumer satisfaction motivates the adoption of return leniency • RLM enables the implementation of consumer-centric processes and practices that increase competitiveness, consumer confidence and consumer satisfaction • Focus on product disposition and recovery for a competitive advantage in the secondary markets ***Impact on other factors*** • Contributes to the economic significance by increasing profits • Contributes to the social significance by improving consumer relationships • Contributes to the legal significance by avoiding non-compliance of laws • Contributes to the environmental significance by enhancing sustainability, reducing environmental damage and improving a green image ***Focus areas*** • Understand RL definition, pre-receipt RL processes and post-receipt RL processes (Framework 1) • Identify and investigate RLM external constraints (Framework 2) • Understand strategic, design, control and relational RLM success factors (Framework 3) • Identify service specific RLM practices (Framework 4) • Confirm competitive significance in Frameworks 5B and 5C
Social significance • Consumer pressure • Corporate social responsibility (CSR) • Corporate citizenship • Consumer requirements and awareness rights • Consumer expectations and awareness of the environment • Demonstrate commitment and respect for environment and society • Align ethical values with environmentally conscious consumers *(section 2.4.3)*	***Explanation*** • Understanding consumer requirements can enhance the implementation of effective RLM • Due to legislation, like the CPA (consumer protection act), consumers are more aware about their rights to return products • Consumers expect socially responsible practices and consumer-centric processes and practices • Implementing lenient return policies can demonstrate CSR • Consumers expect of environmentally responsible practices • Adopting environmentally responsible practices through RLM can increase corporate citizenship • Corporate citizenship involves social responsibility by meeting of economic, ethical and legal values of stakeholders • RLM adoption shows commitment to society and the environment ***Impact on other factors*** • Contributes to the competitive significance by satisfying consumer demand • Contributes to the legal significance by complying with laws • Contributes to the environmental significance by reducing waste ***Focus areas*** • Understand consumer returns, pre-receipt RL processes and post-receipt RL processes (Framework 1) • Identify and investigate RLM external constraints (Framework 2) • Understand strategic and relational RLM success factors (Framework 3) • Identify priority and service specific RLM practices (Framework 4) • Confirm social significance in Frameworks 5B and 5C
Legal significance • Regulation to implement RL • Government and juridical regulations for product take-back, recovery and recycling • Strict environmental laws • Extended producer responsibility mandates to accept products and engage in recover • Recycling quotas and packaging laws • Consumer protection laws to accept product returns • Compliance and respect for regulations and laws *(section 2.4.4)*	***Explanation*** • Legislation represents an external factor that motivates RLM adoption • Governments can impose legislation that drives product recovery and take-back programmes • Legislation that drives RLM adoption associates with the environment and consumer rights • Consumer right laws enable online consumers to return or cancel orders that drive online retailers to implement RLM • Adopting RLM demonstrates compliance and respect for legislation ***Impact on other factors*** • Contributes to the economic significance by avoiding legal costs • Contributes to the competitive significance by enhancing competitiveness • Contributes to the social significance by improving brand image • Contributes to the environmental significance by protecting the environment ***Focus areas*** • Understand RL definition, consumer returns and the disposition process (Framework 1) • Identify and investigate RLM operational and managerial constraints (Framework 2) • Understand strategic, design and control RLM success factors (Framework 3) • Identify priority, and prevention and control specific RLM practices (Framework 4) • Confirm legal significance in Frameworks 5B and 5C
Environmental significance • Concerns with the environment • Sustainable development • Reduce impact on the environment • Green innovation • Reduce waste • Reduce environmental damage • Conserve natural resources	***Explanation*** • Concerns with the environment motivates organisations to explore product recovery initiatives • RLM enables the reduction of waste and harm to the environment • RLM enables adoption of a circular economy to reduce resource consumption • Environmentally sustainable practices through RLM adoption improve environmental performance and image and avoid environmental sanctions and penalties ***Impact on other factors*** • Contributes to the economic significance by reducing costs

• Improve green image • Environmentally sustainability • Avoid environmental penalties *(section 2.4.5)*	• Contributes to the competitive significance by bringing a competitive advantage • Contributes to the social significance by enhancing CSR performance • Contributes to the legal significance by complying with legislation ***Focus areas*** • Understand RL definition, consumer returns and the disposition process (Framework 1) • Identify and investigate RLM operational and managerial constraints (Framework 2) • Understand strategic, design, resource and control RLM success factors (Framework 3) • Identify priority RLM practices (Framework 4) • Confirm environmental significance in Frameworks 5B and 5C

Source: Compiled by the researcher

Table 9.8 shows a detailed overview of Framework 5A with the RLM significance factors and related description, which include an explanation of the significance, impact on other significance factors and focus areas from other frameworks. The framework can help online retailers appreciate the economic, competitive, social, legal and environmental significance of RLM, which can drive them to understand RL, consumer returns and RL processes (Framework 1 in section 9.4), identify and investigate specific RLM constraints (Framework 2 in section 9.5), understand various RLM success factors (Framework 3 in section 9.6) and identify and implement specific RLM practices (Framework 4 in section 9.7). Additionally, online retailers can confirm the economic, competitive, social, legal and environmental significance of RLM by exploring the justification of RLM success factors (Framework 5B in section 9.8.2) and justification of RLM practices (Framework 5C in section 9.8.3)

Subsequently, Framework 5A forms a foundation for the motivation of RLM aiming on creating more awareness of the importance of RLM. In the next section, the justification of the adoption of RLM success factors will be provided.

9.8.2 Framework 5B – Justify the adoption of RLM success factors

Framework 5B focuses on providing online retailers with the justification of adopting RLM success factors, emphasising the importance of RLM success factors for the effective RLM of consumer returns. The RLM success factors relate to Framework 3 (section 9.6), which included strategic, design, resource, control and relational RLM success factors (identified from section 2.5 and chapter 6). The justification for the adoption of RLM success factors entails the (1) mitigation of RLM constraints, including financial, operational, organisational and external constraints (identified from sections 2.3 and 2.5, chapter 6 and Framework 2), and (2) realisation of RLM benefits, including economic, operational, organisational, environmental, social, market and SC benefits (representing the outcomes identified from section 2.5 and chapter 6) through the adoption of the RLM success factors. Furthermore, the framework shows the total number of RLM constraints addressed and benefits realised with the adoption of a specific success factor, which not only confirms the importance (degree of importance in Table 9.9) of adopting the RLM success factors but also help online retailers identify

the most beneficial RLM success factors. Additionally, the framework can enable online retailers that identified specific RLM constraints to identify appropriate RLM success factors that they can adopt for the effective RLM of consumer returns.

Table 9.9 presents a detailed overview of Framework 5B, including the RLM success factors (with references and degree of importance), RLM constraints addressed and RLM benefits realised.

Table 9.9 Framework 5B - Justify the adoption of RLM success factors

JUSTIFICATION OF ADOPTING STRATEGIC RLM SUCCESS FACTORS				
RLM success factors	**RLM constraints addressed**		**RLM benefits realised**	
Strategic importance and commitment to RLM *(Sections 2.3, 2.5.1.1 and 6.9.5.2 and Framework 2)* ***Degree of importance – 35 + 23 = 58*** *(the first number represents the number of constraints addressed and the second number represents the number of benefits realised)*	***Financial constraints*** •Heavy financial investment •Lack of investment in resources •Lack of funding •Financial instability, capacity and investment risks •Losing and attracting new investors •Raising additional capital •Inaccurate view of financial performance •High RL cost •Loss of profits ***Operational constraints*** •Limited forecasting and planning •Poor return process and RL process failures •Poor product return decision making •Product quality problems and risks •Inadequate information systems and technology •Lack of infrastructure and development	***Organisational constraints*** •Lack of awareness about the importance of RLM •Lack of top management commitment •Management inattention •Resistance to change •Management risks •Culture risks •Lack of strategic planning •Lack of RL strategy •Lack of RL policies •Poor performance measurement and management •Loss of managerial control •Poor accountability and reporting •Lack of staff training and education •Lack of internal coordination and integration •Labour risk of unskilled and untrained staff ***External constraints*** •Lack of support from SC parties •Lack of SC collaboration •Opportunistic buying behaviour •Fraudulent return behaviour •SC risks	***Economic benefits*** • Improve profits • Realise cost savings • Improved bottom line ***Operational benefits*** • RL process efficiency and effectiveness • Enable successful RL processes • Improve forecasting ***Organisational benefits*** • Facilitate strategic decision-making • Facilitate successful implementation of RLM • Establish a successful RL function • Enable the development of RL capabilities and expertise • Facilitate skills enhancement • Facilitate functional integration	• Facilitate commitment of resources • Facilitate performance monitoring and evaluation • Improve RL performance ***Social benefits*** • Enhance social responsibility • Enhances corporate image ***Market-related benefits*** • Increase sales • Increase consumer satisfaction and loyalty • Improve consumer relationships • Provide a competitive advantage ***SC benefits*** • Enhance SC competitiveness • Facilitate management of SC relationships
Strategically implemented RLM *(Sections 2.3 2.5.1.2 and 6.5 and Framework 2)* ***Degree of importance – 42+ 44 = 86***	***Financial constraints*** •Heavy financial investment •Lack of investment in resources •Financial instability, capacity and investment risks •Losing and attracting new investors •Raising additional capital •High RL cost •Poor cost visibility and hidden costs •Loss of money ***Operational constraints*** •Poor product return visibility •Limited forecasting and planning •Unpredictable quality and condition of returned products •Demand and forecasting risks •Product quality risks •Inventory risks •Inadequate information systems and technology •Lack of infrastructure and	***Organisational constraints*** •Lack of awareness about the importance of RLM •Lack of top management commitment •Management inattention •Resistance to change •Management risks •Culture risks •Lack of strategic planning •Lack of RL strategy •Lack of RL policies •Poor accountability and reporting •Lack of staff training and education •Labour risk of unskilled and untrained staff •Lack of internal coordination and integration •Silo mentality and internal autonomy ***External constraints*** •Lack of support from SC parties •Lack of SC collaboration •Outsourcing and SC risks •Poor return experience	***Economic benefits*** • Cost savings/reduction • Cost effectiveness and efficiency • Profitability • Lower investment costs • Reduce assets • Cost and asset recovery • Economies of scale ***Operational benefit*** • Reduce product return uncertainty • Improve product return visibility • RL process efficiency and speed • Simplify the RL process • Facilitate operational planning • Improve operational efficiency • Enable FL/RL integration ***Organisational benefits*** • Enable RL implementation	• Improve information management • Support facility/location strategies ***Environmental benefits*** • Environmental protection • Compliance of laws ***Social benefits*** • Improve corporate and green image • Stakeholder satisfaction ***Market benefits*** • Increase sales and market share • Consumer satisfaction • Competitive advantage • Consumer service and responsiveness • Enhance consumer loyalty and retention • Improve consumer relationships ***SC benefits*** • Improve SC relationships

	development •Technology and data management risks •Manual operations and poor systems	•Unmet expectations and dissatisfaction •Consumer frustration and anger •Consumer uncertainty •Service failures •Reputational damage and risk •Loss of sales	• Improve RL expertise and capabilities • Focus on core competency • Reduce resources and risks • Enable strategic control	and communication • Facilitate SCM and integration • Improve SC collaboration, visibility, transparency and efficiency
Well-developed RL strategies and systems *(Sections 2.3, 2.5.1.3, 6.6.1 and 6.9.4 and Framework 2)* ***Degree of importance – 40 + 38 = 78***	***Financial constraints*** •Lack of investment in resources •Lack of funding •High RL cost •Loss of profits ***Operational constraints*** •Poor return process and RL process failures •Obsolete stock •Poor/no recovery •Loss of product, product control and product value •Contaminated and disorganised inventory •Inventory risks •Stockpiling of returns •Poor product return decision making •High and unnecessary returns •Inadequate information systems and technology •Lack of infrastructure and development	***Organisational constraints*** •Lack of awareness about the importance of RLM •Lack of top management commitment •Management inattention •Resistance to change •Management and culture risks •Lack of strategic planning •Lack of RL strategy •Lack of RL policies •Restrictive policies •Poor return policies •Poor performance measurement •Loss of managerial control •Poor accountability and reporting •Lack of internal coordination and integration •Silo mentality and internal autonomy ***External constraints*** •Lack of SC collaboration •Lack of SC information sharing •SC risks •Market liabilities •Brand/brand image damage •Reputational damage and risk	***Economic benefits*** • Economic benefits and performance • Increase budget & funding • Increase revenue/profits • Cost savings • Cost efficiencies and effectiveness • Cost and asset recovery • Improve bottom line ***Operational benefit*** • Improve operational performance, flexibility and efficiency • Enhance RL process efficiency, speed and effectiveness • Reduce inventory ***Organisational benefit*** • Improve RL performance and capabilities • Reduce resource requirements • Facilitate RL implementation and standardisation • Enable return prevention	***Environmental benefits*** • Improve environmental performance and protection • Reduce raw material use and waste • Enhance sustainability • Compliance with laws ***Social benefits*** • Enhance corporate image and reputation • Improve social performance ***Market benefits*** • Increase market share, sales and opportunities • Competitive advantage • Enhance consumer service & responsiveness • Consumer satisfaction • Brand protection • Increase consumer relationships ***SC benefits*** • Facilitate SC integration • Improve SC performance

JUSTIFICATION OF ADOPTING DESIGN RLM SUCCESS FACTORS

RLM success factors	RLM constraints addressed		RLM benefits realised	
Well-designed return policy *(Sections 2.5.2.1, 6.4.2 and 6.9.3 and Framework 2)* ***Degree of importance – 25 + 19 = 44***	***Financial constraints*** •Loss of money and high RL cost risks •Loss of profits and margin •Loss of sales ***Operational constraints*** •Poor product return visibility •Limited forecasting and planning •Unpredictable quality and condition of returned products •Demand and forecasting risks •Product quality risks •Poor return process and RL process failures	***Organisational constraints*** •Lack of RL policies •Restrictive policies •Poor return policies •Internal preservation and strict returns ***External constraints*** •Opportunistic buying behaviour •Fraudulent return behaviour •High fraudulent and ineligible returns •Poor return experience •Unmet expectations and dissatisfaction •Loss of consumer confidence and trust •Loss of sales, market share and consumers	***Economic benefit*** • Higher profits • Cost reduction advantages ***Operational benefits*** • RL process efficiency • Reduce RL process cycle time • Reduce fraudulent returns ***Organisational benefit*** • Improve RL performance • Facilitate return prevention and avoidance ***Social benefit*** • Good reputation • Enhance corporate/brand image	***Market benefits*** • Increase sales and demand • Improve consumer service and experience • Competitive advantage • Enhance consumer satisfaction • Enhance consumer retention, loyalty and trust • Demand satisfaction • Enhance consumer relationship management
Well-designed RL process *(Sections 2.5.2.2, and 6.9.4 and Framework 2)* ***Degree of importance – 34 + 38 = 72***	***Financial constraints*** •Raising additional capital •High RL cost •Indirect expenses •Loss of money and high RL cost risks •Loss of profits and margin •Loss of sales ***Operational constraints*** •Product return uncertainties •Poor product return visibility •Limited forecasting and planning	***Organisational constraints*** •Lack of awareness about the importance of RLM •Lack of top management commitment •Management inattention •Lack of internal coordination and integration •Silo mentality and internal autonomy •Poor internal information sharing ***External constraints*** •Lack of SC collaboration	***Economic benefit*** • Realise cost savings • Enhance cost effectiveness • Higher profits • Financial control and minimise losses ***Operational benefits*** • Increase return visibility • RL process and operational efficiency and effectiveness • Speedy return process • Reduce returns and	• Support internal integration • Facilitate return prevention and avoidance ***Environmental benefits*** • Reduce environmental impact • Improve environmental performance and responsibility ***Social benefits*** • Enhance green image

	•Poor return process and RL process failures •Demand and forecasting risks •Inadequate information systems and technology •Manual operations and poor systems •Lack of infrastructure and development	•Lack of SC information sharing •Lack of SCI •Opportunistic buying behaviour •Fraudulent return behaviour •High fraudulent and ineligible returns •Poor return experience •Unmet expectations and dissatisfaction •Consumer frustration and anger •Consumer uncertainty •Loss of consumer confidence and trust	uncertainties • Increase operational flexibility and control • Simplify and support RL processes • FL/RL integration ***Organisational benefit*** • Facilitate RL system development • Enable RL innovation initiatives • Enable RL function control • Improve RL performance • Facilitate RL decision making	***Market benefits*** • Competitive advantage • Increase consumer satisfaction and sales • Increase consumer loyalty and trust • Consumer retention • Improve consumer service and integration ***SC benefits*** • Enhance SC visibility and information sharing • Reduce SC uncertainties • Improve SC performance and integration

Table 9.9 shows a detailed overview of Framework 5B with the RLM success factors and the related RLM constraints that can be addressed and RLM benefits realised through the adoption of the success factors. The framework enables online retailers to justify the adoption of RLM success factors by identifying the number of RLM constraints addressed and the number of RLM benefits realised. Additionally, the framework can be used to identify the (1) specific RLM constraints and RLM benefits associated with the adoption of a specific RLM success factor, (2) most significant RLM success factor in terms of addressing RLM constraints and realising RLM benefits, (3) most valuable RLM success factor in terms of addressing RLM constraints, (4) most beneficial RLM success factor in terms of realising RLM benefits, (5) least beneficial RLM success factor in terms of addressing RLM constraints and realising RLM benefits, (6) specific RLM constraints that can be addressed through the adoption of RLM success factors and (7) specific RLM benefits that can be realised through the adoption of RLM success factors.

Specifically, the framework demonstrates that *appropriate IT* can be the *most significant RLM success factor* in terms of addressing RLM constraints and realising RLM benefits. Therefore, the effective RLM of consumer returns in online retailing would be unattainable without appropriate IT and systems. Evidently, online retailers can prioritise the adoption of appropriate IT as a RLM success factor. However, the RLM success factor of well-established SC relationships was significant both in the

support of other characteristics (see Framework 3 in section 9.3.3) as well as the second most significant in terms of addressing RLM constraints and realising RLM benefits. Evidently, the effective RLM of consumer returns would be unachievable without well-established SC relationships. Although strategic importance and commitment to RLM is less important in terms of addressing constraints and realising benefits, online retailers must be mindful that this characteristic supports most other RLM success factors (see Framework 3 in section 9.3.3), which means that strategic importance and commitment can include various indirect constraints addressed and benefits realised. Therefore, online retailers must still prioritise the adoption of strategic importance and commitment to RLM.

The RLM success factor of *well-controlled RL costs and risks* was the *most significant* key success factor in terms of *addressing RLM constraints*. Therefore, online retailers that experience various RLM constraints can prioritise the adoption of well-controlled RL costs and risks for the effective RLM of consumer returns. Additionally, the *most beneficial* RLM success factor in terms of *realising RLM benefits* include *appropriate IT*, reemphasising the justification of adopting appropriate IT for the effective RLM of consumer returns in online retailing. Other important key success factors that online retailers can focus on include strategically implemented RLM and well-developed performance management, showing the importance of appropriate RL insourcing and outsourcing decisions and performance measurement for effective RLM. The *least significant* RLM success factor in terms of addressing RLM constraints and realising RLM benefits include a *well-designed return policy*. However, a well-designed return policy can be important for the support of other success factors (Framework 3) and implementation of RLM practices (Framework 4), which means that online retailers can still justify the adoption of a well-designed return policy.

Regardless, online retailers that identified and investigated *specific RLM constraints* can use the framework to identify *specific RLM success factors* that they can adopt. For example, if a lack of investment in resources (financial) was identified as the most significant RLM constraint, the online retailer can change its priorities and consider adopting the RLM success factors of (1) strategic importance and commitment to RLM, (2) strategically implemented RLM, (3) well-developed strategies and systems, (4) appropriate and sufficient resources, (5) skilled and trained staff, (6) well-established SC relationships, and (7) well-established consumer relationships as RLM success factors. Furthermore, online retailers might be interested in *realising specific benefits*, which can help them identify relevant RLM success factors to adopt. For example, if an online retailer seeks to improve consumer relationships, the online retailer can consider adopting strategic importance and commitment to RLM, strategically implemented RLM, well-developed strategies and systems, a well-designed

return policy, appropriate IT, skilled and trained staff, consumer-centric return prevention, and well-established consumer relationships as RLM success factors.

Essentially, all RLM success factors can be justified through the various RLM constraints that can be addressed and numerous RLM benefits that can be realised. Therefore, adopting RLM success factors will help online retailers to effectively manage consumer returns. While effective RLM can be justified through the adoption of RLM success factors, the implementation of appropriate RLM practices requires further justification, ensuring that online retailers can realise the importance of implementing RLM practices. In the next section, the justification of implementing RLM practices will be provided.

9.8.3 Framework 5C - Justify the implementation of RLM practices

Framework 5C focuses on providing online retailers with the justification of implementing appropriate RLM practices, emphasising the importance of RLM practices for the effective RLM of consumer returns. The RLM practices relate to Framework 4 (section 9.7), which included priority RLM practices, prevention and control specific RLM practices, service specific RLM practices, and cost specific RLM practices. The justification of RLM practices associate with the key RLM practices (identified from sections 8.4.2, 8.5.2 and 8.6.2) and the requirements of the key RLM practices (support RL practices from sections 8.4.2, 8.5.2 and 8.6.2 and chapter 6).

The justification for the implementation of RLM practices entails the number of (1) RLM constraints, including financial, operational, organisational and external constraints and causes of the constraints (identified from sections 8.4.2, 8.5.2 and 8.6.2, chapter 6 and Framework 2) that can be addressed, and (2) RLM benefits, including economic, operational, organisational, environmental, social, market and SC benefits (identified from sections 8.4.3, 8.5.3 and 8.6.3 and chapter 6) that can be realised. Furthermore, the framework shows the total RLM constraints addressed and benefits realised against the *degree of implementation* of the different RLM practices (identified in Framework 4), which not only confirms the *importance* of implementing the different RLM practices but also help online retailers identify the most beneficial RLM practices. Additionally, the framework can enable online retailers that identified specific RLM constraints to identify appropriate RLM practices that they can implement for the effective RLM of consumer returns.

Table 9.9 presents a detailed overview of Framework 5C, including the key RLM practices (with references, degree of importance, overall importance against the degree of implementation and the RLM practice requirement categories), RLM constraints addressed and RLM benefits realised.

Source: Compiled by the researcher

Table 9.9 shows a detailed overview of Framework 5C, which can help online retailers to justify the implementation of certain RLM practices through the RLM constraints addressed and RLM benefits realised. While the RLM practices were prioritised in Framework 4 (section 9.7) based on the interview findings, it is evident that most practices can be beneficial for prevention and control, service and cost for the effective RLM of consumer returns in online retailing. Subsequently, online retailers can implement the RLM practices based on their RLM constraints identified in Framework 2 (section 9.5), strategies or goals (e.g. consumer centric returns and consumer service improvement), capabilities and resources (e.g. availability of funding) or maximum value (most beneficial RLM practice).

Specifically, the framework can be used to identify the (1) specific RLM constraints and RLM benefits associated with the implementation of a specific RLM practice, (2) specific RLM constraints that can be addressed through the implementation of RLM practices, (3) specific RLM benefits that can be

realised through the implementation of RLM practices, (4) most beneficial RLM practice per practice category, (5) most valuable RLM practice in terms of addressing RLM constraints, (6) most beneficial RLM practice in terms of realising RLM benefits, (7) most significant RLM practice in terms of addressing RLM constraints and realising RLM benefits, (8) most beneficial RLM practice in terms of the degree of implementation (costs) against the degree of importance (benefits), (9) most beneficial RLM practice category, (10) least beneficial practice category, and (11) least beneficial RLM practice.

Due to the comprehensiveness of Framework 5C, only examples of the specific RLM practice, RLM constraint and RLM benefit (points 1 to 3) that online retailers can identify from the framework will be provided. Specifically, online retailers interested in implementing streamlined return logging (priority RLM practice) can use the framework to determine the RLM constraints addressed and RLM benefits realised as well as the degree of importance, costs versus the benefits and related requirement categories. Additionally, online retailers that identified management inattention as a RLM constraint can identify all the RLM practices that can be implemented to address management inattention. Similarly, online retailers that seek to improve RL performance can identify all the RLM practices that can be implemented to realise RL performance improvements.

Per RLM practice category, the framework illustrates (with pink dots) that the *most significant* (1) priority RLM practice includes an *optimised RL process*, (2) prevention and control specific RLM practice includes *product return visibility, segregation and inventory managemen*t for operational RL control, (3) service specific RLM practice includes *formalisation, service standards and agreements and service failure reduction* for return service performance (RSP) management, and (4) cost specific RLM practice includes *cost determination and understanding return tools* for return cost evaluation (RCE). Therefore, online retailers can consider implementing these practices first for the effective RLM of consumer returns. However, *formalisation, service standards and agreements, and service failure reduction* for RSP management is the most beneficial RLM practice in terms of (1) addressing RLM constraints, (2) realising RLM benefits and (3) the costs (30) versus the benefits (135), meaning that online retailers can prioritise the implementation of RSP management for the effective RLM of consumer returns. Other significant RLM practices in terms of the costs versus the benefits (except those mentioned as the most significant per practice category) include consumer feedback, complaints and product return data (+72), control mechanisms, dedicated resources, standards and guidelines and maintenance for managerial RL control (+74), platforms, streamlining and personalisation for service-oriented return (SOR) communication (+90) and RSP improvement preparation and execution (+103).

Consequently, *service specific RLM practices* can be the most beneficial for the effective RLM of consumer returns. Surprisingly, *cost specific RLM practices* can be the *least beneficial* in terms of the

overall costs versus the benefits. Evidently, online retailers that are cost-driven should reconsider their approach since a consumer-centric approach can be the best approach in terms of financial performance, operational performance, organisational performance and external performance. Nevertheless, the least beneficial RLM practice involve SOR processing, suggesting that online retailers can implement SOR processing as a last priority. Regardless, all RLM practices can be justified through the various RLM constraints that can be addressed and numerous RLM benefits that can be realised. Therefore, implementing any RLM practice will help online retailers to effectively manage consumer returns.

Essentially, Framework 5 demonstrates the significance of RLM, which entails the economic, competitive, social, legal and environmental significance of RLM (see Framework 5A), justification for the adoption of RLM success factors (Framework 5B) and the justification for the implementation of RLM practices (Framework 5C). Therefore, online retailers who refrain from adopting and implementing effective RLM due to the effort and complexity of RLM can be assured that the benefits of effective RLM far outweigh the costs. The next section provides the summary of main findings, recommendations and objectives realised.

9.9 SUMMARY OF MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES REALISED

Since the framework for the effective RLM of consumer returns provided summaries of findings related to various chapters of the study, this section provides an overview of the main findings based on the framework for the effective RLM of consumer returns in online retailing (presented in sections 9.4, 9.5, 9.6, 9.7 and 9.8). Table 9.11 provides the summary of main findings, recommendations and objectives realised based on the structure of the framework for the effective RLM of consumer returns in online retailing.

Table 9.11 Summary of main findings, recommendations and objectives realised

MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES: FRAMEWORK 1
FRAMEWORK 1 A - UNDERSTAND THE CONCEPT OF RL
Main findings
• RL can be defined in various ways, ranging from general to more specific. • This study identified a definition that online retailers can use to understand the concept or RL. Specifically, RL in online retailing was defined as: *The reverse logistics (RL) of online consumer returns is the process of managing (planning, implementing and controlling) the efficient and effective flows of returned products and information from the consumer (point of consumption) to an online retailer (point of recovery) or upstream supplier (point of origin) to recapture value, save costs, increase profits, satisfy, serve and retain online consumers, and improve*

economic and environmental sustainability through RL processes and practices

- The definition of RL in online retailing covered various elements that can be used to describe the traits, management activities, tasks, flows, points, parties and goals
- The traits in the definition of RL involve process, efficiency and effectiveness
- The management activities in the definition of RL involve planning, implementing and controlling
- The flows in the definition of RL involve flows of products and information
- The points in the definition of RL involve the point of consumption, point of recovery and point of origin
- The parties in the definition of RL involve consumers (point of consumption) who are responsible for returning the products, online retailers (point of recovery) who are responsible for accepting and receiving the product returns, and suppliers (point of origin) who are responsible for accepting warranty, defective or damage consumer returns from the online retailers
- The goals in the definition of RL involve recapture value, save costs, increase profits, satisfy, serve and retain online consumers, and improve economic and environmental sustainability that can be realised through the effective execution of RL processes and implementation of effective RL practices

Recommendations

- Online retailers can refer to Framework 1A to develop an understanding of the concept of RL. Additionally, online retailers can develop a greater understanding of the RL definition by focusing on (1) understanding consumer returns and RL processes (frameworks 1B, 1C and 1D), (2) adopting RLM success factors (framework 3), (3) implementing key RLM practices (framework 4) and (4) considering the related significance and justification of effective RLM (framework 5)
- It is recommended that online retailers understand consumer returns, pre-receipt and post-receipt RL processes (frameworks 1B, 1C and 1D) to understand the RL definition elements of process, flows, points, parties and goals
- It is recommended that online retailers consider the adoption and justification of the RLM design success factor of a well-designed RL process (frameworks 3 and 5B) to understand the RL definition elements of process, flows, points, parties and goals
- It is recommended that online retailers consider the implementation and justification of the priority RLM practices of an optimised RL process and effective disposition and recovery (frameworks 3 and 5B) to understand the RL definition elements of process, management activities, flows, parties and goals
- It is recommended that online retailers focus on understanding the economic, competitive, social, legal and environmental significance of RLM (framework 5A) to understand the RL definition element of goals

Objectives realised

- Defining RL can help online retailers to understand the concept of RL, which forms the foundation of understanding RLM. Therefore, defining RL for a basic understanding of RLM contributed to realising parts of SRO-1 (examine RLM) and the primary objective through Framework1A.

FRAMEWORK 1B - UNDERSTAND CONSUMER RETURNS

Main findings

- Online retailers can expect various consumer return types, including business-to-consumer (B2C), warranty, service, recalls and potentially end-of-use returns
- The most significant consumer return type in online retailing include B2C returns, which associate with various return reasons.
- Warranty returns can be another consumer return type that online retailers can focus on for effective RLM

Recommendations

- Online retailers can refer to Framework 1B to develop an understanding of the consumer return types and related product conditions, return reasons and disposition options
- For B2C and warranty returns online retailers can focus on identifying RLM constraints associated with B2C and warranty returns (framework 2), adopting RLM success factors that can be important for managing B2C and warranty returns

(framework 3), implementing key RLM practices for the effective execution of B2C and warranty returns (framework 4) and considering the related significance and justification of effective RLM (framework 5)

- For ***B2C returns***, it is recommended that online retailers (1) investigate product return and recovery, and consumer and market *RLM constraints* (framework 2), (2) consider the adoption and justification of the *RLM control success factor* of consumer centric return prevention (frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of consumer feedback and product return data (priority practice), information sharing initiatives, logistics excellence (proactive prevention practices), product experts for targeted investigations, product interventions of product/package redesign and party interventions of supplier exit (reactive prevention practices) (see frameworks 4 and 5C), and (4) consider the economic, competitive, social and legal *significance of RLM* (see framework 5A). Furthermore, online retailers that experience high fraudulent returns can consider implementing and justifying the reactive return prevention RLM practices of abuse investigations and account suspensions of return abusers (see frameworks 4 and 5C).
- For ***warranty returns***, it is recommended that online retailers (1) investigate product return and recovery, and SC *RLM constraints* (framework 2), (2) consider the adoption and justification of the *RLM success factors* of consumer centric return prevention (control success factor) and well-established SC relationships (relational success factor) (frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of consumer feedback and product return data, effective disposition and recovery (priority practices), information sharing initiatives, logistics excellence (key proactive prevention practices), product experts for targeted investigations, product interventions of product/package redesign and party interventions of supplier exit (key reactive prevention practices) (see frameworks 4 and 5C), and (4) consider the economic, social, legal and environmental *significance of RLM* (see framework 5A).

Objectives realised

- Describing and understanding consumer returns can be important for the effective RLM of consumer returns. Therefore, identifying, describing and understanding consumer returns contributed to realise parts of *SRO-2* (explore and analyse RL literature for consumer return types), *SRO-5* (determine consumer return types in online retailing based on inputs from industry experts) and the *primary objective* through Framework1B.

FRAMEWORK 1C – UNDERSTAND PRE-RECEIPT RL PROCESSES

Main findings

- The pre-receipt RL processes in online retailing included the consumer return request (CRR), gatekeeping (or authorisation), collection and transportation processes
- The pre-receipt RL processes can involve (1) characteristics related to a description, involvement and requirements, influential factors and links to other RL processes, (2) methods, options or types to execute the processes, (3) product flow and information flow activities, (4) consumers, online retailers and third-party providers as parties, and (5) consumer residences/workplaces and collection points as locations
- All pre-receipt RL processes can be important for the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 1C to develop an understanding of the pre-receipt RL processes and related characteristics, methods, activities, parties and locations. Additionally, online retailers can focus on identifying RLM constraints that can hamper pre-receipt RL processes (framework 2), adopting RLM success factors that can facilitate pre-receipt RL processes (framework 3), implementing key RLM practices for the effective execution of pre-receipt RL processes (framework 4) and considering the significance and justification of effective RLM (framework 5).
- For the ***CRR process***, it is recommended that online retailers (1) investigate financial and cash, operational support, policy and consumer and market *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed return policy, a well-designed RL process (design success factors), appropriate IT and well-established consumer relationships (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of streamlined return logging, online authorisation (priority practices) and streamlined communication (service orientated return practice) (see frameworks 4 and 5C), and (4) consider the competitive *significance of RLM* (see framework

5A).

- For the ***gatekeeping process***, it is recommended that online retailers (1) investigate operational support, policy and consumer and market *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed return policy, a well-designed RL process (design factors), appropriate IT, trained/skilled staff (resource success factors) and consumer-centric return prevention (control success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of online authorisation and preventative gatekeeping (priority practices) (see frameworks 4 and 5C), and (4) consider the competitive, social and legal *significance of RLM* (see framework 5A).
- For the ***collection process***, it is recommended that online retailers (1) investigate product return, operational support and SC *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed RL process (design success factor) and well-established SC relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of efficient collection (priority practice), product return visibility (operational control practice) and return avoidance (cost management practice) (see frameworks 4 and 5C), and (4) consider the competitive *significance* of RLM (see framework 5A).
- For the ***transportation process***, it is recommended that online retailers (1) investigate financial and cash, product return, operational support and SC *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed RL process, a well-designed RL network (design success factors) and well-established SC relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of product return visibility (operational control practice) and COR transportation (cost orientated return process practice) (see frameworks 4 and 5C), and (4) consider the economic and environmental *significance of RLM* (see framework 5A).

Objectives realised

- Understanding the pre-receipt RL processes can be important for the effective RLM of consumer returns. Therefore, identifying and understanding pre-receipt RL processes contributed to realising parts of *SRO-2* (explore and analyse RL literature for the pre-receipt RL processes of consumer returns), *SRO-5* (determine RL processes in online retailing based on inputs from industry experts) and the *primary research objective* through Framework1C.

FRAMEWORK 1D – UNDERSTAND POST-RECEIPT RL PROCESSES

Main findings

- The post-receipt RL processes in online retailing included the receiving, processing, inspection, sorting, disposition and redistribution processes
- The post-receipt RL processes can involve (1) characteristics related to a description, involvement and requirements, influential factors and links to other RL processes, (2) product flow, information flow and cash flow activities, (3) consumers, online retailers, staff, third parties and suppliers/manufacturers as parties, (4) collection points, retail locations, consumer locations, standard facilities, specialised facilities and markets as facilities/locations, and (5) aims (applicable to disposition and redistribution)
- All post-receipt RL processes can be important for the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 1D to develop an understanding of the post-receipt RL processes and related characteristics, activities, parties, locations and aims (if applicable). Additionally, online retailers can focus on identifying RLM constraints that can hamper post-receipt RL processes (framework 2), adopting RLM success factors that can facilitate post-receipt RL processes (framework 3), implementing key RLM practices for the effective execution of post-receipt RL processes (framework 4) and considering the significance and justification of effective RLM (framework 5).
- For the ***receiving process***, it is recommended that online retailers (1) investigate product return and operational support *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM design success factor* of a well-designed RL process (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of an optimised RL process (priority practice) and return segregation (operational control) (see frameworks 4 and 5C), and (4) consider the economic *significance of RLM* (see framework 5A).

- For the ***processing process***, it is recommended that online retailers (1) investigate financial and cash, functional and consumer and market *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed return policy, a well-designed RL process (design success factors), well-controlled RL costs and risks (control success factor) and well-established functional relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of return charges (priority practice), SOR processing (service oriented process practice), and accounting (return cost management practice) (see frameworks 4 and 5C), and (4) consider the economic, competitive and legal *significance of RLM* (see framework 5A).
- For the ***inspection process***, it is recommended that online retailers (1) investigate product return and recovery, operational support and functional *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed return policy, a well-designed RL process (design success factors) and skilled and trained staff (resource success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *priority RLM practices* of pre-return inspection, optimised RL process and preventative inspection (see frameworks 4 and 5C), and (4) consider the economic and competitive *significance of RLM* (see framework 5A).
- For the ***sorting process***, it is recommended that online retailers (1) investigate product return and recovery, and functional *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed RL process (design success factor) and skilled and trained staff (resource success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of an optimised RL process (priority practice), return segregation and inventory management (operational control practices) (see frameworks 4 and 5C), and (4) consider the economic, legal and environmental *significance of RLM* (see framework 5A).
- For the ***disposition process***, it is recommended that online retailers (1) investigate investment, product return and recovery, operational support, functional and SC *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of well-developed RL strategies and systems (strategic success factor), well-designed RL process (design success factor), appropriate and sufficient resources, skilled and trained staff (resource success factors) and well-established SC relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *priority RLM practice* of effective disposition and recovery (see frameworks 4 and 5C), and (4) consider the economic, social, legal and environmental *significance of RLM* (see framework 5A).
- For the ***redistribution process***, it is recommended that online retailers (1) investigate product return, operational support and SC *RLM constraints* (see framework 2), (2) consider the adoption and justification of the *RLM success factors* of a well-designed RL process, a well-designed RL network (design success factors) and well-established SC relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practice* of COR transportation (cost orientated return practice) (see frameworks 4 and 5C), and (4) consider the economic and environmental *significance of RLM* (see framework 5A).

Objectives realised

- Understanding the post-receipt RL processes can be important for the management of consumer returns. Therefore, identifying and understanding post-receipt RL processes contributed to realising *SRO-3* (explore and analyse RL literature for post-receipt RL process) and parts of *SRO-5* (determine RL processes in online retailing based on inputs from industry experts) and the primary objective through Framework1D.

MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES: FRAMEWORK 2

FRAMEWORK 2 – IDENTIFY AND INVESTIGATE RLM CONSTRAINTS

Main findings

- The RLM constraints involves barriers, risks, pitfalls and problems that can hamper the effective RLM of consumer returns in online retailing
- The RLM constraints include the (1) financial constraints of investment and costing constraints and financial and cash constraints, (2) operational constraints of product return and recovery constraints and operational support constraints, (3) organisational constraints of management constraints, strategy, policy and control constraints and functional constraints, and (4) external constraints of SC constraints and consumer and market constraints
- All RLM constraints can be caused by other RLM constraints that involve specific risks, pitfalls and problems

- Addressing the RLM constraints can help lessen the degree of other RLM constraints
- All RLM constraint include solution focus areas relating to other RLM constraints that can be addressed as potential mitigating solutions
- The most problematic RLM constraint includes consumer and market constraints
- Financial and cash constraints include the highest number of causes
- All RLM constraints can hamper the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 2 to identify and investigate RLM constraints, constrain causes and solution focus areas. Additionally, online retailers can focus on understanding consumer returns and RL processes (if applicable) (framework 1), adopting RLM success factors that can help address the RLM constraints (framework 3), implementing key RLM practices for mitigating RLM constraints and causes (framework 4) and considering the significance and justification of effective RLM (framework 5).
- For the ***financial RLM constraints***, it is recommended that online retailers (1) consider the adoption and justification of the *RLM success factors* of strategic importance and significance of RLM, well-developed RL strategies and systems (strategic success factors), appropriate and sufficient resources (resource success factor) and a well-controlled RL costs and risks (control success factor) (see frameworks 3 and 5B), (2) consider the implementation and justification of the *RLM practices* of preventative inspection (priority practice), cost determination and understanding tools, cost identification and cost assessment (cost evaluation practices), return avoidance and cost absorption, and formalisation, accounting and monitoring (cost management practices) (see frameworks 4 and 5C), and (4) consider the economic *significance of RLM* (see framework 5A).
- For the ***operational RLM constraints***, it is recommended that online retailers (1) understand consumer return types (see framework 1B), (2) consider the adoption and justification of the *RLM success factors* of well-developed RL strategies and systems (strategic success factor), a well-designed RL process, a well-designed RL network (design success factors), appropriate and sufficient resources, and appropriate IT (resource success factors) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of an optimised RL process, effective disposition and recovery (priority practices) and product return visibility, segregation and inventory management (operational control practice) (see frameworks 4 and 5C), and (4) consider the economic, legal and environmental *significance of RLM* (see framework 5A).
- For the ***organisational RLM constraints***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) consider the adoption and justification of the *RLM success factors* of strategic importance and significance of RLM, well-developed RL strategies and systems (strategic success factors), a well-designed RL policy, (design success factor), appropriate and sufficient resources, skilled and trained staff (resource success factors), well-developed performance management (control success factor) and well-established functional relationships (relational success factor) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of an optimised RL process, (priority practice), control mechanisms, dedicated resources, standards, guidelines and maintenance (managerial control practice), formalisation, service standards and agreements, and service failure reduction (return service management practice) (see frameworks 4 and 5C), and (4) consider the economic, competitive, social, legal and environmental *significance of RLM* (see framework 5A).
- For the ***external RLM constraints***, it is recommended that online retailers (1) understand consumer returns and RL processes (see framework 1), (2) consider the adoption and justification of the *RLM success factors* of strategically implemented RLM (strategic success factor), consumer centric prevention (control success factor), well-established SC relationships and well-established consumer relationships (relational success factors) (see frameworks 3 and 5B), (3) consider the implementation and justification of the *RLM practices* of streamlined return logging, online authorisation, preventative gatekeeping, effective disposition and recovery (priority practices), information sharing initiatives, logistics excellence (key proactive prevention practices), product experts, product interventions and party interventions (key reactive prevention practices), streamlined communication (service orientated return practice), preparation metrics, tools and mystery shopper data (return service performance evaluation practice), RSP improvement preparation and execution (service performance improvement practice), formalisation, service standards and agreements, and service failure reduction (return service management practice) (see frameworks 4 and 5C), and (4) consider the competitive, social and legal *significance of RLM* (see framework 5A).

Objectives realised

- RLM constraints, including barriers, risks, pitfalls and problems, can be important factors to address for the effective RLM of consumer returns in online retailing. Therefore, identifying and investigating the RLM constraints contributed to realising a part of *SRO-1* (determine the factors that influence the implementation of RLM), *SRO-7* (investigate and determine important factors for the effective RLM of consumer returns in online retailing) and the primary objective through Framework 2.

MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES: FRAMEWORK 3

FRAMEWORK 3 - UNDERSTAND THE SUCCESS FACTORS OF EFFECTIVE RLM

Main findings

- The RLM success factors involves measures, initiatives, requirements and practices that can support the effective RLM of consumer returns in online retailing
- The RLM success factors include the (1) strategic success factors of strategic importance and commitment to RLM, strategically implemented RLM and well-designed RL strategies and systems, (2) design success factors of a well-designed return policy, a well-designed return process and a well-designed RL network design, (3) resource success factors of appropriate and sufficient resources, appropriate IT and skilled and trained staff, (4) control success factors of a well-developed performance management, consumer centric return prevention, and well-controlled RL costs and risks, and (5) relation success factors of well-established functional relationships, well-established SC relationships and well-established consumer relationships.
- The success factors of effective RLM can be used as a benchmark to explore ineffective and poor practices, procedures and processes
- All RLM success factors include requirements or practices that can be implemented or adopted (degree of adoption)
- All RLM success factors can facilitate the adoption of other RLM success factors (degree of impact)
- The most significant RLM success factor in term of the degree of adoption and degree of impact was the strategic success factor of strategic importance and commitment to RLM
- Other important RLM success factors in term of the degree of adoption and degree of impact were the relation success factors of well-established SC relationships and well-established consumer relationships
- All RLM success factors can be important for the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 3 to understand the RLM success factors. Additionally, online retailers can focus on understanding RL, consumer returns and RL processes (if applicable) (framework 1), identifying and investigating RLM constraints associated with the RLM success factors (framework 2), exploring RLM practices that can be supported by the RLM success factors (framework 4) and considering the significance and justification of effective RLM (framework 5A and B)
- For the ***strategic RLM success factors***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing (financial constraint) and management, strategy, policy and control (organisational constraints) (see framework 2), (3) explore the *RLM practices* of an optimised RL process (priority practice), preparation and execution for RSP improvement, formalisation, service standards and agreements, and service failure reduction for RSP management (service performance practices) and formalisation, accounting and monitoring for RCM execution (cost management practices) (see framework 4), (4) consider the economic, competitive, social, legal and environmental *significance of RLM* (see framework 5A), and (5) consider the *justification* of strategic importance and commitment to RLM, strategically implemented RLM and well-designed RL strategies and systems (see framework 5B)
- For the ***design RLM success factors***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of operational support (operational constraint) and strategy, policy and control and functional (organisational constraints) (see framework 2), (3) explore the *prevention and control RLM practice* of control mechanisms, dedicated resources, standards, guidelines and maintenance for managerial RLC (see framework 4), (4) consider the economic, competitive, social, legal and environmental *significance of RLM* (see framework 5A), and (5) consider the *justification* of a well-designed return policy, a well-designed return process and a well-

designed RL network design (see framework 5B)

- For the ***resource RLM success factors***, it is recommended that online retailers (1) understand RL and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing, operational support (operational constraint), management and functional (organisational constraints) (see framework 2), (3) explore the *RLM practices* of an optimised RL process (priority practice), preparation and execution for RSP improvement, and formalisation, service standards and agreements, and service failure reduction for RSP management (service performance practices) (see framework 4), (4) consider the economic and competitive *significance of RLM* (see framework 5A), and (5) consider the *justification* of appropriate and sufficient resources, appropriate IT and skilled and trained staff (see framework 5B)
- For the ***control RLM success factors***, it is recommended that online retailers (1) understand consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing, financial and cash (financial constraints), product return and recovery (operational constraints), strategy, policy and control (organisational constraints), and consumer and markets (external constraints) (see framework 2), (3) explore the *RLM practices* of online authorisation, return charges and penalties, preventative gatekeeping (priority practices), metrics, product experts and abuse investigations for RRP examination, product interventions, supplier exit and account suspensions for RRP interventions (reactive prevention practices), control mechanisms, dedicated resources, standards, guidelines and maintenance for managerial RLC (control practice), cost determination and understanding RCE tools, cost identification and assessment for RCE (cost evaluation practices) and formalisation, accounting and monitoring for RCM (cost management practice) (see framework 4), (4) consider the economic, competitive, social, legal and environmental *significance of RLM*, and (5) consider the *justification* of well-developed performance management, consumer centric return prevention, and well-controlled RL costs and risks (see framework 5B)
- For the ***relational RLM success factors***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of functional (organisational constraint), SC and consumer and markets (external constraints) (see framework 2), (3) explore the *service performance RLM practice* of preparation, metrics, tools and mystery shopper data for RSP evaluation (see framework 4), (4) consider the competitive and social *significance of RLM*, and (5) consider the *justification* of well-established functional relationships, well-established SC relationships and well-established consumer relationships (see framework 5B)

Objectives realised

- RLM success factors, including strategic, design, resource, control and relational, can be important factors for the effective RLM of consumer returns in online retailing. Therefore, understanding RLM success factors contributed to realising a part of *SRO-1* (determine the factors that influence the success of RLM), *SRO-7* (investigate and determine important factors for the effective RLM of consumer returns in online retailing) and the primary objective through Framework 3.

MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES: FRAMEWORK 4

FRAMEWORK 4 – IDENTIFY AND IMPLEMENT RLM PRACTICES

Main findings

- The RLM practices involves key practices, propositions, requirements and considerations that can be important for the effective RLM of consumer returns in online retailing
- The RLM practices can be categorised as priority RLM practices, prevention and control specific RLM practices, service specific RLM practices and cost specific RLM practices
- The priority RLM practices include pre-return inspection, an optimised RL process, streamlined return logging, online authorisation, efficient return collection, effective product disposition and recovery, clearly communicated return policies, return charges and penalties, preventative gatekeeping, preventative inspection and consumer feedback and complaints data, which can be important for effective return prevention and control, service performance and cost effectiveness.
- The prevention and control RLM practices include (1) logistics excellence and information sharing initiative for pre-sales PRP (proactive prevention), (2) metrics, product experts and abuse investigations for RRP examination, (3) product interventions, supplier exit and account suspensions for RRP interventions (reactive return prevention), (4) product return visibility, segregation and inventory management for operational RLC (RL control), and (5) control mechanisms, dedicated resources, standards, guidelines and maintenance for managerial RLC.

- The service specific RLM practices include (1) platforms, streamlining and personalisation for SOR communication (service orientated return), (2) SOR processing, (3) preparation, metrics, tools and mystery shopper data for RSP (return service performance) evaluation, (4) RSP improvement preparation and execution, and (5) formalisation, service standards and agreements, and service failure reduction for RSP management.
- The cost specific RLM practices include (1) cost determination and understanding RCE (return cost evaluation) tools, (2) cost identification and assessment for RCE execution, (3) COR (cost orientated return) transportation, (4) return avoidance and cost absorption for RCM (return cost management) mitigation and (5) formalisation, accounting and cost monitoring for RCM execution.
- The priority practice of pre-return inspection can be important for return prevention, service effectiveness and cost effectiveness in the RL process
- Most priority practices can be important for product return and cost prevention and control
- All RLM practices include key elements, requirements and considerations as well as associated RLM success factors that can be implemented for effective execution (degree of implementation)
- The most complex RLM practice in term of the degree of implementation is effective product return disposition and recovery (priority practice), which involve multiple descriptions, requirements, considerations and RLM success factors
- The RLM success factors can play the biggest role in the implementation of an optimised RL process (priority practice), RSP improvement preparation and execution, and formalisation, service standards and agreements, and service failure reduction for RSP management (service practices).
- The most important success factors for the implementation of RLM practices included a well-designed RL process (design success factor), appropriate and sufficient resources (resource success factor), well-controlled RL costs and risks (control success factor) and well-established SC relationships (relational success factor).
- All RLM practices can be implemented for the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 4 to identify RLM practices with related key elements, requirements, considerations and RLM success factors necessary for the implementation of RLM practices. Additionally, online retailers can focus on understanding RL, consumer returns and RL processes (framework 1), identifying and investigating RLM constraints associated with the RLM practices (framework 2), exploring the most significant RLM success factors for each RLM practice category (frameworks 3 and 4) and considering the significance and justification of effective RLM (framework 5A and C).
- For the ***priority RLM practices***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing, financial and cash (financial constraints), product return and recovery, operational support (operational constraints), strategy, policy and control (organisational constraints), SC and consumer and market (external constraints) (see framework 2), (3) explore the *RLM success factors* of well-developed RL strategies and systems (strategic success factor) and a well-designed RL process (design success factor) (see frameworks 3 and 4), (4) consider the economic, legal and environmental *significance of RLM* (see framework 5A), and (5) consider the *justification* of pre-return inspection, an optimised RL process, streamlined return logging, online authorisation, efficient return collection, effective product disposition and recovery, clearly communicated return policies, return charges and penalties, preventative gatekeeping, preventative inspection and consumer feedback and complaints data (see framework 5C).
- For the ***prevention and control specific RLM practices***, it is recommended that online retailers (1) understand consumer returns (see framework 1), (2) identify and investigate the *RLM constraints* of financial and cash (financial constraints), product return and recovery, operational support (operational constraint), strategy, policy and control (organisational constraints), SC and consumer and market (external constraints) (see framework 2), (3) explore the *RLM success factors* of appropriate and sufficient resources (resource success factor), well-developed performance management and consumer centric return prevention (control success factors) (see frameworks 3 and 4), (4) consider the economic, competitive and legal *significance of RLM* (see framework 5A), and (5) consider the *justification* of logistics excellence and information sharing initiative for pre-sales PRP, metrics, product experts and abuse investigations for RRP examination, product interventions, supplier exit and account suspensions for RRP interventions, product return visibility, segregation and inventory management for operational RLC, and control mechanisms, dedicated resources, standards, guidelines and maintenance for managerial RLC (see framework 5C).

- For the ***service specific RLM practices***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of operational support (operational constraints), strategy, policy and control (organisational constraints), consumer and market (external constraints) (see framework 2), (3) explore the *RLM success factors* of a well-designed RL process (design success factor), appropriate and sufficient resources, appropriate IT, skilled and trained staff (resource success factors), well-established SC relationships and well-established consumer relationships (relational success factors) (see frameworks 3 and 4), (4) consider the competitive and social *significance of RLM* (see framework 5A), and (5) consider the *justification* of platforms, streamlining and personalisation for SOR communication, SOR processing, preparation, metrics, tools and mystery shopper data for RSP evaluation, RSP improvement preparation and execution, and formalisation, service standards and agreements, and service failure reduction for RSP management (see framework 5C).
- For the ***cost specific RLM practices***, it is recommended that online retailers (1) understand RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing and financial and cash (financial constraints), operational support (operational constraint), management, and strategy, policy and control (organisational constraints) (see framework 2), (3) explore the *RLM success factors* of well-designed RL strategies and systems (strategic success factor), well-developed performance management and well-controlled RL costs and risks (control success factors) (see frameworks 3 and 4), (4) consider the economic *significance of RLM* (see framework 5A), and (5) consider the *justification* of cost determination and understanding RCE tools, cost identification and assessment for RCE execution, COR transportation, return avoidance and cost absorption for RCM mitigation, and formalisation, accounting and cost monitoring for RCM execution (see framework 5C).

Objectives realised

- The RLM practices, including priority, prevention and control, service and cost practices, can be important factors for the effective RLM of consumer returns in online retailing. Therefore, identifying and implementing RLM practices contributed to realising *SRO-4* (identify and explore RL literature for RL practices to manage consumer returns), *SRO-6* (identify and explore important RL practices for managing consumer returns in online retailing, based on inputs from industry experts), *SRO-7* (investigate and determine important factors for the effective RLM of consumer returns in online retailing) and the primary objective through Framework 4.

MAIN FINDINGS, RECOMMENDATIONS AND OBJECTIVES: FRAMEWORK 5

FRAMEWORK 5A - UNDERSTAND THE SIGNIFICANCE OF RLM

Main findings

- The significance of RLM involves drivers and reasons that motivate online retailers to adopt RLM, which can support the effective RLM of consumer returns in online retailing
- The significance of RLM includes economic, competitive, social, legal and environmental significance
- Economic significance relates to financial benefits and drivers, including capturing economic value, financial gains, an increase in profits, cost savings, an increase in economic power and improvement to the overall bottom line, which can motivate online retailers to adopt RLM for the effective RLM of consumer returns.
- Competitive significance relates to market benefits and drivers, including competitiveness, consumer satisfaction, an increase in consumer service, trust and loyalty, discouragement of future entrants to the market, an increase in market share, competitive pressures, consumer retention and confidence, competitive advantage and prevention of competitor access to the market and technology, which can motivate online retailers to adopt RLM for the effective RLM of consumer returns.
- Social significance relates to social drivers, including consumer pressures, corporate social responsibility and corporate citizenship, which can motivate online retailers to adopt RLM for the effective RLM of consumer returns.
- Legal significance relates to legal drivers, including regulations to implement RL, governmental and juridical regulations for product take-back, recovery and recycling, environmental laws and consumer protection laws, which can motivate online retailers to adopt RLM for the effective RLM of consumer returns.
- Environmental significance relates to environmental drivers, including concerns with the environment, reducing impact on the environment and the adoption of environmentally sustainable practices, which can motivate online retailers to adopt RLM for the effective RLM of consumer returns.
- All significance factors can contribute to other significance factors in terms of benefits.

- The economic significance of RLM can involve benefits related to the competitive and environmental significance of RLM, namely competitive advantage, reuse of resources and waste reduction.
- The competitive significance of RLM can involve benefits related to the economic, social, legal and environmental significance of RLM, namely increase in profits, improving consumer relationships, avoiding non-compliance of laws and reducing environmental damage.
- The social significance of RLM can involve benefits related to the competitive, legal and environmental significance of RLM, namely satisfying consumer demands, complying with laws and reducing waste
- The legal significance of RLM can involve benefits related to the economic, competitive, social and environmental significance of RLM, namely avoidance of legal fees, enhancing competitiveness, improving brand image and protecting the environment.
- The environmental significance of RLM can involve benefits related to the economic, competitive, social and legal significance of RLM, namely reducing disposal costs, bringing a competitive advantage, enhancing corporate social responsibility and complying with environmental legislation.
- All significance factors of RLM can influence the effective RLM of consumer returns

Recommendations

- Online retailers can refer to Framework 5A to understand the significance of RLM. Additionally, online retailers can focus on understanding RL, consumer returns and RL processes (framework 1), identifying and investigating RLM constraints (framework 2), RLM success factors (framework 3) and RLM practices (framework 4) associated with the significance of RLM, and considering the justification of effective RLM (framework 5A and C).
- To understand the ***economic significance of RLM***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of investment and costing, financial and cash (financial constraints) and product return and recovery (operational constraint) (see framework 2), (3) identify and consider the justification of the *RLM success factors* of strategic importance and significance of RLM, well-developed RL strategies and systems (strategic success factor) and a well-designed RL process (design success factor) (see frameworks 3 and 5B), and (4) identify and consider the of *RLM practices* of effective product disposition and recovery (priority practice) (see frameworks 4 and 5C).
- To understand the ***competitive significance of RLM***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of consumer and market (external constraints) (see framework 2), (3) identify and consider the justification of the *RLM success factors* of strategic importance and significance of RLM (strategic success factor), a well-designed return policy, a well-designed RL process (design success factors), and well-established consumer relationships (relational success factor) (see frameworks 3 and 5B), and (4) identify and consider the of *RLM practices* of an optimised RL process, streamlined return logging (priority practices), SOR communication, RSP improvement preparation and execution, formalisation, service standards and agreements, and service failure reduction for RSP management (service practices) (see frameworks 4 and 5C).
- To understand the ***social significance of RLM***, it is recommended that online retailers (1) understand consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of SC and consumer and market (external constraints) (see framework 2), (3) identify and consider the justification of the *RLM success factors* of strategic importance and significance of RLM (strategic success factor), a well-designed return policy, a well-designed RL process (design success factors), and well-established consumer relationships (relational success factor) (see frameworks 3 and 5B), and (4) identify and consider the of *RLM practices* of an optimised RL process, streamlined return logging, effective product disposition and recovery, consumer feedback and complaints data (priority practices) and RSP improvement preparation and execution (service practices) (see frameworks 4 and 5C).
- To understand the ***legal significance of RLM***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of product return and recovery (operational constraint) and strategy, policy and control (organisational constraint) (see framework 2), (3) identify and consider the justification of the *RLM success factors* of strategic importance and significance of RLM (strategic success factor), a well-designed return policy (design success factor), and well-controlled RL costs and risks (control success factor) (see frameworks 3 and 5B), and (4) identify and consider the of *RLM practices* of an pre-return inspection, preventative gatekeeping, preventative inspection (priority practices), metrics, product experts and abuse investigations for RRP examination, product interventions, supplier exit and account suspensions for RRP interventions (reactive return prevention practices), and return

avoidance for RCM mitigation (return cost management) (see frameworks 4 and 5C).

- To understand the ***environmental significance of RLM***, it is recommended that online retailers (1) understand RL, consumer returns and RL processes (see framework 1), (2) identify and investigate the *RLM constraints* of product return and recovery (operational constraint) and strategy, policy and control (organisational constraint) (see framework 2), (3) identify and consider the justification of the *RLM success factors* of strategic importance and significance of RLM, well-developed RL strategies and systems (strategic success factor), a well-designed RL process and a well-designed RL network (design success factor) (see frameworks 3 and 5B), and (4) identify and consider the of *RLM practices* of an pre-return inspection, an optimised RL process, streamlined return logging, online authorisation, efficient return collection, effective product disposition and recovery, return charges and penalties, preventative gatekeeping and preventative inspection (priority practices) (see frameworks 4 and 5C).

Objectives realised

- The significance of RLM, including economic, competitive, social, legal and environmental significance, can be important factors for the adoption of RLM to effectively manage consumer returns in online retailing. Therefore, understanding the significance of contributed to realising a part of *SRO-1* (determine the factors that influence the success of RLM) and the primary objective through Framework 5A.

FRAMEWORK 5B – JUSTIFY THE ADOPTION OF RLM SUCCESS FACTORS

Main findings

- As mentioned in the findings of Framework 3, the RLM success factors can be important for the effective RLM of consumer return in online retailing
- The justification for adopting RLM success factors relates to the number of RLM constraints that can be addressed and the number of RLM benefits realised
- The RLM benefits include various economic, operational, organisational, environmental, social, market and SC benefits
- All RLM success factors addressed various RLM constraints and realised numerous RLM benefits
- Appropriate IT as a resource RLM success factor was the most important success factor in terms of the number of RLM constraints addressed and benefits realised
- The RLM control success factor of well-controlled RL costs and risks was the most significant success factor in terms of addressing RLM constraints
- The most beneficial RLM success factor in terms of realising RLM benefits was appropriate IT
- The least significant RLM success factor in terms of addressing RLM constraints and realising RLM benefits was a well-designed return policy (design success factor)

Recommendations

- To justify the adoption of RLM success factors online retailers can refer to Framework 5B. Additionally, online retailers can prioritise the adoption of success factors based on the findings presented in Frameworks 1B, 1C and 1D (understand consumer returns and RL processes), Framework 2 (RLM constraints), Framework 3 (RLM success factors) and Framework 5B (justify the adoption of RLM success factors).
- It is recommended that online retailers prioritise the adoption of ***strategic RLM success factors*** if they aim to (1) manage B2C returns effectively (framework 1 B), (2) improve or effectively manage collection, transportation, inspection, sorting, disposition and redistribution processes (frameworks 1C and 1D), (3) address investment and costing (financial RLM), operational support (operational RLM), management, strategy, policy, control and functional (organisational RLM) constraints (frameworks 2 and 5B), and (4) improve organisational, environmental, social and market (competitive) performance (frameworks 3 and 5B).
- It is recommended that online retailers prioritise the adoption of ***design RLM success factors*** if they aim to (1) manage consumer returns effectively (framework 1 B), (2) improve or effectively manage CRR, gatekeeping, collection, transportation, receiving, processing, inspection, sorting, disposition and redistribution processes (frameworks 1C and 1D), (3) address

financial and cash (financial RLM), product return and recovery, operational support (operational RLM), strategy, policy, control (organisational RLM), consumer and market (external RLM) constraints (frameworks 2 and 5B), and (4) improve operational, environmental, market and SC performance (frameworks 3 and 5B).

- It is recommended that online retailers prioritise the adoption of ***resource RLM success factors*** if they aim to (1) manage B2C returns effectively (framework 1 B), (2) improve or effectively manage CRR, gatekeeping, receiving, inspection, sorting and disposition processes (frameworks 1C and 1D), (3) address investment and costing (financial RLM), operational support (operational RLM), functional (organisational RLM), SC, consumer and market (external RLM) constraints (frameworks 2 and 5B), and (4) improve operational, environmental, social, market and SC performance (frameworks 3 and 5B).
- It is recommended that online retailers prioritise the adoption of ***control RLM success factors*** if they aim to (1) manage B2C returns effectively (framework 1 B), (2) improve or effectively manage gatekeeping and disposition processes (frameworks 1C and 1D), (3) address investment and costing, financial and cash (financial RLM), product return and recovery risk (operational RLM), strategy, policy, control (organisational RLM), functional (organisational RLM), consumer and market (external RLM) constraints (frameworks 2 and 5B), and (4) improve economic, operational, environmental, social and market performance (frameworks 3 and 5B)
- It is recommended that online retailers prioritise the adoption of ***relational RLM success factors*** if they aim to (1) manage B2C returns effectively (framework 1 B), (2) improve or effectively manage CRR, gatekeeping, collection, transportation, receiving, processing, inspection, sorting, disposition and redistribution processes (frameworks 1C and 1D), (3) address product return and recovery (operational RLM) functional (organisational RLM), SC and consumer and market (external RLM) constraints (frameworks 2 and 5B), and (4) improve environmental, environmental, social, SC and market performance (frameworks 3 and 5B)

Objectives realised

- RLM success factors can be important to improve RL processes, address RLM constraints and realise RLM benefits for the effective RLM of consumer returns in online retailing. Therefore, justifying the adoption of the RLM success factors contributed to realising a part of *SRO-1* (determine the factors that influence the success of RLM), *SRO-7* (investigate and determine important factors for the effective RLM of consumer returns in online retailing) and the primary objective through Framework 5B.

FRAMEWORK 5C – JUSTIFY THE IMPLEMENTATION OF RLM PRACTICES

Main findings

- As mentioned in the findings of Framework 4, the RLM practices can be important for the effective RLM of consumer return in online retailing
- The justification for the implementation of RLM practices relates to the number of RLM constraints that can be addressed and the number of RLM benefits realised
- The service specific RLM practice of formalisation, service standards and agreement, and service failure reduction for RSP management is the most beneficial RLM practice in terms of addressing RLM constraints, realising RLM benefits, and costs (degree of implementation) versus benefits (RLM constraints addressed and RLM benefits realised)
- Service specific RLM practice of can be the most beneficial for the effective RLM of consumer returns in online retailing
- Cost specific RLM practices can be the least beneficial in terms of the overall costs versus the benefits
- All RLM practices addressed various RLM constraints and realised numerous RLM benefits

Recommendations

- To justify the implementation of RLM practices online retailers can refer to Framework 5C. Additionally, online retailers can prioritise the implementation of RLM practices based on the findings presented in Frameworks 1B, 1C and 1D (understand consumer returns and RL processes), Framework 2 (RLM constraints), Framework 4 (RLM practices) and Framework 5C (justify the implementation of RLM practices).
- It is recommended that online retailers prioritise the implementation of ***priority RLM practices*** if they aim to (1) manage

consumer returns effectively (framework 1 B), (2) improve or effectively manage CRR, gatekeeping, collection, inspection and disposition processes (frameworks 1C and 1D), (3) address financial and cash (financial RLM), product return and recovery (operational RLM), and consumer and market (external RLM) constraints (frameworks 2 and 5C), and (4) improve economic, operational, environmental, social, market and SC performance (frameworks 4 and 5C).

- It is recommended that online retailers prioritise the implementation of ***prevention and control specific RLM practices*** if they aim to (1) manage and reduce consumer returns (framework 1 B), (2) improve or effectively manage receiving, sorting and disposition processes (frameworks 1C and 1D), (3) address financial and cash (financial RLM), product return and recovery, operational support (operational RLM), management, strategy, policy and control, functional (organisational RLM), SC and consumer and market (external RLM) constraints (frameworks 2 and 5C), and (4) improve economic, operational, organisational, environmental, market and SC performance (frameworks 4 and 5C).
- It is recommended that online retailers prioritise the implementation of ***service specific RLM practices*** if they aim to (1) manage consumer returns efficiently (framework 1 B), (2) improve or effectively manage CRR, gatekeeping, collection, processing and inspection processes (frameworks 1C and 1D), (3) address product return and recovery, operational support (operational RLM), management, strategy, policy and control, functional (organisational RLM) and consumer and market (external RLM) constraints (frameworks 2 and 5C), and (4) improve economic, operational, organisational, environmental, social, market and SC performance (frameworks 4 and 5C).
- It is recommended that online retailers prioritise the implementation of ***cost specific RLM practices*** if they aim to (1) manage and avoid consumer returns (framework 1 B), (2) improve or effectively manage gatekeeping, transportation, processing and disposition processes (frameworks 1C and 1D), (3) address investment and costing, financial and cash (financial RLM), management, strategy, policy and control, and functional (organisational RLM) constraints (frameworks 2 and 5C), and (4) improve economic and environmental performance (frameworks 4 and 5C).

Objectives realised

- The RLM practices can be important factors to improve RL processes, address RLM constraints and realise RLM benefits for the effective RLM of consumer returns in online retailing. Therefore, justifying the implementation of RLM practices contributed to realising *SRO-4* (identify and explore RL literature for RL practices to manage consumer returns), *SRO-6* (identify and explore important RL practices for managing consumer returns in online retailing, based on inputs from industry experts), *SRO-7* (investigate and determine important factors for the effective RLM of consumer returns in online retailing) and the primary objective through Framework 5C.

Source: Compiled by the researcher

In the next section, the contribution, limitations and future research opportunities will be provided.

9.10 CONTRIBUTION, LIMITATIONS AND FUTURE RESEARCH RECOMMENDATIONS

This section provides the contribution, highlights the limitations of this study, and recommends future research opportunities.

9.10.1 Contribution of the study

This study extensively investigated the effective RLM of consumer returns in online retailing. This study identified that effective RLM requires understanding, exploring, identifying or investigating the concept of RL, consumer returns, pre-receipt and post-receipt RL processes, RLM constraints, RLM success factors, practices for effective RLM and significance of effective RLM. Furthermore, this study developed a framework for the effective RLM of consumer returns in online retailing consisting of

several sub-frameworks for implementation and consideration. Specifically, the study developed a framework (1) that provides online retailers with limited experience in RL with an understanding of the concept of RL (Framework 1A), consumer returns (Framework 1B), pre-receipt RL processes (Framework 1C) and post-receipt RL processes (Framework1D). Following the understanding of the concept of RLM, the study identified that online retailers could identify economic, operational, organisational and external constraints that hamper the adoption and effective implementation of RLM (Framework 2). Without knowledge about the barriers, risks, pitfalls and problems in RLM, online retailers might struggle to implement appropriate RLM practices.

Online retailers that lack knowledge about success factors in RLM can identify the strategic, design, resource, control and relational RLM success factors (Framework 3), which can be used as a benchmark for successful RLM. When effectively managed, these factors can significantly improve the efficiency and effectiveness of RLM. This study identified that various practices can be implemented for effective RLM, including priority, return prevention and control, service and cost RLM practices (Framework 4). All RLM practices in Framework 4 include key elements, requirements and considerations, and associated RLM success factors that can be implemented for the effective execution of RLM.

Additionally, the study identified that understanding the significance of RLM (Framework 5A), justifying the adoption of RLM success factors (Framework 5B) and justifying the implementation of RLM practices (Framework 5C) can be important drivers for adopting and implementing effective RLM. This study determined that online retailers should understand the economic, competitive, social, legal and environmental significance of RLM (Framework 5A) for more awareness of the importance of RLM. Furthermore, the study identified that adopting RLM success factors (Framework 5B) and implementing RLM practices (Framework 5C) can be justified through the number of constraints addressed and the number of benefits realised. Consequently, identifying the beneficial outcomes of RLM can motivate online retailers to adopt RLM success factors and implement RLM practices for the effective RLM of consumer returns.

While the study identified that consumer and market constraints could be most problematic in RLM, strategic, resource and relational factors can be the most significant RLM success factors, and priority and service practices can be the most beneficial for the effective RLM of consumer returns in online retailing, the developed framework is not a one-size-fits-all solution. Instead, it can be uniquely applied to the online retailer's situation, adapting to their specific needs and challenges. For instance, if the online retailer identified economic constraints (Framework 2) as the most significant constraints to the adoption and implementation of effective RLM, they could focus on benchmarking control RLM

success factors (Framework 3), implementing cost RLM practices (Framework 4), understanding the economic significance of RLM (Framework 5A), justifying the adoption of control RLM success factors (Framework 5B) and justifying the implementation of cost RLM practices (Framework 5C).

This study provided several theoretical, methodological, practical and policy contributions, which will be emphasised in the subsequent sections.

9.10.1.1 Theoretical and empirical contributions

In the problem statement of the study, presented in section 1.3, several gaps in research were identified that this study addressed. Additionally, from the unique contributions presented in section 1.8, additional areas were identified that support the theoretical and empirical contributions of the study. Accordingly, this study made the following theoretical and empirical contributions:

- **Development of RL literature**: This study significantly advances the literature on RL by synthesising a wide selection of scientific journal articles and integrating insights from industry experts, specifically in the South African online retail industry. This study provides new perspectives and a deeper understanding of RL processes, practices and the management of consumer returns in online retailing.
- **Focus on online consumer returns**: While most existing research focuses on brick-and-mortar settings, this study addresses the gap by exploring the types and significance of consumer returns in online retailing. Therefore, this study contributes to the theoretical discourse by highlighting the unique challenges and opportunities in the online context.
- **Exploration of RL processes and practices**: The study examines RL processes and practices from theoretical (literature review) and practical (interviews) perspectives. This dual approach enriches the theoretical understanding of effective RLM.
- **Alternative RLM practices**: By identifying various RLM practices beyond return policies, this study offers theoretical insights into alternative strategies for managing consumer returns effectively, expanding the theoretical framework of RLM in online retailing.
- **Geographic focus**: The study contributes empirical knowledge to the relatively unexplored area of RL and RLM of consumer returns in the South African online retail industry, providing a foundation for further research in this geographic context.
- **Research in developing countries**: By focusing on South Africa, the study contributes to the empirical literature on RL in developing countries, addressing the noted gap in research in these regions.

- **Input from industry experts**: Including inputs from industry experts provides empirical validation of the theoretical concepts and offers practical insights into the current state challenges of RLM in online retailing.

9.10.1.2 Methodological contributions

The problem statement (section 1.3) and unique contribution (section 1.8) identified methodological gaps in the research. However, additional contributions were made regarding the methodology chapters (3 and 7) of this study. This study made the following methodological contributions:

- **Qualitative research methodology**: This study addresses the dominance of quantitative methodologies in RL research by employing a multimethod qualitative approach, thus enriching the methodological diversity in the field.
- **Representation in organisational research**: Through a multimethod qualitative design, the study contributes to the underrepresented area of qualitative research in organisational and management studies.
- **Qualitative content analysis**: The study provides a detailed methodological overview of applying QCA to literature and demonstrates the practical use of software like ATLAS.ti, addressing the scarcity of practical guidance in this area.
- **Thematic analysis (TA)**: This study provides a detailed and practical approach to conducting reflexive TA, facilitating other researchers' use and understanding of this methodology.

9.10.1.3 Practical contributions

In the background (section 1.2), problem statement (section 1.3) and unique contribution (section 1.8), it was established that RL and RLM can be more complicated in online retailing and can significantly impact online retailers' performance in terms of cost, market share, corporate image and consumer service. Unfortunately, many online retailers still fail to recognise the importance of RLM, viewing RLM as an unwanted burden. Furthermore, ineffective RLM can be detrimental to the long-term sustainability of online retailers. Various studies, including this study, identified that practise lacks an RLM framework guiding online retailers to manage consumer returns effectively. This study provided the following practical contributions:

- **RLM practices beyond return policies**: The study identifies and emphasises RLM practices such as return prevention and control, service performance, and cost management, which are important for effective RLM rather than focusing solely on return policies.

- **Framework development**: The study develops a comprehensive framework for effective RLM of consumer returns, which online retailers can implement to improve their RLM practices.
- **Guidance for online retailers**: The framework assists online retailers in understanding RL concepts, gaining insights into consumer returns and RL processes, identifying RLM constraints, success factors and practices, and justifying the adoption and implementation of effective RLM.
- **Practical insights and recommendations**: The study provides actionable insights and recommendations that online retailers can apply when using the developed framework, ultimately enhancing their RLM practices and overall performance.

9.10.1.4 Policy contributions

In addition to the theoretical, empirical, methodological and practical contributions, this study contributes to policy in the following ways:

- **Guidelines for policymakers**: The study offers key insights and recommendations that can inform policymakers in developing guidelines and regulations to support effective RLM practices.
- **Policy tool**: The framework can serve as a policy tool to standardise RLM procedures, enhance consumer satisfaction, and improve the sustainability of online retail operations.
- **Supporting sustainable practices**: Policymakers can use the findings of the study to promote sustainable RL practices, which would benefit the broader online retail industry.

In the next section, the limitations of the study will be identified.

9.10.2 Limitations of the study

Despite the valuable contributions, this study was subjected to several limitations in terms of time, scope, lack of research in the field, impact of multimethod qualitative research, field of study, access to participants, sampling, research subjects and geographical region. The limitations of this study are as follows:

- **Time:** The most significant limitation in this study was time. Due to the nature of this multimethod qualitative study, this study was conducted over a period of six years. Additionally, the analysis of almost 300 articles and 13 lengthy interviews added to the time constraints. The researcher personally transcribed, coded and analysed all qualitative data.

- **Scope of the study:** The scope of the study was limited to consumer returns, RL processes, RL practices and RLM in online retailing, with a strong focus on economic, competitive and market performance. Therefore, this study excluded any practices and recovery activities associated with manufacturers and waste management. Particularly, this study excluded green logistics practices, environmental management practices, disposition options of reconditioning, remanufacturing, recycling and waste management. Additionally, this study was limited to consumer returns, which excluded distribution returns and manufacturer returns.
- **Lack of available research:** At the start of the study, almost no publications were found that focused on RL and consumer returns in online retailing. Resultingly, the initial literature review and QCA of RL literature mostly included publications focusing on manufacturing, bricks-and-mortar retailing, automotive industry, construction industry and waste management sectors. Only after the completion of the QCA of RL literature did research in RL and online retailing increase, especially due to the COVID-19 pandemic. However, more recent research was added to the literature study, which supported the empirical findings of the study.
- **Impact of multimethod qualitative research:** As the researcher was familiar with quantitative survey methodologies, substantial effort and time was needed to understand, apply and use qualitative research methods. The researcher underestimated the requirements of a thorough qualitative study, which added to the time constraints of the study. Using three different qualitative research methods created challenges in the writing of various chapters, including two methodology chapters and five findings' chapters. Consequently, the length of this thesis reflects the implication and scope of selecting multiple qualitative research methods.
- **Field of study and access to participants:** In the recruitment stage of this study, it was noted that limited individuals in South Africa can be regarded as experts in RL, consumer returns and RLM. Additionally, industry professionals, CEOs, owners and senior managers are hard-to-access individuals, which complicated the recruitment process. Despite this inaccessibility of industry experts, thirteen were recruited for the empirical research of the study.
- **Sampling, research subjects and geographical region:** Since the interviews with industry experts included a small sample size, the study findings cannot be generalised to a larger population. Furthermore, this study excluded views from operational staff, who might provide different insights into RL processes and activities. While this study focused on consumer returns, consumers were excluded as participants from the study, which can be a shortcoming in terms of identifying consumer-centric RLM practices. Additionally, this research was conducted within the borders of South Africa, which might impact the application of the framework to other regions.

9.10.3 Future research recommendations

Based on the limitations and findings of the study, the following recommendations for future research can be made:

- To extend the scope of this study, future research could focus on the green logistics management of consumer returns in online retailing
- To extend the framework developed in this study, future research can be conducted on the RLM of business-to-business returns
- Future research can be conducted using quantitative research methods to examine consumer returns and RL in the online retailing industry of South Africa
- Future research can focus on risk management and the impact of supply chain disruptions on the management of consumer returns in online retailing
- Future research can focus on the financial management, accounting and costing practices in RL
- More research is needed into the application of modern technologies in managing RL and product returns in South Africa
- More research is needed on the impact of the 4th industrial revolution and circular economy principles in the RLM of product returns in South Africa
- Future research can focus on the economic, legislative, competitive, corporate citizenship and environmental drivers in the adoption of RLM in South Africa
- More research can be conducted on strategic management and top management support as practices for the effective management of consumer returns
- Future research can focus on cross-functional collaboration and internal relationship management as RLM practices to address RL problems
- To extend the sampling scope of this study, future research can include operational staff to understand RL processes and alternative RLM practices
- Future research can include consumers as research subjects, using focus groups that can help online retailers to identify additional problems and success factors
- More research is needed in South Africa to explore the impact of wardrobing, opportunistic buying and fraudulent return behaviours on the economic sustainability and competitiveness of online retailers.

In the next section, the conclusion of the study is provided.

9.11 CONCLUSION OF THE STUDY

In this chapter, a final framework for the effective RLM of consumer returns in online retailing and was presented and a conclusion of this study was provided, including an overview of the study, summary of main findings, recommendations and objectives, contribution, limitations and future research opportunities.

Consequently, the first aim of this chapter was to achieve the primary research objective of the study, which was to ***develop a framework for the effective RLM of consumer returns in online retailing.*** The framework was developed based on the findings of the three research phases of the study, including the literature study (phase 1 presented in chapter 2), QCA of RL literature (phase 2 presented in chapters 4, 5 and 6) and the interviews with industry experts (phase 3 presented in chapter 8). Due to the comprehensiveness of the findings of this study, the final framework was divided into five separate but interrelated frameworks, which in combination represents the framework for the effective RLM of consumer returns in online retailing. Specifically, the framework for the effective RLM of consumer returns in online retailing included (1) Framework 1 – Understand RL, consumer returns and RL processes, (2) Framework 2 – Identify and investigate RLM constraints, (3) Framework 3 – Understand the success factors of effective RLM, (4) Framework 4 – Identify and implement RLM practices, and (5) Framework 5 – Understand and justify the significance of effective RLM. Additionally, the framework was used to structure the summary of main findings, recommendations and objectives realised.

Framework 1 (section 9.4) focused on providing online retailers with a limited understanding of RLM, with a description of the concept of RL, consumer returns and RL processes that can take place in online retailing. Framework 1 consisted of four parts, including Framework 1A – Understand the concept of RL, which focused on defining and describing RL (from section 2.2), Framework 1B – Understand consumer returns, which focused on describing consumer return types (from sections 4.3 and 8.3.1), Framework 1C – Understand pre-receipt RL processes, which focused on describing the pre-receipt RL processes (from sections 4.4 and 8.3.2), and Framework 1D – Understand post-receipt RL processes, which focused on describing the post-receipt RL processes (from chapter 5 and section 8.3.3).

Framework 2 (section 9.5) focused on helping online retailers to identify and investigate RLM constraints that hampers the effective RLM of consumer returns. Specifically, Framework 2 involved the identification and investigation of RLM constraints and RLM constraint causes that represented RLM barriers, risks, pitfalls and problems (from sections 2.3, 8.4.1, 8.5.1 and 8.6.1) and potential

solutions for RLM constraints (derived from identified constraint causes). The main RLM constraints were classified as financial, operational, organisational and external constraints. As a part of the investigation of RLM constraints, Framework 2 indicated the degree of constraints, degree of causes and degree of solutions, which can help online retailers investigate the most significant RLM constraints, constraint causes and solution focus areas. The framework showed that consumer and market constraints can be the most problematic for online retailers, which means that online retailers must focus on avoiding and addressing consumer and market constraints for the effective RLM of consumer returns.

Framework 3 (section 9.6) focused on educating online retailers that lack knowledge about the success factors of effective RLM. Particularly, Framework 3 involved an understanding of the RLM success factors, classified as strategic, design, resource, control and relational RLM success factors, which represented descriptions of the RLM success factors (from section 2.5) and RL practices (from chapter 6). Framework 3 can be used as a benchmark for online retailers to compare their current RL practices, processes and procedures against key RLM success factors, which can help them to consider adopting key RLM success factors for the effective RLM of consumer returns. Furthermore, Framework 3 provided online retailers with the degree of adoption and impact of RLM success factors, which can help them understand the requirements and importance of each key RLM success factor. The framework illustrated that the most important RLM success factor included strategic importance and commitment to RLM, suggesting that online retailer can prioritise the adoption of this RLM success factor for the effective RLM of consumer returns.

Framework 4 (section 9.7) focused on helping online retailers to identify and implement suitable RLM practices for the effective RLM of consumer returns. The main RLM practices were classified as priority RLM practices (most significant key practices in terms of occurring in more than one theme from the interview findings presented in chapter 8), prevention and control specific RLM practices (from section 8.4.2), service specific RLM practices (from section 8.5.2) and cost specific RLM practices (from section 8.6.2). Specifically, Framework 4 involved the identification and implementation of (1) key RLM practices (from sections 8.4.2, 8.5.2 and 8.6.2), (2) RLM practice requirements (from chapter 6), (3) RLM practice considerations (from sections 8.4.2.4, 8.5.2.3 and 8.6.2.4), and (4) RLM success factors to adopt (identified from Framework 3). Additionally, Framework 4 provides the degree of implementation of each key RLM practice, which can help online retailers identify the most complex RLM practices. The framework identified that effective product disposition and recovery (key priority RLM practice) can be the most complex RLM practice, meaning

that online retailers must identify various initiatives, requirements and considerations and adopt several RLM success factors before product disposition and recovery can be implemented successfully.

Finally, Framework 5 (section 9.8) focused on helping online retailers to understand the significance of RLM and identify the beneficial outcomes of adopting RLM success factors and implementing RLM practices. Framework 5 consisted of three parts, including (1) Framework 5A – Understand the significance of RLM, which focused on describing economic, competitive, social, environmental and legal significance of RLM (from section 2.4), (2) Framework 5B – Justify the adoption of RLM success factors, which focused on identifying the RLM constraints addressed (from section 2.3 and Framework 2) and RLM benefits realised (from section 2.5 and chapter 6) through the adoption of RLM success factors, and (3) Framework 5C – Justify the implementation of RLM practices, which focused on identifying the RLM constraints addressed (from sections 8.4.2, 8.5.2 and 8.6.2 and Framework 2) and RLM benefits realised (sections 8.4.3, 8.5.3 and 8.6.3 and chapter 6) through the implementation of RLM practices. Framework 5 showed that RLM can be economically, competitively, socially, legally an environmentally significant, adopting RLM success factors can be highly beneficial and implementing RLM practices can be highly significant. Therefore, online retailers can confidently adopt RLM success factors and implement RLM practices for the effective RLM of consumer returns since the benefits of effective RLM far exceeds the costs.

Based on the justification of the adoption of RLM success factors, Framework 5B demonstrated that the most significant RLM success factor in terms of addressing RLM constraints and realising RLM benefits included appropriate IT. Therefore, online retailers must prioritise the adoption of appropriate IT as a RLM success factor for the effective RLM of consumer returns. Furthermore, based on the justification of the implementation of RLM practices, Framework 5C showed that the most significant key RLM practice included formalisation, service standards and agreements, and service failure reduction for RSP (return service performance) management, which means online retailers must prioritise the implementation of RSP management for the effective RLM of consumer returns in online retailing. Finally, Framework 5C showed that the most significant RLM practice category included service RLM practices, indicating that the effective RLM of consumer returns in online retailing requires a consumer-centric or service-oriented RLM approach.

Following the presentation of the frameworks and summary of findings, this chapter concluded with (1) an overview of the theoretical, methodological, practical and policy contributions of the study, (2) the limitations of this study, including time, scope, lack of research in the field, impact of multimethod qualitative research, field of study, access to participants, sampling, research subjects and geographical

region, (3) future research opportunities based on the limitations and findings in this study, and (4) the conclusion of this study.

A.2 CODING FRAMEWORK FOR QCA

Final coding framework for the QCA of RL literature, which was also used for the initial coding of the interviews with industry experts (deductively).

Code category	Description
CatA: Pre-receipt processes	**These are the processes that take place before the organisation receives the product at the facility. Therefore, this category includes customer return request, gatekeeping, collection and transportation.**
CatA_Sub1: Customer return request	This is the process where the customer notifies the organisation of a product return. This can include any content regarding the processes a customer can follow to notify a firm.
CatA_Sub2: Gatekeeping process	A function where the organisation decides a return is accepted or not. The focus on gatekeeping in this part is the elements that explain the physical process of gatekeeping and not the outcomes of successful or poor gatekeeping abilities. Also added to this could be the RMA process.
CatA_Sub3: Collection	This is a process where the item is moved back from the customer to the facility. The focus here is on the physical process and not strategies or decisions regarding collection.
CatA_Sub4: Transportation of return	This involves the physical movement of products to the facilities. Transportation decisions or strategies will not be included in this category.
CatA_Sub5: Miscellaneous pre-receipt process	Any new content that does not fit into customer return request, gatekeeping, collection and transportation of returns.
CatB: Post-receipt processes	**These are the processes that take place when product returns arrive at facilites and involve RL operations in facilities and the destinations returned products travel. The processes include receiving, processing, inspection and sorting, disposition and redistribution**
CatB_Sub1: Receiving	This involves processes where the returned product arrives at the facility and unloading the products and assigning it to sorters or inspectors
CatB_Sub2: Processing	Can involve issuing credit to customers, data entry regarding the condition of the returns, also which treatment options should the firm follow. It seems that processing can take place at all stages in the RL process.

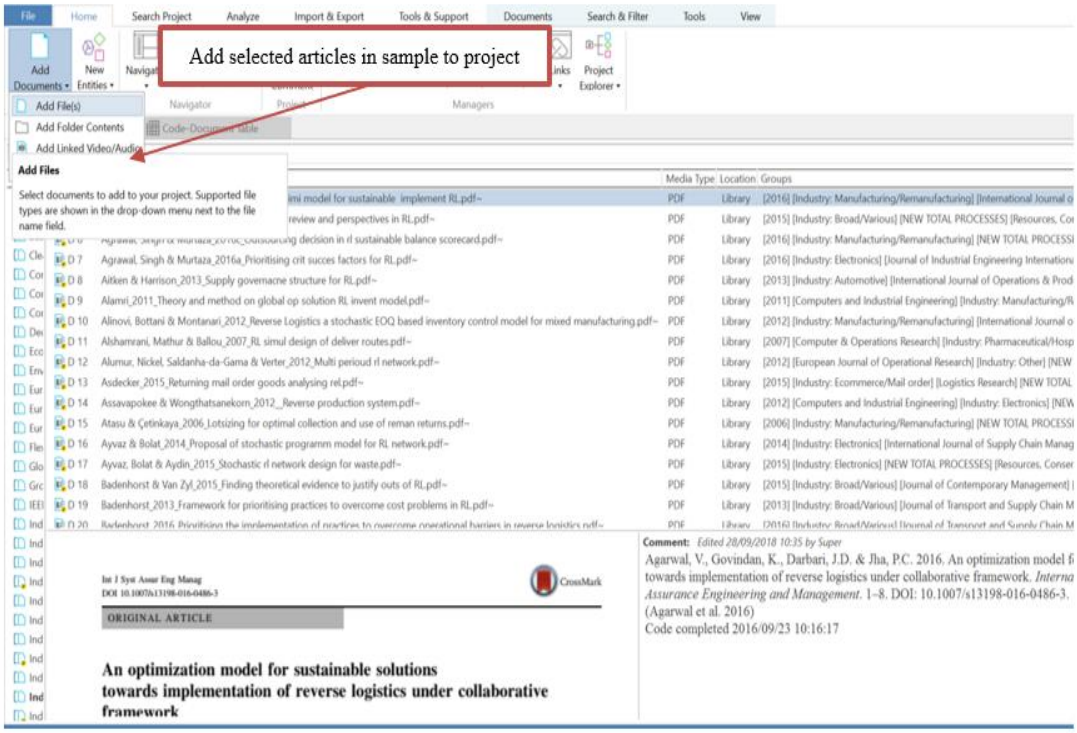
CatB_Sub3: Inspection/sorting	Inspection and sorting are where the overall appearance and state of the returned products are evaluated more intensively than during gatekeeping (Agrawal et al. 2015:78). Again the focus will be on the physical processes and not on strategies or practices.
CatB_Sub3_1: Inspection	Determining the condition of the product after receiving
CatB_Sub3_2: Sorting	Where the returned products are placed into categories, defective or non-defective. This process will also result in determining which disposition option would be followed.
CatB_Sub4: Disposition	Considered the most important process in RL. This process involves several options to decide the fate of returned products. The options can be reuse, recovery and other exit options. Excluded from disposition (for study) is material recovery, remanufacturing and waste disposal.
CatB_Sub4_1: Reuse	Reuse entails reusing or reselling the returned product in its current condition.
CatB_Sub4_2: Repair	Repair involves the work of fixing and replacing malfunctioning components of a product in order to restore the existing used product to a working order (Khor & Udin, 2012: 7).
CatB_Sub4_3: Refurbish	Refurbishing involves the replacement of some parts and upgrading the key components of the returned product (Gandolfo & Sbrana, 2008: 33).
CatB_Sub4_4: Exit options of returns	These other alternatives for product disposition, where retailers mostly shift the responsibility for product recovery to other supply chain parties or due to product condition using alternative markets to sell product returns.
CatB_Sub4_4a: Sell on secondary market	This is where the organisation chooses a route that is outside its normal market. For instance, ebay, factory stores and clearance stores.
CatB_Sub4_4b: Ship to vendor	This is where the organisation decides to ship the product back to the manufacturer/supplier.
CatB_Sub4_4c: Sell to third party	This is where the organisation decides to sell the product to a third-party buyer (such as a jobber)
CatB_Sub4_4d: Miscellaneous exist options	Other exist options that falls outside the already mentioned categories.
CatB_Sub5: Redistribution	The final RL process that takes place after disposition, where recovered/returned products return to markets.
CatB_Sub6: Miscellaneous post-receipt processes	New post-receipt processes are any new processes that can form part of post-receipt processes but fall outside of the receiving, inspection/sorting, disposition and exit option categories.
CatC: Consumer returns	**Returns between end users and retailers (excludes distribution returns and manufacturing returns)**
CatC_Sub1: General consumer returns	Included in consumer returns are B2C commercial returns, service returns, end-of-use returns, warranty returns and recalls. Excludes end-of-life returns.
CatC_Sub2: Miscellaneous types of returns	These will include types of returns that falls outside any of the other return categories
CatD: RL Practices	**Included in this category are all the practices that contribute to the effective management of RL. It also includes strategies and management decision-making. This category is broad since various practices can exist. The most important is that a practice clearly improves or contributes to the effective management of RL.**
CatD_Sub1: Integrations	Integration can take place at functional level and supply chain level. This category will include content regarding having a holistic approach to RL (like integrated logistics)
CatD_sub1_1: Supply chain integration	This involves all the processes regarding collaborating, sharing information, contracts, negotiations and meetings with supply chain partners. The focus must be on relationships and SCI strategies that can improve RLM
CatD_sub1_2: Cross-functional integrations	Different functions from the organisation work together to improve the entire RL process.
CatD_sub1_3: Customer integrations/ engagements	This entails involving the customer in the RL process. This category will include customer engagement and practices to improve customer service/satisfaction. A distinction should be made between consumers (end-users) and retailers and wholesalers (customers of the manufacturer).
CatD_sub2: Outsourcing/insourcing	This is where the organisation makes decisions regarding outsourcing or insourcing RL processes or activities
CatD_sub2_1: Outsource to third parties	This involves outsourcing to any other parties in the RL process. This can include 3PL providers but also any other party that can perform any of the functions within the RL process.
CatD_sub2_2: Keep RL in-house	This is where the organisation decides to keep RL internal and not to outsource any part of RL.
CatD_Sub3: IT practice	Information practices are related to any technology, system, or software that can improve RLM and improve returns processes. Here it is more about the strategies and the type of technologies that organisations use for RL and why these technologies improve RLM.
CatD_sub3_1: General IT	This is anything related to IT in general. Therefore, if literature discuss the strategies and requirements for technology and systems in RL without specifying the specific technology types it can be included in this category. However, if literature contains a sentence that mentions the types of technologies that exit, it can still be coded to this category.
CatD_sub3_2: Internet or web-based	Any IT related to the internet or web-based systems, like online shopping platforms, can be included in this category
CatD_sub3_3: Traditional forward IT	Any traditional logistics technologies, for example, ERP, EDI, WMS, TMS, CRM or anything that is normally used for FL. However, this excludes barcodes and RFID
CatD_sub3_4: RFID and barcode	Anything related to RFID and barcoding. This can include tags, scanners, readers and computer software related to RFID and barcode technologies
CatD_sub3_5: RL technologies	Any technologies that are specifically used for RL, for example, return software and returns management software. Exclude any technologies that can be used for other business functions.
CatD_sub4: Performance measurement	Any metrics or measurements that organisations use to determine its performance in RL.
CatD_sub5: Resource commitment	This category can contain any resources that organisations will need to invest in to improve the RL process (financial, human, technology).
CatD_sub6: Financial management practices	These are practices related to cost reporting, controls and accounting systems. This category can also include identification of costs in RL.
CatD_sub7: Strategic	Focus on any procedures and formal strategies for the effective RLM of consumer returns. Anything related to RL in the

planning and procedures	overall strategic plan of the organisation, standardised processes for RL, SOPs or formalised procedure which includes written rules and procedures for RL
CatD_sub8: Return avoidance and gatekeeping practices	These are either strategies or processes that organisations implement to reduce returns or avoid returns. Gatekeeping should not be confused with the process of gatekeeping, the focus here is on the strategic decisions as well as the reasons why gatekeeping should be a standard practice for improving the RL process.
CatD_sub9: Staff and management practices	These are practices related to management and staff involvement in the RL process. This includes top management support and involvement in RL, practices related to dedicated managers in RL, establishing a dedicated function for RL and staff training
CatD_sub10: Disposition practices	This section should not be confused the disposition process. Different cost structures and revenue recovery are associated with the different disposition strategies. The focus must be on disposition decisions, strategies and practices that can lead to effective recovery of product returns.
CatD_sub11: Facility/locations strategies	This includes strategies regarding the location and type facilities that organisations can utilise in RL and the requirements and outcomes of general facility/location strategies.
CatD_sub12: Miscellaneous practices	Any other practices/strategies or decisions identified that were not identified in previous categories

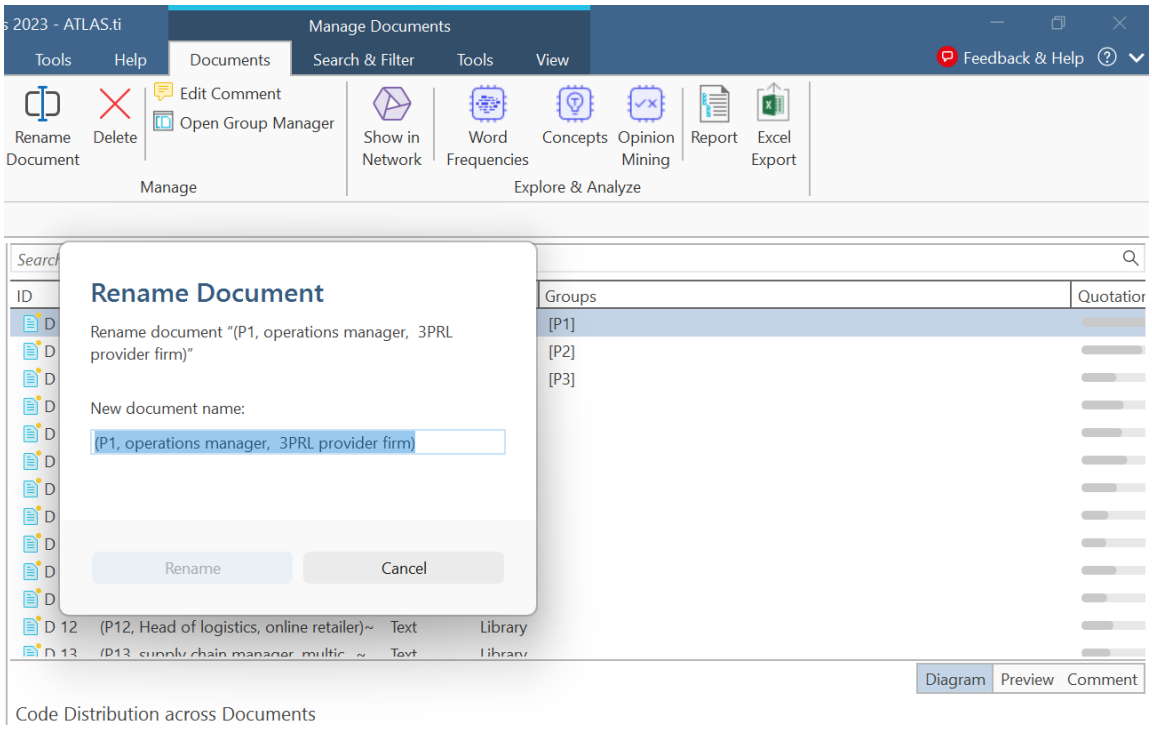
Appendix B - Using ATLAS.ti for QCA methodology

Although this Appendix relates to the QCA methodology discussed in chapter 3, ATLAS.ti was also used for the interviews with industry experts. Therefore, both qualitative methods followed the same procedures in ATLAS.ti.

B.1 PREPARING MATERIALS FOR CODING IN ATLAS.TI

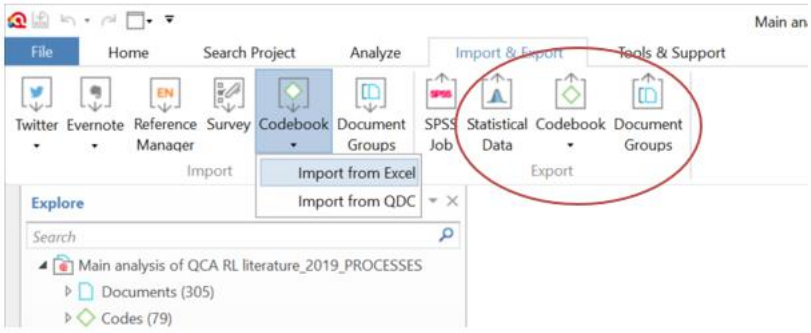


(See section 3.3.2.6.1 for the discussion of preparing codes in ATLAS.ti)



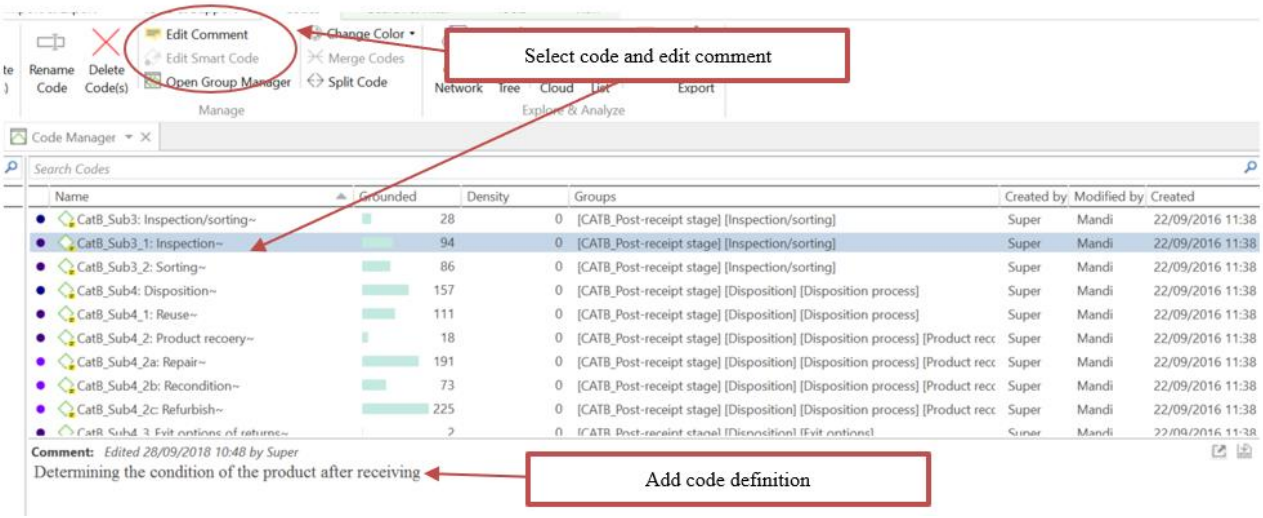
(Renaming the document section 7.3.5.2.2 for the interviews with industry experts)

B.2 IMPORTING CODES FROM THE IMPORT FUNCTION IN ATLAS.TI.



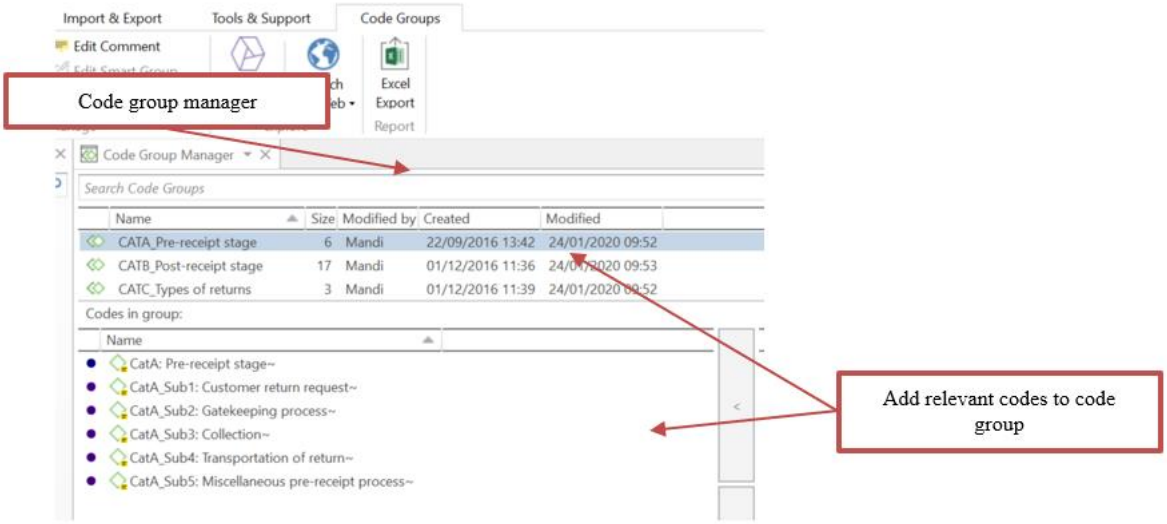
(See code frame used for import in **Error! Reference source not found.** and discussion of importing codes in section 3.3.2.6.2)

B.3 CREATING CODE DEFINITIONS IN ATLAS.TI



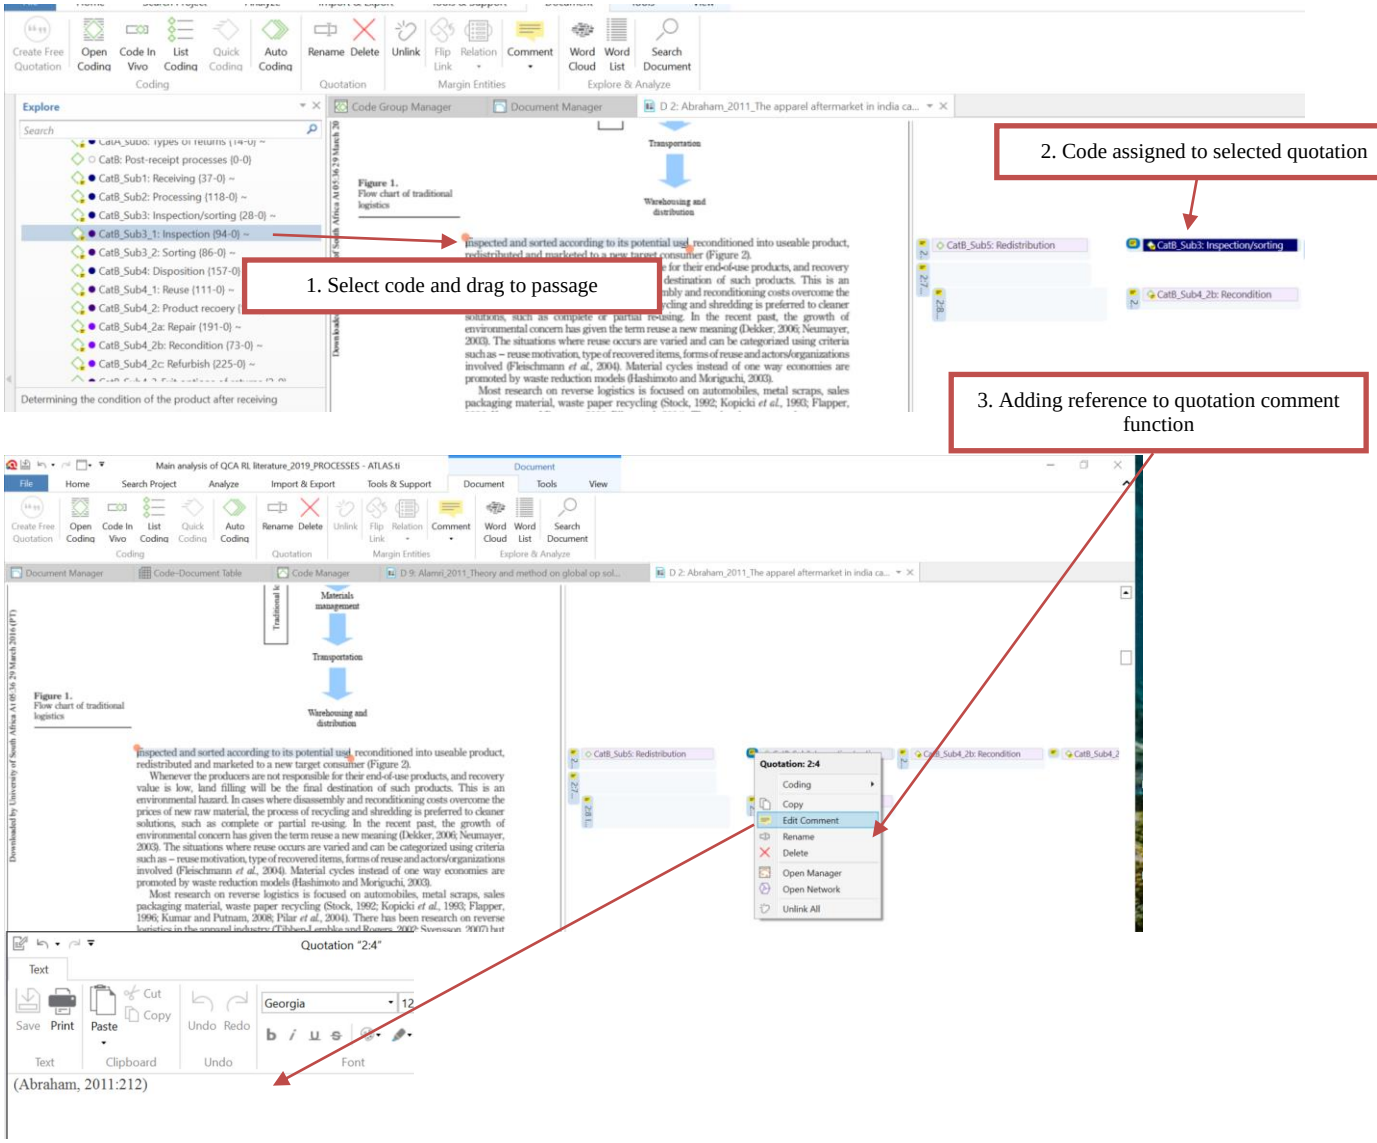
(See code definitions in **Error! Reference source not found.** and discussion of adding code definitions in section 3.3.2.6.2)

B.4 ASSIGNING CODES TO CODE GROUPS IN ATLAS.TI



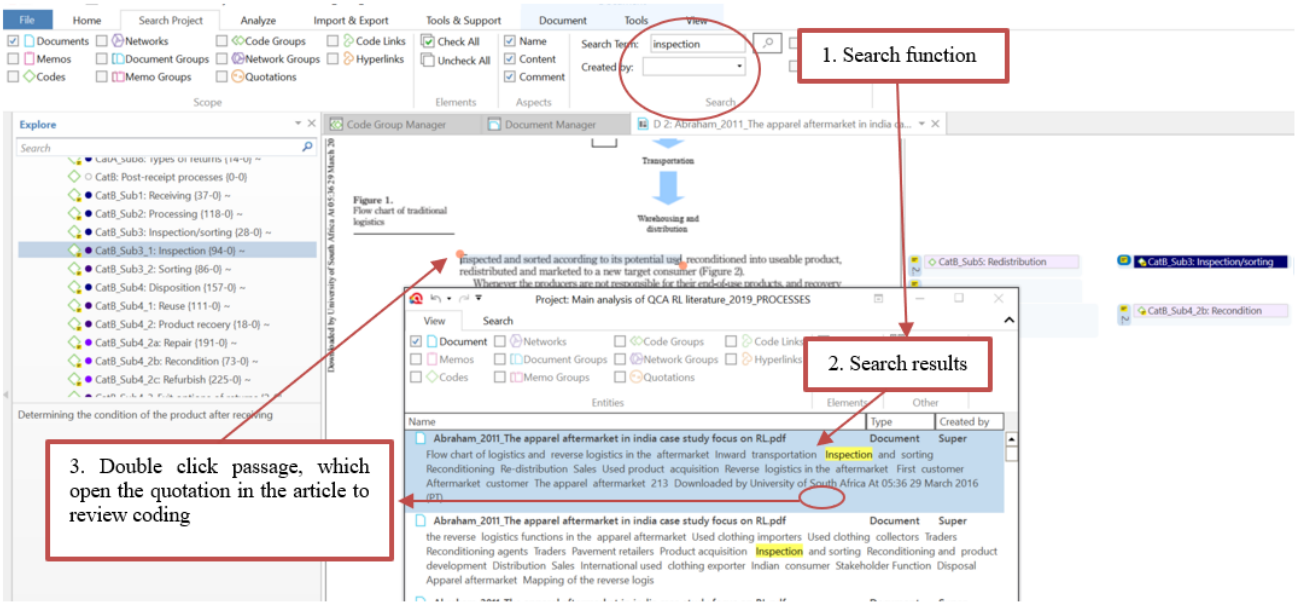
(See discussion of adding codes to code groups in section 3.3.2.6.2)

B.5 EXAMPLE OF CODING ARTICLES IN ATLAS.TI



(See section 3.3.2.6.3 for the discussion of the initial coding process)

B.6 EXAMPLE OF SEARCH FUNCTION IN ATLAS.TI



(See section 3.3.2.6.3 for the discussion of using the search function to ensure accuracy of the coding results)

B.7 EXAMPLE OF CODE-DOCUMENT TABLE IN ATLAS.TI FOR QUANTITATIVE RESULTS

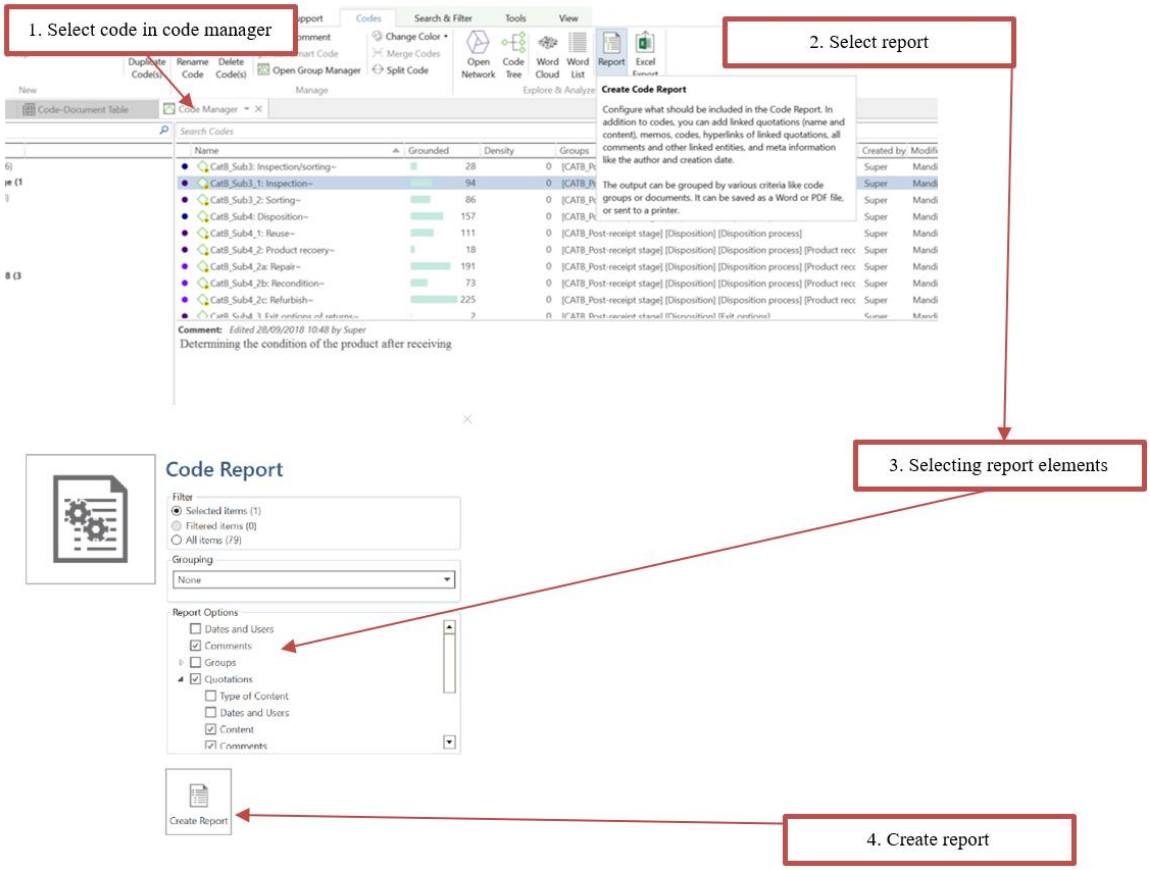
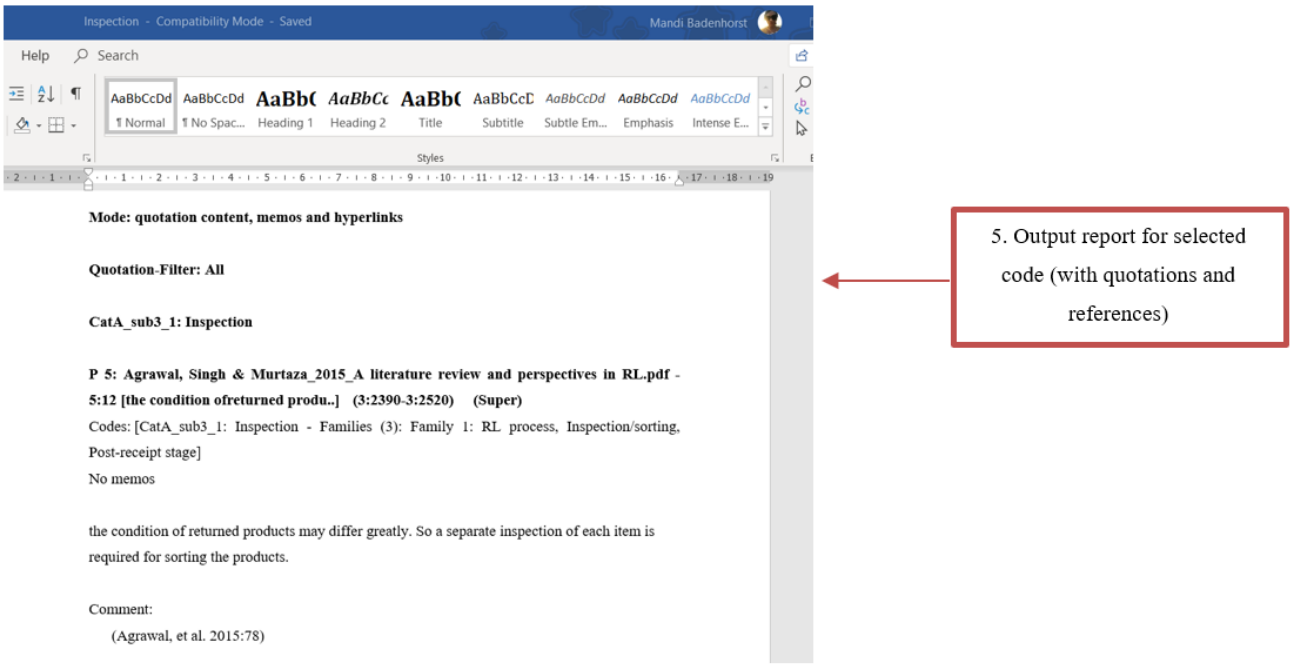
4. Excel output to facilitate analysis

(See section **Error! Reference source not found.** for the discussion of using code-document tables in ATLAS.ti for quantitative results)

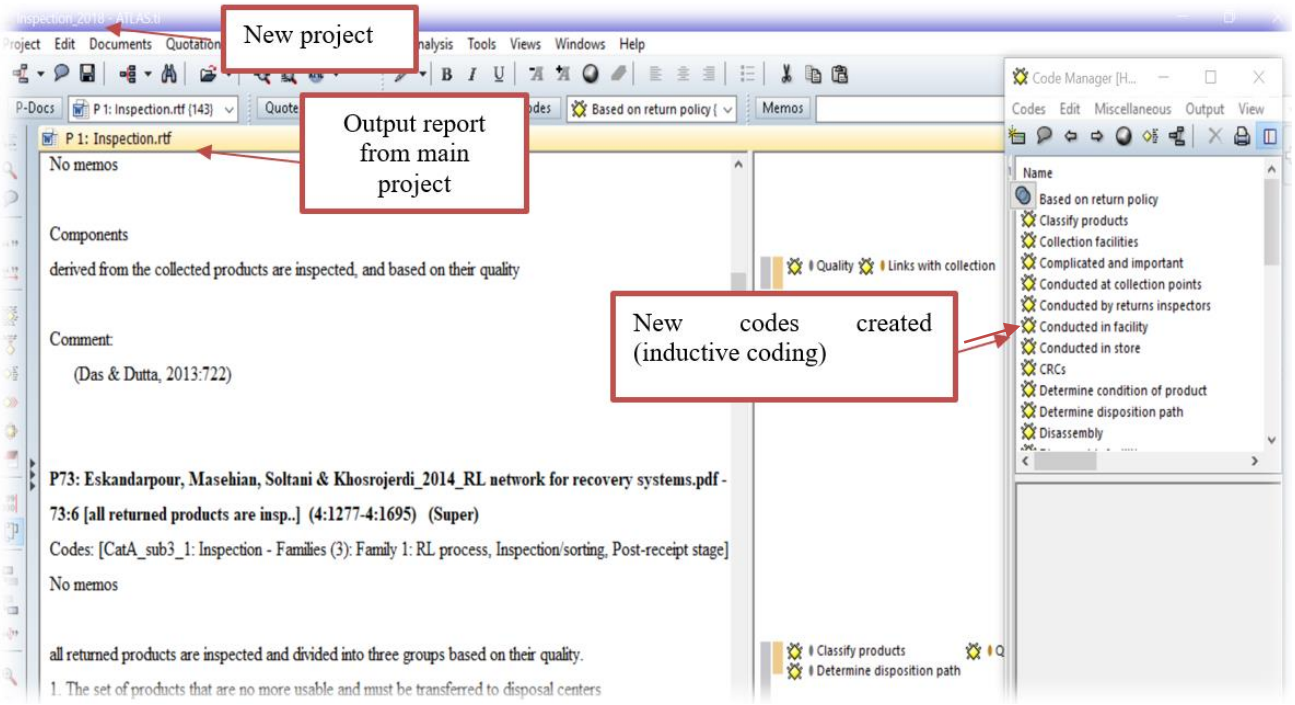
B.8 EXAMPLE OF CREATING CODE QUOTATION OUTPUT REPORTS FOR QUALITATIVE ANALYSIS





(See section **Error! Reference source not found.** for the discussion of creating a quotation output report for selected codes)

B.9 EXAMPLE OF INDUCTIVE CODING FROM CODE CATEGORIES



(See section 3.3.2.6.5 for the discussion related to inductive codings)

Appendix C QCA of RL literature results

C.1 CODE FREQUENCIES OF THE MAIN CATEGORIES FROM THE QCA OF RL LITERERATURE

The results shown in this section is the demographical information of the QCA on RL literature.

The results presented in the table are based on the Excel export function of ATLAS.ti for all the main categories identified in the coding frame (Appendix A.2) based on the research questions. The totals indicate the number of quotations (literature passages) in the content assigned to the main categories presented in the table. This table relates to figure 4.3 in chapter 4.

MAIN CATEGORY	FREQUENCIES
Types of consumer returns	149
Pre-receipt RL processes	288
Post-receipt RL processes	1224
RL practices	1730
Totals	3391

C.2 CODE FREQUENCIES OF PRE-RECEIPT PROCESS CATEGORIES FROM THE QCA OF RL LITERERATURE

The results presented in this table are based on the Excel export function of ATLAS.ti for all the code categories of pre-receipt RL processes identified in the coding frame (Appendix A.2). The totals indicate the number of quotations (literature passages) in the content assigned to the code categories presented in the table. This table relates to figure 4.5 in chapter 4.

CODE CATEGORIES	FREQUENCY
Customer return request	23
Gatekeeping process	33
Collection	130
Transportation	102
Totals	288

C.3 CODE FREQUENCIES OF POST-RECEIPT PROCESS CATEGORIES FROM THE QCA OF RL LITERERATURE

The results presented in this table are based on the Excel export function of ATLAS.ti for all the code categories of post-receipt RL processes identified in the coding frame (Appendix A.2). The totals indicate the number of quotations (literature passages) in the content assigned to the code categories presented in the table. This table relates to figure 5.3 in chapter 5.

CODE CATEGORIES	FREQUENCIES
Receiving	37
Inspection	93
Sorting	88
Processing	121
Disposition	835
Redistribution	50
Total	1224

Since the disposition process consisted of several sub-code categories, representing disposition options and exit options. The results presented in the following table are based on the Excel export function of ATLAS.ti for all the sub-code categories of the disposition processes identified in the coding frame (Appendix A.2). The totals indicate the number of quotations (literature passages) in the content assigned to the sub-code categories presented in the table. This table relates to figure 5.8 in chapter 5.

Disposition categories	Frequency
General disposition	155
Reuse	109
Repair	191
Refurbish	225
Exit options	155
Total	835

C.4 CODE FREQUENCIES OF RL PRACTICE CATEGORIES FROM THE QCA OF RL LITERERATURE

The results presented in this table are based on the Excel export function of ATLAS.ti for all the code categories of RL practices identified in the coding frame (Appendix A.2). The totals indicate the number of quotations (literature passages) in the content assigned to the code categories presented in the table. This table relates to figure 6.3 in chapter 6.

CODE CATEGORIES	TOTAL

IT practices	340
Integration practices	299
RL in/outsourcing	203
RL disposition practices	258
Performance measurement (PM)	150
Facility/location practices	183
Resource commitment (RC)	51
Financial management (FM)	70
Return prevention and avoidance (RPA)	66
Strategic planning and procedural (SPP)	56
Management and staff practices	54
Total	1730

Since the some of the practices consisted of several sub-code categories, the results presented in the following table are based on the Excel export function of ATLAS.ti for all the sub-code categories of the RL practices identified in the coding frame (Appendix A.2). The totals indicate the number of quotations (literature passages) in the content assigned to the sub-code categories presented in the table. This table relates to various figures in chapter 6.

PRACTICE	TOTAL
General IT	100
Internet or web-based	32
Traditional forward IT	72
RFID and barcode	100
RL technologies	36
Supply chain integration (SCI)	186
Customer integration (CI)	85
Cross-functional integration (CFI)	28
RL outsourcing	174
RL insourcing	29
RL disposition practices	258
Performance measurement (PM)	150
Facility/location practices	183
Resource commitment (RC)	51
Financial management (FM)	70
Return prevention and avoidance (RPA)	66
Strategic planning and procedural (SPP)	56
Management and staff practices	54

Total	1730

Appendix D – Interviews with industry expert data collection and analysis information

D.1 INTERVIEW PROTOCOL

Interview protocol and discussion guide during interviews with industry experts:

UNISA university of south africa

SEMI-STRUCTURED INTERVIEW PROTOCOL – DISCUSSION GUIDE

A FRAMEWORK FOR THE REVERSE LOGISTICS OF CONSUMER RETURNS IN ONLINE RETAILING

Dear participant

Thank you for your time and willingness to participate in this study. My name is Amanda Badenhorst and I am doing research with Orpha Cilliers, a professor in the Department Applied Management, towards a PhD in Management studies at the University of South Africa. The purpose of this interview is to determine the practices required for the effective management of reverse logistics for consumer returns in online retailing.

I would like for this interview, which will last for about 30 - 45 minutes, to be an open and informal discussion. The information will be regarded as strictly confidential. I assure you that your identity and your details will not be revealed in the findings of this study. If you feel uncomfortable with any of the questions, you have the right to opt not to answer that particular question. You may also stop the interview at any time, without providing a reason and with no consequences to you. May I record this interview for accuracy and quality purposes? This recording will only be used for the purposes of this study and will not be made available to any other third party.

I would to confirm that you have read the participant information sheet and signed the informed consent form to verify that you understand the purpose of this interview. Do you have any questions before we start?

MAIN QUESTIONS

A. INTERVIEWEE BACKGROUND

1. Can you please tell me more about your background and level of expertise in the field of reverse logistics?

Before we start with the questions, I just want to add that all the questions are applicable to the reverse logistics of consumer returns in online retailing. Therefore, I will not repeat the reverse logistics of consumer returns in online retailing and will only refer to the term reverse logistics where applicable.

B. OVERVIEW OF CONSUMER RETURNS IN ONLINE RETAILING

This section cover the reasons and types of consumer returns, the facilities used for consumer returns and the roles and responsibilities of the parties involved in the reverse logistics processes for consumer returns in online retailing.

1. The reasons and types of consumer returns in online retailing

1.1 Can you tell me more about the type of consumer returns in the online retailing industry?
1.2 In your opinion, what are the most common reasons for consumer returns and why?

2. Operation facilities used for the reverse logistics processes of consumer returns in an online environment

2.1 Can you tell me more about the reverse logistics processes and activities that take place in operational facilities?

3. The parties involved in the reverse logistics processes of consumer returns in an online environment

3.1 Can you please tell me more about the internal and external parties involved in reverse logistics?

C. REVERSE LOGISTICS PRACTICES FOR CONSUMER RETURNS IN ONLINE RETAILING

Included in this category are all the practices that may contribute to the effective management of reverse logistics. It also includes strategies and management decision-making. This category is broad since various practices can exist. The most important is that a practice clearly improves or contributes to the effective management of reverse logistics.

1. The information systems and technologies typically implemented to manage the reverse logistics processes of consumer returns in online retailing

1.1 In your opinion, what are the most important technologies and systems that online retailers can implement, to manage their reverse logistics for consumer returns? **Probe:** Can you explain why you say so?

1.2 Overall, do you think that the investment and use of information technologies for the management of reverse logistics for consumer returns are important practices for online retailers to consider?

1.2.1 **If yes,** why do you say so?
1.2.2 **If no,** why do you say so?

2. Internal/external integrations needed for the effective management of reverse logistics for consumer returns in online retailing

2.1 In your opinion, what are the typical supply chain integration strategies (such as information sharing and collaboration) that can be implemented for the effective management of reverse logistics? **Probe:** Can you tell me more about these integration strategies and why they are important?

2.2 In your view, how can online retailers achieve inter-departmental or cross-functional integration for the effective management of reverse logistics? **Probe:** Can you tell me more about these integration strategies and why they are important?

2.3 In your view, do you think that it is important for online retailers to consider "consumer integration" such as information sharing as an important practice?
If yes, why do you say so?
If no, why do you say so?

2.4 Overall, do you think that internal/external integrations are important practices for online retailers to manage their reverse logistics processes?
2.4.1 **If yes,** why do you say so?
2.4.2 **If no,** why do you say so?

3. Typical resources that online retailers use for the management of reverse logistics?
3.1 In your view, do you think that resource commitment (such as financial, human and infrastructure) is an important practice in the reverse logistics management for consumer returns in online retailing?
3.1.1 **If yes,** why do you say so?
3.1.2 **If no,** please explain to me why you feel this way?

4. Outsourcing to third parties as reverse logistics practices in online retailing?
4.1 In your opinion, is it a good practice to outsource the whole reverse logistics process or only specific reverse logistics activities?
4.1.1 **If yes,** why do you say so?
4.1.2 **If no,** can you explain why this is the case?
4.2 Can you tell me more about the specific reverse logistics activities that are normally outsourced and why?
4.3 Can you please tell me more about the typical third parties that online retailers can employ to manage their reverse logistics?

5. Disposition or recovery strategies (i.e. reuse, repair, return to manufacturer or sell to a third party) that should be considered by online retailers

5.1 In your opinion, what are the factors that influence disposition decisions and why?
5.2 In your view, should disposition decisions be part of the online retailer's strategic planning?
5.2.1 **If yes,** why do you say so?
5.2.2 **If no,** can you tell me why you feel this way?

6. Performance measurements that online retailers can use to determine their performance in reverse logistics?

6.1 In your opinion, do you think that it is important for online retailers to measure their performance in reverse logistics?
6.1.1 **If yes,** why do you say so?
6.1.2 **If no,** can you tell me why you feel this way?
6.2 In your opinion, what are the most important performance metrics (such as costs, quality and time) that online retailers should use and why?

7. Operational facilities and/or location strategies in reverse logistics?

7.1 In your opinion, do you think that centralised operation facilities are better than decentralised facilities for reverse logistics? **Probe:** Why do you say so?
7.2 In your view, do you think that online retailers should use their traditional forward logistics facilities (such as warehouses) for reverse logistics activities?
7.2.1 **If yes,** why do you say so?
7.2.2 **If no,** why do you think it is better to separate the facilities?
7.3 What are some of the factors that influence online retailer's facility/location strategies in reverse logistics? **Probe:** Why do you say so?

8. Staff and managerial practices needed for the effective management of reverse logistics in online retailing

8.1 In your opinion, do you think that online retailers should appoint a dedicated manager and/or create a separate function for their reverse logistics?
8.1.1 **If yes,** why do you say so?
8.1.2 **If no,** why do you feel this way?
8.2 In your view, do you belief that training is needed for staff involved in reverse logistics?
8.2.1 **If yes,** why do you say so?
8.2.2 **If no,** why do you feel this way?

9. Cost and accounting systems used for reverse logistics?

9.1 In your opinion, what are the typical reverse logistics costs for online retailers? **Probe:** Can you tell me more about each of these costs?
9.2 In your opinion, should online retailers use their normal accounting systems to manage their reverse logistics cost?
9.2.1 **If yes,** why do you say so?
9.2.2 **If no,** why do you feel this way?

D. CONCLUSION

Do you have anything to add to our discussion, that you belief is important in the reverse logistics management for consumer returns in online retailing?

Do you know of any other individual/s that qualify to participate in this study? Do you want to a summary of the findings once the research has been published?

Please feel contact me if you can think of anything else you would like to share with me regarding the study.

Thank you for taking the time out of your busy schedule to meet with me. You have been very helpful.

D.2 INTERVIEW QUESTIONS CHECKLIST

Checklist used to structure the interview protocol for the interviews with industry experts.

Aspects of an Interview Protocol	Y	N	Feedback for Improvement
Interview Protocol Structure			
Beginning questions are factual in nature			
Key questions are majority of the questions and are placed between beginning and ending questions			
Questions at the end of interview protocol are reflective and provide participant an opportunity to share closing comments			

A brief script throughout the interview protocol provides smooth transitions between topic areas			
Interviewer closes with expressed gratitude and any intents to stay connected or follow up			
Overall, interview is organized to promote conversational flow			
Writing of Interview Questions & Statements			
Questions/statements are free from spelling error(s)			
Only one question is asked at a time			
Most questions ask participants to describe experiences and feelings			
Questions are mostly open ended			
Questions are written in a non-judgmental manner			
Length of Interview Protocol			
All questions are needed			
Questions/statements are concise			
Comprehension			
Questions/statements are devoid of academic language			
Questions/statements are easy to understand

D.3 RECRUITMENT OF INDUSTRY EXPERTS: EXAMPLES

- *SAPICS RECRUITMENT COMMUNICATION EXAMPLES*

Interview call from SAPICS to members via email

From: Elaine Andrews <Elaine@sapics.org.za>
Sent: Thursday, July 23, 2020 10:26 AM
To: Elaine Andrews <Elaine@sapics.org.za>
Cc: Badenhorst, Mandi <Badena@unisa.ac.za>
Subject: [EXTERNAL] Invite to participate in a Phd in Management studies at the University of South Africa

Dear SAPICS Community Member

You have been selected to participated in a study being conducted by one of our members who is a Senior Lecturer at UNISA.

Mandi Badenhorst would great appreciate your contribution to a study entitled ***a framework for the reverse logistics management of consumer returns in online retailing***.

If you are willing and able, please contact Amanda Badenhorst | badena@unisa.ac.za directly.

Thank you
Elaine

My name is Amanda Badenhorst and I am doing research with Orpha Cilliers, a professor in the Department of Applied Management towards a PhD in Management studies at the University of South Africa. We are inviting you to participate in a study entitled **a framework for the reverse logistics management of consumer returns in online retailing.**

I am conducting this research to determine the processes, policies and practices for the effective management of reverse logistics with a focus on consumer returns in the online retailing industry. The aim of this study is to develop a framework for the effective management of reverse logistics focusing on consumer product returns in online retailing. This study is expected to collect important information that could guide online retailers to review policies, manage processes, and implement appropriate practices in terms of the reverse logistics management for consumer returns.

You are invited to participate in this study due to your knowledge of reverse logistics management. Therefore, you are either an owner/CEO/manager of an organisation that specialises in reverse logistics as a service for online retailers or you have managerial experience in the reverse logistics processes of online retailing.

The study involves semi-structured remote interviews with the options of telephone, Skype or Microsoft Teams, which will be audio recorded. If you agree to participate in this study, you will receive an interview protocol to familiarise yourself with the questions that will be asked during the interview. The questions will cover the reverse logistics practices for consumer returns in online retailing. The interview is expected to last approximately 30 minutes and will take place in the months of August and September 2020.

This study has received written approval from the Research Ethics Review Committee of the College of Economic and Management Science, Unisa. A copy of the approval letter can be obtained from the researcher if you so wish. Participating in this study is voluntary and you are under no obligation to consent to participation. If you do decide to take part, you will be given this information sheet to keep and be asked to sign a written consent form. You are free to withdraw at any time and without giving a reason.

Attached to this email is a participant information sheet containing details of the study. I kindly request that you respond to this email informing me if you are willing or unwilling to participate in this study. Your agreement to participate would be greatly appreciated, since your participation could contribute significantly to the reverse logistics management for consumer returns in the online retailing industry.
If you agree to take part in this study, you will be asked to sign an informed consent form. In addition, you will also be asked to choose between a telephonic interview, Skype interview or Microsoft Teams inteview. You can also choose the interview time and date between August and September 2020 that will suit you.

It would be greatly appreciated if you would forward this invitation to two (or more) contacts in your network whom fulfil the criteria of this study. Thank you for taking time to read this information and for considering participating in this study. Your time and inputs are most valued!

Kind regards,

Follow-up to respondent from SAPICS example

Badenhorst, Mandi

Flag Status: Flagged

Dear [redacted].

Thank you for your willingness to participate.

Kindly find the interview protocol and participation sheet attached. If you are an industry expertise or have knowledge and skill in the field of reverse logistics management, I will appreciate your contribution to the development of a framework for the reverse logistics management of consumer returns in online retailing.

Once you have read through attached documents and signed the declaration you can choose, a date and time in August/September and the interview method (telephone, Microsoft Teams or Skype) that will suit you.

It would be greatly appreciated if you would forward this invitation to two (or more) contacts in your network whom fulfil the criteria of this study. Thank you for taking time to read this information and for considering participating in this study. Your time and inputs are most valued!

Feel free to contact me, if you have any other questions.

Kind regards,

UNISA university of south africa

Subject: PhD study assistance

Good day,

My name is Amanda (Mandi) Badenhorst and I am doing research with Orpha Cilliers, a professor in the Department of Applied Management towards a PhD in Management Studies at the University of South Africa. We are inviting you to participate in a study entitled **a framework for the reverse logistics management of consumer returns in online retailing.** I am conducting this research to determine the processes, policies and practices for the effective management of reverse logistics with a focus on consumer returns in the online retailing industry.

I am looking for potential participants that are either an owner/CEO/manager of an organisation that specialises in reverse logistics as a service for online retailers or individuals with managerial experience in the reverse logistics processes of online retailing.

The study involves semi-structured remote interviews with the options of telephone, Skype or Microsoft Teams, which will be audio recorded. The questions will cover the reverse logistics practices for consumer returns in online retailing. The interview is expected to last approximately 30 minutes and will take place in the months of August and September 2020.

This study has received written approval from the Research Ethics Review Committee of the College of Economic and Management Science, Unisa. A copy of the approval letter can be obtained from the researcher if you so wish. Participating in this study is voluntary and you are under no obligation to consent to participation. If you do decide to take part, you will be given this information sheet to keep and be asked to sign a written consent form. Participants are free to withdraw at any time and without giving a reason.

I will appreciate it if you can forward my invite to any members in your organisation whom fulfil the criteria of this study, or individuals that can send my official call to participate to the members of your organisation.

Your time and inputs are most valued!

Kind regards,

UNISA university of south africa

D.4 INTERVIEW PREPARATION PROCEDURES

- *SAMPLE EMAIL TO PARTICIPANTS FOR SCHEDULING THE INTERVIEWS*

From: "Badenhorst, Mandi" <Badena@unisa.ac.za>
Date: Friday, 31 July 2020 at 14:07
T [redacted]
Subject: Participation in PhD follow up

Dear [redacted]

This email serves as a reminder to confirm your participation in the PhD study, titled *a framework for the reverse logistics management of consumer returns in online retailing.*

Can you kindly let me know the date (in August/September), time and interview platform (Microsoft Teams, Skype or Telephone) that will suit you?

Additionally, please sign the informed consent form, if I have not received it. Please remember that this study is voluntary, and you can withdraw at any time before or during the interview.

For your convenience I am attaching the informed consent form, participation information sheet and interview protocol.

Thank you again for your valuable time, it is genuinely appreciated.
Looking forward to your response.

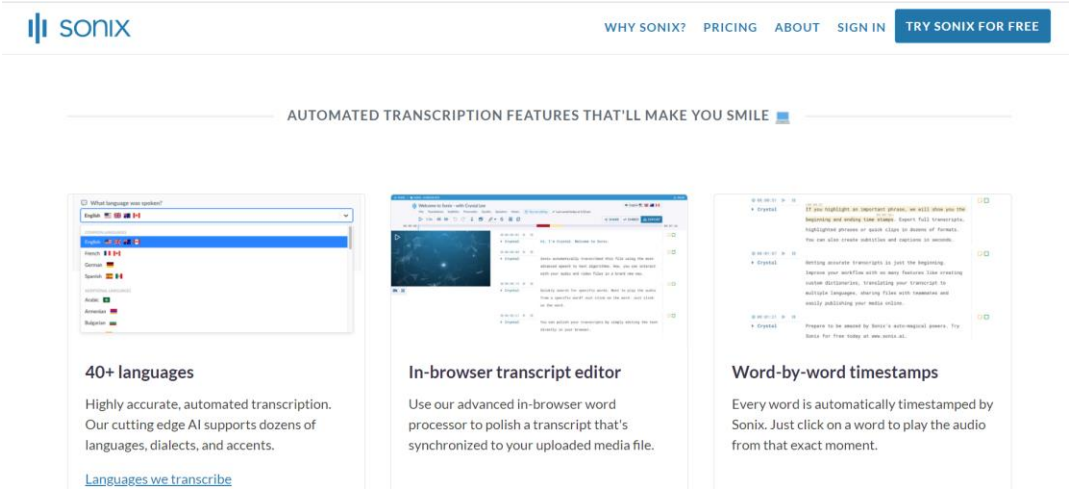
D.5 PHASE 1 – TRANSCRIPTION INFORMATION

INFORMATION ON TRANSCRIPTION SERVICE USED TO TRANSCRIBE INTERVIEW RECORDINGS



Speaker labeling

Every paragraph represents a new speaker. Easily label who said what with our speaker dropdown.

Automated diarization

Sonix will automatically identify speakers and separate exchanges into different paragraphs.

Upload with existing transcript

Already have a transcript? Upload the transcript and media file to Sonix and we'll stitch the audio to your existing transcript.

Notes and commenting

Easily add your notes or comment directly in your transcript.

Text exports (DOCX, TXT, PDF)

Flexible exporting of the text in your transcript in either Microsoft Word, TXT, or PDFs and many other formats.

Subtitle exports (SRT, VTT)

Download your transcript in the most popular subtitle formats (SRT & VTT).

Custom dictionary

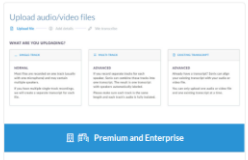
Add specific words and phrases to your own custom dictionary. We'll prioritize these words when transcribing.

Multiple custom dictionaries

Set up multiple dictionaries for different content or clients. Then, choose them during upload.

Automated timecode realignment

After polishing your transcript, perfectly realign your transcript with the audio.



Multitrack uploads

Upload multiple tracks and Sonix will combine them into one transcript with the speakers automatically labeled.

SECURE STORAGE?

Yes. Enterprise-grade.

Enterprise-grade storage for all of your sensitive transcripts and media files.

SECURE IN TRANSIT?

SSL Secured

Bank-level, SSL-secured data transfers to protect your media and transcripts.

SECURE LOGIN?

Two-factor authentication

For extra security, enable two-factor authentication to ensure your account's safety.

WHY SONIX?

The world's best

Sonix is consistently reviewed as the best automated transcription software.

SONIX IS A SECURE, FLEXIBLE WORKSPACE FOR ALL OF YOUR MEDIA FILES

Secure file storage

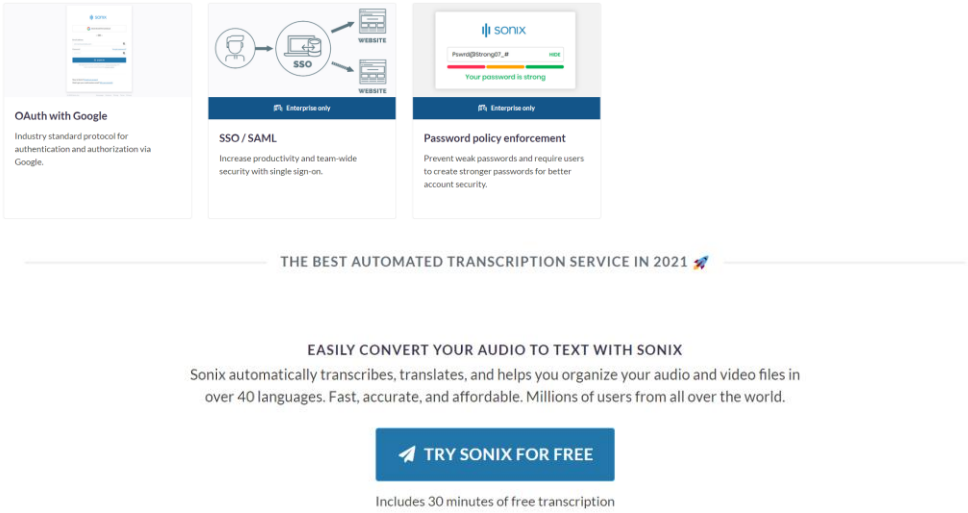
All your data is safe and secure with Sonix. Enterprise-grade security for all users and their files.

SSL & at-rest encryption

Your data is protected at rest and in transit. We use bank-level SSL certificates and encryption algorithms.

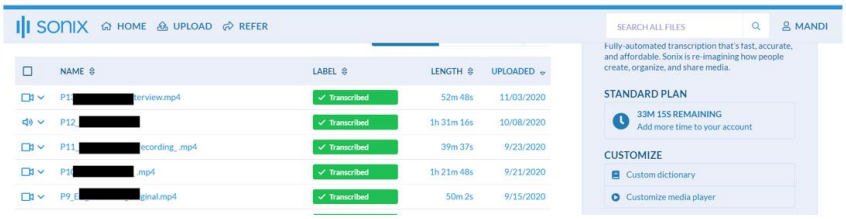
Two factor authentication

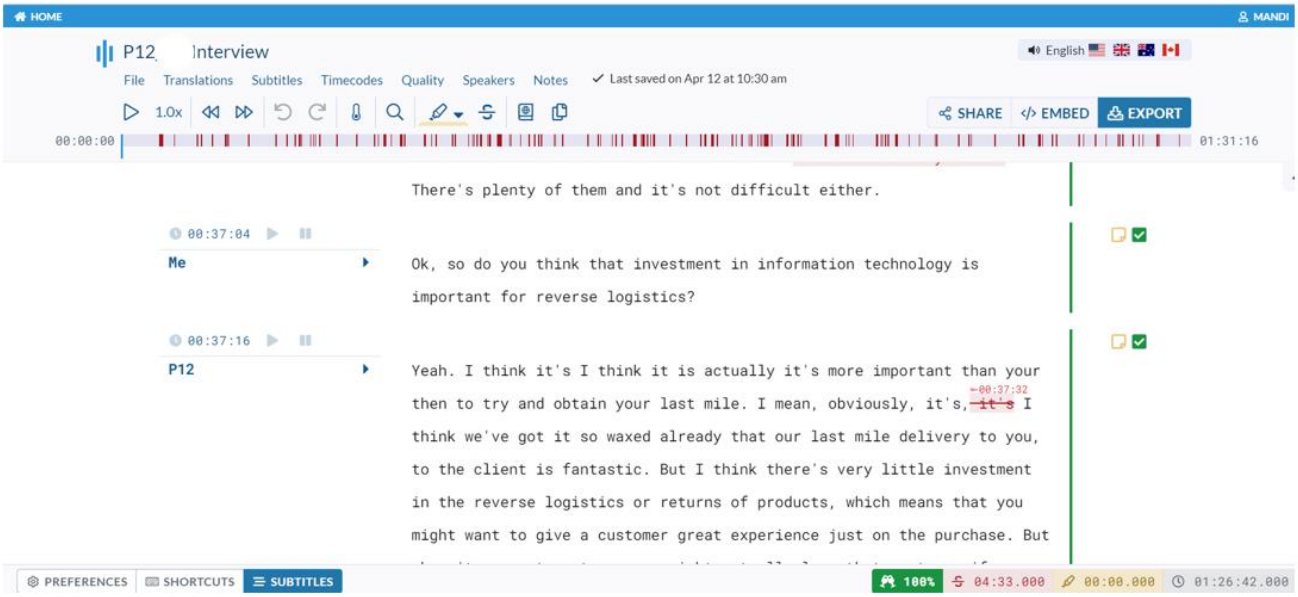
Six-digit security code generated by your phone required to log into your account.



(See https://sonix.ai/)

EXAMPLE OF TRANSCRIPTION OF INTERVIEWS WITH INDUSTRY EXPERTS

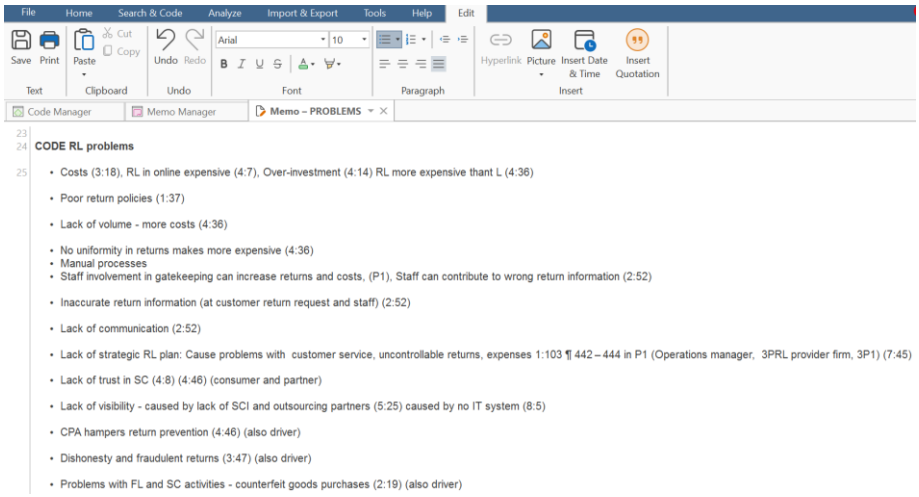




D.6 PHASE 2 – GENERATING CODES

NOTES ON INDUCTIVE CODES

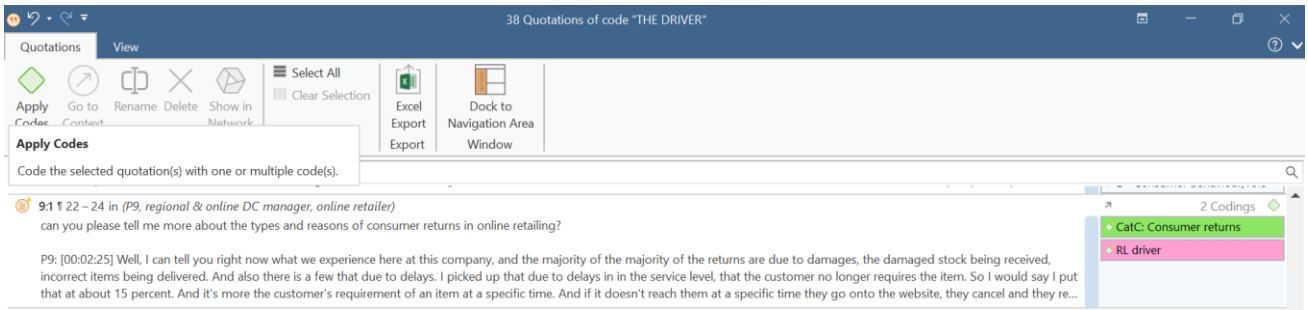
Example applicable to section 7.3.8.3.2, which focuses on commenting on inductive codes during the second coding round.



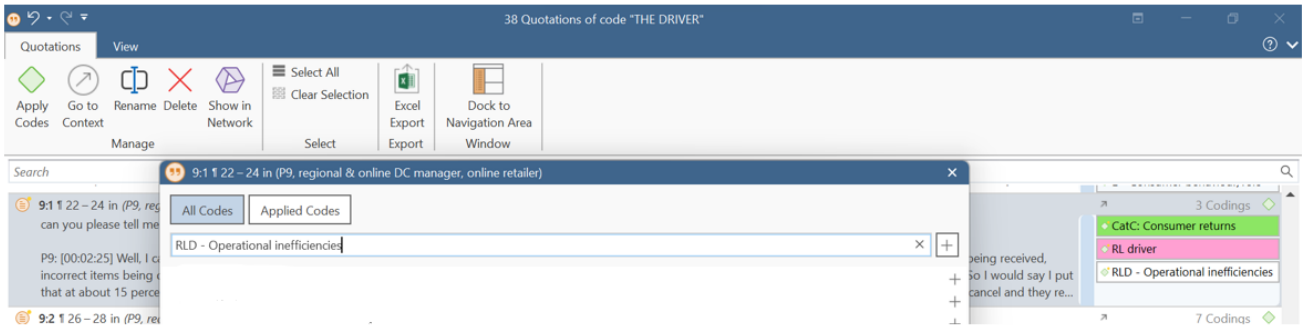
- *EXAMPLES OF RECODING BROAD CODES IN ATLAS.TI*

Example applicable to section 7.3.8.3.2

- Double clicking on the code RL driver in ATLAS.ti:



- Adding new inductive codes to the quotation initially coded with the broad code RL driver



- *PHASE 2 - FINAL CODING FRAME*

Deductive codes from QCA for descriptive analysis, and inductive code categories and codes.

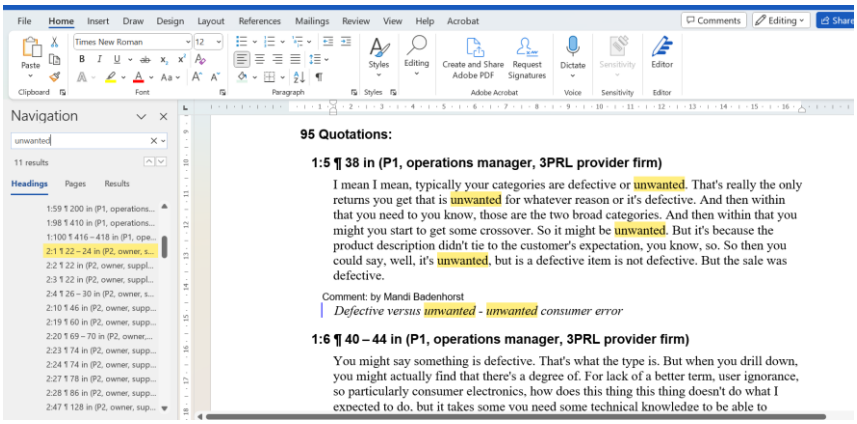
CODES	DESCRIPTION
Deductive codes	Codes applied to the descriptive analysis
Customer return request	This is the process where the customer notifies the organisation of a product return. This can include any content regarding the processes a customer can follow to notify a firm.
Gatekeeping process	A function where the organisation decides a return is accepted or not. The focus on gatekeeping in this part is the elements that explain the physical process of gatekeeping and not the outcomes of successful or poor gatekeeping abilities. Also added to this could be the RMA process.
Collection	This is a process where the item is moved back from the customer to the facility. The focus here is on the physical process and not strategies or decisions regarding collection.
Transportation of return	This involves the physical movement of products to the facilities. Transportation decisions or strategies will not be included in this category.
Receiving	This involves processes where the returned product arrives at the facility and unloading the products and assigning it to sorters or inspectors
Processing	Can involve issuing credit to customers, data entry regarding the condition of the returns, also which treatment options should the firm follow.
Inspection	Determining the condition of the product after receiving
Sorting	Where the returned products are placed into categories, defective or non-defective. This process will also result in determining which disposition option would be followed.
Disposition	Considered the most important process in RL. This process involves several options to decide the fate of returned products. The options can be reuse, recovery and other exit options. Excluded from disposition (for study) is material recovery, remanufacturing and waste disposal.
DISP - Reuse	Reuse entails reusing or reselling the returned product in its current condition.
DISP - Repair	Repair involves the work of fixing and replacing malfunctioning components of a product in order to restore the existing used product to a working order (Khor & Udin, 2012: 7).
DISP - Refurbish	Refurbishing involves the replacement of some parts and upgrading the key components of the returned product (Gandolfo & Sbrana, 2008: 33).
DISP - Exit options of returns	These other alternatives for product disposition, where retailers mostly shift the responsibility for product recovery to other supply chain parties or due to product condition using alternative markets to sell product returns.
DISP - Sell on secondary market	This is where the organisation chooses a route that is outside its normal market. For instance, eBay, factory stores and clearance stores.
DISP - Ship to vendor	This is where the organisation decides to ship the product back to the manufacturer/supplier.
DISP - Sell to third party	This is where the organisation decides to sell the product to a third-party buyer (such as a jobber)
Consumer returns	Returns between end users and retailers (excludes distribution returns and manufacturing returns)
CR - General consumer returns	Included in consumer returns are B2C commercial returns, service returns, end-of-use returns, warranty returns and recalls. Excludes end-of-life returns.
CR - Miscellaneous types of returns	These will include types of returns that falls outside any of the other return categories

Inductive codes	Codes applied to theme development and reflexive analysis
RL Benefits and importance of RLM	Any benefits derived from RL practices and any reference to the significance of RLM
RL Drivers	Drivers of product returns
RLD - Lenient returns	Can include practices to encourage returns, no-question asked return acceptance, no gatekeeping, limited return conditions
RLD - Operational inefficiencies	Can include defective manufacturing and poor procurement, FL inefficiencies that contribute to returns and RL inefficiencies that contribute to returns
RLD - Fraudulent behaviour	Anything related to fraudulent return behaviour from consumers
RLD - Online shopping practices	Includes poor pictures, descriptions or a lack of guides that can lead to returns
RLD - Management inefficiencies	Internal management practices that can increase returns
RL Problems	Extending the drivers and include problems that lead to ineffective or poor RLM, poor RL process and problems that impact customer service
RLP - Communication problems	Poor communication between parties in RL
RLP - Cost-related problems	Associate with high costs, cost inefficiencies, poor cost management and poor accounting
RLP - Party-related problems	Problems in party relationships, e.g. distrust and poor integration
RLP - Poor RLM	Involves lack of planning, lack of resources, lack of strategies and procedures, ineffective decision-making and management inattention
RLP - IT problems	Poor systems and manual operations
RLP - Inefficiencies in the return process	Any problems related to return processes that can cause
Resources and investments	Any resources and investment requirements needed for effective RLM
RI - human resources and investment	Human resources needed for RLM, can include training and development of staff
RI - IT and infrastructure investment	IT resources needed for RLM
RI - Financial resources	Financial resources needed for RLM
Measurement and control	Measuring performance for effective RLM
MC - Measuring staff performance	Any practices related to measure staff performance for RLM
MC - Measuring SC performance	Any practices related to measure SC performance for RLM
MC - Measuring customer service performance	Any practices related to measure customer service performance for RLM
MC - Functional control	Any practices that help control the RL function
MC - Operational control	Practice related to control RL processes
MC - Product/brand control	Any practice that helps control over product returns and brand image of online retailer
MC - Policies and procedures	Any policies and procedures that help with RLM, including return policies, return strategies and SOPs
Centralisation	Can be centralised facilities or anything related to centralisation for RLM
Decentralisation	Can be decentralised facilities or anything related to decentralisation for RLM
Outsourcing RL	Any outsourcing practices for RLM
OUT - Decision factors in outsourcing	Factors for effective outsourcing decisions
OUT - Options	Outsourcing options that online retailers can consider for RLM
OUT - Reasons	Reasons for outsourcing RL
Information and communication	Any practices related to information and communication needed for RLM
IC - Information	Any practices that help to manage information for RLM

management	
IC - Information sharing between parties	Practices that enable effective information sharing
IC - IT types	Types of IT that can be used for RLM
IC - Visibility	Practices that enhance transparency and visibility in the return process
RL Relationships	Any practices that help improve party relationships for effective RLM
RLR - Internal relationships	Practices that help internal relationships and integration between functions
RLR - SC relationships	Practices that help SC relationships and integration
RLR - Consumer relationships	Practices that help consumer relationships and integration
Consumer-centricity	Any practices that focus on customer satisfaction, service and retention for RLM
CC - Consumer-centric RL processes	Any practices related to RL processes that can lead to satisfaction
CC - Consumer-centric returns	Any practices related to lenient returns
CC - Consumer expectations	Practices to identify consumer expectations
CC - Consumer trust	Practices to enhance consumer trust
CC - Consumer experience	Practices to enhance consumer return experiences
Reduce returns	Practices that prevent high or fraudulent returns
RR - Operational improvements	FL and RL operational improvements for return reduction
RR - Investigate returns	Practices to identify the reasons or causes for returns
RR - Gatekeeping function	Practices related to gatekeeping and inspection to prevent returns
RR - Online store improvements	Online shopping practices that can reduce returns, e.g. product descriptions, videos and photos
Cost reduction and management	Any practices related to cost for the effective RLM of consumer returns
CRM - Cost savings	Any practice to save costs
CRM - Cost identification	Any practice to identify cost for RLM
CRM - Cost avoidance	Any practice that can avoid or prevent costs
CRM - Cost management and accounting	Any practice that helps manage costs
CRM - Financial recovery	Any practice related to recovery of costs, can include product recovery and disposition practices

- *DESCRIPTIVE ANALYSIS EXAMPLES*

Example of keyword search to compare QCA with interview findings discussed in section 7.3.8.3.3



Examples of comparing the interview and QCA findings, using the data tables from chapters 4 and 5

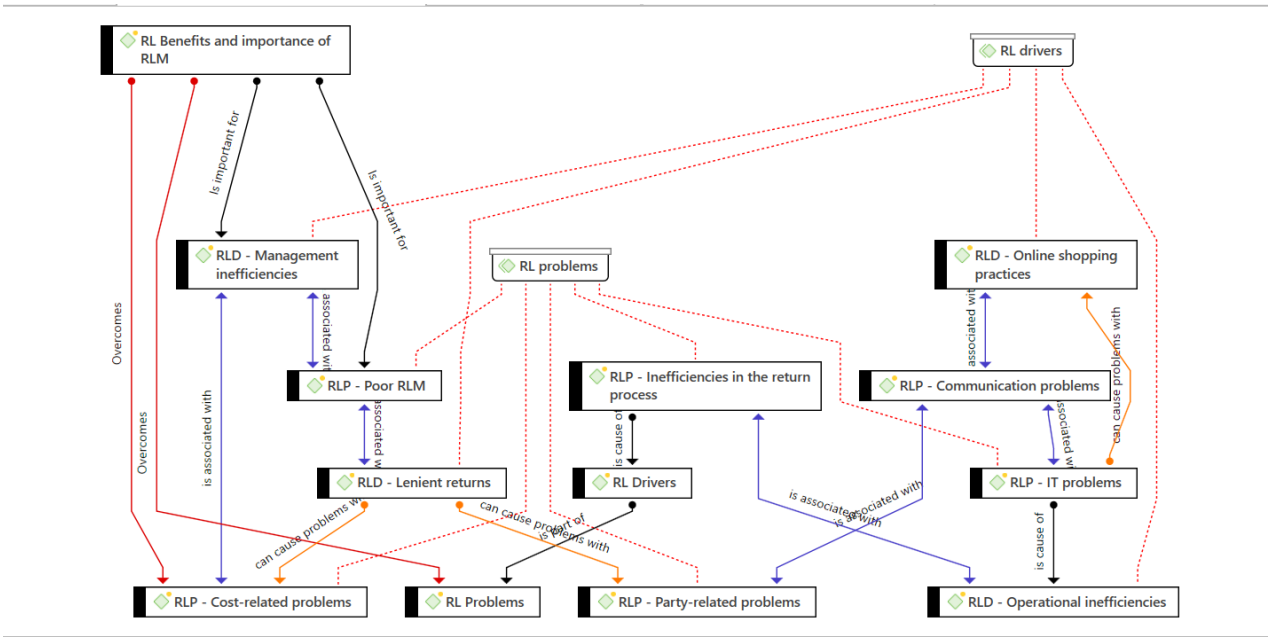
CATEGORY	SUBCATEGORY	KEY QUOTATIONS QCA	KEY QUOTATIONS INTERVIEWS
Product condition	• ***Defective upon arrival***	• *"Defective […] product was inoperable at first use." (Genchev 2009:146)* • *"[…] failure of new products […]." (Jena & Sarmah, 2015:822)*	• *"An example might be I might use reasons for returns such as […] dead-on-arrival […]." (P12, Head of logistics, online retailer)*
Consumer error/fault return reasons (push returns)	• ***Order errors*** • ***False failures*** • ***Problems experienced with products*** • ***Buyer's remorse/ change of mind*** • ***Dissatisfaction*** • ***Unwanted***	• *"Other reasons stated for customer returns include wrong products ordered."* (Li & Olorunniwo 2008:385) • *"Most products are returned not because they are defective or damaged, but for other reasons such as […] the wrong product was ordered in the first place."* (Olorunniwo & Li, 2011:4) • *Many customers could not operate the equipment and therefore returned the product as faulty." (*Bernon & Cullen, 2007:48*)* • *"[…] most product returns are in perfect working order– that is they have no defects. These returned products are commonly referred to as false failure returns and they constitute more than two-thirds of all returns." (*Ruiz-Benítez *et al.* 2014:54) • *"A major reason for returns was the difficulty that customers experienced with the instructions provided with the products."* (Bernon & Cullen, 2007:48) • *"[…] problems with item descriptions, installation, or instructions; […]."* (Bower & Maxham, 2012:114) • *"[…] customers return the products for several reasons, for example […] the customers are unhappy with the functionality of the product […]."* (Gonçalves & Silva, 2016:71) • *"[…] variety of reasons including buyer's remorse […]."* (Bernon *et al.* 2011:491) • *"Marketing-related causes for returns must also be addressed, including […] customers who change their mind after the initial purchase".* (Genchev, 2009:140) • *"[…] consumer-induced returns (e.g., customer changed mind, did not like the product after seeing it, did not like styling)."* (Mollenkopf *et al.* 2007:242) • *"Most products are returned not because they are defective or damaged, but for other reasons such as […] the customers changing their minds […]."* (Olorunniwo & Li, 2011:4) • *"[…] most common reasons for product returns were […] change of mind […] and regret about buying impulsively."* (Seo *et al.* 2015:2) • *"[…] customer is not satisfied with the product's quality."* (Li *et al.* 2013:453) • *"After receiving and trying the product, the customer may feel that it does not match its expectations, and then decide to return back the product."* (Yang *et al.* 2015:363) • *"[…] customers decide to return an unwanted item."* Rogers *et al.* (2013:42)	• *"Look, the types of returns are diverse […] from incorrectly chosen products […]." (P7, owner, 3PRL provider firm)* • *"So if, if the item is found to be in working condition and then […] it was actually just the consumer who purchased the incorrect product and didn't read that it's not compatible with the device, etc." (P5, general manager, online retailer)* • *"[…] with online more so than others, is that people buying it and they haven't tried it on in the store and they either find that the colour is wrong, or the sizing doesn't fit and." (P8, logistics manager, multichannel retailer)* • *"[…] the majority of our returns that we've had now are all buyer's remorse, I don't really need this product […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)* • *"We've got different reasons that the customers can select for returns […] So most common is, I've changed my mind, obviously, at being an online store, a lot of customers don't have the product in hand and therefore when they get the item, it is not as they expected it. And they say they change their mind, and they would like a different variation of product." (P3, returns manager, online retailer)* • *Some of them some of the returns was […] the product doesn't perform as advertised." (P5, general manager, online retailer)* • *"So you might well say this customer has returned […] Jimmy Choo stilettos, saying that as an unwanted item. In other words, they've decided that they know they don't want them […]." (P1, operations manager, 3PRL provider firm)*

D.7 PHASE 3 – GENERATING THEMES OF INTERVIEWS – PHASE 3

Example applicable to section 7.3.8.4.

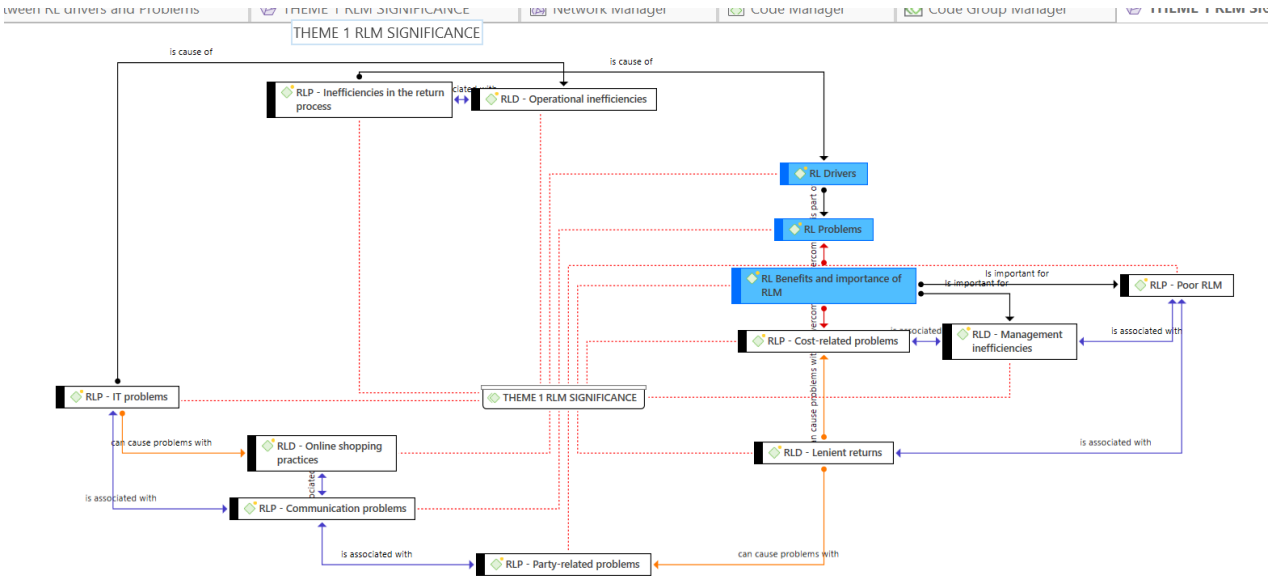
- *EXAMPLE OF STUDYING CODE RELATIONSHIPS USING ATLAS.TI NETWORK FUNCTION*

Using the network function in ATLAS.ti for studying the relationships between codes for theme generation.



- *EXAMPLES OF USING THE NETWORK FUNCTION TO GROUP CODES INTO THEMES*

The figure below shows an example of grouping codes into themes and subthemes, using the network function of ATLAS.ti.



- *NOTES FOR GENERATING INITIAL THEMES*

Notes based on observations, initial notes created in the coding process, notes created from revisiting interview transcripts in phase 3 and exploring relationships between codes.

Code Manager | Memo Manager | Memo – PROBLEMS | Memo – Search for themes

GENERATING THEMES.
NOTES from comments, initial notes during coding and network functions

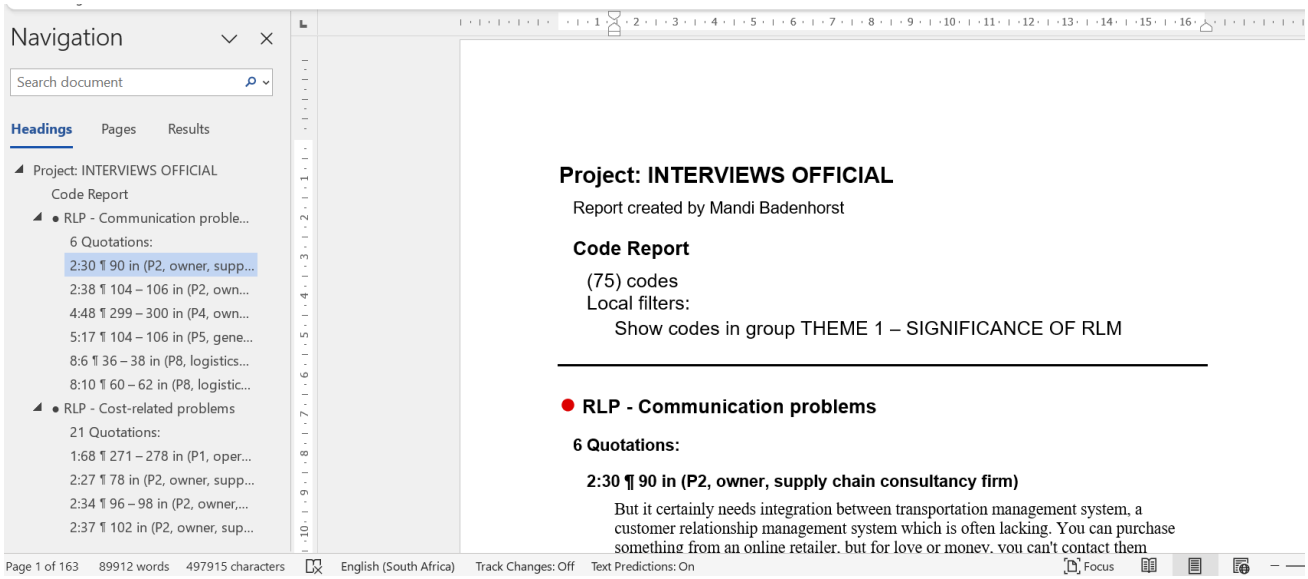
- *Understanding the significance of RLM - consequences of mismanagement, problems, costs, drivers, benefits. Why is it important to manage RL? What are the implications if ignored? [Codes: RL drivers, RL problems, RL benefits and importance]. Subthemes - RL drivers, RL problems and RL benefits and importance*
- *RL decision-making elements and influencing factors - factors the influence decision plans, disposition, insource/outsource - all things costs/benefit decisions. Factors that must be considered for effective RLM. [Codes: RL outsourcing, centralisation and decentralisation, content from RL resources and investments, and customer relationships, information, reduction, cost management also applies. Should this be a separate theme or subtheme within a theme? Subthemes - Considerations for RLM and Factors that influence decisions*
- *RL relationship & information management - Consumer return relationship management - all things consumer, CI, Returns supply chain relationship management - supplier agreements, courier 3PLs, SCI, also internal relationships and communication. Important link to party problems in RL. Types of systems important for information management and communication. Why is information sharing important? [Codes: Relationship management, information and communication and consumer-centric]. Subthemes - Information management, consumer communication and relationships, and internal and SC communication and relationships*
- *RL reduction and recovery- reducing returns and costs can be important for RLM, relates to the drivers and cost related problems. Also financial recovery and management. Why is it important to reduce RL and recovery of financials in RLM? However, consider cost management. Maybe more appropriate for business management [Codes: reducing returns, cost reduction and management, measurement and control]. Subthemes - Return reduction and control and cost reduction and recovery strategy.*
- *Business management for RLM - Focuses on resources and investments. What resources needed to improve RLM? How are retailers generally managing their business? This can be measurements, general and return policies, procedures (standards) and control mechanisms. Will financial management not potentially fit here? Check again in reviewing themes [Codes: measures and controls, RL investment and resources, policies and procedures]. Subthemes - Policies, plans and measures for RLM and resource management*

D.8 PHASE 4 – REVIEWING THEMES

Examples related to phase 4 discuss in section.

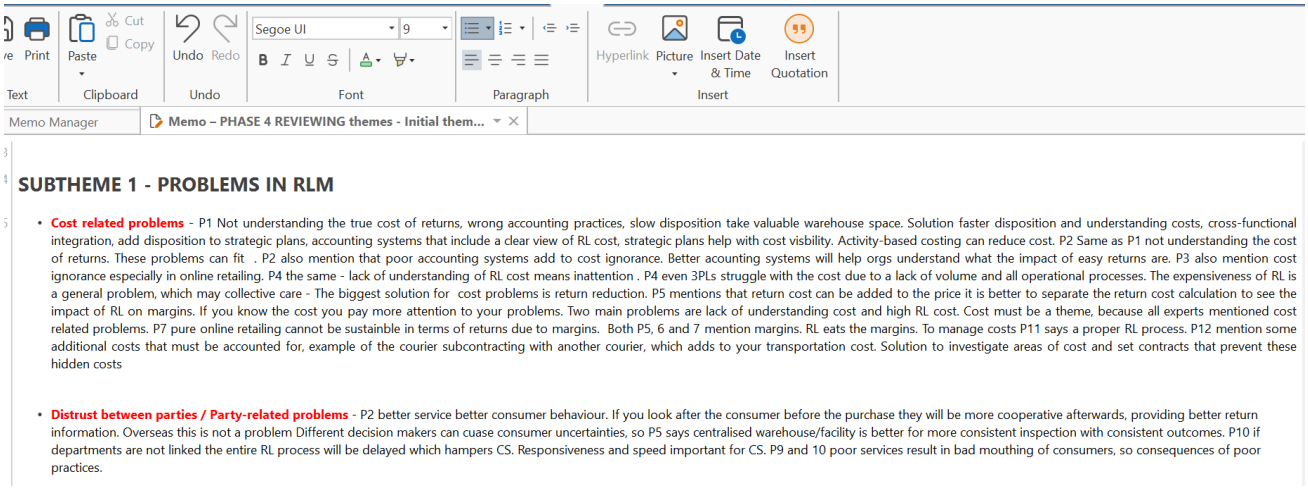
- *OUTPUT REPORTS FOR REVIEWING THEMES*

Step 1 of reviewing themes discussed in section 7.3.8.5.2.



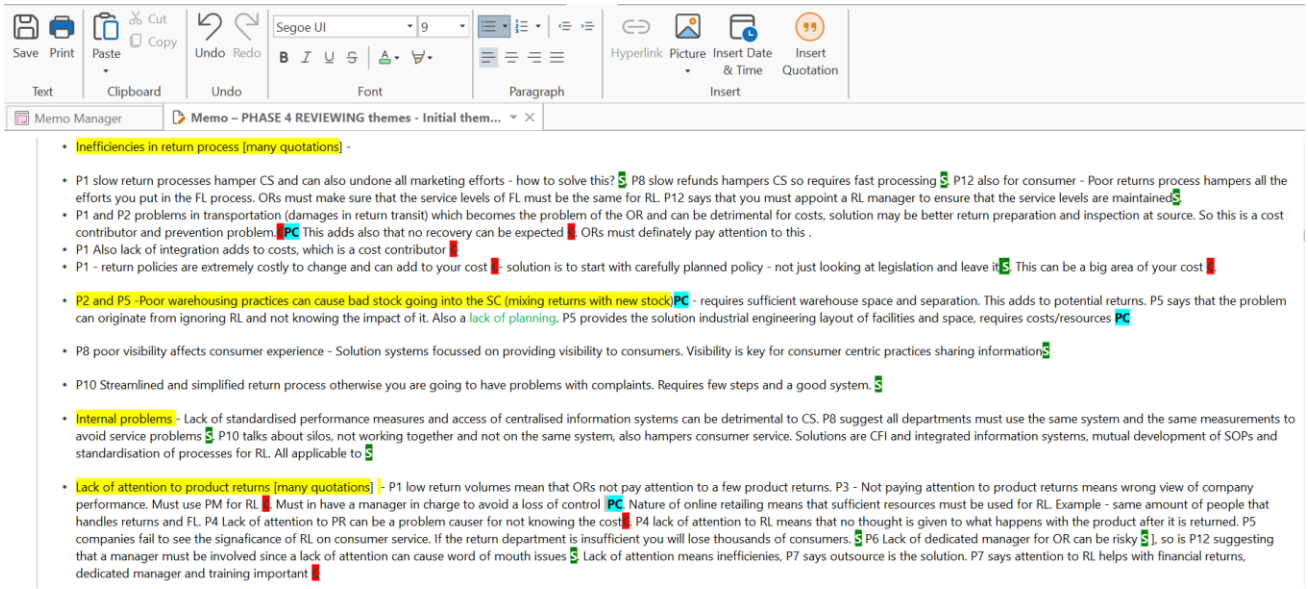
- *REVIEWING THEMES EXAMPLE OF NOTES TAKEN IN READING THE EXTRACTS AND IDENTIFICATION OF NEW THEMES*

Step 2 of reviewing themes discussed in section 7.3.8.5.2.



- *EXAMPLE OF ASSIGNING CODES TO THE NOTES CREATED IN STEP 2*

Step 3 of reviewing themes discussed in section 7.3.8.5.2, returning to the initial notes and assigning codes representing the themes to the comments from step 2.



D.9 PHASE 5 – SELECTING AND ORGANISING QUOTATIONS FOR NARRATIVES

The table shows and example of selecting and organising quotations for phase 5 of the analysis, discussed in section 7.3.8.6. These tables formed the foundation of quotation tables used for the presentation of findings.

THEME 1: PREVENTION AND CONTROL	
Theme elements	**Supporting quotations**
Importance of theme	• "[…] you are always going to have an element of returns. But you can reduce, I believe you can reduce the percentage of returns." (P12, Head of logistics, online retailer) • "[…] returns are always kind of like an afterthought for a lot of companies. So, if you don't manage it proactively and like every single day, it is something that can get out of hand extremely quickly." (P3, returns manager, online retailer)
SUBTHEME 1 – PREVENTION AND CONTROL PITFALLS AND PROBLEMS	
Operational failures - FL failures - RL process inefficiencies	• "[…] pick accuracy is a big driver of returns for obvious reasons." (P5, general manager, online retailer) • "But people, the consumers talk amongst each other about the product quality, and you start losing sales because of a bad experience that one consumer had with the product that was bought online that had a defect […]." (P2, owner, supply chain consultancy firm) • "If your evaluators are stupid, they'll put products into bad stock, which are not supposed to be there, or they'll put products into good stock that are not supposed to be there either. And you create a perpetual problem of returns because these guys are not doing the job correctly […] you don't want to resell bad stuff. You don't want to be known in the trade as the guy that takes back rubbish and sends you [the new consumer] back rubbish." (P5, general manager, online retailer) • "[…] keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items and possibilities of counterfeit goods, for example, entering your supply chain through a back door or having defective merchandise entering your supply chain again." (P2, owner, supply chain consultancy firm)
Poor website and systems	• "[…] the dumbest thing you can do is to use old or dated or incorrect photography." (P5, general manager, online retailer) • "[…] reverse logistics is simply not possible without a solid technology platform, because what you'll end up doing is you'll sit in a position where you manually logging things in, but you've got no idea of who's doing what, [and] how to track it." (P5, general manager, online retailer)
Poor prevention - Lenient returns - Poor gatekeeping	• "I've seen in the marketplace and people that shared this with me and because it is so easy and there are such a variety of online retailers […] it's very easy to buy something at one online retailer and return it to another online retailer where you basically duplicate the transaction and then claim a return from it. And some of the online retailers are also selling counterfeit goods or goods that are not in the right format." (P2, owner, supply chain consultancy firm) • "[…] a no-questions-asked return policy […] it's difficult to say no to those customers, but your customers take chances." (P8, logistics manager, multichannel retailer)
Poor RLM - Inattention to RLM - Poor planning - Lack of resources	• "[…] reverse logistics […] doesn't receive focus. It doesn't receive attention […] [returned products] eventually gets swept out and thrown away, it is pilfered, etc." (P7, owner, 3PRL provider firm) • "[…] your biggest damages of your brand could be the product finding its way into illegal or illegitimate markets. […] That's one example of justification of why it should be in your strategic plan." (P7, owner, 3PRL provider firm) • "You want to make sure that your parcels return to you […], you want to be able to see that stuff, and if you don't invest in systems and information technology […] it's very difficult to manage that and actually proactively get the visibility [of product returns]." (P13, supply chain manager, multichannel retailer) • "And if you don't measure [RL], you can't manage it. So, whether it's reverse or not reverse, if you don't have a measurement process in place, you will not be able to manage something. It's impossible." (P6, logistics manager, multichannel retailer)
SUBTHEME 2: PREVENTION AND CONTROL PROPOSITIONS	
Proactive prevention - FL prevention - RL prevention	• "[…] if you can provide an exceptional forward logistics, your reverse logistics will reduce. No doubt about it." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "[…] make sure that your online image reflects exactly what the customer's going to get, so that it doesn't confuse them with colour or quality. And make sure that the metadata on your website […] is 100 percent accurate so that the sizes and weights and dimensions are all 100 percent right." (P8, logistics manager, multichannel retailer) • "[…] they will reduce the number of returns if they do attach a cost to the return." (P2, owner, supply chain consultancy firm)
Reactive prevention - Reactive prevention examination - Reactive prevention investigation	• "[…] you have robust feedback loops. So, when returns do happen, you're able to understand why. Look, you will always get a certain level of returns. But when they're driven by either operational process or product itself, unless you're getting that feedback, you're not going to fix these processes, you just exacerbate the problem. So, I think that those are probably key." (P1, operations manager, 3PRL provider firm) • "[…] looking at a root cause analysis as to what are the causes of the returns. I mean, it could be a myriad of things. It could be damages, it could be product issues, it could be actual products or dead-on-arrival products being latent damages, et cetera." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "[…] there needs to be the feedback loops into the business as well. If the same five-inch board-shorts keeps generating returns every summer, it's time to stop selling the five-inch board shorts or change its design." (P1, operations manager, 3PRL provider firm) • "[…] what we found with Retailer E was that the same consumer would keep trying to commit the fraud and they eventually just block their accounts." (P4, owner/CEO, 3PRL provider firm)

Return control - Return product and process control - Return function control	• "[…] if you want to run your reverse logistics process accurately, you definitely need someone to account for it. You definitely need someone to manage the flow of it […]." (P4, owner/CEO, 3PRL provider firm) • "[…] you need some kind of inbound visibility. You can imagine if you've got a warehouse that has limited receiving space and you've got fresh product being flown into a distribution centre, you need to know what your volumes are going to be for returns […]." (P1, operations manager, 3PRL provider firm) • "You need to have the right space also at your facility. You deal with returns when it does come back so that you can keep the return segregated from, call it, clean stock that hasn't been dispatched so that you don't have cross contamination of items […]." (P2, owner, supply chain consultancy firm) • "[…] you need an end-to-end inventory management system. So, you need to be able to create a reverse order, and systematically track and update the status of that order as it goes back into the DC […] So, you need to […] make sure that you don't lose that product and that you don't miss it somewhere in the system […]." (P5, general manager, online retailer**)** • "[…] a dedicated outsourced reverse logistics business […] Our facilities are adopted for [the] management of reverse logistics. […] our disposal mechanisms are all in terms of policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm) • "[…] that's all about how you set up your internal controls […] is it easier in one place when everything comes back, [and] one team dealing with it […] to keep an eye on that." (P13, supply chain manager, multichannel retailer) • "[…] you'd have to have a manager to make sure that things are kept in control." (P8, logistics manager, multichannel retailer) • "[…] if you do not have standard processes and regulations in place […] you do get the people selling off or taking stock or hand it out to staff, and then just say, but we weren't aware that it's not allowed. Where your policy and guidelines give you clear indication what needs to be done with return stock." (P11, Demand and sales manager, FMCG distributor) • "I still have to measure that ultimate percentage level […] to make sure that it doesn't creep up on me […]. I still need to make sure that returns as a department doesn't grow." (P6, logistics manager, multichannel retailer)
Parameters - Volume - Product - Organisational - Cost versus benefits - SC - Market-related - Legislation - Environmental	• "[…] you would exit the supplier if they've got more comebacks than what is normal. And that's an obvious red flag. You simply exit that supplier and say, you know what, we've got too many comebacks. You are tarnishing our brand, so cheers." (P5, general manager, online retailer) • "But the value-add team, they would have to take that garment out of the bag […] to see whether there are any makeup marks or any dirt marks […] to see whether it's actually been worn. If so, they'll return it to the customer, and say, you know what, you wore it, we've got lipstick, mascara or deodorant or perfume on the jacket, we can't resell it. Sorry you take it [back], you keep it." (P5, general manager, online retailer) • "So, you need sort of sufficient testing capacity if you're really going to validate and assess these products […] if you're going to approach it from a 'we want to protect ourselves from fraud', then you need to build these mechanisms […]." (P1, operations manager, 3PRL provider firm) • "It all depends on your network design […] we've centralised [RL] because the decision-making criteria is more consistent in one depot in the country […]. So, it's a managerial control decision versus a cost optimised decision."." (P8, logistics manager, multichannel retailer) • "There's a cost involved in uploading photographs, […] because all of those photographs have to be hosted and stored and someone needs to take it and upload it and all of that." (P2, owner, supply chain consultancy firm) • "[…] integration with a stock management system […], which can be both internal and external, so internal your own, warehouse and external with a third party, that's if they would like to integrate, that is first prize, it's easier to control […] on the reverse logistic side […]." (P12, Head of logistics, online retailer) • "[…] you couldn't really dictate to the customer because you've got such a small penetration into the market, you literally have everything to lose. So, they were a lot more accommodating than what they were supposed to be. […] the next level of innovation in South Africa is where the penetration increases, the online retailers will become a lot more sticky and saying, you know what? Sorry, pall, I'm not going to take that back, you broke it, or you didn't use it properly." (P5, general manager, online retailer) • "[…] the product is going to come back to you anyway […] because […] the Consumer Protection Act works against you. So, you could implement a verification process [in the facility], which is the gatekeeper." (P4, owner/CEO, 3PRL provider firm) • "The problem about returns, it's not ever flowing, like you don't get product in, product out. So, it's a big request from our side to the supplier to actually get the products out […] in this lockdown period, the stock on hand that we have for returns […] piled up greatly […]." (P3, returns manager, online retailer
SUBTHEME 3: PREVENTION AND CONTROL PROFITS	
Product return profits - Reduce/avoid unnecessary returns - Reduce/avoid fraudulent returns	• "[…] on our website, if you want to log a return for something that you've changed your mind, but you've ordered it outside the [return] period […], it automatically rejects it. I think that's a great way to avoid unnecessary returns." (P3, returns manager, online retailer) • "[…] by digitising your returns policy […] Your computer system understands what the product is and when they bought it […] and allows that customer to return it or rejects the return with treatable messaging that avoids those sorts of fraudulent returns […]." (P1, operations manager, 3PRL provider firm)
Operational profits - Return control, handing and visibility - RL process speed and efficiency - Inventory management	• "I would definitely have it all together. Because it relates directly then to the existing or current stock that you may carry or may not carry, and you've got immediate control." (P12, Head of logistics, online retailer) • "[…] you need an end-to-end inventory management system. So, what I mean by that, you need to be able to create a reverse order. And systematically track and update the status of that order as it goes back into the DC […] So, you need to keep accurate track of where that product is in the system […]." (P5, general manager, online retailer) • "[…] the staff needs to be trained […] on the [return] process […] in order to function efficiently." (P4, owner/CEO, 3PRL provider firm) • "[…] the reverse logistics manager is actually managing the [return] inventory component […]." (P1, operations manager, 3PRL provider firm)
Organisational profits - Organisational performance - Improve RLM	• "So, the customer wasn't happy and complained, you know, the customer always complained due to something that was an error in their order […]. So, it just becomes so important for us because this is where we improve our business. You know, we pull from that complaint's we pull from that to iron out the creases […]." (P9, regional & online DC manager, online retailer)

	• "I use the courier's delivery online platform, whatever they've got, I use that […] for reverse logistics control and management, because they've got already all the steps in there that you would need, which is I've received your item, I'm in transit, and I'm back in the hub, I've confirmed it back in the hub, and I've taken ownership of it, there is the receipt of it." (P12, Head of logistics, online retailer) • "[…] appoint additional resources to make reverse logistics a division that manages the returns […]." (P10, Head of Sales and Logistics, OEM/multichannel retailer)
External profits - SC profits - Market profits	• "I see benefit in the data for any supplier. You can quite easily pick up certain trends on returns that can be valuable for any supplier, whether it sizes, whether it's malfunctioning of a product, whether it is any reason for the return […] then that highlights certain data issues that you can take on with that […] supplier or manufacturer." (P12, Head of logistics, online retailer) • "[…] you would exit the supplier if they've got more comebacks than what is normal. And that's an obvious red flag. You simply exit that supplier and say, you know what, we've got too many comebacks. You are tarnishing our brand, so cheers." (P5, general manager, online retailer) • Our facilities are adopted for [the] management of reverse logistics. […] our disposal mechanisms are all in terms of policy, in terms of the management of brand equity. We do all those things and commit ourselves and contract ourselves to make sure the products get disposed of in the correct fashion." (P7, owner, 3PRL provider firm)
Other theme profits - Improve consumer service, satisfaction and retention - Reduce and avoid costs	• "[…] we try to reduce the amount of times […] the customer goes to social media badmouthing your company […] And the way you do it again is by providing the best customer service […] because if you providing this customer with the most exceptional service from the get go and he receives his product, I can tell you now already he'll embrace it." (P10, Head of Sales and Logistics, OEM/multichannel retailer) • "So, when a customer logs a return, they obviously need to take a photo of an item […] that person can see that item has been used. It obviously it gets declined right away. So, you don't have that cost incurred […] to send it back […] I think that's a great way to try to avoid unnecessary returns." (P3, returns manager, online retailer)

D.10 PHASE 6 – EXTRACT OF FINAL QUOTATION TABLE FOR WRITE-UP

The table shows an extract of the quotation tables used for the write-up of findings in phase 6, discussed in section 7.8.3.7 (step 1).

SUBTHEME CATEGORY	MAIN ELEMENT	KEY POINTS	KEY QUOTATIONS	COMMENTS
SUBTHEME 1: SERVICE PITFALLS AND PROBLEMS				
Internal culture	***Functional autonomy***	Silos mentality	*"I think when it comes to inter-departmental, it's, that the scary part that we have these days in organisations that everyone works in within silos. Right. And because everyone has an ego. Right. Who suffers in the end, the customer? Because I'm not going to do, I'll do it in my own time to prove a point to so-and-so. So you've got so for example, […] if logistics delays on some certain items or certain activities, it'll create an impact or bottleneck on the entire operation. OK. Same applies for the call centre. If the call centre, do not follow up on a call, I could have a delay on the entire process. If finance delay on refunding a customer that can, and remember, it's not only about collecting a unit and delivering it to the warehouse." (P10, Head of Sales and Logistics, OEM/multichannel retailer)*	Poor return experience Poor return processes and service failures
		Separate PM	*"[…] the worst thing that can happen is that different department gets measured on different things, and they are reporting on different aspects, which may not be customer centric." (P8, logistics manager, multichannel retailer)*	
	Internal preservation	Stringent returns	*"[…] if the customers sort of 18 days out and they wanted to return the product and you say, no, I'll never go back and buy it for those people again […]." (P4, owner/CEO, 3PRL provider firm)* *"You know, there are good reasons often to stop a customer from returning a product legitimately is the worst thing you can do to put a computer system in there, that says okay 14 days old I'm going to reject this. If it was me as a consumer, I would want to speak to a human being and say, hey pall, this is what I want to send back. And these are the reasons why I don't need a computer to tell me I'm 14 days out. I can't do it." (P4, owner/CEO, 3PRL provider firm)* *"[…] it shouldn't be a hassle for any person […] to return an item because then it will make them skittish to buy from you again." (P3, returns manager, online retailer)* *"I think it is because the online retailer that doesn't do so will be behind in the marketplace, because within a very short period of time, the consumer has come to expect that everything is a free delivery and is a free return." (P2, owner, supply chain consultancy firm)*	Loss of consumers Loss of market share Loss of sales
Poor RLM	***Inattention to RLM***	Lack of RL manager	*"[Dedicated manager for RL] Yeah […] Particularly in ecommerce, I think, because the reputational risks are so high […] to get it wrong is, is quite rife." (P6, logistics manager, multichannel retailer)*	P12 Damaged reputation
		Lack of	*"And your, your biggest risk in terms of customer retention sits in that returns*	Loss of

SUBTHEME CATEGORY	MAIN ELEMENT	KEY POINTS	KEY QUOTATIONS	COMMENTS
		knowledge on the importance of RL	*department. So that's another thing that people neglect is that they don't they don't necessarily understand that when things go wrong in that department, you are bound to lose thousands of customers by word of mouth." (P5, general manager, online retailer)* *"Amazon a product and they deliver that product tomorrow and you say, yay, what a great experience. But then you see, hang on, I've got a problem with this pen, and now I want to return this pen and you don't have that same experience, then you've lost all confidence in that company. So you've lost credibility." (P12, Head of logistics, online retailer)*	consumers and damaged reputation
	Poor planning	Problematic policies	*"[…] if you've got a poor returns policy and or poor returns process, all the effort that you're putting into marketing is being undone by this process." (P1, operations manager, 3PRL provider firm) [also applies above]* *"Yeah, I think obviously if you leave something open for interpretation from a customer perspective, which we've obviously had quite frequently, and then you get a lot of upset customers because the policy was a bit open-ended." (P3, returns manager, online retailer)*	Loss of market share
		Lack of formalisation and standardisation	*"[Formalisation and standardisation in RL] Absolutely, I think it is imperative because, […] If it doesn't happen within my own reasonable expectation, I get very, very frustrated." (P7, owner, 3PRL provider firm)* *"You know, there's nothing worse than a consumer having an expectation of X but getting Y because somebody decided that the SOP wasn't the one, they wanted to follow today." (P6, logistics manager, multichannel retailer)* *"[…] you do not want six or seven reclaim centres where the six or seven people that handled electronics all have a different view of what is used. Because that creates uncertainty with the consumer." (P5, general manager, online retailer)*	Frustration Dissatisfaction Uncertainty
		Poor outsourcing decisions	*"I am totally against outsourcing, because when you outsource, especially the reverse logistics […] because if you fail in that in any of those services or if your outsource company would fail in any of those services, it's YOU that will have to bear the brunt for it." (P9, regional & online DC manager, online retailer)* *"So, if I had to run a little courier service to manage my returns, the consumer experience would have been a shocker." (P6, logistics manager, multichannel retailer)*	Poor return processes and service failures
	Lack of RL investment and resources	Lack of commitment to resources	*"If you haven't made those investments and you're actually not going to be able to capitalise on your initial investment in attracting the customer and the initial sale because they won't come back." (P1, operations manager, 3PRL provider firm)* *"But I think there's very little investment in the reverse logistics or returns of products, which means that you might want to give a customer great experience just on the purchase. But when it comes to return, you might actually lose that customer if you don't deal with it properly." (P12, Head of logistics, online retailer)* *"[…] without investment in technology […] your customers will not shop with you anymore because they'll get much better experiences elsewhere because they'll know where their stuff is." (P8, logistics manager, multichannel retailer)* *"[resource commitment is] as important, if not equally as important as what you would spend on delivering your outbound experience. And like I said earlier, if you spent a whole lot of money developing a site that ships products, lovely experience on the outbound, lots of marketing goes into driving those customers. All that money is being spent and they come to return the product and it's a poor experience and you lose that customer." (P1, operations manager, 3PRL provider firm)*	P2 Inability to capitalise on investment loss of market-share Loss of consumer Unsatisfactory experience
		Lack of IT resources	*"[Investment in IT is] Absolutely crucial […] to smoothen the reverse logistics [process]. Because I tell you why, this is where online companies lose business and, in the end, they lose the customer's trust." (P9, regional & online DC manager, online retailer)*	Loss of consumer trust & market share
		Lack of financial resources	*"Now you want a smooth flow the same technology to apply, to be applied similarly into that smooth flow, backwards. That is what is not happening at the moment. And see. Obviously, I think companies don't want to outlay funds if there's no return. Yeah, that's more of an expense. You don't outlay money with an expense." (P9, regional & online DC manager, online retailer)*	Poor return processes and service failures
Information-related pitfalls	***Poor visibility***		*"There's nothing worse than a customer that doesn't know what. What's going on, how far in the process the return is, when are they getting their money? When are they getting their return, et cetera. So that's definitely the most tricky part in the whole situation, is keeping your customer informed on the progress that you are making." (P5, general manager, online retailer)* *"I mean, if you've ever bought online and you can't see what's happened to your order when you try to return it, it frustrates you and it probably will encourage you to shop somewhere else." (P8, logistics manager, multichannel*	Loss of consumer Frustration Poor experience

SUBTHEME CATEGORY	MAIN ELEMENT	KEY POINTS	KEY QUOTATIONS	COMMENTS
			retailer) *"Our visibility poor so customers will return something […] things happen in the background so the courier will collect it and then they will just have to wait until one day they get a refund. It's not visible as to what step in the process they're in very clearly. And some vendors or some retailers are doing it a lot better than us. So, I don't think bring us to industry." (P8, logistics manager, multichannel retailer)* *"[…] if you're not communicating and keeping the customer up to date, up to speed as to what's going on with his order, that really places a dampener on the customer experience." (P10, Head of Sales and Logistics, OEM/multichannel retailer)* *"[…] for reverse logistics […] the customer wants to see, have they logged my call? It's approved or not approved, and when are they going to come and collect. […] if you go with a company that does not have it, then it's, you going to be on the phone all the time. It's quite a bad experience then at the end of the day." (P12, Head of logistics, online retailer)*	
	Poor systems	Manual operations	*""[…] with your inventory system […] you need to keep accurate track of where that product is in the system […] you also need to make sure that you don't lose that product […] You sent me a product that I've returned to you. You've acknowledged the receipt of that product. But you haven't done anything about it yet, so I'm still sitting at this point as a customer, I'm sitting without money and I'm sitting without the product. […] that creates a hell of a lot of frustration from the customer's point of view." (P5, general manager, online retailer)* *"Whereas if you go with a company that does not have it, then it's, you going to be on the phone all the time. It's quite a bad experience then at the end of the day." (P12, Head of logistics, online retailer)*	Poor experience Frustrated and angry
		System failures	*"But if your front-line system is not up to scratch and there's a lot of glitches within that system, all right, then you're going to have massive problems. You're going to have huge void VOC levels. I mean, the customer level, the voice of customer is going to be crazy, the amount of calls, you know, your call centre is going to be, will experience a spam of calls from these customers because they feel that you know what? How can you have an online system that doesn't work for us? I mean, you quick to make, it's easy to make a purchase and you're quick to take my money. All right. But from a return's perspective, I have to go through probably six or seven activities to try and get my returns sorted out, you know?" (P10, Head of Sales and Logistics, OEM/multichannel retailer)*	Poor experience and anger
	Poor integration	Lack of SCI	*"[…] when the customer generates a return, she will obviously go into the website into her account and generate that return. And if the if the courier company and the fulfilment centre's ERPs are not plugged in and assessed and has a smooth flow in between the three ERPs, you know, then you're going to have a break in, you can have a break in communication and a delay. And this is what we don't want. And I figured out that something in this country at the moment that's very, immature. It's very slow. It has to be improved quite a bit. It has to be improved." (P9, regional & online DC manager, online retailer)*	Poor return processes and service failures
		Lack of CI	*"Because if it's not integrated, then the customer will not have access to all the relevant information and trust is established through transparency, which means access to current information." (P8, logistics manager, multichannel retailer)*	Loss of trust

Appendix E – Ethics and related documentation for interviews

E.1 PARTICIPATION SHEET

The participation sheet was provided to prospective participants during the recruiting stage of the interviews. This sheet also contributed to the ethical standards adopted throughout the research.

UNISA university of south africa

PARTICIPANT INFORMATION SHEET

20 July 2020

Title: **A framework for the reverse logistics management of consumer returns in online retailing.**

Dear Prospective Participant

My name is Amanda Badenhorst and I am doing research with Orpha Cilliers, a professor in the Department Applied Management, towards a PhD in Management studies at the University of South Africa. We are inviting you to participate in a study entitled a framework for the reverse logistics management of consumer returns in online retailing.

WHAT IS THE PURPOSE OF THE STUDY?

I am conducting this research to determine the processes, policies and practices for the effective management of reverse logistics with a focus on consumer returns in the online retailing industry. The aim of this study is to develop a framework for the effective management of reverse logistics focusing on consumer product returns in online retailing. This study is expected to collect important information that could guide online retailers to review policies, manage processes, and implement appropriate practices in terms of the reverse logistics management for consumer returns.

WHY AM I BEING INVITED TO PARTICIPATE?

You are invited to participate in this study due to your knowledge of reverse logistics management. Therefore, you are either an owner/CEO/manager of an organisation that specialises in reverse logistics as a service for online retailers or you have managerial experience in the reverse logistics processes of online retailing.

psychological and social harm. Participation is voluntary and you can withdraw from the study at any time before or during the interview.

WILL THE INFORMATION THAT I CONVEY TO THE RESEARCHER AND MY IDENTITY BE KEPT CONFIDENTIAL?

You have the right to insist that your name will not be recorded anywhere and that no one, apart from the researcher and researcher's supervisor, will know about your involvement in this research. Your answers will be given a code number or a pseudonym and you will be referred to in this way in the data, any publications, or other research reporting methods such as conference proceedings. The researcher will transcribe and code the data and no other external party, apart from the supervisor, will have access to the data.

HOW WILL THE RESEARCHER(S) PROTECT THE SECURITY OF DATA?

A software programme ATLAS.ti will be used to analyse the data and all recorded data will be password protected on the researcher's computer. No external party will have access to the ATLAS.ti files used to analyse the data. The electronic copies of your answers will be stored in a password-protected folder for a period of five years for future or academic purposes, where after it will be permanently deleted from the hard drive of the researcher's computer.

WILL I RECEIVE PAYMENT OR ANY INCENTIVES FOR PARTICIPATING IN THIS STUDY?

You will not receive any payment nor incentives for participating in this study. You will receive the option of a (1) telephonic interview, (2) Skype interview or (3) virtual meeting software. If you choose a telephonic interview, the researcher will cover the telephonic costs. However, if you choose the option of an interview via Skype or Microsoft Teams, you and the researcher will equally be responsible for the cost of data, if needed.

HAS THE STUDY RECEIVED ETHICS APPROVAL?

This study has received written approval from the Research Ethics Review Committee of the College of Economic and Management Science, Unisa. A copy of the approval letter can be obtained from the researcher if you so wish.

University of South Africa
Preller Street, Muckleneuk Ridge, City of Tshwane
PO Box 392 UNISA 0003 South Africa
Telephone: +27 12 429 3111 Facsimile: +27 12 429 4150
www.unisa.ac.za

HOW WILL I BE INFORMED OF THE FINDINGS/RESULTS OF THE RESEARCH?

If you would like to be informed of the final research findings or require any further information, please contact the researcher Amanda Badenhorst telephonically on 084 5814285 or via email to badena@unisa.ac.za. Alternatively, if you are interested in any published material related to this study, you are also welcome to request such documents from the researcher.

Should you have concerns about the way in which the research has been conducted, you may contact Prof Orpha Cilliers telephonically on (012) 429 4030 or via email at cillijo@unisa.ac.za. Alternatively, contact the research ethics chairperson Mrs Poole of the Department Applied Management, telephonically on 012 433 4668 or via email at loedoc@unisa.ac.za.

Thank you for taking time to read this information sheet and for participating in this study.

Thank you.

Amanda Badenhorst

E.2 INFORMED CONSENT FORM

CONSENT TO PARTICIPATE IN THIS STUDY

I, _____ (participant name), confirm that the person asking my consent to take part in this research has told me about the nature, procedure, potential benefits and anticipated inconvenience of participation.

I have read (or had explained to me) and understood the study as explained in the information sheet.

I have had sufficient opportunity to ask questions and am prepared to participate in the study.

I understand that my participation is voluntary and that I am free to withdraw at any time without penalty (if applicable).

I am aware that the findings of this study will be processed into a research report, journal publications and/or conference proceedings, but that my participation will be kept confidential unless otherwise specified.

I agree to the audio recording of the semi-structured interviews.

I have received a signed copy of the informed consent agreement.

E.3 APPROVAL LETTERS FOR STUDY ASSISTANCE

UNISA university of south africa

REQUEST TO ASSIST WITH RESEARCH – SAPICS

19 April 2018

Dear SAPICS representative,

My name is Amanda Badenhorst and I am a registered member of SAPICS. I am doing research with Orpha Cilliers (also a registered member of SAPICS), a professor in the Department of Entrepreneurship, Supply Chain, Transport, Tourism and Logistics Management towards a PhD in Management studies at the University of South Africa. This letter serves as a request to assist me in conducting the empirical part of my study entitled

"A framework for the reverse logistics management of consumer returns in online retailing".

The focus of my study to determine the processes, policies and practices for the effective management of reverse logistics with a focus on consumer returns in the online retailing industry - a field with a lacking body of scientific literature and empirical studies. The aim of this study is to develop a framework for the effective management of reverse logistics focusing on consumer product returns in online retailing. This study is expected to collect vital information that could guide online retailers to review policies, manage processes, and implement appropriate practices in terms of the reverse logistics management of consumer returns

SAPICS's vast network of professional members in the logistics and retail sectors would be extremely valuable to contribute to my study. I would like to request if you (SAPICS) are willing to assist me in identifying possible participants from your list of members. I plan to send the invite to prospective participants in January 2019. Based on the processes prescribed in Unisa's Research Ethics Policy, I need a letter of CITLSA indicating your willingness to assist with the dissemination of the call to participate in this study.

The study involves semi-structured face-to-face interviews, or telephonic interviews or Skype interviews, which will be audio recorded. The interviews will be scheduled for February/March

University of South Africa
Preller Street, Muckleneuk Ridge, City of Tshwane
PO Box 392 UNISA 0003 South Africa
Telephone: +27 12 429 3111 Facsimile: +27 12 429 4150
www.unisa.ac.za

2019. The prospective participants in this study must have knowledge of reverse logistics management; therefore, they should either be (1) an owner/CEO/manager of a logistics organisation that specialises in reverse logistics as a service for online retailers, or (2) have managerial experience in online retailing and specifically the reverse logistics processes.

The specific value expected from the framework that will be developed in the study will lie in guiding online retailers to (1) get insight into the most effective reverse logistics processes, policies and practices, (2) recognise the importance of effective management of reverse logistics in online retailing, (3) increase profitability through improved reverse logistics management and (4) improve customer relationships. However, findings of this study could also contribute to the reverse logistics management of consumer returns in any organisation/industry/supply chain. Finally, this study will contribute in addressing the current lack of scientific academic literature on reverse logistics management in online retailing.

This study is categorised as low risk study, with the only foreseeable risk of harm to participants being the potential inconvenience of their time during the interview. This study will not lead to any physical, psychological and social harm. Participation is absolutely voluntary and participants can withdraw from the study at any time before or during the interview. The data will be captured anonymously and no individual participant's response will be identifiable.

If you would like to be informed of the final research findings or require any further information, please contact the researcher Amanda Badenhorst telephonically on 084 5814285 or via email to badena@unisa.ac.za. Also, if you are interested in any published material related to this study, you are also welcome to request such documents from the researcher.

Your favourable consideration of my request would be highly appreciated. If you agree to participate, please complete the details on the next page or alternatively, provide your own permission letter with your signature.

Yours sincerely

Amanda Badenhorst

E.4 ETHICS CLEARANCE CERTIFICATE

UNISA university of south africa

UNISA DESTTL ETHICS REVIEW COMMITTEE

Date: 15/06/2018

Reference number : 2018_CEMS_ESTTL_006
Name: Ms Amanda Badenhorst
Student number: 33351589
Staff number:

Dear Ms A Badenhorst

Decision: Ethics Approval from 06/2018 to 06/2021

Researcher(s): Ms Amanda Badenhorst
badena@unisa.ac.za
084 581 4285/ 012 433 4713

Supervisor (s): Prof JO Cilliers
cillijo@unisa.ac.za
082 788 5915/ 012 429 4030

Working title of research:

A framework for the reverse logistics management of consumer returns in online retailing

Qualification: PhD in Management Studies – Logistics (90021)

Thank you for the application for research ethics clearance by the Unisa DESTTL Ethics Review Committee for the above mentioned research. Ethics approval is granted for three years.

*The **low risk application** was **reviewed** by the DESTTL Ethics Review Committee in June 2018 in compliance with the Unisa Policy on Research Ethics and the Standard Operating Procedure on Research Ethics Risk Assessment. The decision was approved on the 14th of June 2018.*

The proposed research may now commence with the provisions that:

1. The researcher(s) will ensure that the research project adheres to the values and principles expressed in the UNISA Policy on Research Ethics.
2. Any adverse circumstance arising in the undertaking of the research project that is relevant to the ethicality of the study should be communicated in writing to the DESTTL Committee.

University of South Africa
Preller Street, Muckleneuk Ridge, City of Tshwane
PO Box 392 UNISA 0003 South Africa

Open Rubric

3. The researcher(s) will conduct the study according to the methods and procedures set out in the approved application.
4. Any changes that can affect the study-related risks for the research participants, particularly in terms of assurances made with regards to the protection of participants' privacy and the confidentiality of the data, should be reported to the Committee in writing, accompanied by a progress report.
5. The researcher will ensure that the research project adheres to any applicable national legislation, professional codes of conduct, institutional guidelines and scientific standards relevant to the specific field of study. Adherence to the following South African legislation is important, if applicable: Protection of Personal Information Act, no 4 of 2013; Children's act no 38 of 2005 and the National Health Act, no 61 of 2003.
6. Only de-identified research data may be used for secondary research purposes in future on condition that the research objectives are similar to those of the original research. Secondary use of identifiable human research data require additional ethics clearance.
7. No field work activities may continue after the expiry date (06/2021). Submission of a completed research ethics progress report will constitute an application for renewal of Ethics Research Committee approval.

Note:

*The reference number **2018_CEMS_ESTTL_006** should be clearly indicated on all forms of communication with the intended research participants, as well as with the Committee.*

Yours sincerely,

UNISA DEPARTMENT APPLIED MANAGEMENT RESEARCH ETHICS REVIEW COMMITTEE (DAM-RERC)

15 June 2018 (Date of issue)
30 August 2022 (Date of amendment)

Ref #: 2018_CEMS_ESTTL_006
Student #33351589

Dear Ms A Badenhorst

Decision: Ethics Approval Extended to July 2024

Working title of research:

A framework for the reverse logistics management of consumer returns in online retailing

Qualification: Ph.D. in Management Studies – Logistics

Thank you for the application requesting **amendments** to the original research ethics certificate issued by the Department of Applied Management for the above-mentioned research in August 2022. The approval of the requested amendment is granted/extended for the study for the period 1 July 2021 – 31 July 2024.

*The **low-risk application** was reviewed by the departmental RERC in compliance with the Unisa Policy on Research Ethics by the University of South Africa using the expedited method.*

The proposed research may now continue with the proviso that:

1. *The researcher/s will ensure that the research project adheres to the values and principles expressed in the UNISA Policy on Research Ethics.*
2. *Any adverse circumstance arising in the undertaking of the research project that is relevant to the ethicality of the study, as well as changes in the methodology, should be communicated in writing to the UNISA Research Ethics Review Committee. An amended application could be requested if there are substantial*
